Contemporary with these men were two poets, Nævius and Ennius—metrical annalists we may call them—who gave the Romans histories in verse of the first and second Punic wars. Nævius wrote in the old native Italian metre—Saturnian, as it was termed; Ennius (half a Greek by birth) introduced the Greek hexameter. With these two poets, both men of considerable genius, Latin literature made a decided advance. A few poor fragments of their works are still extant, sufficient to show that they accepted the current legends and traditions about the origin of Rome.

Side by side with these essays in epic poetry there grew up a dramatic literature, to which Ennius and Nævius also contributed. This arose in the 3d century B.C. out of rude old Italian stage representations connected with popular festivals, and from a growing acquaintance with Greek culture, which by this time was widely diffused throughout Italy. The rough Latin humour, not much better than a sort of horseplay, could not evolve anything that deserved to be called the drama till it had come into contact with Greek art. The first play is said to have been exhibited on a Roman stage under the superintendence of Livius Andronicus, a Greek from Tarentum, whom we may regard as the father of Roman dramatic poetry. From that time the theatre became a recognised institution among the Romans. The plays of Andronicus were adaptations, almost translations, from the Greek; for the most part they seem to have been clumsy, inartistic performances. Still, they were popular and very widely circulated, and gave the Romans a decided taste for theatrical entertainments. Ennius and Nævius improved on them; nor did they confine themselves to a servile imitation of the Greeks, but aspired to build up a truly national drama, taking their subjects from old Roman legends or even from the history of their time. Tragedy as well as comedy, though never equally popular, now took its place at Rome. Through Ennius more especially the rather questionable moral influence of the clever and subtle Euripides, with its cosmopolitan and denationalising tendencies, filtered down into the Roman mind, with the result of somewhat weakening the fibre of Roman character. Of Roman tragedy, however,

we know but little; sensational horrors seem to have been peculiarly attractive, fostering perhaps the vile taste which subsequently found its gratification in the gladiatorial combats. Of comedy the chief and to us the best-known representative is Plautus, deservedly a most popular poet with the Roman people, as his twenty extant plays testify, full as they are of original humour, of bright, witty dialogue, and funny, laughable incidents. Plautus, it seems, was exhibiting his plays in the latter part of the 3d and the early years of the 2d century B.C. Terence followed at no distant interval; six of his comedies which have come down to us show that a rather more refined and cultivated taste was coming into fashion. There is something of a modern tone and flavour about Terence. He is a pleasing, graceful writer, without, however, much originality; he in fact did little more than reproduce Greek comedies, especially those of Menander.

There was another branch of literature alongside of the drama, distinctively Roman, so that Quintilian (x. 1, 93) says of it 'it is all our own.' This was satire—'satura,' as the Romans called it—by which they seem to have meant both a sort of rude dramatic medley or miscellany, and a string of reflection, in a poetical form, on mankind and the world in general. Indeed all poetry that could not be classed as epic or dramatic came under the head of satire. There was nothing necessarily satirical in our sense about it. Ennius was a writer of 'satires' in the old meaning of the phrase; but it was Lucilius, in the latter half of the 2d century B.C., who introduced what we understand by 'satires,' and prepared the way for Horace and Juvenal. It was from the poets of the old Greek comedy, from Aristophanes, Eupolis, and Cratinus, that he borrowed the idea of political satire, in which, it seems, he allowed himself the utmost freedom. The public men of the day were the subjects of his attacks, and he lashed them, it is said, with merciless severity. His versification was rough, but he was undoubtedly a man of real wit and genius. We have unfortunately only a few scraps of his poetry.

Prose literature was but poorly represented in the 2d century B.C. by a few inferior historians, or rather annalists, of whom Cicero and Tacitus express a very mean opinion. They seem to have been utterly uncritical chroniclers, ridiculously pretentious, and always straining after rhetorical effect. In the early part of the 1st century was a historian of some merit, Sisenna, who described the social war and the civil wars of Marius and Sulla. Cicero speaks of him with considerable praise (*Brutus*, 64), and Sallust (*Jugurtha*, 95) says that in his treatment of the period of Sulla he was a careful and painstaking writer.

In the 1st century B.C. Roman literature made a great advance. A man of prodigious learning and industry, Marcus Terentius Varro, poured forth a multitude of works on every variety of subject, discussing agriculture in a treatise which has come down to us, and philology, grammar, and antiquities in elaborate dissertations which are unhappily lost. Varro, too, was a prolific writer of 'satires,' which in his case seem to have taken the form of moral and philosophical essays, more or less resembling the papers in the *Rambler* and *Spectator*, or Cicero's short dialogues on 'friendship' and 'old age.' Varro's heart was with the old life of Rome, and he liked to ridicule the new lights and Greek philosophy, then becoming fashionable. Indeed he was a witty and lively satirist, as we may see from our extant fragment, and he must certainly have been one of the very first of Roman men of letters, a profound student and a clever essayist.

Cicero was ten years junior to Varro. It was

the aim of his life to create a perfect prose style, and in this he has generally been regarded as successful. As head of the Roman bar he was accepted as an arbiter of finished composition and of correct taste. His speeches were published after careful revision as political pamphlets. In his numerous philosophical works he dexterously adapted Latin to Greek thought and speculation, achieving with considerable success a difficult work which had hitherto been but very imperfectly accomplished. The general verdict on him is, and as far as we can see will always be, that he was a consummate artist in style, if not a deep or fruitful thinker.

In poetry, in the first half of the 1st century, there was a new departure, a school which formed itself on the model of the Greek fashionable poets. At the head of this movement stands Catullus, the first to naturalise Greek lyric metres at Rome, a man of genuine poetic feeling and with true pathos. There is a more hearty ring about his poetry than in the more elaborate odes of Horace. Catullus had a touch of genius as well as scholarship and culture. His poems—the coarse ones too, it must be feared—accurately reflect the tone of gay Roman fashionable society. A widely different poet was the earnest and philosophical Lucretius, who in his *De Rerum Natura* puts the doctrines of Epicureanism, acceptable no doubt to many of his contemporaries, into the dress of hexameter verse, in which he considerably improved on Ennius. There is a stateliness if not much grace about the hexameters of Lucretius. The subject-matter of his work is decidedly unpoetic, but the genius of a poet makes itself felt in several passages. In the midst of a dreary wilderness are many beautiful spots and resting-places.

The later part of the 1st century was the great age of Roman poetry, the age of Virgil, Horace, and Ovid, familiar names throughout the whole civilised world. The fact that we happily possess their works entire is a proof of the high estimation in which they were held. Much of what is best in modern poetry is distinctly traceable to their inspiration. It has been the fashion to speak of this period as the Augustan age.

Virgil (70–19 B.C.), said to have been a great admirer of Lucretius, to whom he was evidently indebted, has the special merit of having brought Latin hexameter verse to exquisite perfection. There are no hexameters in the whole range of Latin poetry to compare with those of Virgil. His peculiar charm lies in a nice subtlety and refinement of expression, which makes the work of a translator almost hopeless. Every scholar recognises the great difficulty of Virgil. His *Pastorals* (*Bucolics*) and his four *Georgics*, poems on the various phases of agricultural life, and written, it would seem, to stimulate a healthy taste for rural pleasures, were direct imitations of Greek originals. Along with minute descriptions of farming operations, which he forces into verse with extraordinary ingenuity, are beautiful and highly poetic episodes—as, for instance, when he sings the praises of the farmer's life by way of conclusion to his second *Georgic*, or tells the tale of Orpheus and Eurydice in the fourth and last of these poems. In his *Æneid* he imitates Homer; here he writes with the definite purpose of stirring Roman patriotism, tracing back Rome's origin to Troy and to the gods, while he seeks to please Augustus by suggesting a comparison between him and the Trojan hero *Æneas*. Virgil stood high in the emperor's favour, and rose from the rank of rather a small country squire to a foremost place in the great fashionable world of Rome.

Horace (65–8 B.C.) was a man of very humble origin, the son of a father who had been a slave, but he received a liberal education, which his natural

genius enabled him to turn to good account. His *Odes* are to a great extent imitations of Greek lyric poetry, his metres are borrowed from the Greek; still there is much that is truly original in them, much that is distinctly Roman, and there is an indescribable charm about the exquisite finish of the language. Their peculiar grace and beauty, which to all Latin scholars are most delightful, seem to evaporate even in the most skilful translations. In his satires and epistles, the most popular of his writings, because so full of homely common sense and a pleasant, genial humour, there is a charming lightness of touch, an easy natural style and manner which perhaps have never been equalled. His laugh has no bitterness; of satire in one sense there is next to nothing in these amusing essays. 'The terseness of his language,' it has been well said, 'is that of a proverb, neat because homely.' Like Virgil, whose friend he was, Horace enjoyed the favour of Augustus.

Ovid (43 B.C.—18 A.D.) is the most voluminous of the Roman poets, and his facility in poetic composition seems to have been absolutely boundless. His verse is a marvel of cleverness and ingenuity. His great poem, the *Metamorphoses*, is a collection of mythological stories, turning on the change of men and women into animals, trees, plants, or flowers. His *Fasti* or *Roman Calendar*, a sort of poetical almanac, abounding in well-told stories of old Rome and her heroes, is on the whole pleasant reading. His love poems, on which he specially prided himself and no doubt took great delight, are very bright and playful, in style and expression almost perfect, but they have not much depth of sentiment, and here and there they are so sensuous as to be positively offensive. One can well understand how it was said of him that he corrupted the morals of youth. He has been fairly well described as the poet of fashionable society. From some cause unknown to us he was forced to end his days in a sort of Siberian exile on the shores of the Black Sea.

Two poets, writers of elegiac verse, contemporaries of Ovid, deserve a passing mention—Propertius and Tibullus: the first learned, pedantic, and obscure, yet often rising with true poetic fervour into a manly dignity and nobleness of thought; the latter sweet and tender, with a decided tinge of melancholy, the melancholy of a Roman who resigned himself to what he regarded as the fallen fortunes of his country, and who deliberately kept aloof from the imperial court. Tibullus was the friend of Horace and Ovid.

Prose-literature in the 1st century B.C. was represented by Cæsar, Sallust, and Livy. The great Cæsar wrote the history of his campaigns in a style admirably suited to the subject-matter, and recognised by all scholars as a specimen of the best and purest Latinity. Sallust (86–34 B.C.), whom we know through his narratives of the Catiline conspiracy and the war with Jugurtha, modelled himself on Thucydides, and like him aimed at a philosophical treatment of history. As yet Rome had had mere annalists; in Sallust she found a man who really deserved to be called a 'historian.' Of his *Histories*, a work which is said to have treated of the period immediately following Sulla's death, we have but fragments.

Livy (59 B.C.—19 A.D.) was simply a man of letters, taking no part in politics. His great work, the history of Rome from the beginning down to 9 B.C., the year of the last campaign of Drusus in Germany, and of his death, written during the reign of Augustus, with whom he was on friendly terms, though himself a republican, was comprised in 142 books, of which we possess 35, the last of these bringing us down to 167 B.C., the year of the annexation of Macedonia as a province to Rome.

Livy's treatment of his subject evidently became fuller and more detailed as he approached his own time. Hence the loss of his later books is irreparable. As it is, we have not adequate material for a thorough history of Rome in the 1st century B.C. Livy's style is all that can be desired, bright and lively, as picturesque as that of our own Macaulay, but he is not a learned or critical writer; he wrote for the public generally, not for scholars or antiquaries; his aim in fact was to popularise the history of Rome and to magnify her empire, not to sift the legends which had gathered round her origin and early growth.

The last years of Augustus, and indeed most of the 1st century A.D., were, as regards literature, almost a barren desert: no poetry of any account, no forensic oratory, which under the empire had little scope, and no history. With Domitian, the last of the Cæsars (81–96 A.D.), came a revival of letters, the silver age of Latinity, as it has been called, marked by the names of Juvenal, Tacitus, Pliny the Younger, and Quintilian. Under Nero indeed there had been a few minor lights in literature: the satirist Persius, spirited and dramatic, but obscure and affected, reminding one here and there of Browning; Lucan, author of a poem once read in schools and universities, describing under the title *Pharsalia* the civil war of Cæsar and Pompey; and Seneca, whose essays on morals and philosophy embody what was best in Stoicism, while his plays are rhetorical rather than dramatic. To these we may add the witty epigrammatist Martial and the learned and laborious Pliny the Elder (23–79 A.D.), in whose *Natural History* we have a comprehensive work on geography, botany, zoology, medicine, with attempted explanations of every kind of natural phenomena. A compilation rather than an original work, it is very useful as giving us an insight into the physical philosophy of the ancient world.

Juvenal's satires—satires in our sense of the word, bitter and savage—were published in the early part of the 2d century A.D., under Trajan and Hadrian. The man's honest indignation against the vulgar rich and the cringing tribe of parasites and fortune-hunters, with which Rome swarmed, has our hearty sympathy, and it is expressed in pure, vigorous Latin. Johnson has imitated two of his satires in his *London* and his *Vanity of Human Wishes*.

The most conspicuous literary figure of the age was the great historian Tacitus, who was not, like Livy, a man of letters and nothing more, but who was practically acquainted with public life, and had distinguished himself at the Roman bar. An undertone of satire runs through his writings, which at many points remind us of Carlyle. He sums up a character with a few trenchant epithets, and throws out reflections which have passed into proverbs. There is perhaps no ancient author who has supplied more material for the modern essayist and historian. His concise and nervous style at once arrests the reader, and again and again demands from him a very considerable mental tension. His life of his father-in-law, Agricola, governor of Britain under Domitian, a masterpiece of biography, was written in 98 A.D.; so too was his *Germany*, a description of the native population of that country, with a sketch of its geography—a subject which must have been interesting to Romans who knew how little impression their arms had made on those wild regions. In his *Annals* and *Histories*, much of which has been unfortunately lost, he describes the period from the accession of Tiberius to that of Nerva (14–98 A.D.). All that remains to us is his history of the reigns of Tiberius, Claudius, Nero in part, Galba, Otho, Vitellius, and of the rise of Vespasian. His *Histories*, as he termed the

memoirs of his own time, were evidently written with great fullness of detail, and the loss of the later books is much to be deplored. In these we should have had a minute and trustworthy narrative of the three last Cæsars, and of the better time which began with the brief reign of Nerva. Suetonius, a writer of the same period, the author of biographies of the twelve Cæsars, which have come down to us, supplies but very poorly our deficiency.

With Tacitus we may couple his intimate friend, Pliny the Younger, as he is known in contradistinction to his uncle, whom we have already mentioned. The name is generally familiar as that of the man who as the governor of a Roman province in Asia Minor came into collision with the early Christians, and gave his opinion of them in a letter to the Emperor Trajan. Pliny's letters, dealing as they do with every variety of topic—politics, literature, art, society, with glimpses into his home-life and descriptions of his villas—and written, too, in a pleasing style of good Latinity, rank among the best literary specimens of the period. They are of special interest as illustrating aspects of Roman life which would otherwise be unknown to us.

A work also of great merit has happily come down to us from the pen of an eminent professor of rhetoric, Quintilian, who is said to have numbered Pliny among his pupils. It is a treatise on rhetoric and kindred subjects, written in the reign of Domitian, discussing with deep learning and sound critical taste the whole subject of education, and concluding with a short sketch of Greek and Roman literature in its special connection with oratorical training. Scholars have always admired its diction.

Latin literature is from this time almost a blank, represented only by a few feeble writers whose names are not worth noting in a brief summary. The age of what we call classical Latin was finally over. Petty rhetoricians and epitomisers alone survived. Coming down to the close of the 4th century A.D., the period of the Emperor Theodosius (the first of that name), we light on a writer who has been described as 'the last subject of Rome who composed a profane history in the Latin language,' Ammianus Marcellinus, the historian of the period from 96 to 378 A.D. Rather more than the half of his work is extant; in this we have a full account of the reigns of Julian, Jovian, Valentinian I. and II., and Valens—in all twenty-five years of the history of which he had a personal knowledge. He is a good, useful writer, but hardly a man of letters. The last of the classic poets, Claudianus, flourished about the same time.

In the last years of the 5th and the first half of the 6th century A.D. lived the learned Boethius, whose work on the consolation to be derived from philosophy (*De Consolatione*) was translated by King Alfred. There is something of a mystery about Boethius: whether he was a Christian or half-heathen philosopher is uncertain; he seems to have hovered on the borderland between the rising and the declining belief.

Latin was now the language of the Christian church of the West, and the Vulgate the current version of the Scriptures; in Latin, more or less cultured, were written the works of the Latin Fathers, of the theologians and thinkers of the middle ages; sonorous Latin hymnology with rhyming metres grew up; and Latin remains still the language of the services in the Catholic Church.

Learning and literature almost died out for centuries, the period we call the dark ages. Latin in its fusion in the Celtic and Teutonic dialects was quite losing its distinctive character, although it is true that Rome imposed not only her yoke but her language on Spain and Gaul; still, as regards language, her victory was won with heavy loss. The grammar and syntax indeed

were to a great extent retained; but, with the introduction of the definite and indefinite articles, of the auxiliary verb, the addition of a number of words from the barbarians, and the utter disregard of quantity in pronunciation, Latin underwent a complete change, and was at last transmuted into its derivatives, the Romance languages. In its corrupted form, however, it was for a long period a living language, but it ceased to be so in the 10th century. With the revival of letters in the 15th and 16th centuries Latin recovered itself; Ciceronianism became the fashion, Erasmus being one of its most eminent representatives. Latin for the time established itself as the recognised medium of communication in the learned world; and almost all books of any importance, theological and scientific treatises, were written in that language. The controversial works of the English and Swiss reformers were written in Latin; so were the works of Bacon, and Newton's *Principia*—to quote but a few examples. In the universities professors lectured in Latin; candidates for degrees disputed in Latin theses; the grace before and after meals was in Latin—a usage still surviving at Oxford and Cambridge and in the Inns of Court. Notes to editions of the classics, both critical and explanatory, were always in Latin; and Dr Arnold thought it necessary to apologise in the preface to his *Thucydides* in 1830 for deviating from the universal practice. It was indeed a true instinct which assigned the Latin language a principal place in our schools and universities. Not only is it the key to a most important literature, but it throws infinite light on the history of language in general, as well as on the particular languages of modern Europe. Hence it is an admirable instrument of mental discipline.

See the articles in this work on the several Latin authors referred to; those on ALPHABET, ARYANS, DRAMA, CHURCH HISTORY, FATHERS OF THE CHURCH, GRAFFITI, HYMNS, INSCRIPTIONS, PHILOLOGY, RENAISSANCE, ROME, ROMANCE LANGUAGES; the grammars of Roby, Kennedy, Madvig, Kühner, Stolz and Schmalz, Gildersleeve and Lodge, Lindsay; the German works on the history of the language and literature by Bähr, Bernhardt, Munk, Teuffel; Simcox's *History of Latin Literature from Ennius to Boethius*; Cruttwell's *History of Roman Literature*; Browne's *History of Roman Classical Literature*; Sellar's *Roman Poets of the Republic and of the Augustan Age*; Wilkins's *Primer*; Tyrrell's *Latin Poetry*; Mackail's *Latin Literature*; and Dimsdale's *Latin Literature* (1915). Mayor's *Bibliographic Clue to Latin Literature* (1875) is based on Hübner. See also W. M. Lindsay, *The Latin Language* (1894); R. S. Conway, *The Making of Latin* (1923); Sandys, *History of Classical Scholarship*.

Latin Union. See BIMETALLISM.

Latitude and Longitude. In Geography, denote the angular distances of a place on the earth from the equator and first meridian respectively. The latitude of a place is the angle subtended at the centre of the earth by the arc of the meridian from the equator to the place in question. The longitude of a place is the angle at the earth's axis between the plane of the first meridian and that of the meridian of the place. Latitude is reckoned from the equator to the poles, the equator having 0° lat., and the poles 90° N. and 90° S. respectively. Longitude is reckoned along the equator or along a parallel of latitude from the first meridian; but as nature has not in this case supplied us with a fixed starting-point, it is necessary to fix upon one in an arbitrary manner. Cardinal Richelieu in the 17th century proposed to use the meridian of Ferro, one of the Canary Isles, for this purpose, as this meridian lay to the west of all the Old World and to the east of America. The Arab geographers had also reckoned longitude from the 'Fortunate Isles.' For convenience the meridian of Ferro was subsequently

reckoned as exactly 20° W. of Paris, and thus lost its independent character. The meridian of Greenwich came into widest use, being universal as the zero of longitude in sea-charts and in the land maps made in the United Kingdom and the United States. Large scale maps of the United States are usually marked with longitudes west from Greenwich and also the number of degrees from Washington. One set of engraved meridians serves for this purpose, as Washington lies 77° W. of Greenwich. By the decision of a conference of delegates from almost all the civilised countries in the world, held at Washington in 1884, the meridian of Greenwich was accepted as the universal prime meridian, from which longitudes were measured to + 180° (or 180° E.) and - 180° (180° W.); the French delegate dissented, and in France maps continued to be drawn to the prime meridian of Paris, although reference marks to Greenwich longitude were usually added. On German maps the meridian of Berlin was sometimes employed, in Italian maps that of Rome, and in Russian maps that of Pulkova Observatory together with that of Ferro. France in 1911 adopted Greenwich.

The determination of both latitude and longitude depends upon astronomical observation. The principle on which the more usual methods of finding the latitude depend will be understood from the following considerations: To an observer at the earth's equator the celestial poles are in the horizon, and the meridian point of the equator is in the zenith. If now he travel northwards over one degree of the meridian the north celestial pole will appear one degree above the horizon, while the meridian point of the equator will decline one degree southwards; and so on, until, when he reached the terrestrial pole, the pole of the heavens would be in the zenith, and the equator in the horizon. The same thing is true with regard to the southern hemisphere. It thus appears that to determine the latitude of a place we have only to find the altitude of the pole, or the zenith distance of the meridian point of the equator (the complement of its altitude). The method most usual with navigators and travellers is, by means of a sextant, to observe the meridian altitude of a star whose declination or distance from the equator is known; or of the sun, whose declination at the time may be found from the *Nautical Almanac*; the sum or difference (according to the direction of the declination) of the altitude and declination gives the meridian altitude of the equator, which is the co-latitude—i.e. when subtracted from 90° leaves the latitude.

The determination of the longitude is less easy, and long presented insuperable practical difficulties. All methods depend on measuring the difference between local time and the time of the first meridian, which, reduced to degrees (at the rate of 360° per day, or 15° for every hour, or 1° for 4 minutes), gives the longitude. Eclipses of the sun, moon, or Jupiter's satellites, occultations of fixed stars by the moon, the time occupied in the moon's transit over the meridian, &c. are occurrences the exact period of which are calculated in advance in Greenwich time. When one of these phenomena is observed the true Greenwich time can at once be obtained from the *Nautical Almanac*, and the local time from direct observation is the only other datum required. The longitude of stations on land connected by telegraph with an observatory is most readily and accurately determined by an exchange of time signals; the exact position of every observatory is always ascertained to a high degree of accuracy by repeated observations of celestial phenomena. The two methods in use among travellers and on board ship are remarkable for their combination of simplicity with accuracy.

The first and most common consists merely in determining at what hour on the chronometer (which is set to Greenwich time) the sun crosses the meridian. If, when the sun is on the meridian, at the place of observation, the chronometer points to 3 hours 52 minutes, the difference of longitude is 58°, and the longitude will be W., as the sun has arrived over the place *later* than at Greenwich; similarly, if the sun be over the meridian of a place at 9 hours 40 minutes A.M., the longitude is 35° E. (by the chronometer). The accuracy of this method depends evidently upon the correctness of time-keepers (see HOROLOGY). The other method—that of 'lunar distances'—is much used at sea in order to check the results of chronometer measurements, and may be thus explained: The angular distance of the moon from certain fixed stars is calculated with great accuracy (about three years in advance) for every three hours of Greenwich time, and published in the *Nautical Almanac*. The moon's distance from some one star having been observed, and corrected for refraction and parallax, and the local time having also been noted, the difference between this local time and *that time in the table which corresponds to the same distance* gives the longitude. When applied to a heavenly body, the terms latitude and longitude have the same relations to the ecliptic and its poles, and to the point on the ecliptic called the Equinox (q.v.), that terrestrial latitude and longitude have to the equator and a first meridian. The positions of a heavenly body relatively to the equator are called its Declination (q.v.) and Right Ascension (q.v.). See also DEGREE.

Latitudinarians, a name applied by contemporaries to a school of theologians within the English Church in the latter half of the 17th century. It grew out of the earlier movement in favour of a more liberal constitution for the church, represented by the names of Falkland, Hales, Jeremy Taylor, and Chillingworth. This earlier movement was mainly ecclesiastical, aiming at a wider extension of the Anglican Church system; the later was mainly philosophical, and had still more directly in view the interests of rational religion. The school was represented by a succession of well-known Cambridge divines, of whom the chief were Whichcote, Smith, Cudworth, and More. Starting from the same ground as Hales and Chillingworth, in the disregard for authority and tradition in matters of faith, and the assertion of the supremacy of reason as the test of truth, their liberalism takes a higher flight, and brings us to the discussion of larger questions and principles of a more fundamental and far-reaching character. The Cambridge divines, nurtured on Plato and the later Platonists, sought to wed philosophy to religion, and to confirm the union on an indestructible basis of reason. Theirs was the first attempt to link together philosophy and Christianity ever made by any Protestant school; and, indeed, the first true attempt since the days of the great Alexandrine teachers to construct a philosophy of religion at once free and conservative, in which the rights of faith and the claims of the speculative intellect should each have free scope and blend together for mutual elevation and strength.

See the articles on CHILLINGWORTH, FALKLAND, HALES, SMITH, &c.; and Principal Tulloch's *Rational Theology in England in the Seventeenth Century* (2 vols. 1872).

Latium. See ROME.

Latona, or LETO. See APOLLO.

La Touche, GASTON (1854-1913), born at St Cloud, was a pupil of Manet, and from 1880 was known as an eminent painter and engraver.

Latouche, HENRI DE (1785-1851), born at La Châtre in Berry, wrote biographies, comedies,

novels, pamphlets, mystifications and apocryphal pieces, poems, and as a journalist bitterly opposed the Restoration government and that of Louis Philippe.

Latour, MAURICE-QUENTIN DE (1704-88), a great pastellist and portraitist, was born at St Quentin, and in his work enshrined the very spirit of the 18th century.

La Tour d'Auvergne, THÉOPHILE MALO CORRET DE, dubbed by Napoleon 'First Grenadier of the Armies of the Republic,' was born, 23d November 1743, at Carhaix in Finistère, of an illegitimate branch of the family of the Dukes of La Tour d'Auvergne. He enlisted as a musketeer, distinguished himself at the siege of Port Mahon, and was killed, a simple captain, on 28th June 1800 at Oberhausen in Bavaria. His remains were interred in the Panthéon in 1889. French biographies are full of instances of his daring valour, his Spartan simplicity of life, and his chivalrous affection for his friends. He wrote on the Breton language and antiquities.

La Trappe. See TRAPPISTS.

Latreille, PIERRE ANDRÉ (1762-1833), was born at Brives, in Corrèze, and became a professor in the Museum of Natural History at Paris. In 1796 he published his great *Précis des Caractères Génériques des Insectes*—an important step towards a truly natural system. He also wrote on salamanders, monkeys, crustacea, insects, and zoological classification.

Latter-day Saints. See MORMONS.

Lattice Leaf, or LACE LEAF (*Aponogeton fenestrata*), an aquatic plant, a native of Madagascar, grows on the margins of running streams in shallow water. The leaves grow in radiating clusters, and float immediately under the surface; in outline they are oblong, rounded at base and point, from 9 to 12 inches long. Their peculiar structure is due to the absence of the cellular tissue that fills up the spaces between the nerves or veins of ordinary leaves. The veins are almost geometrically parallel longitudinally and transversely. The flower-stems rise to the surface and there divide into two spikes of flowers, which are accompanied by conspicuous white bracts. The plant is not only curious but useful as an article of food to the natives, who eat the yam-like roots. The native name *Ouvrandrano* means water-yam. There are several other species of the genus, but none so remarkable and interesting as the lattice-leaf plant, which is frequently to be seen growing in hothouses. See AQUATIC PLANTS for illustration.

Latude, HENRI MASERS DE, prisoner in the Bastille, was born at Montagnac, in Languedoc, 23d March 1725. A young artillery officer, he sought to secure Madame de Pompadour's favour by revealing to her a plot to poison her. The plot was discovered to be of his own contriving, and he was sent to the Bastille in 1749. In spite of ingenious escapes, he remained in prison till 1777, when he was released on condition of living in his native village. But having lingered in Paris, he was imprisoned till 1784. At the Revolution he was treated as a victim of despotism; but he died forgotten, 1st January 1805. See the monograph by Thiéry (1792; new ed. 1889).

Latvia, **Latvija**. See LETTLAND, LIVONIA.

Lauban, an ancient town of Prussia in Lower Silesia, on the Queiss, 15 miles by rail E. of Görlitz, carries on linen and cotton weaving, printing, bleaching, &c., and has a population of 15,000. It was destroyed by the Hussites (1427 and 1431), and by the Swedes (1640).

Laud, WILLIAM, Archbishop of Canterbury, was born at Reading, a well-to-do clothier's son, on 7th

October 1573. From Reading free-school, where he 'had the happiness to be educated under a very severe schoolmaster,' he passed at sixteen to St John's College, Oxford, of which four years later he was admitted a fellow. Ordained in 1601, he made himself obnoxious to the university authorities by his open antipathy to the dominant Puritanism; but his solid learning, his amazing industry, his administrative capacity, his sincere and unselfish churchmanship, soon won him both friends and patrons. One of these was Charles Blount, Earl of Devonshire, whom in 1605 Laud married to the divorced Lady Rich (an offence that ever weighed heavy on his conscience); another was Buckingham, to whom he became confessor in 1622, having a month previously disputed before him and the countess his mother with Fisher the Jesuit. Meanwhile he rose steadily from preferment to preferment—incumbent of five livings (1607-10), D.D. (1608), president of his old college and king's chaplain (1611), Prebendary of Lincoln (1614), Archdeacon of Huntingdon (1615), Dean of Gloucester (1616), Prebendary of Westminster and Bishop of St Davids (1621), Bishop of Bath and Wells, Dean of the Chapel Royal, and a privy-councillor (1626), Bishop of London (1628), Chancellor of Oxford (1630), and finally Archbishop of Canterbury (1633). That very week he received two offers of a cardinal's hat; but 'my answer,' he writes in his Diary, 'was that somewhat dwelt within me, which would not suffer that, till Rome were other than it is.'

Already, after Buckingham's assassination, he had virtually become the first minister of the crown, one with Strafford and Charles I. in the triumvirate whose aim was absolutism in church and state, and which thus stood opposed to Puritanism alike and democracy. Laud's task, a grateful one, was to raise the English Church to its rightful position of a branch, if a younger branch, of the Church Catholic, to root out Calvinism in England and Presbyterianism in Scotland. In the former country he drew up a list of 'Orthodox' and 'Puritan' ministers, whom, the wheat and the tares, he proceeded to separate by scolding, suspending, depriving. Freedom of worship was withdrawn from Walloon and French refugees; Englishmen abroad were forbidden to attend Calvinistic services; and at home 'gospel preaching,' justification by faith, and Sabbatarianism were to be superseded by an elaborate ritual, by the doctrine of the real presence, celibacy, and confession, and by the Book of Sports (q.v.)—changes rigorously enforced by the court of High Commission and the Star Chamber. Nor was a policy without result which checked the development of Puritanism within the Anglican communion; which raised up a school of such Laudian clergy as Cosin, Nicholas Ferrar, George Herbert, Juxon, Manwaring, Montague, and Wren; which has borne later fruit in the Nonjurors, the Tractarians, and the Ritualists; and which to-day has a standing memorial in every Anglican church throughout the world—the altar-wise position of the Holy Table. In Scotland it was otherwise. There the tentative effort made by James I. and Laud in 1617 to give back life to dead Episcopacy had merely failed. Laud's second attempt (1635-37), involving the thorough Anglicising of the Scottish Church, gave birth to the riot in St Giles', Edinburgh, that riot to the Covenant (q.v.), the Covenant to the 'Bishops' war,' and this in turn to the meeting of the Long Parliament, which on 18th December 1640 impeached the archbishop of treason, and ten weeks later sent him to the Tower. He would not escape (Grotius urged him to do so); and at last, after a tedious and complicated trial before a handful of peers, of whom never more than fourteen were present, and of whom the

Speaker alone sat through the whole proceedings, after a defence that extorted praise even from Prynne, on 17th December 1644 he was voted 'guilty of endeavouring to subvert the laws, to overthrow the Protestant religion, and to act as an enemy to parliament.' The judges unanimously declared that this was not treason; but under an unconstitutional ordinance of attainder, and the gallows reluctantly commuted for the axe, he was beheaded on Tower Hill, 10th January 1645. He was buried first in the church of All-Hallows, Barking, and in 1663 translated to the chapel of St John's at Oxford.

To Heylin Laud is 'the holy martyr;' to Laud's accusers 'the great incendiary;' to Macaulay just 'a ridiculous old bigot.' To us he seems rather a typical college don, fussy, restless, high-handed, concerned about trifles, cold and unsympathetic, as little in mind as in person. Withal, he was childishly superstitious, his Diary teeming with omens and silly dreams, as 'Dreamed of the marriage of I know not whom,' and 'Dreamed of the burial of I know not whom, and waked sad.' Superstition, of course, was a failing of that age; so, too, was the chief sin of which Laud stands accused—intolerance. For if Laud cut off Puritans' ears, the Puritans cut off Laud's head. His great misfortune, indeed, was that he rose, like the parasite ivy, to eminence. Had he lived and died a college president, his waspishness would have long since lost its sting, and his memory survived only as that of the founder of the chair of Arabic, and a munificent benefactor of the Bodleian Library.

Of Laud's works, collected in the Anglo-Catholic Library (7 vols. Oxford, 1847-60), by far the most interesting is his Diary, which was published by Wharton in 1694. Peter Heylin, Laud's chaplain, first wrote his biography, *Cyprianus Anglicanus* (1668); and there are modern lives by Le Pas (1836), Mozley (1845; republished in *Essays*, 1878), Hook (*Lives of Archbishops*, 1875), A. C. Benson (1887), C. H. Simpinson (1894), and R. H. Hutton (1895). See also the articles, with works there cited, on CHARLES I., STRAFFORD, CHILLINGWORTH, HALES, JEREMY TAYLOR, and PRYNNE.

Laudanum, or more correctly TINCTURE OF OPIUM, is the most generally used of all the preparations of opium. It is obtained by macerating the sliced or powdered drug in dilute spirit, and filtering. It is of a deep brownish-red colour, and possesses the peculiar odour and smell of opium. One of the greatest objections to it is that it is liable to great variations of strength. When the tincture of opium is ordered a definite strength is always obtained, but under the name of *laudanum* various compounds are sold, and the former term should therefore alone be used. Laudanum is a powerful anodyne and soporific, but is more liable to cause headache than the solution of one of the salts of morphia. Its general action and its uses will be described in the article OPIUM. The dose for an adult varies from ten minims to a drachm. To children (as is the case with all opiates) it must be given with extreme caution. One minim, or about two drops, has been known to prove fatal to an infant. See POISON.

Lauder, a quaint little royal burgh of Berwickshire, on Leader Water, 25 miles SE. of Edinburgh. Near it is Thirlstane Castle, the seat of the Earl of Lauderdale. Till 1885 it united with Haddington, &c. to return one member to parliament. Pop. 760. See JAMES III.; and for the town's immemorial tenure of Lauder Common, Gomme's *Village Communities* (1890).

Lauder, ROBERT SCOTT, subject and portrait painter, was born at Silvermills, Edinburgh, in 1803, studied at the Trustees' Academy and in London, and in 1829 was elected a member of the

recently founded Royal Scottish Academy. He lived in Italy and at Munich in 1833-38, and then chiefly in London till 1849, when he returned to Edinburgh. He died there, 21st April 1869. Among his best works are two portraits, 'Christ teaching Humility,' and 'Sentinels,' all in the National Gallery of Scotland; scenes from 'The Bride of Lammermoor,' 'The Trial of Effie Deans,' and 'Meg Merrilees.'—His brother, JAMES ECKFORD LAUDER, R.S.A. (1811-69), was also a subject-painter. His works include 'Hagar,' in the National Gallery of Scotland; 'The Unjust Steward;' and 'The Wise and Foolish Virgins.'

Lauder, SIR THOMAS DICK, Bart., was born in 1784, the eldest son of Sir Andrew Lauder of Fountainhall, Haddingtonshire. He served for a time in the Cameron Highlanders, succeeded to the baronetcy in 1820, and lived at the Grange, Edinburgh, from 1832 until his death on 29th May 1848. For the last nine years of his life he was secretary to the Board of Manufactures and of Fisheries. Of Lauder's two romances, *The Wolfe of Badenoch* and *Lochandhu*, the former is still a popular book. His best works are not these, however, but his *Morayshire Floods* (1830) and, especially, *Scottish Rivers*, which was appearing in *Tait's Magazine* when his death cut the series of papers short. His *Legendary Tales of the Highlands* (3 vols. 1841) may also be mentioned. In politics a Liberal, and of unwearied public spirit, Lauder was in private a lovable and accomplished gentleman. Lord Cockburn, who describes him as 'the greatest favourite with the mob that the Whigs have,' says: 'Lauder could make his way in the world as a player, or a ballad-singer, or a street fiddler, or a geologist, or a civil engineer, or a surveyor, and easily and eminently as an artist or a layer-out of ground.' See Dr John Brown's preface to the reprint of *Scottish Rivers* (1874).

Lauderdale, JOHN MAITLAND, DUKE OF, who earned the detestation of his countrymen, was born at Lethington (now Lennoxlove), near Haddington, 24th May 1616, son of the first Earl of Lauderdale. In his youth he simulated ardent zeal for the Covenanting cause, and was actually one of the Scottish commissioners at the Westminster Assembly of Divines. He succeeded as second earl in 1645, was taken prisoner at Worcester in 1651, and confined nine years in the Tower and elsewhere. Before the Restoration he had gained the king's ear, and he now became Secretary of State in Scotland. He found the nobles impoverished and corrupt beyond all precedent, and for the first seven years he was engaged in an incessant struggle to maintain his place with rivals like Middleton as unscrupulous as himself, as well as with more open and honourable opposition from Clarendon and others in England. He made himself indispensable to Charles, who liked his clever and caustic wit, and felt no repugnance at his sensuality, his ribaldry and his drunken buffooneries, his slobbering mouth and heavy face brutalised by vice, as we see it still in Lely's portrait. His main object was to bring about the absolute power of the crown in church and state, and for this end he laboured with the most unceasing persistence, using patriotism, honour, and religion alike as mere pawns in his unscrupulous game. He was ever bold, full of resource, and quick to recognise the use to be made of such creatures as the brutal Rothes and the 'Judas' Sharp. His harsh measures goaded the poor peasants of the west country into the rebellion of 1666, but the greater guilt of the Highland invasion during the winter of 1677 and the spring of 1678 lies on the shoulders of the bishops no less than of the ruthless Lauderdale. He formed a militia of 20,000 men ready to do the

bidding of the king anywhere, and drilled the Episcopal Church into complete subservience. He was a member of the king's privy-council, had a seat in the famous Cabal ministry, and was created a duke in 1672. Fresh intrigues against him of the Scottish nobles, in concert with Shaftesbury in London, reached their height in 1674, but were foiled by his own ability in counter-plots and the king's personal regard for him. On the 7th May 1678 a vote was carried in the House of Commons for an address to the king praying for Lauderdale's removal from the royal presence for ever; but two days later, through lavish use of court intimidation and the Speaker's corrupt management of the forms of the House for procuring adjournments, the address when prepared was thrown out by a single vote. Another short struggle with Hamilton in the Convention of Estates left him again triumphant, and for two years more he held his power, until unable from infirmity to hold it longer. Lauderdale in his later life married the ambitious Lady Dysart, and it was alleged had cleared the way by hastening the death of his countess. He had but one daughter, and his dukedom died with him, while the earldom and family titles passed to his brother. He died, worn out by debaucheries and the anxieties of constant intrigue, at Tunbridge Wells, 20th August 1682, and eight months later was laid in Haddington Church, but not to rest, according to persistent popular tradition.

See Life by W. C. Mackenzie (1923); a selection from the Lauderdale MSS., edited by Osmund Airy (Camden Society, 3 vols. 1884-85); *Lauderdale Correspondence* (Scottish History Society, 1893).

Laudon. See **LOUDON**.

Lauds. See **BREVIARY**.

Lauenburg, or **SAXE-LAUBURG**, a former German duchy, once united to the crown of Denmark, lying on the right bank of the Elbe between Holstein and Mecklenburg. In the 12th century this district was conquered by the dukes of Saxony. In 1260 John I., son of Albert I. of Saxony, founded the ducal House of Saxe-Lauenburg. After the extinction of this line it was inherited by the Duke of Brunswick-Celle in 1702, and passed into the possession of the Hanoverian kings of Great Britain, was seized along with Hanover by the French in 1803, and afterwards, with some changes of boundary, was made over to Prussia, and by Prussia transferred to Denmark (1816), but with reservation of all rights and privileges. By the treaty of Gastein (1865) it came again into the possession of Prussia. In 1876 it was finally incorporated with the province of Sleswick-Holstein, of which it now forms the southernmost district. Prince Bismarck was made Duke of Lauenburg on his retirement from office in 1890.—The small town of Lauenburg, once capital of the duchy, on the Elbe, 25 miles SE. of Hamburg, contains the old ducal palace, dating from 1182.—**LAUBURG**, in Pomerania, 38 miles NW. of Danzig, has flax and woollen spinning, iron-founding, and machine-making. Pop. 15,000. It was originally a town of the Teutonic Knights (from 1322), then of Poland (1454-1657), and finally of Brandenburg.

Laughing Gas. See **NITROGEN**, **ANÆSTHESIA**.

Laughing Jackass, or **GREAT KINGFISHER** (*Dacelo gigas*), a bird belonging to the Alcedinidæ (see **KINGFISHER**), but in some respects an aberrant form. It has the general build of a kingfisher, but is not a fisher. It feeds upon insects, reptiles, and even small mammals. The peculiar hoot which it utters has, of course, given to it its name. It lays its pearl-white eggs in a hole in a gum-tree. There is another closely allied species (*D. Leachii*), of identical habits; both birds inhabit Australia. The

native name, Kookaburra, is now in general use in Australia.

Laughton, **SIR JOHN KNOX** (1830-1915), naval historian, born in Liverpool, was educated at the Royal Institution School and Caius College, Cambridge. He entered the navy in 1853, served in the Russian and China wars, lectured on mathematics and meteorology in the naval colleges at Portsmouth and Greenwich, and from 1855 to his death was professor of modern history in King's College, London. He wrote much on naval history and biography, and was founder and secretary of the Navy Records Society.

Launceston, till 1838 the county town of Cornwall, on the Kensey, a tributary of the Tamar, 36 miles NW. of Plymouth and 50 W. of Exeter, has a handsome granite church (1511); the circular Norman keep of a castle which figured much in the Great Rebellion, and in which Fox the Quaker was imprisoned (1656); an old gateway; and a town-hall. A municipal borough since about 1227, Launceston returned two members till 1832, one till 1885. It is officially called 'the borough of Dunheved, otherwise Launceston,' Dunheved being the old British name. Pop. 4000.

Launceston, the second city of Tasmania, is to the north of the island what Hobart, the capital, is to the south—the chief port of entry and mart of trade. It stands in a valley enclosed by hills at the junction of the Esk with the Tamar. It is accessible to ships of considerable burden, and carries on a thriving commerce with the principal Australian ports. There is a railway (133 miles) to Hobart. The town is supplied with water from St Patrick's River, 15 miles E. The principal buildings are the government-house, post-office, convent, theatre, town-hall, and mechanics' institute. Launceston was incorporated in 1858, and made a city in 1889. Pop. (1881) 12,753; (1921) 26,318.

Laura. See **MONACHISM**.

Lauraceæ, a natural order of dicotyledons, consisting of trees or shrubs which have leaves without stipules, and flowers in panicles or umbels. The perianth is 4-6-cleft; the stamens are opposite to its segments, and twice as many. The fruit a one-seeded berry or drupe; the fruit-stalk often enlarging and becoming fleshy. This order contains about 1000 known species, mostly tropical. The Laurel (q.v.) is the only European species. An aromatic and fragrant character pervades the order, and amongst its products are cinnamon, cassia, and other aromatic barks, also a number of aromatic fruits somewhat resembling nutmeg (see **NUTMEG**). The timber of some species, as greenheart, is valuable; some are esteemed for their medicinal barks, as greenheart (*bebeeru*) and sassafras; some for their secretions, of which camphor is the most important. *Ocotea opifera*, a South American tree, yields a camphoraceous volatile oil in great quantity if mere incisions are made in its bark. The fruit of some species is agreeable, as the Avocado Pear (q.v.). A very few remarkable species, forming the genus *Cassytha*, have been united with this order by many botanists, although others separate them as a distinct order. They are climbing parasites, like dodders, found in the woods of the hottest parts of the globe.

Laureate, **POET**, an official attached to the household of the English sovereigns. His early history is involved in some obscurity. In the *Domesday Book* we find one Berdic described as 'Joculator Regis,' and a certain Roger or Raherus, king's minstrel, is said to have founded the monastery of St Bartholomew in Smithfield under Henry I. We read of Richard I. carrying William the Foreigner to Palestine to sing his exploits, and of Edward I. tak-

ing the Carmelite friar, Robert Baston, with him to Scotland in 1304. The latter apparently went also for the same purpose with Edward II. to Bannockburn, but was captured by the Scottish soldiers and forced to celebrate their prowess instead, as the price of his freedom. The badness of his verses (rhymed hexameters) was humorously ascribed by the next century Scottish writers to the unwillingness of his conscience. We read of one John Kaye attached to Edward IV. as versifier (*versificator*); and before this period we meet the term 'laureate' applied on the one hand to one who had earned the laurel wreath at one of the universities for rhetoric and versification in Latin, and on the other to any poet of surpassing merit. Skelton was one of the former, and proudly styled himself 'Poeta Skelton Laureatus' in the headings of his Latin poems; the term 'laureate poet' applied by Chaucer to Petrarch bears the latter sense. Spenser, Daniel, Jonson, and Davenant are traditionally reckoned laureates. Jonson, indeed, had not merely a somewhat precarious pension (like some other poets), but also the tierce of canary that is associated with the office. James II. was mean enough to discontinue the allowance of wine, but it was afterwards resumed, until commuted for £27 a year in the laureateship of Pye. Davenant seems never to have been formally appointed, or to have received any pension after the Restoration; but it was as his successor that, six days after his death (1668), Dryden was admitted to the office. This seems to be the first definite official recognition of the laureateship. From 1679 an allowance of £100 was made, as one to which the laureate had formerly been entitled. It was long the duty of the poet-laureate to write an ode on the king's birthday—'his quit-rent ode, his peppercorn of praise,' in Cowper's phrase; but this task fell into abeyance towards the end of the reign of George III. The list of poets-laureate preserves the memory of a few names else almost forgotten; but it contains Dryden, Southey, Wordsworth, and Tennyson. The complete list, with the years of office, is as follows: John Dryden (1670-89), Thomas Shadwell (1689-92), Nahum Tate (1692-1715), Nicholas Rowe (1715-18), Laurence Eusden (1718-30), Colley Cibber (1730-57), William Whitehead (1757-85), Thomas Warton (1785-90), Henry James Pye (1790-1813), Robert Southey (1813-43), William Wordsworth (1843-50), Alfred Tennyson (1850-92), Alfred Austin (1896-1913), Robert Bridges (appointed 1913). See W. Hamilton, *The Poets Laureate of England* (1878); Kenyon West, *The Laureates of England* (1896); E. K. Broadus, *The Laureateship* (1921).

Laurel (*Laurus*), a genus of Lauraceæ, containing (besides *L. canariensis*) only the Noble Laurel or Sweet Bay (*L. nobilis*), a native of the Mediterranean region. It is often a mere bush of 15 feet or less, but sometimes becomes a tree of 30 or even 60 feet high. It has rather large, lanceolate, leathery, shining leaves, reticulated with veins, and axillary clusters of yellowish-white flowers of no beauty. The fruit is oval, bluish-black, and about half an inch long. Both the leaves and the fruit are bitter, astringent, and aromatic, and were formerly much used in medicine as a stomachic and stimulant. The leaves are still used in cookery for flavouring. They contain a volatile oil (*oil of sweet bay*), and a bitter, gummy extractive. See the article BAY, and the illustration there.

By the ancient Greeks the laurel was called *daphne*; it was sacred to Apollo. Berry-bearing twigs of it were wound round the forehead of victorious heroes and poets; and in later times the degree of Doctor was conferred with this ceremony—whence the term *laureation*; and, according to some, the term *Bachelor* (q.v.). And to

this day a laurel-crown is the emblem of the honour to which poets, artists, and warriors aspire.

The Noble Laurel is common in shrubberies in Britain, but not nearly so common as the species of Cherry-laurel, which share with it the name Laurel, as do not a few other shrubs botanically very different, but somewhat similar in their ever-green foliage. See AUCUBA, DAPHNE.

LAUREL-CHERRY, or CHERRY-LAUREL, is a name given to those species of *Prunus* (sub-genus *Cerasus*)

Common Cherry-Laurel
(*Prunus Laurocerasus*).

(see CHERRY) which have ever green leaves. They have small flowers in long racemes, and small fruit—the fruit of a nauseous taste—and most parts of the plant, but particularly the buds, leaves, and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous. The Common Cherry-laurel (often spoken of simply as the Laurel or Common Laurel, or even more erroneously as the Bay Laurel), *Prunus Laurocerasus*,

is a shrub, sometimes of the very largest size, with large ovate-lanceolate, convex, smooth, remotely serrated, shining, light-green leaves, and erect racemes of flowers. It was discovered towards the middle of the 16th century by Belon, at Trebizond, and thirty years later introduced by Clusius through the imperial ambassador at Constantinople, and planted at Vienna, whence he soon widely distributed it. Gerard thus mentions it as a choice garden shrub in England before the end of the century. It is now naturalised throughout the south of Europe, and is one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and have in great abundance the same essential oil (see ALMONDS, OIL OF), and hydrocyanic acid. From these leaves, by maceration in water for twenty-four hours, and subsequent distillation, is obtained the *Laurel-water*, or *Cherry-laurel water*, formerly employed in medicine as a substitute for hydrocyanic acid. The leaves are sometimes employed also for flavouring puddings, sauces, &c., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution, fatal accidents being on record. A bottle of cherry-laurel leaves bruised and moistened is often carried by entomologists to kill their captured prey. Neither the essential oil nor the hydrocyanic acid seems normally present during the life of the leaf; both are believed to be produced by the decomposition of amygdalin, or by a ferment, but neither of these has been successfully isolated. Several varieties are in cultivation—notably, e.g., var. *latifolia*, large leaved; *colchica*, dwarf, with narrow, sharply serrate leaves; and *caucasica*, which is said to be the handsomest, hardiest, and most

vigorous of all. Another species, also very common as an ornamental shrub in Britain, but not quite so hardy, is the Portugal Laurel (*Prunus lusitanica*), a large shrub—sometimes a tree—with smaller dark-green leaves and lateral racemes.

Laurentian System. See ARCHÆAN SYSTEM, CANADA.

Laurier, SIR WILFRID (1841-1919), born at Saint Lin, Quebec, was educated at L'Assomption College and McGill University, admitted to the bar in 1864, and to the Provincial Assembly in 1871. Soon after being sent to the Dominion parliament, he was made minister of Inland Revenue; in 1891 he became leader of the Liberal party, and in 1896-1911 he was premier of Canada, the first French-Canadian or Roman Catholic to hold that office. He was an accomplished orator in both tongues. See his *Life and Letters* by O. D. Skelton (1922).

Lauriston, ALEXANDRE JACQUES BERNARD LAW, MARQUIS DE, marshal and peer of France, was a grand-nephew of John Law, the financier, and was born at Pondicherry, 1st February 1768. He was Napoleon's comrade at the Artillery School, received rapid preferment in the army, and held diplomatic appointments at Copenhagen and London. After Austerlitz (1805) he took possession of Venice. He held high commands at Wagram (1809) and in the retreat from Moscow (1812). He fought at Bautzen (1813) and the Katzbach, and was taken prisoner at Leipzig. Already ennobled, he was made a peer by Louis XVIII. as not having joined Napoleon during the Hundred Days, and became marquis in 1817 and marshal in 1821. He died 10th June 1828.

Laurium (Gr. *Laurion*), a mountain (1171 feet) of Attica, NW. of Cape Colonna, was famous in ancient times for its silver-mines, but these were already exhausted in Strabo's day. Since 1874, however, the great heaps of slag have been profitably worked, and fresh deposits of argentiferous lead and of zinc ore have also been found, so that the most important mining in the kingdom is carried on here. The often repeated story of the germination of seeds, dormant for thousands of years, on resumption of work on the old slag-heaps, has been exploded. Pop. 5000.

Laurium, formerly CALUMET, on Keweenaw peninsula, Michigan, 11 miles NE. of Houghton, stands in one of the richest copper-mining districts of the United States; pop. 7000. See CALUMET.

Laurustinus (*Viburnum Tinus*, see VIBURNUM), a beautiful evergreen shrub, a native of the south of Europe and North Africa, belonging to the natural order Caprifoliaceæ. Its beauty is enhanced by its habit of flowering in winter. The flowers are white, in corymbs, and are succeeded by small black berries with a blue bloom, which inflame the mouth, if eaten, like those of mezereon, and are said to be violently purgative, yet are the favourite food of certain birds. Laurustinus suffers from severe winters in Britain, and will not endure the winters of northern Europe and the colder regions of America.

Laurvik, a seaport and spa of Norway, at the head of a small fjord on the western side of Christiania Fjord, 98 miles by rail SSW. of Christiania. It has several sawmills, and exports timber and other products. Pop. 11,000.

Lausanne, capital of the Swiss canton of Vaud, a town of much old-world charm, is very picturesquely situated on the southern slope of the Jura Mountains, close to the northern shore of the Lake of Geneva, on which the village of Onych forms its harbour. Two principal parts of the city are separated by a valley, across which are

fine bridges. Lausanne is famous for its educational institutions; amongst these are the cantonal university, (1891), and industrial, music, and art schools. The cathedral, a beautiful Gothic building, begun in the 10th century and completed in the 13th, is the greatest ornament of the city; this church was the scene of the disputation between Calvin, Farel, and Viret in 1536, which led to the introduction of the Reformation in the city. Here are the cantonal museum of natural history and antiquities, and the Arlaud Museum (1846) of Art, &c. Since 1875 Lausanne has been the seat of the Federal Tribunal, which decides all questions pending between the several cantons, and between the cantons and the federal government. Lausanne is much frequented by visitors from all parts of the world. Here Gibbon resided for many years, and the house in which he wrote the greater part of the *Decline and Fall* is still shown. The town has little industry, but considerable trade. Pop. 68,500, mostly Reformed, and French-speaking. The treaty of Onych (1912) made peace between Italy and Turkey, that of Lausanne (1924) between the Allies and Turkey.

Lausitz. See LUSATIA.

Lauterbrunnen, the name of an exceedingly beautiful Alpine valley in the Swiss canton of Bern, through which flows the Weisse Lutschine, one of the principal feeders of the Aar. The valley is surrounded by perpendicular walls of sandstone from 1000 to 1600 feet in height, down which pour about a score of waterfalls. Of these the finest is the *Staubbach* ('dust-stream'), 866 feet in height.

Lautverschiebung. See GRIMM (J. K. L.).

Lauzun. See BIRON (ARMAND LOUIS).

Lava, any rock erupted from a volcanic orifice in a state of fusion. Lavas differ much in liquidity at the time of eruption—the basic lavas being more fluid generally than those that contain a high percentage of silica. The surface of a lava-stream, which speedily cools and hardens, is generally more or less porous and vesicular, from the escape of the confined gases; but, as rock is always a bad conductor of heat, the interior often remains long in a liquid condition, permitting the continued flow of the stream sometimes to a very great distance from the orifice from which it has been discharged, notwithstanding its indurated covering. The end of the stream is a slowly-moving mass of loose porous blocks, rolling and tumbling over each other with a loud rattling noise, being pushed forward in fits and starts by the viscid lava, when it bursts the hardened crust and rushes on. The structure of the interior of a solid lava-stream shows a compact and homogeneous rock, assuming a more or less crystalline structure as the cooling has been the work of a longer or shorter period of time. Caverns are sometimes formed in lava-streams by the escape of the molten mass below, leaving the cooled crust standing like the roof of a tunnel.

Laval, capital of the department of Mayenne, is on the Mayenne, 46 miles E. of Rennes. Its cathedral dates from the 12th century; in the old ducal castle of the Trémouilles young Philippe de la Trémouille was guillotined in 1794. Since the 13th century, when Flemish weavers settled here, the town has been a centre of linen-manufactures. Near it the Vendéans defeated the Republicans in 1793. Pop. 27,500.—Here was born the missionary bishop François Xavier de Laval-Montmorency, sent to Canada as papal vicar in 1659; after him Laval University at Montreal (q.v.) is named. See a work on him by Leblond de Brumath (1906).

La Valetta. See VALETTA.

Lavalette, FATHER. See JESUITS.

La Vallière, LOUISE FRANÇOISE DE LABAUME LEBLANC DE, a celebrated mistress of Louis XIV. of France, was born at Tours, in 1644, of an ancient and noble family. At an early age she lost her father, and was brought to court by her mother, who had married a second time. She was not a great beauty, and was slightly lame; but the winning charm of her manners, and the sweetness of her face, quickly took captive the affections of the king. She really loved Louis, and bore him four children, of whom two survived infancy; but, although she and they received wealth and titles of honour, she never lost her sensitiveness to the dishonour of their birth. When Madame de Montespan became the royal favourite she retired into a Carmelite nunnery in Paris (1674). She died 6th June 1710, after more than thirty years of penances and religious austerities. Her *Réflexions sur la Miséricorde de Dieu par une dame pénitente* (1680) was re-edited in 1860, with a collection of her letters.

There are Lives of the Duchesse de la Vallière, by Quatremère de Roissy (1823), Capefigue (1859), Houssaye (1860; new ed. 1895), Ducloux (4th ed. 1890), Lair (1881; new ed. 1907; Eng. trans. 1908), and Panthe (1891).

Lavandula. See LAVENDER.

Lavater, JOHANN KASPAR, writer on physiognomy, was born on 15th November 1741 at Zurich, studied there under Bodmer and Breitinger, and in 1769 received Protestant orders. He early gained a high reputation by a volume of poems, entitled *Schweizerlieder* (1767). His *Aussichten in die Ewigkeit* (4 vols. 1768-78), is a work of high religious enthusiasm, mingled with asceticism and a considerable leaven of mysticism. From 1769 he officiated in the orphanage church in his native city, and from 1778 in the church of St Peter. He brought his keen powers of observation and his skill in judging character to bear upon physiognomy, which he attempted to elevate into a science, in his most celebrated work, *Physiognomische Fragmente zur Beförderung der Menschenkenntniss und Menschenliebe* (4 vols. 1775-78); trans. Hunter (1789-98); Holcroft (1793). It gave rise to much discussion, was bitterly attacked, as by Nicolai, although Goethe greeted it with praise, and occasioned not a little display of wit and humour from Lichtenberg and others. Lavater was the chosen spiritual adviser of many persons in Switzerland and Germany, with whom he maintained an unwearied correspondence. On his tours in Germany he was received with extraordinary marks of popular esteem and honour. Whilst tending the wounded on the street at the capture of Zurich by Masséna, 26th September 1799, he received a wound which was the cause of his death on 2d January 1801. His *Vermischte Schriften* appeared in 2 vols. (1774-81) and his *Sammtliche kleinere prosaische Schriften* in 3 vols. (1784-85). See Lives by Gessner (1802), Heisch (English, 1842), and Muncker (1883), and monographs by Steck (1884) and Von der Hellen (1888).

Lavaur, a town in the French department of Tarn, on the Agout, 25 miles ENE. of Toulouse. A bishop's see from 1317 to 1801, it was the strongest fortress of the Albigeuses, but in 1211 was taken by Simon de Montfort. Pop. 6000.

Laveleye, ÉMILE LOUIS VICTOR DE, political economist, was born at Bruges on 5th April 1822, studied at Paris and Ghent, and was appointed to the chair of Political Economy at Liège in 1864. His works include *De la Propriété et de ses Formes Primitives* (1874; Eng. trans. 1878); *Lettres d'Italie* (1880-84); *Le Socialisme Contemporain* (1881; 7th ed. 1892; Eng. trans. 1885); *Éléments d'Economie Politique* (1882); *La Péninsule des Balkans* (1886;

curtailed trans. 1887); and works on rural economy in the Netherlands, and on current topics of the day, such as education, luxury, the gold question, and democracy. He was made a baron just before his death, 2d January 1892. See Life by Count Goblet d'Alviella (1894).

La Vendée. See VENDEE.

Lavender (*Lavandula*), a genus of labiate plants, having the stamens and style within the tube of the corolla, the upper lip of the corolla bifid, the lower trifid. The Common or Narrow-leaved Lavender (*L. vera*) grows wild on stony mountains and hills in the south of Europe, and in more northern regions is very generally cultivated in gardens. It has a delightful aromatic fragrance, and an aromatic bitter taste, and contains a great quantity of a volatile oil, *oil of lavender*. The whole plant is used in medicine, particularly the spikes of the flowers, as a tonic, stomachic, nervous stimulant, &c. Lavender-flowers are often put into wardrobes to keep away moths, and are much used in perfumery. *Oil of Lavender* is procured by distillation of lavender-flowers with water, and is rather lighter than water, pale yellow, very fluid, and very fragrant; it requires 70 lb. of flowers to yield 1 lb. of oil. *Spirit of Lavender* is made by distilling lavender-flowers with rectified spirit; *Lavender Water*, one of the most popular of all perfumes, by dissolving oil of lavender with smaller quantities of other volatile oils in rectified spirit. Lavender is extensively cultivated for its flowers at and near Mitcham, Carshalton, and Beddington in Surrey, at Hitchin, at Canterbury, and at Broadstone in Dorset. Broad-leaved Lavender (*L. spica*) is more tender than common lavender. It is also less fragrant, and the oil it yields, *Oil of Spike* or *Foreign Oil of Lavender*, is used by painters on porcelain, and in the preparation of varnishes. For sea-lavender, see PLUMBAGINÆ.

Laver, a name given to a number of kinds of seaweed, which are used as food, especially *Porphyra vulgaris* and *P. laciniata*, of the sub-group Floridæ, or Rhodophyceæ. These plants grow on rocks and stones in the sea, and are not unfrequent on British shores. They consist of a very thin, flat, purple frond, which is not gelatinous. The frond of *P. vulgaris* is wavy and undivided, that of *P. laciniata* (sometimes called Sloke) is deeply cleft, and has the segments lobed and cut at the edges. Laver is sometimes stewed and brought to table; also pickled and eaten with pepper, vinegar, and oil, or with lemon-juice. It is regarded as useful in scrofulous affections and glandular tumours, a property which it probably owes to the iodine which it contains. *Porphyra* is the 'red laver' of commerce. The name of Green Laver is given to *Ulva latissima*, of the sub-group Chlorophyceæ, or green algæ. It is a common seaweed of British shores, the frond of which is green, membranous, broad, flat, wavy, and sometimes inflated. It is bitterish, but is often used in the same way as the true laver, and possesses similar properties.

Lavery, SIR JOHN, R.S.A. (1896), A.R.A. (1911), R.A. (1921), portrait-painter, of the Glasgow school, was born at Belfast in 1856, studied in Glasgow, London, and Paris, and was knighted in 1918.

La Villemarqué, THÉODORE-CLAUDE-HENRI HERSART, VICOMTE DE, Celtic antiquary and scholar, was born of an ancient Breton family at Quimperlé, 6th July 1815, and became in due time a member of the Institute, and a corresponding member of the Berlin Academy. His first important work was *Barzaz-Breiz* (2 vols. 1839; Eng. trans. by Tom Taylor, 1865), a collection of popular Breton songs and melodies, with a French

translation and notes. Unfortunately the scientific value of this work was seriously impaired by the embellishments added to the ballads by the editor, and the composite product of artificially-made history and affected archaisms can be accepted neither as sound literature nor as safe philology. The author was inspired by glowing patriotism and a too facile imagination, but his conscience failed to teach him the respect that is due to the grave dignity of history. But Brittany is not the Scottish Highlands of Macpherson's day, and Breton scholars are too learned for such impositions. An admirable exposure of the defects of M. de la Villemarqué's work is Luzel's paper, *Les Chants du Barzaz-Breiz* (1872). He died 9th December 1895.

Later works are *Contes populaires des Anciens Bretons* (2 vols. 1842), *Poèmes des Bardes Bretons* (1850), *Notices des Principaux Manuscrits des Anciens Bretons* (1856), *Le Grand Mystère de Jésus* (1865), *La Légende Celtique en Irlande, en Cambrie et en Bretagne* (1859), *Myrdhin ou l'Enchanteur Merlin* (1861), *Les Romans de la Table ronde* (3d ed. 1860), and *Poèmes Bretons du Moyen-âge* (1879). He also edited Le Gonidec's *Dictionnaire Français-Breton* (Saint-Brieuc, 1857).

Lavoisier, ANTOINE LAURENT, the founder of the antiplogistic or modern chemistry, was born in Paris, on 26th August 1743, and devoted himself to scientific studies, particularly to chemistry. In order to obtain means for more fully prosecuting his investigations he accepted, in 1769, the office of farmer-general. In 1768 he was made an academician. As director of the government powder-mills, he discovered in 1776 a way of greatly improving the quality of gunpowder; and in 1791 he was appointed a commissioner of the treasury. He rendered great service in the application of chemistry to agriculture. A statement of his principal discoveries, and of the great part he played in the establishment of modern chemistry, will be found under CHEMISTRY; his discovery of oxygen was wholly independent of Priestley (see *Nature*, xxvii., also WATER). Lavoisier's services to science could not save him from the popular rage against farmers of the taxes during the Reign of Terror, and he died by the guillotine, 8th May 1794. His principal work is the *Traité Élémentaire de Chimie* (1789). His *Œuvres* were published in 6 vols. in 1864-93. See his *Life* by Grimaux (Paris, 1888); *Edinburgh Review*, July 1890; Berthelot, *La Révolution Chimique: Lavoisier* (1890).

Law is a term which must be variously defined, according to its application. The laws of nature, as expounded by men of science, are general propositions as to the order in which physical events have occurred, and will probably recur; the moral law, or the law of God, is a body of truth thrown into the form of rules for the guidance of human conduct. But when we speak of law we usually mean to indicate the law which is set and enforced by civilised states. Law, in this sense, derives its sanction, or binding force, from the penalties by which men are constrained to obey it or punished for breaking it. The earliest source of law is custom; the customary rules of a primitive community formed the basis of the Civil Law at Rome, as they form the basis of the Common Law (q.v.) in England. Customary law is rigid and formal; in a progressive society it is relaxed and improved by the use of legal fictions, by the influence of Equity (q.v.), and by legislation. At Rome, for example, the growing commerce of the city compelled the prætor to go beyond the civil law (which was a law for Romans only), and to devise a new law of nations, based on principles of equity, such as all civilised men could understand. When the Romans began to study Greek they identified this law of nations with the law of nature, as expounded by the Stoics. The civil law, amended and rational-

ised by successive prætors and emperors, has furnished most of the nations of modern Europe with the greater part of their legal rules and ideas; even England, while refusing to borrow directly from the *Corpus Juris Civilis*, has derived no small part of her law from that source. Scots law has largely drawn its principles and nomenclature from Roman law.

It is usual to distinguish public law (constitutional and criminal) from private law (which applies to personal status, family relations, property, and contract). Canon Law (q.v.) is not received, as an entire system, by any modern state; but its rules are followed in defining the powers and functions of ecclesiastical persons. The Law of Nations, or International Law (q.v.), is also divided into public and private.

See such works as Maine's *Ancient Law*, Colquhoun's *Civil Law*, Austin's *Jurisprudence*, and Pollock and Maitland's *History of English Law* (1895); also the articles AGENT, BARRISTER, CODE, CONGRESS, COURTS OF LAW, CRIMINAL LAW, JURISPRUDENCE, JURY, JUSTINIAN, LAND LAWS, PARLIAMENT, SOLICITOR, &c.

Law, ANDREW BONAR, British Prime Minister, was born in New Brunswick, 16th September 1858, and after a successful career as an iron-merchant in Glasgow, entered parliament in 1900. From 1902 he held various offices in Unionist and Coalition Governments, including those of Colonial Secretary, Chancellor of the Exchequer, and member of the War Cabinet. Leader of his party from 1911, he withdrew from politics owing to ill-health in 1921, but returned to become Prime Minister in October 1922. The strain was too much. He resigned in May of next year, and died 30th October. His influence was mainly due to character; an unswerving honesty and devotion to principle being the guiding factors of his political life. To this must, however, be added a very extensive knowledge of economic affairs.

Law, JOHN, famous for his credit operations during the minority of Louis XV., was born at Edinburgh, 21st April 1671. His father was a goldsmith and banker, and proprietor of the estate of Lauriston, near Edinburgh. Law early showed a most remarkable talent for arithmetic, algebra, and kindred sciences. At twenty he removed to London, where he found admission into good society; but condemned to death for killing a man in a duel, he escaped from prison and fled to Amsterdam, where he spent his time in studying the credit operations of the bank. About the year 1700 he returned to Edinburgh, a zealous advocate of a paper currency; but his proposals to the Scottish parliament on this subject met with an unfavourable reception. He now visited different parts of the Continent, where he won and lost vast sums in gambling and speculation, but sought in vain to win the favour of governments for his financial schemes. At last he settled in Paris, and, in company with his brother William, set up in 1716 a private bank. This was soon so successful and prosperous that the Duke of Orleans, the regent, adopted in 1718 Law's plan of a national bank, and issued prodigious quantities of bank-notes, which enjoyed perfect credit, whilst the ordinary national bonds remained, as they had long been, at a price far below their nominal value. In 1719 Law originated his *Mississippi Scheme* (q.v.), and the following year was made a Councillor of State and Comptroller-general of Finances. When the bubbles burst he became an object of popular hatred, and found it best to quit France. After wandering here and there he finally settled in Venice, where he spent his last years poor and forgotten, yet to the very end occupied with plans for restoring himself to power and prosperity. He died 21st March 1729.

See Lives of him by Wood (1824) and A. W. Wiston-Glynn (1908); and Thiers, *Law et son Système des Finances* (trans. New York, 1859). An edition of his works was published at Paris, 1843.

LAW, WILLIAM, one of the ablest controversialists of the 18th century, was born a grocer's son at Kingsliffe, in Northamptonshire, in 1686, entered Emmanuel College, Cambridge, in 1705, and became a fellow in 1711. At the accession of George I. he found himself unable to subscribe the oath of allegiance, and consequently forfeited his fellowship. About 1727 he became tutor to the father of Edward Gibbon at Putney, and here, or at Cambridge with his pupil, he spent ten years 'the much honoured friend and spiritual director of the whole family.' Gibbon, in his autobiography, speaks of the unworldly thinker with unusual warmth as 'a worthy and pious man who believed all that he professed, and practised all that he enjoined.' The elder Gibbon died in 1737, and three years later Law retired to his native village, and there was soon joined by his disciples, Miss Hester Gibbon, sister of his pupil, and Mrs Hutcheson, a wealthy widow. The two ladies had a united income of about £3000 a year, and most of this they spent in those works of charity to which they devoted themselves in their seclusion, which lasted over twenty years. Law rose at five, and spent many hours of every day in silent meditation and in exercises of devotion. About the year 1733 he had begun to study the writings of Jacob Boehme, and most of his later books are more or less expositions of his mysticism. Law died in his retreat, April 9, 1761. William Law, however unworldly in his theology, was a strong thinker and a consummate dialectician. He won his first triumphs against Bishop Hoadly, in the famous Bangorian controversy, with his *Three Letters* (1717). His *Remarks on Mandeville's Fable of the Bees* (1723; republished by F. D. Maurice, 1844) is a masterpiece of incisive logic, caustic wit, and terse and vigorous English. Only less admirable is the *Case of Reason* (1732), in answer to Tindal's able book, *Christianity as old as the Creation*. But the most famous of his works remains the *Serious Call to a Devout and Holy Life* (1729), to which Dr Johnson ascribed his first religious convictions, and which profoundly influenced the Wesleys, and earned the praises of Gibbon. Of Law's mystical works may be named *The Way to Divine Knowledge*, and *The Spirit of Love* (1752).

There are two collected editions of his works, each in 9 vols.—that of 1762 and that of Moreton (1893 *et seq.*). See C. Walton's *Notes and Materials for a Complete Biography* (1848), Canon Overton's *William Law, Nonjuror and Mystic* (1881), and Dr Whyte's *Characters and Characteristics of William Law* (1892). See also Lecky's *History of England in the 18th Century*; and Leslie Stephen's *English Thought in the 18th Century*.

Lawburrows, LETTERS OF, in Scots law, a writ commanding a person to give security against offering violence against another. See PEACE.

Lawes, SIR JOHN BENNET (1814–1900). See ROTHAMSTED, AGRICULTURE.

Lawes, HENRY (1596–1662), a song-composer, who set Milton's *Comus* to music, was born at Dinton in Wiltshire.—His elder brother, WILLIAM (d. 1645), was also a composer.

Lawfeldt, or LAVELD, close to Maestricht in Belgium, was the scene of the defeat of the combined Austrian, Dutch, and English forces under the Duke of Cumberland by the French, commanded by Marshal Saxe, on 2d July 1747.

Law-merchant, a name often used in law to denote the customs which have grown up among merchants in reference to mercantile documents

and business, such as bills of exchange, bills of lading, &c. These customs become incorporated with, and form part of, the common law, and are binding as such.

Lawn, a fine kind of Linen (q.v.), from which bishops' sleeves are made. For grass-lawns, see GARDENING.

Lawn Tennis. See TENNIS.

Lawrence, (1) capital of Douglas county, Kansas, on the Kansas River, 34 miles SSW. of Leavenworth by rail. It is the seat of the state university (1864), and has important and varied manufactures. Lawrence was founded in 1854 by Free-soil settlers, shared in the violent struggle against slavery (see KANSAS), and was partly burned by Quantrell's guerillas in 1863. Pop. about 12,500.—(2) One of the capitals of Essex county, Massachusetts, and an important manufacturing city, on both sides of the Merrimack River, 26 miles N. of Boston, with which it is connected by two railways. The river, which here falls 28 feet in half a mile, is crossed by two railway and two other bridges, and by a dam of granite, 900 feet long and 40 high; and canals on either bank conduct the water to the mills. The mills, some of which are amongst the largest in the world, manufacture cotton and woollen goods, cloth, and paper; and engines, boilers, machinery, clothing, hats, &c. are also produced here. Pop. (1870) 28,921; (1880) 39,151; (1920) 94,270.

Lawrence, ST. See ST LAWRENCE.

Lawrence, ST. the Deacon, a martyr of the early church, the subject of an elaborate hymn by Prudentius. According to the legendary account, he was born at Huesca in Spain, and became a deacon of Rome in the pontificate of Sixtus I. (3d century). In the persecution of Valerian, being summoned before the prætor as a Christian, and being called on to deliver up the treasures of the church, he produced the poor and the sick, who were his special charge; and on his persisting in his refusal to sacrifice, he was condemned to be broiled on a gridiron. The martyrdom is unquestionably historical, its probable date 258. His day is the 10th August. The Escorial (q.v.) is dedicated to him.

Lawrence, DAVID HERBERT, poet, novelist, and historian, was born a coal-miner's son, at Eastwood, near Nottingham, 11th September 1885. Educated at the High School and University College of Nottingham, he was a teacher in London till the publication of his novel *Sons and Lovers* in 1913. From that time he devoted himself altogether to literature. He has always been an outspoken moralist. His novel *The Rainbow* was suppressed. His earnest interest in sex and psychoanalysis has often deterred readers, though it has won their respect for the truth-seeker. Some find that to pass from *Women in Love* (1921) to *Aaron's Rod* (1922) is like emerging suddenly from a tropical valley to a high mountain-top, where the wind blows freely. In 1923 appeared 'a new and living thing' entitled *Fantasia of the Unconscious*. Australia and Mexico have been the scenes of later books. As a poet Mr Lawrence is of the Imagists. His works in verse include *Love Poems and Others* (1913), *Amores* (1916), *Look! We have come Through* (1917), *New Poems* (1918). He has also written short stories, plays, Italian travel sketches, translations, and *Movements in European History* (by 'Lawrence H. Davison,' 1921; under his own name, 1925).

Lawrence, JOHN LAIRD-MAIR LAWRENCE, LORD, was one of twelve children of Lieut.-col. Alexander Lawrence, an Irish Protestant, who served in the Mysore campaign and at the storming of Seringapatam. Born at Richmond, Yorkshire, 4th March 1811, he obtained in 1827

a presentation to Haileybury College. His first years in the Indian civil service were spent in Delhi and the neighbourhood. On the annexation of the Punjab Lawrence was appointed commissioner, and afterwards lieutenant-governor. His administration of this once anarchic province made him deservedly popular with Europeans and Indians alike. He used every effort to curb the oppression of the people by their chiefs, devised a rational system of land tenure, and devoted his whole time and energy to the work of restoring peace and prosperity. It was through the influence which he then acquired over the native population that he was able to render such effective service during the Indian Mutiny. Indeed, it is no exaggeration to say that he then proved himself to be the mainstay of the British dominion in India. The once restless Sikhs had become so attached to his firm and beneficent rule that Lawrence was enabled to disarm the mutineers in the Punjab, to raise an army of 59,000 men, and to capture the city of Delhi from the rebels after an eventful siege of three months. So timely was this succour, and so great had been his foresight, that he was thereafter styled 'the saviour of India.' On his return to England he received the thanks of parliament, with the grant of a pension of £1000 a year. He was made a baronet in 1858, and a privy-councillor in 1859. In 1861 Lawrence was nominated one of the knights of the 'Star of India.' In 1863 he succeeded Lord Elgin as Governor-general of India; he was made a member of the Indian council, and the Court of Directors of the East India Company granted him a life pension of £2000 a year. His five years' administration of the Indian empire was marked by the same wisdom, foresight, and prudence as distinguished his career in the Punjab. His financial policy was based upon sound principles; he took a strong personal interest in the many social problems which Indian statesmen have to confront; and his foreign policy was generally approved of. He did not believe in British interference in Asia beyond the frontier of India, and was especially opposed to intriguing in Afghanistan. In 1869 he was raised to the House of Peers as Baron Lawrence. Lord Lawrence was chairman of the London School-board from 1870 till 1873. He devoted the last days of his life in parliament (1878) to an exposure of the policy which led up to the disastrous Afghan war, and which he had vainly striven to counteract in his retirement. He died 27th June 1879. See his *Life* by Bosworth Smith (1883), Sir Richard Temple (1889), and Sir C. Aitchison (1892).

His elder brother, SIR HENRY MONTGOMERY LAWRENCE, was born at Matura, Ceylon, 28th June 1806. In 1823 he joined the Bengal Artillery near Calcutta, where Havelock was stationed at the same time. He took part in the first Burmese war in 1828, in the first Afghan war in 1838, and in the Sikh wars of 1845 and 1848; and in 1848 he was made K.C.B. In 1856, while in charge of the Rajputana province, Lawrence published two articles pointing out the danger of reducing the strength of the British army of occupation in India, and the latent causes of mutiny, which might burst forth at any time. These warnings were more than justified by subsequent events. In March 1857 he was appointed to the charge of affairs in Lucknow, and did all that he could to restore contentment there. But the mutiny broke out in May, and Lawrence saw that it would inevitably spread throughout India. He made extensive preparations at Lucknow, and it was owing to his wonderful foresight that it was made possible for a mere handful of European soldiers to defend the Residency for about four months against an army of the rebels which was in possession of the town. Sir Henry Lawrence himself was injured by the explosion of

a shell on 2d July 1857, and died two days afterwards from the effects of the wound. His death was a great blow to the little garrison, but they held out bravely till the end of September, when relief came from Cawnpore. In addition to his reputation as a statesman and soldier, Sir Henry Lawrence is known as a philanthropist, and was the founder of the Lawrence Military Asylums in the Punjab, Rajputana, and Madras. He devoted most of his income to these and other deserving institutions. A marble statue has been erected to his memory in St Paul's Cathedral. See his *Life* by Sir Herbert Edwards and Herman Merivale (1873), and that by M'Leod Innes (1898).

Lawrence, SIR THOMAS, portrait-painter and President of the Royal Academy, was born at Bristol, an innkeeper's son, on 4th May 1769, and at the early age of ten years began to draw portraits in crayons at Oxford, afterwards at Bath. At the age of eighteen he entered as a student of the Royal Academy, having a little while previously taken to painting in oil. In 1791 he was elected associate, and in 1794 full member. After Reynolds's death he was appointed limner to the king in 1792, and was knighted in 1815; and on Benjamin West's death in 1820 he succeeded him as President of the Royal Academy. He died in London, 7th January 1830. Lawrence was the favourite portrait-painter of his time, had an immense practice, and obtained higher prices perhaps than were paid to any previous portrait-painter; but his work, in spite of the elegance and taste that often distinguish it, scarcely rises above the conventional level.

See *Life* by Williams (1831); monograph by Lord Ronald Gower (1900); Knapp, *Artist's Love Story* (1904); and especially Armstrong, *Lawrence* (1913).

Lawrence, SIR WILLIAM, Bart., F.R.S., a distinguished surgeon (1733-1867), became in 1815 one of the professors of Anatomy to the Royal College of Surgeons, and in 1829 a lecturer on Surgery to St Bartholomew's. He wrote important works on *The Treatment of Hernia* (1807), *An Introduction to Comparative Anatomy and Physiology* (1819), and *A Treatise on the Venereal Diseases of the Eye* (1831).

Lawrenceburg, a city of Indiana, on the Ohio, 22 miles below Cincinnati; pop. 3500.

Lawson, HENRY HERTZBERG (1867-1922), born near Grenfell (N.S.W.), farmed with his father, Peter H. Larsen, a Norwegian, but soon took to verse-writing and journalism. He travelled far in Australia and New Zealand, and was in London from 1900 to 1903. The Sydney *Bulletin* brought out his poems and sketches. These were collected in *Short Stories in Prose and Verse* (1895), *In the Days when the World was Wide* (verse, 1896), *While the Billy Boils* (prose, 1898), *The Skyline Riders* (verse, 1910), and other volumes. Like A. B. Paterson he sings robustly, in rough and swinging lines, of his native land and the 'good old days;' and he has been described as the most representative writer Australia has yet produced.

Lawson, SIR WILFRID (1829-1906), baronet and M.P., was from 1864 the foremost representative of temperance reform legislation, a witty and weighty speaker. See *Life* by G. W. E. Russell (1909).

Lawyer, in the United Kingdom, is not a technical term of law, but a popular name given to those who are either practitioners of the law or intimately connected with its administration. In Great Britain and Ireland lawyers are subdivided into two main classes (see ATTORNEY, SOLICITOR, BARRISTER, ADVOCATE). In the United States an attorney acts as council, and *vice versa*, there being no similar subdivision of the profession, and

the expediency of the subdivision has often been canvassed in the United Kingdom.

Layamon, the son of Leovenath, called in the later text of his poem *Lawman* the son of Leuca, was, as he himself tells us, a priest of Ernley (now Arley), on the banks of the Severn, near Bewdley, and appears to have flourished about the close of the 12th century. Nothing more is known concerning him. He produced an amplified imitation of Wace's *Brut d'Angleterre*, the value of which is not so much literary as linguistic. It was confessedly a compilation from Bede, St Albin, and Austin, and more particularly Wace. Wace's *Brut* contains 15,300, and Layamon's 32,250 lines, the additions consisting of dramatic speeches put into the mouths of the figures and of an extension of the Arthurian romance with names of persons and places supplied. The author seems to have been a simple, pious, and patriotic priest—in his own words 'it came to him in mind and in his chief thought that he would tell the noble deeds of the English.' The versification is very arbitrary and rude, exhibiting sometimes the alliteration of Old English, and sometimes the rhyme of French poetry. The language shows us Old English changing or changed into Early English, and a study of its peculiarities of grammar and phraseology enables us to trace the process by which the speech of Alfred and the Chronicle became transformed into that of Chaucer and Wyclif. Sir Frederick Madden pointed out that in the earlier of the two MSS. (13th century) of Layamon's *Brut*, there were less than fifty words derived from French; while in the second (written about 1250) twenty of these are dropped and only about forty more added. There are thus but ninety words of French origin in the two texts, together more than 56,800 lines.

See the edition by Sir Fred. Madden (3 vols. Lond. 1847); and the selections edited by Joseph Hall (1924).

Layard, SIR AUSTEN HENRY, G.C.B., English traveller and diplomatist, was born in Paris, 5th March 1817, and passed his boyhood in Italy. At sixteen he was sent to London to study law. In 1839 he set out on an overland journey for Ceylon. Travelling along the banks of the Tigris in 1840, he was struck with the ruins at Nimrud, pointed out by tradition as the site of Nineveh (q.v.), and felt an irresistible desire to examine the remains. In 1842 Botta, consul at Mosul, conducted some extensive excavations at Khorsabad; and Layard, returning to the region, again directed his attention to Nimrud. It was 1845 before he could obtain the requisite means and facilities for his search, and he then, with the help of some Arabs, began secretly to dig in the mound supposed to contain the ruins. His excavations were resumed in 1846 and 1847, and his energy and perseverance were rewarded by the discovery of the ground remains of several palaces, with bas-reliefs and cuneiform inscriptions. Many of these were sent to England by Layard, together with gigantic winged human-headed bulls and lions, and eagle-headed deities, now in the British Museum (see ASSYRIA). Layard at first conducted his search at his own expense; he was in 1845 liberally assisted by Lord Strafford de Redcliffe, then British ambassador in Constantinople; and eventually, as the value of these specimens of Assyrian art began to be known, the House of Commons voted a sum of £3000, which was applied by the trustees of the British Museum in continuing the excavations under Layard's superintendence. On his return to England he published a narrative of his explorations under the title of *Nineveh and its Remains* (1849), and another work entitled *Monuments of Nineveh* (1853). In 1852 he became M.P. for Aylesbury, and in 1860 for Southwark; in 1861-66 he was Under-secretary of State for

Foreign Affairs, and thereafter Chief Commissioner of Works. In 1869 he went as British ambassador to Spain; and in 1877-80 he was ambassador to Constantinople. His markedly philo-Turkish sympathies during and after the war with Russia provoked comment at home. In 1887 he published his *Early Adventures in Persia, Babylonia, and Susiana*. He died 5th July 1894. See his *Autobiography and Letters* (ed. Bruce, 1903).

Laying, or **LAYERING**, a mode of propagating trees, shrubs, and perennial herbaceous plants which is very frequently employed by gardeners and nurserymen. It consists in bending and fastening a branch, so that a portion of it is imbedded in earth, there to throw out roots, the extremity being made to grow erect in order to form a new plant. The separation from the parent plant is not effected till the layer is sufficiently provided with roots. Any injury which prevents the free return of the sap greatly promotes the formation of roots, and a notch is therefore usually made in the under side of the branch, at the place where the formation of roots is desired; it is also often a little split up from the notch; and sometimes a ring of bark is cut off, or a wire is twisted round it. The time which must elapse before the layer should be separated from the parent plant is very various; a few weeks being sufficient for some, and two years requisite for others. Many plants which cannot readily be propagated by cuttings are more easily and successfully propagated by layers.

Lay-reader, in the Anglican Church, is a layman who receives authority to read the lessons or a part of the service. The incumbent can permit any one to read the lessons, but for authority to read the morning or evening prayer a license from the bishop of the diocese is required. The absolution, of course, cannot be read by a lay-reader, nor any part of the communion service, but he may receive permission, especially in connection with missions, to preach, or to read the sermons of others. Readers (*lectores, anagnostai*) have existed as an order in the church from at least the 3d century: in the Greek Church they constitute the first, in the Latin Church the second of the minor orders that lead to the priesthood. (The office was anciently a favourite one with well-born youths: Julian, afterwards the Apostate, was in his younger years a reader in the church of Nicomedia.) Their duty at first was only to read (and perhaps to interpret) the lessons; afterwards they were often employed also as bishops' secretaries, and had some other functions assigned to them. The appointment of readers in the Anglican Church received the sanction of the bishops in 1866; but they were not to be ordained.

Lazarus, MORITZ (1824-1903), Hebrew philosophical writer, became in 1873 professor at Berlin.

Lazareff, PORT, a fine natural harbour, 40 to 60 feet deep, and 8 sq. m. in extent, in Broughton Bay on the east side of Korea.

Lazaretto. See LEPROSY, and QUARANTINE.

Lazarillo de Tormes, the first of picaresque novels, one of the great works of Spanish literature, used to be ascribed to Hurtado de Mendoza. Many other writers have been suggested. The English translation by David Rouland (1586) was reprinted in 1924 (ed. J. E. V. Crofts). See MENDOZA, NOVELS.

Lazarists. See VINCENT DE PAUL.

Lazistan, a coast strip at the south-east corner of the Black Sea, inhabited by the rough Lazs. See GEORGIA.

Lazulite (from *lazuli*), a mineral long confounded with Lapis Lazuli (q.v.), but, although somewhat similar in colour, very different in com-

position; consisting chiefly of phosphoric acid and alumina, with magnesia and protoxide of iron. It occurs imbedded in quartz, or in fissures in clay-slate, in Styria, North Carolina, Brazil, &c.

Lazzaroni (Ital. *lazzaro*, 'leper'; probably from their being outcasts or separate from other citizens), until lately a special class of the inhabitants of Naples. They had no fixed habitations, regular occupation, or secure means of subsistence, but occasionally obtained employment as messengers, porters, boatmen, itinerant vendors of food, &c. They performed an important part in all the revolutions and movements in Naples.

Le, or **LEH**, the capital of Ladakh (q.v.), stands 3 miles from the bank of the Indus, 11,538 feet above the sea, with an observatory; pop. 3000.

Lea, from Bedfordshire flows 46 miles SE. and S. through Hertfordshire, S. between Middlesex and Essex to the Thames near Blackwall.

Lea, HENRY CHARLES (1825-1909), born at Philadelphia, a son of Charles Lea, publisher, and nephew of H. C. Carey the economist, devoted himself to the study of the later middle ages. Lord Acton said his *History of the Mediæval Inquisition* was 'the most important contribution of the New World to the religious history of the Old.' He wrote also on the Inquisition in Spain and the Spanish dependencies, and a *History of Sacerdotal Celibacy*.

Leacock, STEPHEN BUTLER, born in 1869 at Swanmoor, Hants, was educated in Canada, taking his B.A. at Toronto. Later he added the Ph.D. degree of Chicago, and was appointed to the staff of McGill University, Montreal, where he became head of the Department of Political Economy. His serious work, such as *Elements of Political Science* and monographs on Baldwin and La Fontaine in the 'Makers of Canada' series, is overshadowed in public appreciation by his delightful volumes of parodies and skits, beginning with *Literary Lapses* (1910) and *Nonsense Novels* (1911).

Lead is one of the metals which have been known from early times. It is mentioned in Job, xix. 24, and articles made of it by the ancient Romans—some of them inscribed and dated—such as water-pipes, water-tanks, weights, rings, and small ornamental cylinders, are still preserved. As examples found in the grounds of some of the old abbeys and cathedrals show, the Roman method of making pipes from sheet-lead, which differs from the modern way, continued in use till late in the middle ages. Small lead weights of curious forms have been found among Viking remains dating as early as the 10th century. Of lead compounds, litharge and red lead were known to the ancients.

Lead (symbol Pb; atomic number 82; average atomic weight 207) is a soft metal of a bluish-white colour, tending to gray, and having also a bright metallic lustre when newly cut or melted. Its surface soon tarnishes, however, when exposed to the air, by taking on a thin film of what is supposed to be suboxide. But the oxidation proceeds so slowly that lead suffers less than most ordinary metals either by exposure to atmospheric agencies or by being placed in damp soils. Lead can be scratched with the nail, and easily cut with a knife, and it makes a streak upon paper. Its specific gravity varies from 11.352 in the ingot to 11.365 when rolled into sheets, and its melting-point is 633° F. (334° C.) It is highly malleable and in a less degree ductile, but its tenacity is small—a wire $\frac{1}{16}$ th of an inch being unable to carry a load of 20 lb. Lead has been ascertained to be the final product of the auto-transmutation of the radioactive metals of the uranium and thorium groups. Lead resulting from the uranium-radium sequence has an atomic weight of 206,

that from the thorium sequence of 208. Chemically, these two *isotopes* of the metal are identical. Ordinary lead contains both isotopes, though in variable proportions. Lead is not a good conductor of heat or electricity. When gently heated it can be forced by pressure through perforations, so that pipes and solid rods for rifle-bullets, &c., are in this way manufactured. Neither sulphuric nor hydrochloric acid in the dilute state has any action upon lead.

The Action of Lead upon Water is of great importance, because the metal is so much employed for pipes and cisterns, and because lead salts dissolved even in minute quantities in drinking-water act as cumulative poisons, and are therefore injurious when taken for some length of time into the system. Lead is rapidly acted upon by pure water to which air has access, such as rain; and it is also dissolved to an appreciable extent by the water of rivers or lakes if exceptionally pure. Bicarbonate and sulphate of lime, which are common salts in potable waters, prevent water acting on lead. A small amount of peat-extract in solution has the same inhibitive effect. Even a soft and almost pure water, like that supplied to Glasgow from Loch Katrine, contains enough impurity to render harmless the short lead service pipes used in houses.

Plumbic Oxide (monoxide of lead, massicot, litharge), PbO. Massicot, from which red lead is manufactured, is obtained in the form of a yellow powder by heating lead to dull redness. Litharge is produced when lead is oxidised, as in the cupellation furnace, at a high temperature in a current of air. The melted litharge flows from the cupel into iron pots, and after cooling breaks up into crystalline scales of a colour varying from a pale to a reddish yellow. This is called flake litharge, and when ground it is termed buff or levigated litharge. Both massicot and litharge enter into the composition of certain Cements (q.v.). Litharge is used in the fabrication of oil-varnishes to increase their power of drying, in the preparation of lead plaster, and for glazing earthenware. *Red Oxide of Lead* (red lead or minium), Pb₃O₄, is occasionally found native. Its manufacture is referred to below. *Plumbic Peroxide* (binioxide of lead, puceoxide), PbO₂, is obtained by treating the red oxide with dilute nitric acid. This oxide, which is of a brown colour, is used mixed with sulphur along with other ingredients for tipping some kinds of matches, the mixture of puceoxide with sulphur being spontaneously inflammable when rubbed.

The most important lead salts are: *Plumbic Carbonate* (carbonate of lead, white lead), PbCO₃; *Plumbic Chloride* (chloride of lead), PbCl₂; *Lead Acetate* (sugar of lead), Pb(C₂H₃O₂)₂·3H₂O. The latter is soluble in 1½ parts of cold water, and in eight parts of alcohol. Like litharge, it is used in the manufacture of oil-varnishes, and it is an important substance in medicine. For the chromate of lead, which is employed as a yellow pigment, see under CHROMIUM.

Ores and Smelting.—The principal ore is *galena*, the sulphide of lead, PbS (lead, 86.6; sulphur, 13.4 per cent.). All galena is argentiferous, but not always to a degree sufficient to make the extraction of the silver feasible. The only other ore of importance is *cerussite*, the carbonate; it is mined in Australia and in the United States.

Lead ores are widely distributed. The principal lead-producing countries are the United States, Spain, Australia, Germany, and Mexico, of which the first produces about one-third of the world's supply. The chief lead-exporting countries are Spain and Australia, from both of which Britain annually receives large amounts, mainly as pig-lead. South-eastern Missouri is the most important

lead-mining region of the States, the ore-bodies (galena) being of large size, and lying at shallow depths. In the Joplin district lead and zinc ores occur interbedded with limestone and cherts. The Cœur d'Alene region, Idaho, ranks next to Missouri as the second great lead-producing area of the States; here the principal manner of occurrence is that of argentiferous galena in veins in quartzitic rocks. The main lead-mining area in Spain lies in the province of Jaén, between the Sierra Nevada and the Sierra Morena, and, in that area, the districts of La Carolina and Lináres are especially noteworthy. The lead ores of La Carolina occur in Silurian quartzite and slate, while the Lináres lodes are associated with granite. There are many rich silver-lead-zinc mines in Córdoba province, notably in the Posadas district; some have been worked since Roman times. Lead, associated with silver and sometimes with gold, occurs in all the States of Australia, but that continent owes its high position among lead-producers almost entirely to the mines at Broken Hill, New South Wales. The ore, which is complex, is found in wide lodes in schist. The lead smelting and refining works at Port Pirie are engaged on Broken Hill concentrates; they are the largest in the world, being able to produce, at full capacity, 200,000 tons of pig-lead and 8 to 12 million oz. of silver per annum. One of the richest lead-zinc regions of Europe lies near Beuthen and Tarnowitz in Upper Silesia. The Polish-German frontier passes through it. The ores, which are argentiferous, occur in beds, probably replacing limestones. At one time an important lead-producing country, Great Britain now yields but little of the metal, 90 per cent. of her annual consumption of lead being obtained from abroad. Flintshire, Derbyshire, and Durham yield lead from veins in Carboniferous rocks; while the mines at Leadhills and Wanlockhead, in South Scotland, those of the Lake District and Mid and North-west Wales work veins in Silurian rocks. There is an enormous number of lead veins in the older Palæozoic rocks of Wales, but, in general, they soon become unproductive in depth. Though of small account to-day, some of the lead-mines of the Isle of Man have been important producers in the past.

Smelting.—Lead ore coming from the mine passes through the operation known as 'dressing' in order to remove much of the impurities and to make it acceptable to the smelter (see ORE-DRESSING). If the dressed galena is

Fig. 1.—Section of a Flintshire Furnace.

a, hearth on which ore is spread; b, the fireplace or grate; c, the fire bridge; d, chimney; e, e, working doors; f, opening for supplying ore; g, tap-hole.

nearly pure, as it often is, the smelting operation is simple. A charge of ore of at least 20 cwt. is first partially roasted for about two hours on the bed of a reverberatory furnace (*Flintshire furnace*), shown in fig. 1, which results in one portion being

converted into oxide and another into sulphate of lead, while some of the sulphur goes to form sulphur dioxide, which escapes as gas. There remain on the hearth of the furnace oxide, sulphate, and some unaltered sulphide of lead. These, when the heat is raised and the furnace doors closed, practically to stop the supply of air, react upon each other, forming sulphur dioxide and metallic lead. Towards the end of the process lime is thrown in to aid in the manipulation of the slag and undecomposed ore; and when a further portion of metal is extracted from these the melted lead is run off into a vessel, and the slag removed from the furnace. The changes which take place in the later or melting stage of the process are shown by the following equations:

In the northern lead districts of Great Britain the calcined ore is removed from the reverberatory furnace and smelted with the aid of a blast of air on a separate ore-hearth called the 'Scotch furnace.'

Owing to lead being to some extent volatile at a red heat, a considerable quantity of the metal would, if not prevented, pass from the smelting-furnaces into the atmosphere as smoke or fume, and cause a loss of, sometimes, 10 per cent. of what the ore should yield. Moreover, lead fume destroys vegetation for some distance around the furnaces, and herbage on which it condenses is apt to poison animals feeding upon it. At Holywell in Flintshire, Alston Moor in Cumberland, and at other lead-works this smoke is conveyed through a system of flues whose combined length amounts in some cases to several miles. Sometimes it is one very long flue. The fume condenses on the sides of these

Fig. 2.—Vertical Section of the Pilz Blast-furnace for melting Lead:

a, hearth; b, tuyères, by which air-blast enters; c, water-jacket; d, tap-hole; e, cover; f, flue.

flues, openings being left to collect it. Condensing chambers are also used, in one form of which the lead fume is precipitated by being forced through water. These condensers are constructed to save the expense of long flues, but sometimes both are employed. Lead is extracted from the collected fume. More refractory or impure ores, also lead-bearing slags and products obtained in lead-refining, are, in some places, treated by the *iron-reduction process*. A certain proportion of iron is added to the charge of ore in a blast-furnace, with charcoal or coke for fuel, because the sulphide of lead is

completely reduced when heated with metallic iron, since this metal has a greater affinity for sulphur than lead. The reduction of these complex ores is rather a combination of processes than a single one. Besides lead and silver, copper and sometimes other metals are obtained as accessory products.

As an example of a water-jacketed blast-furnace for lead-smelting we give in fig. 2 a vertical section of the cupola-shaped one called the Pilz furnace, which is now in use at Freiberg, and which has also been adopted in the United States. It has eight tuyères, and varies in size from 4 feet in internal diameter, and 14 feet high from the hearth-plates, up to 20 feet in height, with a proportional width across. In the United States, however, the Rachette or rectangular form of blast-furnace seems to be preferred, because its capacity can be increased by lengthening it on plan without also increasing the height, as must be done if a circular furnace is made larger in diameter. The pressure of the blast in these furnaces is from $\frac{1}{2}$ to 1 lb. per square inch. Cerussite or lead carbonate is easily reduced in a blast-furnace by coke or charcoal.

Desilverising, &c.—Lead usually contains antimony, tin, zinc, and other metals as impurities. These are separated by fusing the metal in shallow pans, when the foreign metals form oxides, and as such are skimmed off. Lead reduced from galena always contains a little silver, of which 8 or 10 oz. to the ton of lead is a very common proportion, although it often exists in much larger quantity, and as little as 3 oz. to the ton can

Fig. 3.—Pattinson Desilverising Pot.
a, pot; b, fireplace; c, main flue.

be profitably extracted. The desilverising process patented by H. L. Pattinson of Newcastle-on-Tyne in 1833 is still used. A series of cast-iron pots about 6 feet in diameter (see fig. 3) is used in the process. The argentiferous lead is melted in one of these and allowed to cool slowly, and at the same time it is briskly stirred. A portion of the lead is thus made to separate in small crystals, which, as pure lead solidifies at a higher temperature than a lead-silver alloy, leaves the fluid portion richer in silver. Suppose that the lead to begin with contains 10 oz. of silver to the ton; then if two-thirds of the charge of this pot, which is usually the centre one of several, is transferred as crystals to another pot, it will contain only about 5 oz. of silver to the ton. The one-third remaining in the liquid state will contain 20 oz. of silver to the ton. With both portions this process is repeated several times, the one becoming poorer, and the other richer in silver after each crystallisation. When the lead is enriched to the extent of from 250 to 300 oz. of silver to the ton the concentration is usually stopped, although it is sometimes carried a good deal further. The silver is then obtained from this rich lead by melting it on a flat bone ash cupel, placed in a reverberatory furnace, and exposing it to a current of air which reduces the lead to the oxide, or *litharge*

of commerce, leaving the silver on the cupel. Desilverisation benefits the lead and increases its value.

The Rozan process for desilverising lead is the same in principle as Pattinson's, except that steam is used instead of manual labour, the result being that there is a considerable saving in the cost.

Another method of desilverising lead, known as Parkes's process, was patented in 1850. By this method the silver is separated by adding to the melted lead from 1 to 2 per cent. of zinc, which has a greater affinity for silver than has lead. The zinc carrying the silver with it forms, on cooling, crusts on the surface. From these crusts the zinc is afterwards distilled, leaving silver mixed with some lead as a residue. A modification of Parkes's method was patented in France by Condurié in 1866. He used superheated steam for the separation of the zinc from the crust or scum, and for getting rid of any foreign metals remaining in the desilverised lead. It is said that a very pure commercial lead is obtained by Condurié's process.

Sheet-lead is much used for roofing buildings, for the construction of cisterns, and for chambers in sulphuric acid works. Lead-coated sheet steel is employed where plain sheet steel would rapidly corrode. Lead, being virtually opaque to X-rays, is used for screens and for body-coverings to protect operators of the rays. Lead is much used for electric accumulators; the positive plate consists of a lead frame strengthened with antimony and perforated by holes into which is pressed a paste of red lead and sulphuric acid; the negative plate is of chemically pure lead. The value of lead for the manufacture of shot is well known. Alloyed with antimony, &c., it is largely consumed for type-metal, and with tin for solder. Much lead is also required for the manufacture of pewter, Britannia metal, &c. See ALLOY.

White Lead or Basic Carbonate of Lead ($2\text{PbCO}_3 \cdot \text{PbH}_2\text{O}_2$) is a substance very extensively used as a white pigment, as a cement, and for pottery glazes. White lead is still largely made by the old Dutch process. Metallic lead is cast into the form of stars, gratings, or thin perforated slabs in such a way as to facilitate its conversion into the carbonate. These pieces of lead placed in earthenware vessels, like flower-pots, containing a little weak acetic acid, are built up in tiers in the form of a stack, and surrounded with spent tan bark. The heat given out from the fermenting bark volatilises the acid, which along with the air changes the surface of the lead into the basic acetate, and this is, in turn, converted into the carbonate by the carbonic acid given off from the hotbed. Metallic lead requires from four to eight weeks for conversion into white lead, during which a repetition of these reactions goes on. Among the numerous alternative processes, the German and French are perhaps the best known. In the former, wooden chambers are employed, each holding five tons or more of metallic lead, rolled into long, thin strips and hung up on racks. Wood-vinegar is boiled, and the vapour and steam allowed to pass through the closed chamber for two or three days, whereby the basic acetate of lead is formed. Then carbon dioxide with more acetic acid vapour is passed in, when the acetate is converted into white lead. The French process is similar in the chemical sense; lead acetate is prepared, and is converted into the basic salt by boiling an aqueous solution with litharge; carbon dioxide is passed into the solution through pipes, and the resulting white lead settles as a precipitate.

Minium, Red Lead, or Red Oxide of Lead, is much consumed in the manufacture of flint-glass, as a cement, and as a pigment. For glass-making it requires to be made of very pure lead, as a

slight trace of copper would impart a colour to the glass. Minium is prepared by heating *massicot* or monoxide of lead to a temperature of 600° F. in iron trays, in an oven, carefully avoiding fusion. More oxygen is thus gradually absorbed; and a bright-red compound is formed, which is the red lead of commerce. Orange lead, made from white lead instead of from *massicot*, is a very pure kind of red lead.

Yellow Lead.—This name is sometimes given by manufacturers to a mixture of the oxides of lead and antimony, which is to some extent used to give a yellow colour to earthenware and as a pigment. The so-called *Black Lead* (q.v.), of which pencils, &c., are made, contains no lead.

LEAD-POISONING, or PLUMBISM.—Minute doses of lead introduced into the system for some time bring on peculiar and distinctive symptoms. In the 18th century, before its cause was ascertained, the disease was well known in Poitou (hence called '*colica pictorum*'), in Devonshire, and in the West Indies. It was proved by Sir George Baker in 1767 that it was due in each case to the presence of lead in the prevalent alcoholic drink of these regions—wine, cider, rum respectively, owing to its introduction during the process of manufacture. It is occasionally met with in consequence of the action of water, generally very soft water, on the lead pipes through which it passes to the consumers. But it most often attacks persons brought much into contact with lead compounds, such as makers of white lead, workers in the glaze of potteries, painters, and plumbers. The intestinal canal and the nervous system are affected; gout also occurs; and the blood-vessels, heart, and kidneys after some time show degenerative changes.

(1) Lead or painter's colic is much the most common form of the disease. It consists in more or less severe attacks of pain in the abdomen (see COLIC), not differing much except in their persistency and frequent recurrence from pains otherwise produced, attended by obstinate constipation and frequently by vomiting. They may be so slight for some time that they do not interfere with the sufferer's continuing his work. Lead-colic is rarely fatal; but may be so if the cause of the affection is not recognised.

(2) The commonest affection of the nervous system is paralysis of some of the voluntary muscles; usually those first and most affected are the extensor and supinator muscles of the forearm, and the muscles of the ball of the thumb; and from the characteristic deformity thus arising the condition is termed *wrist-drop*. Other muscles may be first or alone affected; but in almost all cases the muscles of the upper limbs are those where the disease manifests itself. It is not certain whether the nerve-trunks or the centres in the spinal cord are the primary seat of morbid change. Atrophy of the brain-substance, or of the optic nerves, epileptic attacks, and coma occasionally occur as results of lead-poisoning. All the nervous disorders are generally preceded by lead-colic.

(3) The association of gout with lead-poisoning is frequent; and the former is certainly sometimes produced by the latter. But it is probable that gouty subjects are specially sensitive to the action of lead. Cirrhosis of the kidneys (see KIDNEYS, DISEASES OF) occurs in some cases, following upon degenerative disease of the blood-vessels (arteriosclerosis).

Besides the more obvious effects of the poison above described, there are others of great importance, as they aid in the discovery of the cause of the disease. The most distinctive is the formation of a dark line along the edges of the gums close to the teeth, due to precipitation of lead in the form of sulphide in the tissues. The general health usually

suffers, the complexion is sallow and the skin dry and harsh.

Prevention.—The most important point to be attended to is that those exposed to the cause of the disease should pay scrupulous attention to cleanliness; should never eat in their workrooms, or without washing their hands; and where dust containing lead is present should wear respirators during their work. Lemonade or some other drink slightly acidulated with sulphuric acid should be used as a beverage, for it forms the insoluble and inert sulphate of lead with any other lead compound which has obtained access to the stomach. Where the water-supply is at fault lead pipes must be discarded, or means must be taken to render the water hard before it is admitted to the pipes.

Treatment.—When lead is present in the system and causing any of the symptoms above described, its removal can be effected by the administration of iodide of potassium (see IODINE). Sulphuretted baths, formerly recommended, are of doubtful efficacy. Lead-colic requires free administration of castor-oil or other purgatives with antispasmodics; lead paralysis is often benefited by electric stimulation of the affected muscles.

Lead, on shipboard. See SOUNDING.

Leader-cable. See LIGHTHOUSE.

Lead-glance. See GALENA.

Leadhills, a village of Lanarkshire, the highest in Scotland, being 1300 to 1400 feet above sea-level, on Glengonner Water, 45 miles SSW. of Edinburgh. Allan Ramsay was a native. Lead has been mined here for at least six hundred years.

Leading Question is a technical expression in law to denote a question so put to a witness as to suggest the answer that is desired or expected. Thus, if a witness is asked, 'Was he dressed in a black coat?' it is supposed the witness will answer, 'Yes;' whereas the proper way of putting the question is, 'How was he dressed?' or 'What kind of coat was he wearing at the time?'

Leadville, a mining city of Colorado, capital of Lake county, stands in a valley 10,200 feet above the sea, 78 miles SW. of Denver. Its mines produce gold, silver, and lead. The town, which was incorporated in 1878, contains numerous smelting-furnaces and stamp-mills. Pop. (1880) 14,820; (1920) 4959.

Leaf. Leaves are lateral organs developed from the stem or Axis (q.v.) of the plant below its growing point. They never bear flowers, and after reaching their full development they retain their form and size unchanged until death, after which they are removed from the stem either by gradual decay (most monocotyledons) or by breaking off at a distinct articulation (most dicotyledons). They normally consist of two main parts, a stalk or *petiole*, and a blade or *lamina*, the latter being usually flattened and expanded. They may also possess lateral appendages or *stipules* at the base of the petiole. Physiologically considered, they are of the highest importance, as can best be understood after examination of their minute anatomy. The petiole resembles a stem in structure; the blade, however, is distinguished by the great development of cellular tissue, through which the fibro-vascular bundles pursue a course usually similar to that which they possess in the stem, thus exhibiting the parallel and reticulated venation so characteristic of Monocotyledons (q.v.) and Dicotyledons (q.v.) respectively. Taking common examples of such leaves, it is easy to make out all the principal tissues (see BARK); (1) thus, by tearing the leaf obliquely, we can remove shreds of dry, colourless, transparent *epidermis*, which exposes the subjacent (2) cellular ground tissue or parenchyma, which is dark green

on the upper, and paler because of looser texture on the lower side, while (3) the fibro-vascular bundles can readily be prepared as a skeleton by scraping, or better by maceration. A thin transverse section placed under the microscope shows, proceeding from above downwards, (1) the upper epidermis, a continuous layer of empty cells, with walls often considerably thickened, especially on the upper surface, to form the so-called cuticle; (2) the parenchyma, which contains the fibro-vascular bundles, and which is readily distinguishable into two chief layers. Above is the so-called 'palisade parenchyma,' in which the cells are elongated vertically and placed close together like the

Fig. 1.—Transverse Section of a Leaf, Magnified :

posts of a palisade, and below this lies the loose parenchyma of the middle and lower surface of the leaf, in which the cells are polyhedral and loosely arranged, leaving irregular air-passages. Finally we have the lower epidermis, in which numerous openings, the *Stomata* (q.v.), place the spaces in the parenchyma in continuity with the external atmosphere.

The essential function of leaves resides in their chlorophyll-containing parenchyma, in which, in presence of light, carbonic acid (CO_2) is decomposed with restoration of oxygen to the atmosphere and formation of starch (see *CHLOROPHYLL, VEGETABLE PHYSIOLOGY*). This process has, of course, nothing to do with the function of *Respiration* (q.v.)—oxidation of protoplasm with formation of carbonic acid which is going on constantly during life in all the tissues of plants as well as of animals; it is a compensatory process whereby the green plant is enabled to repair its respiratory losses of matter and energy, and provide for its continued growth by the formation of new food substances by aid of energy derived from the sun. The newly-formed starch, first distinguishable in the form of granules which are visible in the substance of the chlorophyll grains, is converted by the ferment *Diastase* (q.v.) into fluid glucose or maltose, and carried off by the descending sap, either to be directly assimilated as food or to be reconverted into starch and stored for future use.

The functions of the blade of the leaf are shared to some extent by the petiole, by the green cellular envelope of the stem and branches (which thus not unfrequently come to replace the leaves altogether, good respective instances being furnished by cactuses and acacias), and often by the calyx and ovaries; in short, every part of the plant exposed to light tends to utilise it by producing chlorophyll, excepting only those parts of the flower where, in current phrase, more conspicuous colouring matters are required for the attraction of insects.

The forms of leaves are greatly varied, often

obviously in adaptation to the habit of the plant, large and free-growing plants which obtain unobstructed light most frequently bearing simple or slightly lobed leaves, while the smaller vegetation generally produces leaves either long, simple, and narrow (e.g. grasses), or highly compound, with small leaflets (e.g. ferns), so as to seize as many as possible of the broken sunbeams which have not been intercepted by the loftier plants, while casting as little shadow as possible upon each other. Again, the leaves of aquatic plants, if floating, are simple and largely expanded, so as to maintain their position and obtain the maximum of light (e.g. water-lily and pond-weed), but if submerged are usually dissected into filiform segments (water-primrose), so as to allow the water to flow unobstructed, and thus constantly renew the supplies of carbonic acid. Again, where in one and the same plant the leaves on the lower and upper portion of the axis are in different circumstances, their form is also varied, and we have the *heterophyllous* condition, which can be seen in many land-plants, but perhaps most conveniently in the water-buttercup (*Ranunculus peltatus*), which possesses both floating leaves which are simple, and submerged leaves which are highly dissected. So, too, plants which grow in dry and sandy situations, and obtain scanty supplies of water, either owing to drought or to too pervious soil, very frequently store water in their leaves, which may thus become succulent, preserving it against too ready evaporation due to sun or wind by a thickened cuticle, by stomata sunk in pits, by rolling the stomatic surface inwards, or by some other means.

Again, leaves may acquire entirely new functions, and have their form altered in correspondence with these. Where the plant is a climber the whole or part of the leaf may be modified into a tendril; where it is insectivorous it may be converted into a fly-trap (see *INSECTIVOROUS PLANTS*); or, as in the very highly specialised *Nepenthes*, we may have the base of the leaf of ordinary form and function, the middle twining as a tendril, and the tip hollowed and enlarged into a complicated pitcher.

Fig. 2.

A, B, forms of leaves—*a*, circular; *b*, elliptical; *c*, oval; *d*, linear; *e*, spatulate; *f*, ovate; *g*, oblong; *h*, reniform; *i*, hastate; *k*, sagittate; *l*, pointed ovate; *m*, ovate-lanceolate. C, Leaf-tips—*a*, acute; *b*, obtuse; *c*, retuse; *d*, acuminate. D, Leaf-margins—*e*, entire; *f*, serrate; *g*, dentate; *h*, crenate; *i*, undulate; *k*, labulate; *l*, divided.

Where protection is required, new modifications present themselves; in response to repeated attacks by herbivorous animals, the leaves or leaf-tips may become converted bodily into thorns, or covered with epidermic prickles. Bitter or acrid secretions,

too, may develop, or stinging hairs be produced; while, if ants are to be guarded against, a hairy or glandular epidermis is the surest protection. Such at least are the interpretations commonly current (see DARWINIAN THEORY).

The fact that leaves are so capable of adaptation to the manifest needs of plants would inspire one to imagine some subtle cause for their infinite variety of shape and outline in response to other requirements, but space forbids discussion of such matters, and the reader is referred to Kerner and Oliver's *Natural History of Plants*, and Schimper's *Plant Geography*.

The parenchyma of the blade may be either in one continuous piece, when the leaf is said to be *simple*, or cut up into separate leaflets, when it is termed *compound*. Simple leaves may be conveniently reduced to three main forms, the *circular*, the *elliptical*, or the *oval*, according to the respective length and position of the longitudinal and the transverse diameter; the *linear* leaf being thus regarded as an elongated variety of the elliptical, and so on. Innumerable variations in detail arise, however, according to the shape assumed by the apex, the margin, or the base of the leaf. The apex may be *obtus* or *acute*, *retuse* or *acuminate*;

Fig. 3.

a, peltate leaf derived from A by backward prolongation of the lobes; b, amplexicaul leaf; b', perfoliate; b'', connate—all derived from B; c, pedate leaf, its branching represented diagrammatically in d.

the margin may be *serrate* or *wavy*, or *parted* into lobes so deep as to furnish transitions to the compound leaf; the base may be *hastate* or *reniform*, and so on. If the leaf base be prolonged beyond the insertion of the petiole and its lobes unite, we obtain the *peltate* condition familiar in the common Indian Cress (*Tropæolum*). If the petiole be absent, the leaf becomes *sessile* upon the axis; if its lobes are produced downwards, as in the reniform leaf, and clasp the axis, the leaf is termed *amplexicaul*; if the lobes coalesce on the other side of the axis, it becomes *perfoliate*; and if they unite with those of a similar leaf arising on the opposite side, the pair are said to be *connate*.

In compound leaves the leaflets may arise one from another on each side of a median lobe, as in the *pedate* leaf of Hellebore, or may radiate in *palmate* fashion from a common point—the end of the petiole, as in horse-chestnut; or, as is most frequent, they may be placed at intervals along the midrib, like the ribs of a feather, when we have the *pinnate* arrangement, of which the ash furnishes a familiar example. The simplest case of pinnate structure is where the lateral lobes or *pinnæ* are only two, as in the *ternate* leaf of clover: complex cases also are frequent, termed *bipinnate*, *tripinnate*, or *decompound*, according as secondary, tertiary, or even quaternary series of leaflets are developed.

How little morphological importance can be attached to these countless variations of form is well illustrated by the study of the development of the apparently similar 'pinnate' leaves of palms, dicotyledons, and ferns. In the palm the pinnate

character is seen to be due to a mere tearing of a primarily simple leaf, by the midrib continuing to elongate after the parenchyma is developed; in dicotyledons the lobes develop separately, but sometimes from above downwards, and sometimes from below upwards; while in ferns the leaf is produced by a series of regular bifurcations of the growing point alternately to right and left, the first pinna being thus equivalent to all the rest of the leaf, and the apparent midrib a false axis, resulting from numerous separate dichotomies.

The comparative morphology of leaves is of the greatest interest. The essential conception, which floated before the eyes of Wolff and of Linnæus, was renewed by Goethe, and systematised by De Candolle, is that of a fundamental correspondence or *serial homology* among all the outgrowths from the sides of the axis—from the lowest and earliest, the seed leaves or cotyledons, upwards through the leaves proper to the bracts, and even thence through the parts arranged upon the floral axis—the *sepals*, composing the *calyx*, and the *petals*, forming the inner floral envelope or *corolla*, being still modifications of the leaf type, which we finally find most highly metamorphosed in the stamens and pistils (see FLOWER).

The transition from leaf to bract can be seen in any flowering plant, that from bracts to calyx may be conveniently studied in the mallow, that from sepals to petals in the cactus, that from petals to stamens in almost any garden rose (which indeed appears to have suggested the whole theory), and that from leaves to carpels in many monstrous flowers, especially the double cherry. Our consideration of the pinnate type of leaf-formation having shown that such apparent resemblances in adult anatomy are not necessarily real, it becomes necessary to test our theory by actual observation of the development of flowers. Embryology here furnishes an absolute confirmation—leaves and sepals, petals, stamens, and carpels, are all seen to develop as precisely similar processes of cellular tissue from

Fig. 4.

a, development of compound from simple leaf; b, imparipinnate leaf; c, trifoliate leaf; d, palmate leaf; e, development of pinnate leaves; f, of palm by tearing; g, of dicotyledons by development either (1) basifugal, or (2) basipetal.

the sides of the axis; and when the forms of leaves are fairly borne in mind, the apparent anomalies of flower structure become clear. Thus, the outer calyx (*epicalyx*) of a strawberry is readily seen to be composed of the united stipules of the sepaline leaves, the numerous stamens in five bunches of

the St John's Wort become resolved into a whorl of compound staminal leaves, and so on. While petals are obviously modified leaves, there is ground both developmental and analogical for regarding them, in some if not all cases, as barren stamens specialised to the attraction of insects; their relation to the leaf type becoming more remote. This favours the alternative and more modern hypothesis which regards leaves and leaf-like organs as being, in part, produced at the expense of reproductive tissue.

The arrangement of leaves upon the axis (termed *phyllotaxis*) is always definite, and possesses a high degree of interest, although perhaps rather mathematical than morphological. An ascending spiral line may in all cases be traced round the axis through successive leaf bases, and these are found to occur at fixed distances, including a certain fraction of the circumference, most commonly $\frac{1}{2}$, $\frac{2}{3}$, $\frac{3}{5}$, or $\frac{1}{5}$, although higher fractions of the same 'convergent series'—viz. $\frac{1}{7}$, $\frac{2}{9}$, &c.—or fractions of different series, and even transitions from one system to another, also not unfrequently occur, especially in such complex arrangements as the scales of fir cones. When leaves are opposite there are two primary generating spirals; when whorled there are three or more. The mode in which leaves are folded in the bud, termed *prefoliation* or *vernation*, is of interest, since it is definite for each species. See Sachs's, Vines's, and other text-books; also Avebury's *Flowers, Fruits, and Leaves*; and Kerner and Oliver's *Natural History of Plants*.

Leaf-insect, or WALKING LEAF (*Phyllium*), a genus in the family Phasmodæ (q.v.), order Orthoptera, famous for the females' likeness to

Female Leaf-insect (*Phyllium siccofolium*).

leaves. They occur in tropical regions of the Old World, especially on islands, from Mauritius and the Seychelles to Fiji. The young are reddish-yellow, but soon become green; the pigment is spectroscopically like chlorophyll. The female's wing-covers or tegmina are strikingly leaf-like (the hind-wings are minute vestiges), and even the joints of the legs are foliaceous. The male has tegmina and large hind-wings, neither leaf-like. The dying insects sometimes (as in *P. siccofolium*) become brown like a withering leaf. The egg-capsule is extraordinarily seed-like, even in minute detail. See MIMICRY.

League (Lat. *leuca*, a 'Gallic mile,' a word of Celtic origin), a measure of length of great antiquity. The Romans estimated it as equivalent to 1500 Roman paces, or 1·376 modern English miles. The league was introduced into England by the Normans, probably before the battle of Hastings, and had been by then lengthened to two English miles of that time, or 2· $\frac{1}{2}$ modern English miles. At the present day the league is a nautical measure, and signifies the 20th part of a degree—i.e. 3 geographical miles, or 3·456 statute miles. The French and other nations use the same nautical

league, but the former nation had (until the introduction of the metrical system) two land-measures of the same name, the legal posting-league = 2·42 English miles, and the league of 25 to the degree = 2·76 statute English miles. For the German league or *Meile*, see MILE.

League, a term employed to designate a political alliance or coalition. The most famous leagues were the Ætolian and Achaian Leagues, the Lombard League, the Hanseatic League (q.v.), the leagues of Cambray ('Holy League'), Schmalkald, Nuremberg ('Catholic League'), and Würzburg in the Thirty Years' War (q.v.); also the Solemn League and Covenant, the Anti-corn-law League, the Land League. But the name has a peculiar importance in the history of France, as applied to the opposition organised by the Duke of Guise (q.v.) to the granting of the free exercise of their religion and political rights to the Huguenots. This league, known as the Holy League (*Sainte Ligue*), was formed at Péronne, in 1576, to maintain the predominance of the Roman Catholic religion; but the object of the Guises was rather to exclude the Protestant princes of the blood from the succession to the throne. For an account of the civil war that ensued, see HENRY III., HENRY IV., and GUISE; and for its full history, see Mignet's *Histoire de la Ligue* (5 vols. 1829).

League of Nations. The League of Nations came into actual existence on 10th January 1920, when the ratifications of the Treaty of Versailles were exchanged at Paris. It represented the concrete elaboration of an aspiration which—to leave aside the illusive precedent set by the Holy Alliance and the idealistic schemes of writers like William Penn and Immanuel Kant—had taken definite shape during the war, both in the British Foreign Office and in the minds of groups of men working separately but concurrently in several different countries. Among the leading figures in such groups may be mentioned President Wilson and ex-President Taft in the United States, Sir Edward Grey and Lord Robert Cecil in Great Britain, M. Léon Bourgeois in France, and General Smuts in South Africa.

As a consequence, the question of the creation of a 'League of Nations against War' figured prominently from the outset among the tasks to which the Peace Conference had to apply itself in the early months of 1919. President Wilson was chairman of the special commission entrusted with the drafting of the 'Covenant' of the League, as it was termed at Mr Wilson's instance, and among its members were Lord Robert Cecil and General Smuts for the British Empire, M. Bourgeois for France, M. Venizelos for Greece, Signor Orlando for Italy, M. Paul Hymans for Belgium, and Dr Wellington Koo for China. No neutral or enemy States were represented. The first draft of the Covenant was provisionally approved by the full Peace Conference before the end of February, and President Wilson took it with him on the flying visit he paid to America immediately afterwards. When he returned to Paris he proposed certain changes demanded by American opinion, notably the inclusion of a safeguarding reference to the Monroe Doctrine, and the observations of neutral States were also invited. The final draft of the Covenant was approved by the Peace Conference on 28th April, and embodied in the general treaty at that time in preparation. The German delegation then at Versailles offered some comments on the Covenant, but the suggestions put forward were not adopted. Considerable difference of opinion existed among the Allies as to whether the Covenant should form part of the Treaty of Versailles or be negotiated separately and subsequently.

President Wilson was insistent on the former course, and accordingly the twenty-six articles of the Covenant actually form the first twenty-six articles of the Treaty of Versailles. As such they were signed by the Allied Powers and by Germany in the Hall of Mirrors on 28th June 1919. The Covenant was similarly placed at the head of the Treaties of St Germain (with Austria), the Trianon (with Hungary), and Neuilly (with Bulgaria). China, which declined to sign the Treaty of Versailles, was brought into the League by her signature of the Treaty of St Germain.

The Covenant is, and has the force of, a treaty. It was contracted originally between the signatories of the Treaty of Versailles and other States which subsequently adhered, even though the common procedure of signature and ratification was not precisely followed, assumed obligations equally binding. The Covenant itself consists of twenty-six articles and a preamble, and constitutes the basis of common action between members of the League. By it they undertake to pursue or refrain from pursuing certain policies, but in view of the diversity of the tasks it is sometimes sought to impose on the League of Nations, it is well to emphasise the fact that there is no technical or moral obligation on the League as such to initiate action in any field not brought under its purview by one or other of the articles of the Covenant.

The general purpose of the League is adequately set out in the Preamble to the Covenant, which runs as follows:

- 'The High Contracting Parties
- 'In order to promote international co-operation and to achieve international peace and security
- 'by the acceptance of obligations not to resort to war,
- 'by the prescription of open, just, and honourable relations between nations,
- 'by the firm establishment of the understandings of international law as the actual rule of conduct among governments, and
- 'by the maintenance of justice and a scrupulous respect for all treaty obligations in the dealings of organised peoples with one another,

'Agree to this Covenant of the League of Nations.'

It was to achieve those objects that League members bound themselves when they signed the Covenant, and the twenty-six articles that follow are designed to give detailed effect to the undertakings broadly outlined in the preamble. Articles I. to VII. are mainly of internal interest, laying down conditions of membership, specifying the constitution and duties of the Assembly, Council, and Secretariat, and prescribing the method of meeting the expenses of the League. Articles VIII. and IX. deal with the limitation of armaments and the creation of an expert commission to advise the Council on this and other military questions. Article X. is in the minds of some of the founders of the League so largely the pivot of the whole institution, and has in any case become so much a centre of controversy, that it will be well to quote it in full. It runs as follows:

'The Members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League. In case of any such aggression or in case of any threat or danger of such aggression the Council shall advise upon the means by which this obligation shall be fulfilled.'

Article XI. indicates how any war or threat of war, or any circumstance which threatens to disturb international peace, may be brought before the Council. Articles XII. to XV. and XVII. deal

with the procedure to be followed in the handling of disputes between States, three alternatives being prescribed: (a) arbitration by some agreed tribunal, (b) inquiry by the League Council, (c) reference to the Permanent Court of International Justice, for whose creation Article XIV. makes provision. Members agree that they will in no case resort to war till three months after the arbitrators' award, or the Council's report, or the Court's findings, have been promulgated. Article XVI. deals with the League's method of enforcing its decisions, and lays it down that in the event of a League State going to war in violation of the articles just cited, it 'shall *ipso facto* be deemed to have committed an act of war against all members of the League, which undertake immediately to sever all trade and financial relations with it.' It is left to the Council to recommend to member-states military, naval, or air action in addition.

Article XVIII. lays it down that all treaties contracted by members of the League shall be registered with the League and published, being invalid in international law till this is done. (By the end of 1924 over 750 agreements had been so registered.) By Article XIX. the Assembly is authorised to recommend to the parties concerned the reconsideration of treaties which changed circumstances have made inapplicable, or which do not conduce to the maintenance of peace. By Article XX. members of the League undertake that both existing and future treaties to which they are parties shall be made to conform with the spirit and obligation of the Covenant. Article XXI. expresses and recognises the validity of treaties of arbitration and regional understandings like the Monroe Doctrine. Article XXII. institutes the mandate system (see below). Article XXIII. entrusts the League with responsibility for a variety of international social activities, notably in regard to labour conditions, the opium traffic, the traffic in women and children, the arms traffic, health, freedom of communications and transit, and equitable treatment for the commerce of all members of the League. Articles XXIV. and XXV. interest the League in the Red Cross and in all international bureaux established by general treaties, and finally Article XXVI. prescribes the procedure for the amendment of the Covenant itself. It may be observed that down to the end of the Fifth Assembly, in September 1924, out of a number of amendments carried through the Assembly of 1921, four (to Articles VI., XII., XIII., and XV.) had received sufficient ratifications to bring them into force.

The Covenant was signed as part of the Treaty of Versailles by thirty-one Allied States, and in addition thirteen neutrals were invited to accede to it. All of them accepted; but of the original signatories three—the United States, Ecuador, and the Hejaz—have never ratified, and consequently are not members of the League. On the other hand China, which did not sign the Treaty of Versailles, entered the League through its signature of the Treaty of St Germain. Thus the number of League members when the First Assembly met at Geneva in November 1920 was forty-two, a total increased to fifty-five by the end of the Fifth Assembly in 1924. The principal non-members at the latter date were the United States, Germany, Russia, Mexico, Turkey and Egypt. The three ex-enemy States which applied for membership (Austria, Hungary, and Bulgaria) were at once admitted. The creation of the League marked an important development in the constitutional relationships of the British Empire in that the four self-governing Dominions of Canada, Australia, South Africa, and New Zealand, and also India, were admitted as full members of the League,

with complete liberty to act and vote if they chose in opposition to the British delegation.

The constitution of the League is defined in the Covenant. Its main organs are two bodies with concurrent powers, an Assembly, consisting of three delegates from each member-state, meeting at stated intervals at the seat of the League, and a Council, originally of eight, but later of ten members, meeting 'at least once a year' at the seat of the League or elsewhere. The Assembly itself decided that it should meet regularly once a year at Geneva on the first Monday in September. While each State may send three delegates and a number of assistant-delegates it can cast only one vote. The Council, whose composition represents a compromise between the rights of the greater and lesser States, consisted in 1924 of four of the former (Great Britain, France, Italy, Japan) with permanent seats, and six other members elected from time to time by the Assembly. These 'non-permanent' places were held in 1924 by Spain, Brazil, Belgium, Sweden, Czechoslovakia, and Uruguay. Greece and China had previously held seats for a time. It has been generally assumed that the United States, Germany, and Russia will have permanent seats on the Council when they enter the League.

In both Assembly and Council a unanimous vote is necessary for any decision of importance. Any other procedure would expose a State to the danger of being coerced against its will; a derogation of national sovereignty which would keep all great States and most lesser ones out of the League altogether. Though the unanimity rule is sometimes criticised as making inevitably for deadlock, it has not so worked out in practice. As to its necessity in any international discussion it is worth quoting President Harding's speech at the closing session of the Washington Armaments Conference, which he referred to as 'a Conference of Sovereign Powers, where only unanimous agreement could be made the rule. Majorities could not decide without infringing on national rights.'

The day to day business of the League is conducted by an International Secretariat at Geneva, its first head, known as Secretary-General, being Sir Eric Drummond, K.C.M.G., formerly of the British Foreign Office. The official languages of the League are English and French, and all documents are printed in both versions.

While practically all the work of the League passes through the hands of the Council, which holds four regular, and usually one or two extraordinary, sessions each year, its main tasks are being more and more specialised and devolved on expert committees which advise the Council on matters falling in their own particular sphere. Among these may be mentioned the Permanent Advisory Committee on Armaments, the Mandates Commission (both created by the Covenant itself), the Financial and Economic, the Communications and Transit, the Health, the Opium, the Women and Children's Advisory Committees, and the Committee on Intellectual Co-operation. Certain of these bodies, notably the Transit Committee, have a dual responsibility to the Council and to General Technical Conferences convened once every two or three years. Conspicuous among these are the Transit Conferences of Barcelona (1921) and Geneva (1923), and the Brussels Financial Conference (1920). To two virtually autonomous organs of the League, the International Labour Office and the Permanent Court of International Justice (established by the First Assembly in 1920), more detailed reference must be made later.

The League is financed by contributions from its members. Estimates, rigorously scrutinised and controlled, are approved by the Assembly each

year, and the total thus voted is divided up between member-states on a scale approved by the Assembly. The scale is based on a varying number of units, ranging from 38 in the case of Great Britain to 1 in the case of Albania and Austria. As the total number of units for 1924 was 932, and the total expenditure (including the cost of the International Labour Office and the Permanent Court of Justice) rather over £900,000, the British share came to roughly £88,000. On the estimates for 1925 the figure was slightly less.

Between January 1920 and the end of 1924 the Assembly held five and the Council thirty-two sessions. In addition there were held the technical conferences mentioned above, together with a Health Conference (at Warsaw in 1922), a Conference on Customs Formalities (Geneva, 1923), and a Conference on the Suppression of the Drug Traffic (Geneva, 1924). The Transit and Customs Conferences resulted in the framing and signature of new international conventions.

The administrative or semi-administrative tasks with which the League is charged include responsibility for the working of the mandate-system set up by Article XXII. of the Covenant; for the government of the Saar territory, temporarily severed from Germany by the Treaty of Versailles, and of the Free City of Danzig; and for the protection of minorities in various countries of Europe. The terms of Article XXII. provide that certain non-European territories taken from Germany and Turkey in the Great War shall be administered 'as a sacred trust of civilisation' under the ultimate supervision of the League and with the interests of the inhabitants as prime concern. The Permanent Mandates Commission, which sits at Geneva once a year and sometimes oftener, receives reports from the mandatory Powers, and petitions and complaints from, or on behalf of, the inhabitants, and discusses orally questions of administration with representatives of the mandatories who attend for the purpose. The most important question so far dealt with was the circumstances attending the suppression of a rebellion of the Bondelswart Hottentots in South-west Africa in 1922.

Neither the Saar, Danzig, nor minorities are mentioned in the Covenant. The responsibility in all these cases is laid on the League by various treaties signed between European States in 1919 and 1920. Conditions for the government of the Saar territory, with its 700,000 inhabitants and important mining interests, are laid down by the Treaty of Versailles, and it falls to the League to appoint the Commission of five by whom the administration is carried on. The League's responsibility is thus indirect and its hands are largely tied by the treaty conditions, but its power to remove as well as appoint an individual commissioner enables it to exercise a good deal of real control. In the case of the Free City of Danzig the League appoints a High Commissioner to act as mediator between the senate of the Free City and the government of Poland, whose treaty rights in regard to Danzig are often matters for diverse interpretations. From the High Commissioner an ultimate appeal lies to the League Council. In 1923 the League's Financial Commission carried through an important and successful scheme for the reform of the Danzig currency.

The care of minorities represents an important but delicate task, the more so since the League's powers in this sphere are merely mediatory. The peace treaties have left vast populations (estimated at over thirty millions) in Europe under alien rule, and discontent with a government often oppressive, voiced by a minority often unreasonable and intransigent, may easily lead to sporadic outbreaks or open war. The not inconsiderable success the

League has attained in this sphere has been due largely to its impartiality and the publicity of its discussions. The problem of minorities is always discussed at the Assembly; petitions from discontended minorities can be, and are, presented to the Council; and a very competent section of the Secretariat is devoted to the special study of minority questions, its director being in perpetual touch with the government of countries bound by minority treaties, and finding it constantly possible to get abuses of local administration corrected by judicious representations to the central authorities.

The League's primary duty of 'achieving international peace and security' involves it in two formidable tasks, the provision of effective machinery for the settlement of international disputes without war, and the formulation of plans for the reduction of those competitive national armaments which are frequently a temptation to war. By Article VIII. of the Covenant the aim of the League in the latter sphere is defined as 'the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations,' and the Council is by the same article enjoined definitely to formulate plans for such reduction. To assist it in that task Article IX. of the Covenant provided for the creation of a Permanent Advisory Committee of naval, military, and air experts; and the Council itself, feeling that other advice than that of technical experts alone was needed, created what was known as the Temporary Mixed Commission on Armaments, which included experts, politicians, industrialists, financiers, and representatives of the workers.

This body, commonly known as the T.M.A., after attempting unsuccessfully to draw up immediately a scale of land armaments for various States (all serious discussion of naval questions was suspended in view of the imminence of the Washington Conference) on the basis of the army of 100,000 allotted to Germany under the Treaty of Versailles, applied itself in pursuance of a resolution of the Third Assembly (1922) to the elaboration of a Treaty of Mutual Assistance. The aim of this instrument, which emerged logically from Articles VIII., X., and XVI. of the Covenant, was to interlock the principles of national security and reduction of armaments by providing that every signatory should be under pledge to assist any other signatory made the object of unprovoked attack, but only on condition that the latter had reduced, or was in process of reducing, its forces to a level approved by the League Council.

The Treaty of Mutual Assistance was presented to the Fourth Assembly (1923), which ordered it to be referred to the different governments for their consideration. France and many other States broadly approved the document, but a number, including Great Britain (then under a Labour Government) declared against it. Expectation that under these circumstances controversy regarding the treaty would be the main feature of the Fifth Assembly (1924) was not fulfilled, the whole discussion being given a new turn at an early stage in the sessions by the speeches of the British and French Prime Ministers, Mr MacDonald and M. Herriot, who, by linking in a new way the three principles, Arbitration, Security, Disarmament, initiated the discussions which resulted before the Assembly ended in the preparation and adoption of the document known as the Geneva Protocol. From that moment the Treaty of Mutual Assistance was tacitly dropped.

The purpose of the Protocol was threefold—to 'complete' the Covenant by providing that all disputes, instead of almost all, should be assured of peaceful settlement (either by the Court, or by

arbitrators or by the Council); to make more definite the guarantees given by League members severally and collectively to defend any member against a State which either refused to submit its dispute for peaceful settlement or to comply with the award given; and, on the basis of the security so conferred, to carry through a scheme for the reduction of armaments at a world conference specially convened by the League. The convocation of the conference was to be made dependent on the prior ratification of the new arbitration agreement by a reasonable number of States (three out of the four permanent Members of the Council and ten others), and the actual operation of the arbitration agreement on the adoption of a satisfactory disarmament scheme. It was the intention of the Fifth Assembly that the Disarmament Conference should meet in June 1925, but the need for more protracted discussions of the Protocol made a postponement inevitable.

Among other and secondary activities in the sphere of armaments mention should be made particularly of the important Arms Traffic Convention drafted by the Temporary Mixed Commission on Armaments and approved by the Fifth Assembly in 1924. A convention (the Arms Traffic Convention of St Germain) had been framed and extensively signed in 1919 as one of the subsidiary labours of the Peace Conference, but it never became operative owing to America's refusal to ratify. The same absence of American co-operation for some time frustrated the League's efforts to validate the St Germain Convention, but in the course of 1923 the United States government agreed to collaborate with the League in preparing a new Convention for the control of the international traffic in arms and munitions. The instrument was duly drafted, with the active assistance of the American representative, who joined the Temporary Mixed Commission for the purpose, and approved as stated by the Fifth Assembly. It was decided to call an international conference (which America agreed in advance to attend) in 1925 for the final adoption and signature of the Convention.

But progress in the reduction of armaments is only possible if States have sufficient confidence in the League to submit their disputes to it as a matter of course and abandon the idea of war as an instrument of settlement. The function of the League as mediator or arbitrator is therefore the most important it has to discharge. The Covenant as it stood in 1924 laid it down that all disputes between States members of the League should be brought before it, failing a settlement by direct negotiation or by arbitration arranged directly between the parties. The whole duty of League members in this regard is defined in the first paragraph of Article XII. of the Covenant, whereby 'the members of the League agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or judicial settlement or to inquiry by the Council.' By other provisions of the Covenant its signatories agree to accept and carry out any decision of judges or arbitrators, and in the case of *unanimous* findings by the League Council undertake not to go to war with any State complying with the recommendation. It is only when the Council cannot reach a unanimous conclusion that the disputants are free to go to war, though even here a three months' delay must intervene after the Council has given its decision. It was largely to remove this one 'loophole for war' that the Geneva Protocol was drafted.

In the course of the first five years of the League's activity a number of international disputes of varying importance were brought before

it, and were dealt with by different methods best suited to the individual circumstances of each case. In two disputes, those between Sweden and Finland over the Åland Islands in 1921 and between Great Britain and France over nationality decrees in 1922, a plea was entered by Finland and France respectively that the matter at issue fell solely between the domestic jurisdiction of one of the parties, in which case the League is debarred (under Article XV. of the Covenant) from going further in the matter. Both pleas were referred for examination, the former to a special Commission of jurists appointed for the purpose, the latter to the Permanent Court of International Justice, with the result that both were disallowed. The chief disputes dealt with, apart from certain boundary questions in Central Europe, are as follows:

Between Poland and Lithuania over the occupation of Vilna by Polish troops.

Between Sweden and Finland over the possession of the Åland Islands.

Between the Allied Powers over the division of Upper Silesia between Germany and Poland under the Treaty of Versailles.

Between Albania and Yugoslavia over the invasion of Albanian territory by Yugoslav troops.

Between Finland and Russia over the status of Eastern Carelia.

Between Great Britain and France over nationality decrees in Morocco and Tunis.

Between Greece and Italy over events following the murder of Italian officers in Greek territory.

Between the Allied Powers and Lithuania over the regime to be established in Memel.

In all these cases except two a permanent settlement was effected. The exceptions are the dispute between Poland and Lithuania, the attempt being finally abandoned when, after protracted negotiations, both parties declined to accept the Council's unanimous recommendations; and the Eastern Carelian dispute, regarding which the Permanent Court declared itself by a majority not competent to give an advisory opinion in a case between a League member and a non-member when the latter declined to plead. In the Italo-Greek dispute the verdict was given by the Conference of Ambassadors acting as an arbitral body accepted by both parties, and therefore approved by the League Council. A dispute between Great Britain and Turkey over the northern boundary of Iraq was at the end of 1924 in the hands of the League Council, and the prospects of a settlement appeared good.

The work of the Council in the matter of the settlement of disputes was greatly lightened by the creation of the Permanent Court of International Justice by a resolution of the First Assembly in 1920 in pursuance of the provisions of Article XIV. of the Covenant. The Court sits at The Hague and began its work in 1922, its bench of eleven judges and four deputy-judges (who hold office for nine years) having been elected by the League Council and Assembly at the Second Assembly in 1921. Lord Finlay was chosen as British member of the bench, which also included an American, Dr John Bassett Moore. The chief work of the Court has so far consisted of giving authoritative rulings at the request of the League Council, but decisions have also been given in the case of certain disputes brought directly before the Court. Among the latter may be mentioned the verdict given (by a majority vote) against Germany, who was charged in 1923 by the Allied Powers with having closed the Kiel Canal to a British ship, the *s.s. Wimbledon*, contrary to the provisions of the Treaty of Versailles. Decisions were also given in 1923 against France in an advisory opinion sought in connection with the

dispute with Great Britain over nationality decrees in Tunis and Morocco, and against Great Britain in 1924 in a case brought by Greece in connection with contracts in the British mandated area of Palestine. Down to the end of 1924 the Permanent Court had given nine advisory opinions and three judgments.

No part of the League's work has been more successful or done more to increase its prestige than its efforts for the financial reconstruction of Austria and Hungary, and the refugee settlement scheme it has administered on slightly different lines in Greece. When Austria approached the League at the instance of the Supreme Council of the Allies in August 1922 her financial condition was so desperate—the krone having fallen to the then unprecedented level of 330,000 to the £—that there was every prospect of an immediate economic collapse, involving in all probability internal rioting followed by external intervention on the part of Austria's neighbours, acting not in co-operation but in rivalry. The situation was therefore politically as well as financially grave.

Before the League could venture far in a field at that time entirely new to it the question of whether Austria, within the frontiers assigned to it by the Treaty of St Germain, was an economic possibility at all had to be faced. That question having been answered in the affirmative by the League's Financial Commission after full investigation of the situation, a Committee of the League Council, presided over by the Earl of Balfour, proceeded to formulate a reconstruction scheme. The essence of the proposals finally adopted was that Austria should immediately cease inflation of her currency, and, by gradually reducing expenditure and increasing taxation, put herself in a position to stabilise her public finance permanently at the end of two years. To enable her to live through that period the League undertook to co-operate in the flotation of an external loan of 650,000,000 gold crowns (about £26,000,000) to be expended under the supervision of a League High Commissioner established at Vienna, who would authorise payment to the Austrian Government only so long as he was satisfied that the financial reforms for which the League stipulated were being loyally carried out. Austria's credit being at that time non-existent, the governments of Great Britain, France, Italy, Czechoslovakia, and certain other countries guaranteed the capital and interest of the loan, for the service of which Austria set apart various productive revenues, including the customs. To remove any Austrian suspicions of interested external intervention the three Allied Powers and certain of Austria's immediate neighbours signed a Protocol pledging themselves to respect absolutely her territorial integrity and political independence, and to seek no privileged position, economically or financially, in Austria, who, on her part, undertook neither to grant such privileges nor to alienate any of her territory during the currency of the loan.

The reconstruction scheme was an immediate success. The loan was rapidly over-subscribed in the markets of London, New York, and other capitals. Dr Zimmerman, at that time Burgo-master of Rotterdam, was installed as High Commissioner of the League at Vienna. The Austrian government, in accordance with pledges given by the Chancellor, Dr Seipel, carried through its parliament the legislation necessary to fulfil the League's requirements. The krone was immediately stabilised. Financial confidence returned, as was evidenced by the rapid rise of deposits in the savings-banks. As a result the budget was actually being balanced by the end of 1923 instead of the end of 1924, the date originally contemplated

by the League. That, however, was in the opinion of the League Financial Committee the result of unsound finance, taxation having been unduly increased and expenditure insufficiently reduced, and did not represent permanent stability. In the summer of 1924 certain detailed adjustments in the scheme were made by agreement between the Austrian government and the League in the light of experience. At that time, in spite of various difficulties that arose as the result of internal political differences in Austria, the reconstruction scheme remained to all appearance a proved and outstanding success.

It was the demonstration thus provided of the value of the League's co-operation in a country adjacent to her frontiers that led Hungary in 1923 to make similar application for assistance from Geneva. The problem in this case was simpler, in that financial demoralisation had not gone so far as in Austria's case and that Hungary's natural resources were greater than Austria's. On the other hand, the political difficulties were greater, since Hungary's relations with her neighbours and former enemies, whose co-operation in a reconstruction scheme was essential, had not been happy. Some delay in definitely floating the scheme was caused by negotiations with the Reparation Commission, for no loan could be raised by either Austria or Hungary till the Commission had consented to suspend for a term of years the lien it enjoyed over all the assets of the two countries. In Austria's case the lien was finally suspended altogether, but Hungary was required to make small reparation payments during the currency of the League loan. On this basis the money required (£10,400,000) was easily raised. No external guarantee was needed, investors being sufficiently assured by the knowledge that Hungarian public finance would be reformed in accordance with the League's requirements, and expenditure supervised by a League High Commissioner. To that post Mr Jeremiah Smith, of Boston, was appointed in the early part of 1924. A general return of confidence was immediately manifest as in the case of Austria, and at the time of the Fifth Assembly in 1924 the scheme was in full and completely successful operation.

Concurrently with the preparation of the Hungarian plan the League was also working out a scheme of financial assistance for Greece, whose social and financial stability had been threatened by the influx, during 1922 and 1923, of upwards of a million refugees of Greek origin from Western Anatolia and Eastern Thrace consequent on the Turkish re-occupation of those regions after the later phases of the Greco-Turkish war. There was thus created the double problem of immediate relief and of permanent settlement. It was to the latter that the League primarily applied itself, for it appeared on investigation that if a loan could be raised for such primary necessities as the building of houses, the fencing of land, and the supply of implements, the bulk of the refugees could be established either on the land or in organised industries in towns. A scheme was accordingly prepared by the League in concurrence with the Greek government, its administration being in the hands of a commission of two League and two Greek nominees. The chairman, who was to exercise a casting vote in case of need, was to be one of the League representatives, and to that post Mr Henry Morgenthau, formerly American Ambassador at Constantinople, was appointed in 1923. The immediate application of the scheme was made possible by advances from the Greek Treasury and two short-term loans of £1,000,000 each by the Bank of England, the long-term loan of £10,000,000 being successfully floated at the end of 1924.

Apart from its political and economic tasks the League is charged with general responsibility for international action in regard to Labour conditions and over a wide field of social and humanitarian activity. Of these duties that regarding Labour is being most actively discharged, an autonomous International Labour Organisation having been created by the Treaty of Versailles and working independently of the general League machinery, though its expenses are borne on the same budget. Its administrative organ is the International Labour Office, established in its own buildings near the League Secretariat at Geneva. M. Albert Thomas, Minister of Munitions in France during the war, was appointed the first Director. A notable feature of the Labour Organisation is the association of representatives of governments, of employers, and of organised Labour in its management, the General Conference of the Organisation (roughly corresponding to the Assembly of the League) consisting of four delegates from each participating country, two of them representing the government, one of them the employers, and one the workers. The Governing Body (which meets at least four times a year, while the General Conference meets once) consists similarly of twelve representatives of governments, six of employers, and six of workers. In addition to the members of the League, Germany, through her ratification of Articles 387 to 420 of the Treaty of Versailles, became a member of the Labour Organisation, and has a seat on the Governing Body.

Apart from the useful part played by the International Labour Office as a centre of industrial information from all countries the main work of the Labour Organisation consists in the adoption at the General Conferences each year of international conventions on industrial conditions. These conventions do not forthwith bind the States whose representatives sign them, but every government is pledged (by Article 405 of the Treaty of Versailles) to bring such a draft convention within twelve, or, in exceptional cases, eighteen, months 'before the authority or authorities within whose competence the matter lies, for the enactment of legislation or other action.' It is thus intended that recommendations or draft conventions adopted by the General Conference (a two-thirds majority being necessary) shall be embodied in the domestic legislation of the individual countries participating, but all a particular government is required to do is to *submit* the conventions to its legislative authority. It is not under an actual obligation to get them adopted, but once they have been adopted it is under obligation to enforce them.

Down to the end of 1924 six General Conferences had been held and seventeen conventions adopted. The principal work of the conferences is as follows:

Washington, 1919. Conventions on the eight-hour day and forty-eight hour week; employment of women and children in industry.

Genoa, 1920. Conventions on minimum age of employment at sea, on unemployment indemnity in case of shipwreck.

Geneva, 1921. Conventions on rights of association and of workmen's compensation for agricultural workers; on the use of white-lead in painting; on weekly rest periods of twenty-four consecutive hours.

Geneva, 1922. Discussions on unemployment and on emigration conditions.

Geneva, 1923. Recommendation on principles of factory inspection.

Geneva, 1924. Proposed convention on abolition of night-work in bakeries.

As regards humanitarian activities the League's mandate is contained in part in that clause of

Article XXIII. of the Covenant which entrusts the League 'with the general supervision over the execution of agreements with regard to the traffic in women and children, and the traffic in opium and other dangerous drugs,' while another clause of the same article engages members to 'endeavour to take steps in matters of international concern for the prevention and control of disease.' Other humanitarian tasks—such as the repatriation of 430,000 prisoners of war in 1921 and 1922, under the general direction of Dr Nansen acting as High Commissioner of the League—have been assumed as occasion demanded without any direct authority from the Covenant. In the same category falls the work carried on, again through Dr Nansen, for the welfare of expatriated Russian and Armenian refugees.

The campaign against the opium traffic is of special interest, in that the Opium Advisory Commission appointed to deal with this question on behalf, and subject to the ultimate control, of the Council has (like several other League Commissions) since 1923 included official representatives of the United States. The main business of the Commission was first of all to secure the general ratification of the Hague Opium Convention of 1912, hitherto the governing instrument in this field, and then to prepare an amending convention whereby certain defects in the earlier document might be remedied. The Assembly having in 1923 adopted a resolution declaring, subject to some reservations, that the world production of opium and other narcotics ought to be limited to an amount equal to the world's medical and scientific needs, an international conference was held at Geneva in 1924 to draft a convention based primarily on this principle.

The Health Organisation of the League was for some time organised on a provisional basis owing to the necessity of arriving at a satisfactory working arrangement with the existing Office International d'Hygiène at Paris. This had been satisfactorily effected by the date of the Fifth Assembly in 1924, and the Health Organisation is now on a permanent footing. Like the other technical organisations of the League it consists of a general advisory council, a standing committee of experts and a special section of the League Secretariat, all subject ultimately to the League Council. The Health Committee, on which the United States and Germany are regularly represented, while Russia sits from time to time, organised in conjunction with the League's Epidemic Commission a vigorous campaign against epidemics in Eastern Europe in 1920 and subsequent years, the experience gathered serving, through a conference held at Warsaw in 1922, as basis for a series of agreements for systematic co-operation in health matters between Eastern European States. The Health Organisation has carried out extensive investigations into malaria, it has largely succeeded in effecting the standardisation of antitoxic sera, it has conducted inquiries into the statistics of cancer and tuberculosis, and through grants from the Rockefeller Foundation in America it has been able to organise several important series of exchange visits between Medical Officers of Health of three continents. In 1922-23 the Epidemics Commission organised an extensive prophylactic campaign (consisting of inoculation against cholera, typhus, and other diseases) among the Greek refugees from Eastern Thrace and Asia Minor. In 1924 it was decided to open a sub-office of the Commission at Singapore to deal primarily with disease borne by trading vessels from Far Eastern ports.

Other humanitarian activities include the work of the special Commission on Slavery, which only began effective work in 1924, and the Advisory

Committee on the Traffic in Women and Children. This committee is charged primarily with supervising the execution of an international convention on the subject negotiated by the League in 1921. In 1924 the scope of the committee was enlarged, with the transference to the League of the duties of the International Association for the Protection of Children, established at Brussels a few years previously. A convention on the suppression of obscene literature, signed originally in 1923, is now also under the supervision of the League.

One League committee, that on Intellectual Co-operation, stands a little apart from the main stream of League activities. Its purpose is to promote and co-ordinate scientific and research work, and ameliorate the condition of intellectual and scientific workers in different countries. In 1923 the committee decided to establish an International Office for university information as part of the League Secretariat at Geneva. The committee obtains a small subvention from the League Budget, and was also encouraged to appeal elsewhere for assistance, with the result that in 1924 the French government offered a building and an annual subsidy of 1,000,000 francs, and the Italian government a building and an annual subsidy of 1,000,000 lire. Both offers were accepted, and particular sections of the committee's work will thus be domiciled at Paris and Rome.

A word must be added in conclusion on the League's two principal technical organisations, to which reference has already been made, the Financial and Economic and the Communications and Transit Committees. The former, which was primarily responsible for the Austrian, Hungarian, and Greek reconstruction schemes, and which organised the Brussels Financial Conference in 1920, has been engaged on various important investigations on financial and commercial matters, such as the unification of national laws on bills of exchange, double taxation and the treatment of foreigners abroad. In September 1923 a Protocol embodying an agreement, negotiated by the Economic and Financial Committee, regarding arbitration clauses in commercial contracts was opened for signature, and in November of the same year a Convention on the Simplification of Customs Formalities was drafted and signed as the result of an international conference organised by the same committee at Geneva.

The Communications and Transit Committee deals with various questions regarding international communications entrusted to the League by the different peace treaties, and it is gradually elaborating a wide system of international agreements on transit questions. The most important conventions so far signed are those on transit generally and on international rivers, negotiated at the Barcelona Transit Conference of 1921, and those on railways and ports, which emerged from the Geneva Conference of 1923. The Committee is also dealing, among other matters, with hydro-electric power transmitted across frontiers, the simplification of passport formalities, and conditions affecting road transport.

Leake, WILLIAM MARTIN, topographer of Greece, was born in London on 14th January 1777, and, having in 1794 obtained a commission in the artillery, was sent out five years later to instruct the Turks. He was employed on various other missions in the Levantine countries, till in 1823 he retired a lieutenant-colonel from the army; in 1838 he married the widow of Marsden, the orientalist; and he died at Brighton on 6th January 1860. With critical acuteness and soundness of judgment he combined great learning and an admirable power of clear statement. He wrote

many books on Greece. See *Memoir* by the Rev. J. H. Marsden (1864).

Leamington, a municipal borough and fashionable watering-place of Warwickshire, is beautifully situated on the Leam, a tributary of the Avon, 2 miles N.E. of Warwick. It is wholly of modern growth, having become important only since the rediscovery of its mineral waters in 1784 (noticed by Camden in 1586), which are saline, sulphureous, and chalybeate. The town, too, stands in the centre of a good hunting-country and delightful scenery. It contains three large open spaces: Jephson Gardens (for concerts, games, &c.), Pump Room Gardens, and Victoria Park. Among its buildings are the Pump-room and Baths, and the fine old parish church. The chief industries are the manufacture of bricks and cooking-ranges. Visited by the Duchess of Kent and the Princess Victoria in 1830, Leamington eight years later received the name of 'Royal Leamington Spa.' It was incorporated in 1875. Pop. (1811) 543; (1851) 15,692; (1901) 26,888; (1911) 26,713; (1921) 28,941. See Dudley's *History of Royal Leamington Spa* (1901), and F. W. Smith's *Leamington Waters* (1884).

Leander. See **HERO**.

Leap-year. See **CALNDAR**.

Lear, EDWARD, author of the inimitable *Book of Nonsense*, was born at Holloway, London, 12th May 1812. From his boyhood he had a passion for painting, and from the age of fifteen he had to make his own living. Later he was sent by the Earl of Derby to Italy and Greece, where he painted many landscapes in Albania, Athos, the Morea, and the islands of the *Ægean*. He exhibited at the Royal Academy from 1850 until 1873. His later years were spent in Italy, and at San Remo he died, January 30, 1888. Lear made himself better known by his illustrated books of travels than by his paintings. Of these the most important were his *Sketches of Rome and its Environs* (1842); *Illustrated Excursions in Italy* (1846); *Journal in Greece and Albania* (1851), which called forth the praises of Tennyson in a well-known poem—'I read and felt that I was there'; *Journal of a Landscape Painter in Calabria* (1852); *In Corsica* (1869). The *Book of Nonsense* (1846) went at once to the heart of all English children, and ran through some thirty editions before the end of the century, owing to the felicity of the rhymes, and the humour and wit of the verses. *More Nonsense Rhymes* followed in 1871, *Nonsense Songs and Stories* in 1870, *Laughable Lyrics* in 1876. Two collections of letters appeared in 1907-11, and another nonsense book.

Lease, the contract establishing the relation between landlord and tenant. The granting of leases, commonly for a term of nineteen years, has become common in Scotland since 1312, and to this system is largely to be ascribed the rapid improvement in agriculture in Scotland during the past century. Every lease has its own peculiarities as to drainage, houses, cropping, &c. See **BUILDING LEASES, LANDLORD AND TENANT, LAND LAWS**.

LEASEHOLD is a dependent tenure derived either from a freehold or a copyhold, and held by lease. Schemes for the enfranchisement of leaseholds (allowing persons having long leases of small portions of land a right to purchase the fee-simple) concern mainly **Building Leases** (q.v.). See also **GROUND-RENT**.

Leasing-making, in Scots law, means seditious words, which constituted an offence punishable with death by statutes of 1584 and 1585. The punishment was afterwards mitigated to fine and punishment, or both, at the discretion of the court.

Leather consists of the skins of animals chemically modified by tanning and otherwise, so as to

arrest that proneness to decomposition which characterises unprepared skins, and to give to the substance greatly increased strength, toughness, and pliancy, with insolubility and inalterability in water. Some method of preparing skins so as to make them wearable must have been known from very early times, and there yet exist remains of tanned leather made in Egypt not less than 900 years B.C. In modern times the methods and principles of leather-making have come to be well understood; but the processes employed in the manufacture have not been seriously modified, the attempts made to hasten the essentially slow processes having met with but limited success. There are three methods by which leather is prepared: first, and by far the most important, with tan barks and other vegetable substances containing tannin; second, by tawing with alum, bichromate of potash, and other mineral salts; and third, by shamoying or impregnating the raw skin with oil.

The skins of all animals used for leather-making consist chiefly of a fibrous gelatinous substance called collagen, which on being boiled forms the ordinary gelatin of commerce, with an interfibrous compound called corin, which is insoluble in water, but in common with collagen unites with tannin to form the insoluble and unalterable compound tanno-gelatin, the chemical basis of tanned leather. The compounds are similarly acted on by bichromate of potash and other mineral salts in tawing, whereby insoluble combinations are formed.

The skins of all animals may be made into leather; but in practice the raw materials of the manufacturer consist of the skins of certain animals which are reared and slaughtered primarily for other purposes, and of which the supply is sufficiently large to form the basis of a great industry. Large skins, it may be remarked, such as those of oxen and horses, are in trade termed hides; those of calves, sheep, goats, and other smaller creatures are called skins. Of all leather-making hides the most important are those of oxen, which are primarily distinguished as ox, cow, and bull hides, and calfskins. To the tanner they come in several forms and from many quarters. The first source of supply is the local slaughter-house, from which the newly-flayed skins called market hides are obtained. From abroad ox-hides come either as wet or dry salted hides, or as simply dried hides, the great sources of supply being Australia, the Cape of Good Hope, the River Plate and South America generally, and China and Japan. From the East Indies there come vast quantities of small hides termed kips, both salted and tanned. Buffalo-hides are imported in large quantities from Singapore, Batavia, Bombay, Karachi, and Calcutta. Horse-hides are brought in considerable quantities from South America, and the knackers' yards at home supply fresh hides, which, however, are generally in bad condition. Sheep-skins, from the vast quantities available in nearly all parts of the world, are a most important source of leather. Besides native supplies the British market chiefly obtains them from Australia and New Zealand, the Cape, and Buenos Aires. Goat-skins and kid-skins come from the Cape, the East Indies, Asia Minor, and Switzerland; but many of the East Indian and Asiatic skins are when imported already tanned, and require only dressing. A now important source of leather is from seal-skins, the supply of which is derived from the Greenland and Newfoundland fisheries. Other skins which have only a local or a limited market are the walrus, rhinoceros, and elephant, from which leather of great thickness, suitable for polishing-wheels and other mechanical purposes, is obtained; and hog or pig skin is an important source of leather for saddle-making and other purposes. The skins of various species of

deer and antelope, porpoise and kangaroo, are also sources of leather; and from the Cape there are occasionally sent to the London market skins of the gnu and zebra. As sources of leather for fancy articles there may be mentioned the alligator (a leather now extensively imitated), and certain snakes' and sharks' skins.

Tanning.—The operations of tanning and the duration of the process vary very widely according to the nature of the tanning materials employed, the nature and thickness of the hides and skins under treatment, and the class of leather being produced. The sources of Tannin (q.v.; and see BARK) are exceedingly numerous, but oak-bark is the most important, and that which produces the most valuable and substantial of all leathers. Oak tannage is, however, a very tedious process, and the common practice is now to hasten the completion of the operation by mixed tannage, in which more rapidly acting agents play a part. In America hemlock-bark from *Tsuga canadensis* is a very important tanning material; and the mimosa or wattle barks of Australia are now very largely used, as also mangrove bark from Africa or elsewhere. Standard extracts containing a fixed percentage of tannin have also come into favour for rapid tannage. But, with all the devices which have been suggested, tanning is essentially a slow operation, and it cannot be forced through without injury to the resulting leather, any more than can the operations of roasting beef or toasting bread be hastened unduly. The many processes which have been suggested, involving chiefly the use of strong tan liquors, or ooze as it is technically called, and the transfusion of these liquors through the hides, have resulted generally in the production of hard and intractable leather, or of a superficial tanning only. Such imperfectly made leather gets an appearance of uniformity and finish by being impregnated with grape-sugar, or with sulphate of magnesia, chloride of barium and other salts, which add weight, but which otherwise are the most rank and deleterious adulterants.

In the treatment of ox-hides for the production of, say, sole-leather, the first object of the tanner is to clean and soften the hide. This is done by washing with water, and if necessary working the hide under stocks till the whole is uniformly soft and pliant. The unhairing and removal of the scarf skin is the next operation, for which in English tanneries the hides are steeped in pits containing lime-water, while in America the plan adopted consists of sweating the hides, or artificially heating them till incipient putrefactive fermentation is set up. The hides are afterwards stretched over a tanner's beam, and the hair and scarf skin are removed by shaving with a fleshing-knife. At the same time the flesh side is gone over, and any fragments of fibre or fat adhering to it are pared away. Lime is got rid of, sometimes in the first tan-pit, containing acid liquors weak in tannin, and sometimes by 'bating' or 'puring' in a warm decoction of pigeons' or other fowls' or dogs' dung, or (especially for book-binding) some artificial substitute. The *modus operandi* of actual tanning varies endlessly, but in general it may be said to consist in suspending or depositing in layers the hides in a successive series of pits containing tan liquor or ooze which is weak at first, but which as the tanning proceeds is made increasingly rich in tannin. In the early stages of the tanning the hides are frequently handled or turned over in the tan-pits, as often as two or three times daily at first; but as the tanning progresses this handling becomes less and less frequent, till in the final pits, in which strong liquor is used, and in which the hides may be interstratified with tanning material, they may rest for six weeks without being

disturbed. When finally taken from the tan-pit the hides are carefully drained in a heap covered over from the light, after which they are suspended in the loft for drying, in which condition they form rough leather, hard, uneven, and refractory. To finish the hides they are damped and softened in water, scoured to remove the bloom from their surface, then liberally oiled and the whole surface worked over by pressure with a three-sided steel implement called a striking-pin. This operation removes all creases and smooths out and solidifies the leather—an operation carried further and finished after renewed oiling, by rolling the hide on a smooth floor under a heavy hand-roller. For both these operations very efficient machinery is now generally substituted for the old method of hand labour. The different portions of an ox-hide, and of all hides in some degree, possess distinct qualities which render them available for special applications; hence in the trade they receive distinctive names, and frequently are separately dealt in. An entire hide is termed a *crop* (see fig.); one-half the crop cut longitudinally forms a *side*; the pieces around the margins are designated as on the diagram, and collectively form the *offal*; the neck and shoulders are sometimes detached from the *butt*, which forms the hide minus the *offal*, and half a butt cut lengthways makes a *bend*.

Ox-hide or Crop.

As the moisture evaporates from the leather the grease penetrates and thoroughly permeates the whole texture. For the numerous operations of currying and finishing leather elaborate machinery is now employed, which has almost entirely superseded hand work.

Dressed Leather.—Under this head there is embraced a great range of leathers which after tanning undergo a varied series of finishing operations at the hands of the currier and leather-dresser, to fit them for the diverse uses to which dressed leather is applied. The currier has to do with the paring down of the flesh side of the leather, to smooth its surface, and to equalise its thickness; and he also, when desirable, splits hides by means of a machine into two or more useful layers or splits. His further and principal operations have for their objects the rendering of the leather soft, flexible, and waterproof, and giving it the finished surface, grained or smooth, waxed or blackened, glacé or enamelled, dyed, &c. For stuffing the leather, which is the most essential operation of the currier, it is first softened in water, then the surface is gone over with a scraping tool or slicker, and while still wet it is liberally covered with a dubbing composed of mixed tallow and cod-oil. As the moisture evaporates from the leather the grease penetrates and thoroughly permeates the whole texture. For the numerous operations of currying and finishing leather elaborate machinery is now employed, which has almost entirely superseded hand work.

Morocco leather is a term which now applies rather to the finish of a certain class of goods than to the source of the skin of which it is formed. It is a richly grained and dyed leather, originally and properly made from goat-skins tanned in sumach; but now sumach-tanned split calf-skins and sheep-

skins are the source of much so-called morocco. Sheep-skins roughly tanned and undressed are termed basils; dressed and dyed as for morocco, but finished smooth, they form roans; and split sheep-skins (the flesh sides of which go to be shamoyed to form wash-leather) tanned and dressed are known as skivers. Russia leather is now any smooth finished thin leather, impregnated with the empyreumatic oil of birch-bark, which gives the substance its peculiar odour and insect-resisting qualities. Originally it was made in Russia of dressed calf-skins.

Tawing consists in dressing skins with certain mineral salts, and is useful principally for glove leathers and the so-called kid-leather employed for the uppers of ladies' boots. It is also by tawing that furriers' skins are prepared, and hides and skins in the hair generally preserved. The process of tawing a lamb-skin may be taken as a typical example of the process, which, however, is much varied, as experience suggests. The skins are generally limed on the flesh side with cream of lime to detach the wool, which is removed as in ordinary hide-tanning. After thorough cleansing, the pelts are steeped for two or three weeks in a pit filled with water and lime, being taken out from time to time, and drained on sloping benches. When removed finally from the lime-pit, the skins are worked with the knife, to render them still more supple, and they are then put into the branning mixture. This consists of bran and water, in the proportion of two pounds of bran to a gallon of water. From this mixture, in about two days, they are transferred to another bath, consisting of water, alum, and salt. After the proper amount of working in this mixture, they undergo what is called the pasting, if intended to form white leather. The paste is a mixture of wheaten-bran and sometimes flour and the yolks of eggs. They are usually worked in a rotating cylinder with this paste and water, and are found in time to have absorbed the paste, leaving little more than the water. If the skins are not intended to be white, other materials are often used, and much pigeons' and dogs' dung is employed. Lastly, the skins are dried and examined, and, if necessary, the pasting is repeated; if not, they are dipped into pure water and worked or staked by pulling them backwards and forwards on what is called a stretching or softening iron, and smoothed with a hot smoothing-iron. Numerous other tawing processes are in use and have been suggested, one of the most promising of which was the chrome tanning of Dr Heinzerling, introduced about 1876. In this the active agent is bichromate of potash, after treatment with which the leather is stuffed with paraffin.

Shamoying consists simply in impregnating and saturating skins with oil. The name is derived from the fact that the process was originally applied for the preparation of the skins of the Alpine chamois, and as it was also used for deer-skins the name buck-leather or buckskin was also given to the preparation. Shamoy-leather now consists principally of the flesh splits of sheep-skins. The oil is worked by means of stocks slowly into the interstices of the skin and there becomes oxidised, forming a kind of combination with the gelatinous constituents, and yielding a peculiarly soft and spongy texture. A good deal of the buff-leather of commerce is prepared by a process which partakes of the features of both tawing and shamoying.

See for the recommendations of the Society of Arts on leather for book-binding the report by Lord Cobham and Sir H. T. Wood (1905); also the articles PARCHMENT, VELLUM, FURS.

Leather-cloth, sometimes called American leather-cloth, or more briefly American cloth, is a

textile fabric coated on one face with certain mixtures of a flexible nature when dry so as to resemble leather. Unbleached calico is the most common ground or backing employed, and this is coated with boiled oil, dark pigments, driers, and sometimes other ingredients, made up to such a consistency that the mixture can be uniformly spread on the cloth by rollers. Another method of making leather-cloth is by coating calico with 'linoleum cement' (see FLOORCLOTH). A third and extensively used coating consists of gelatine rendered insoluble by some chemical agent, to which glycerine is sometimes added. But the different mixtures which are or have been employed in making leather-cloth are numerous, and many of them have been patented. A good quality of leather-cloth when employed for covering chairs and sofas has considerable durability. As a cover to writing-tables it is even more durable than morocco leather, and it is not nearly so costly. It is more durable when glazed with a varnish than when finished in imitation of morocco leather.

Leatherwood (*Dirca palustris*), a deciduous shrub of 3-6 feet high, with the habit of a miniature tree, a native of North America. It belongs to the natural order Thymeleaceæ. The bark and wood are exceedingly tough, and in Canada the bark is used for ropes, baskets, &c. The leaves are lanceolate-oblong; the flowers are yellow, and appear before the leaves.

Leaven. See YEAST, BREAD.

Leavenworth, a city of Kansas, capital of Leavenworth county, on the Missouri River, 20 miles NW. of Kansas City. First settled in 1854, it is now a handsome town, of broad avenues, and contains a Roman Catholic cathedral, a Soldiers' Home, a state normal school, and large factories and mills. Eight lines of railway centre here, and the river is crossed by a fine iron bridge. Adjoining the city is Fort Leavenworth (1827), an important dépôt for troops and supplies, with large barracks, &c. Pop. 17,000.

Leaves. See LEAF.

Lebanon, a mountain-range in Syria, extending from the latitude of Homs in the north (34° 43' N.) to that of Mount Hermon (33° 24' N.) in the south. The word Lebanon is derived from a Semitic root meaning 'white,' and this name is given to the mountains, not because their peaks are covered with snow (as they are even in summer), but because of the whitish colour of their rocks. The mountains belong geologically to the Cretaceous system, and consist principally of limestones and chalks. They are divided into two parallel ranges, the Lebanon on the west and the Anti-Lebanon (or more correctly Anti-Libanus) on the east. Between them lies the deep valley of the Bukâ'a (the ancient Coele-Syria), which is from 4 to 6 miles wide, and is watered by the rivers Litany and El-Asi (the ancient Orontes). The former flows south-westwards, then, turning abruptly to the west, reaches the sea a little north of Tyre; whilst the latter flows in the opposite direction, and, after crossing the plains of Hamath, likewise turns to the west to the Mediterranean. The highest summits occur in the north in both ranges, but are higher in Lebanon than in Anti-Lebanon: in the former they vary from 10,018 (El-Kazib) to 7000 feet and less, and in the latter are about 8000 or 9000 feet. In both ranges the eastern versant is the steeper and sterner. The western slopes of Lebanon are broken by numerous deep transverse valleys, running between the spurs that the main chain sends down to the very edge of the sea, where they often terminate in bold headlands. The western slopes of Anti-Lebanon are not so

much cut up by valleys as those of Lebanon, but are more barren and more broken by crags and bare rocks. The valleys and the lower slopes of the hills are generally verdant with vegetation. The vine is extensively grown, and wine is made, but is all consumed at home. Mulberry-trees figure prominently; for the manufacture of silk is one of the most important industries of the mountaineers—it was introduced from China in Justinian's time. Olive-groves and orchards (nuts and figs) abound everywhere. The higher slopes are in many districts covered with forests of oak, cypress, pine, plane, &c. Contrary to the current belief, remains of the great cedar forest of Solomon's time exist in more places than the single grove at the head of Kedisha Valley (see CEDAR). Thickets of low scrubby bushes, generally thorny, and often aromatic, are found at nearly all altitudes. Tobacco, wheat, barley, and millet are the chief crops cultivated. Owing to the elevated situation, the climate is healthy and bracing. Streams of clear water are numerous. The inhabitants are a hardy, ruddy race of people, of Syrian (Aramæan) descent, who keep large herds of sheep and goats. The predominating element is the Maronites (q.v.), more than two-thirds of the total; next come the Orthodox and the Druses (q.v.). Besides these there are Metawilé (a sect of Shi'ite Moslems), Greek Uniates, Sunnis, and a few converts of the American Protestant and the Roman Catholic missionaries of Beirut. After the bloody quarrels of the Druses and Maronites in 1860 the district of Lebanon was separated (1861) from the Turkish pashalik of Syria, and put under a Christian governor, the European powers constituting themselves the 'guardians' of the new province. With boundaries extended to the Antilibanus and along the coast to Palestine, it became a state of the French mandatory territory (1920), not included in the Syrian federation. Pop. 629,000; capital, Beirut.

Lebanon, a city of Pennsylvania, 26 miles E. of Harrisburg, with ironworks and rolling-mills, and manufactures of bolts and chains; pop. 25,000.

Le Brun, CHARLES, French historical painter, born in Paris, 24th February 1619. He was patronised in his youth by Nicolas Poussin, who took him to Rome, where he was kindly treated by the Barberini, and studied for four years. He then returned to Paris, and was employed by Fouquet on his château of Vaux, and afterwards by Cardinal Mazarin, Anne of Austria, and Louis XIV. He was the first director of the Gobelins tapestry works on its foundation by Colbert in 1662. For nearly forty years (1647–83) Le Brun exercised an immense and despotic influence over French art and artists, and he is usually considered the founder of the French school of painting, Poussin being rather an Italian than a French artist. From 1668 to 1683 Le Brun was employed by Louis XIV., and given an absolutely free hand in the direction and management of the decoration of the palace of Versailles; but Mignard being favoured by Louvois on his accession to power, and the younger artist consulted by the king as to the completion of the work, Le Brun, who could brook no rival, retired, sickened, and died, 12th February 1690. See works by Genevay (1885), Jouin (1889), and Marcel (1909).

Le Brun, MARIE, born in Paris, 16th April 1755, was a daughter of one Vigée, a painter of little note, and in 1776 married J. B. P. Le Brun, a picture-dealer and grand-nephew of Charles Le Brun. Her great beauty, as well as the charm of her painting, speedily made her the fashion in Paris and at Versailles. 'Le Brun de la beauté le peintre et le modèle' was the friend of La Harpe and

D'Alembert, copied Greuze, and painted all the fine ladies and gentlemen of the day. Her first portrait of Marie Antoinette (in 1779) led to a lasting friendship with the queen of France. She subsequently painted numerous portraits of various members of the royal family, and in 1783 was admitted, on the proposition of Joseph Vernet—though after much opposition on account of her sex—a member of the Royal Academy of Painting. She became more than ever the fashion, but left Paris for Italy at the outbreak of the Revolution in 1789, and after a species of triumphal progress through Europe, being admitted a member of the principal academies of painting, including that of St Petersburg, she arrived in London in 1802. There she painted portraits of the Prince of Wales, Lord Byron, and other celebrities. In 1805 she returned to Paris, where she lived until her death (30th March 1842), and where her *salon* was ever the resort of artists, amateurs, and people of fashion. Of unblemished character, of great industry, and of immense charm both of manner and of personal appearance, Madame Vigée Le Brun enjoyed a lifelong popularity. Her drawing is correct, her imagination moderate, her colouring delicate, graceful, and pleasing. Her delightful portrait of herself, gay and smiling, now in the Uffizi gallery at Florence, is well known. Many of her best works are in the Louvre gallery in Paris. See her *Souvenirs* (1837; trans. 1904), a work illustrated with 662 portraits and 200 landscapes, chiefly taken in England and Switzerland; and a book by W. H. Helm (1915).

Lecce (formerly called TERRA DI OTRANTO), a town of Southern Italy, 7 miles from the Adriatic and 24 by rail SSE. of Brindisi. As Lycia (hence Lecce) it was the seat of a countship in Norman times. Here tobacco, cotton, woollens, and linen are manufactured, and there is a large trade in olive-oil and wine. Lecce has a cathedral and numerous churches, one—St Nicholas—dating from the 12th century. Pop. 40,000.

Lech, a right-hand tributary of the Danube, rises in the Alps in Vorarlberg, flows northward past Augsburg, and after a course of 177 miles joins the Danube a few miles east of Donauwörth. It is a mountain-stream, and not navigable. Near Rain, not far from its mouth, the imperialist general Tilly was defeated and killed on 5th April 1632 by the Swedes under Gustavus Adolphus.

Lechler, GOTTHARD VICTOR, theologian, was born at Kloster Reichenbach in Württemberg, 18th April 1811, and after various preferments came to Leipzig in 1858 as professor of Theology. There he died 26th December 1888. His first book was a history of English Deism (1841). *The Apostolic and Post-apostolic Times* (1851; 3d ed. 1885) was translated into English in 1886, and *John Wiclif and his English Precursors* (1873), by Lorimer, in 1878. He also wrote a history of presbyterian and synodal church organisation (1854), and, with Gerok, a Commentary on Acts (Eng. trans. 1879).

Lecky, WILLIAM EDWARD HARTPOLE, a historian and philosopher, was born near Dublin, March 26, 1838, and educated there at Trinity College, where he graduated B.A. in 1859 and M.A. in 1863. Already in 1861 he had published anonymously *The Leaders of Public Opinion in Ireland*, four brilliant essays on Swift, Flood, Grattan, and O'Connell. Later works were his learned, luminous, and dispassionate *History of the Rise and Influence of the Spirit of Rationalism in Europe* (2 vols. 1865), *History of European Morals from Augustus to Charlemagne* (2 vols. 1869), and *History of England in the Eighteenth Century* (8 vols. 1878–90). The last is not a history in strict chronological form, but rather a philosophical study

of events and their causes, relieved by an admirable series of finished historical portraits. Perhaps the ablest and most original portion of the work is the treatment of the American war of independence; the pages on Ireland are very valuable. A volume of poems (1891) hardly raised his reputation. *Democracy and Liberty* (1896) was anti-Radical in tone; *The Map of Life*, a miscellany of practical views on the conduct of life. Unionist M.P. from 1895 for Dublin University, a member of the Privy-council (1897) and of the Order of Merit (1902), he died 22d October 1903. Singularly free from prejudice, Lecky stood midway between the dramatic or literary historian and the modern scientific researcher. See *Life* by his widow (1909).

Leclaire, EDMÉ-JEAN (1801-72), born at Aisy-sur-Armançon, left farm-work to become a house-painter's apprentice in Paris; and having in 1827 begun business on his own account, soon took front rank in the trade. His desire to put an end to the existing antagonism between employer and employed led him to take M. Frégier's advice, and allow the workmen to participate in the profits of the master. Besides, he compelled people to be honest by issuing pamphlets exposing the tricks of the painting trade by means of which bad and scamped work was passed off for good. He also discovered a method of utilising white of zinc, instead of white of lead, much to the benefit of the workmen's health. His system of Profit-sharing (q.v.), which worked most successfully, was begun in 1842.

Le Clerc, JOHN, better known as JOHANNES CLERICUS, a Reformed theologian of somewhat free opinions, was born at Geneva, 19th March 1657, made his studies there in philosophy and theology, next repaired to Grenoble, Saumur, Paris, and London, gradually adopted the Remonstrant theology, and became in 1684 professor of Philosophy in the Remonstrant seminary at Amsterdam. In 1728 a stroke of apoplexy robbed him of speech; he died on 8th January 1736. His works were over seventy in number, many of a polemical character. In his controversy with Richard Simon he revealed opinions which were startling then, however innocent now, on the composition and Mosaic authorship of the Pentateuch, and on inspiration generally. He wrote commentaries on the Bible, edited the Apostolic Fathers, but was best known for his three series of *Bibliothèques* or critical reviews (82 vols. 1685-1726).

Lécluse. See CLUSIUS.

Lecocq, ALEXANDRE CHARLES (1832-1918), composer of comic operas, was born at Paris, and trained at the Conservatoire. From his first successful opera, *Le Docteur Miracle* (1857), he showed Offenbach's influence and tendency. His best-known works are *La Fille de Madame Angot* (1872), *Giroflé-Girofla* (1874), *Le Petit Duc* (1877).

Lecoute, JOSEPH (1823-1901), born in Georgia, was ultimately professor of Geology at the university of California. He did important field-work, wrote a notable textbook of geology, and books on religion and science and on evolution.—His brother JOHN (1818-91), physicist, became president of the same university in 1881.

Lecoute de Lisle, CHARLES MARIE, a great French poet, was born on the island of Réunion, 23d October 1818. He was carefully educated, and after some years of travel settled to a literary life in Paris. His early enthusiasm for Fourierism soon disappeared, but his ardent temperament found a more lasting poetic impulse in Greek ideals and in the sympathetic study of oriental pantheism. He succeeded to Victor Hugo's chair at the Academy in 1886. Besides his original poems he translated Theocritus, Anacreon, the *Iliad* and

Odyssey, Hesiod, the *Orphic Hymns*, Æschylus, Horace, Sophocles, and Euripides. His *Poèmes Antiques* (1852) and *Poésies Nouvelles* (1854) he collected as *Poésies Complètes* (1858). Other volumes are *Poèmes Barbares* (1862), *Poèmes Tragiques* (1884), *Derniers Poèmes* (1895). He died 17th July 1894. He exercised a profound influence on all the younger poets of his time, and was head of a school called, from their organ, 'Les Parnassiens.' He has a great power of sympathy with the dumb emotion in the life of nature, the vaster aspects of which—the virgin forest, the immense sea, the profound sky—the reader ever feels the presence of, like the ground-plan on which his poetic phantasies are built. He stands aloof from, yet comprehends, the hot emotions that perplex the heart of man, and surveys the drama of the ages not with the eye of a Michelet or a Hugo, but with the calm, unimpassioned intuition of pure intellect. His versification is marked by classic regularity and by faultlessness of form.

See books on him by Dornis (1895, 1909), Calmettes (1902), and Le Blond (1906); the admirable essays by Paul Bourget in *Nouveaux Essais de Psychologie Contemporaine*, and Jules Lemaitre in *Les Contemporains*.

Lecouvreur, ADRIENNE, actress, was born near Châlons, 5th April 1692, made her début at the Comédie Française in 1717, and soon became famous for her power as an actress, her fascinations, and the number and eminence of her admirers, amongst whom were Marshal Saxe, Voltaire, and Lord Peterborough. Her death, 20th March 1730, was ascribed to poison administered by a rival, the Duchesse de Bouillon. This is the plot of the play by Scribe and Legouvé. See her *Lettres*, edited by Monval (1892).

Le Creusot. See CREUSOT (LE).

Lectern (O. Fr. *lettrun*, Late Lat. *lectrum*), a reading-desk or stand, properly movable, from which the Scripture lessons (*lectiones*), which form portion of the various church-services, are chanted or read. The lectern is of very ancient use, of various forms, and of different materials. The most ancient lecterns are of wood, a beautiful example of which is that of Ramsay Church, Huntingdonshire (about 1450), represented in the woodcut; but they were frequently also made of brass, and often in the form of an eagle (the symbol of St John the Evangelist), the outspread wings of which form the frame supporting the volume. Sometimes a 'pelican in her piety' takes the place of an eagle.

Lectern.

Lectionary. See LESSONS.

Lecythidaceæ, a natural order of dicotyledons, tropical trees, the distinguishing characteristic being that the fruit is a large woody capsule, with a number of cells, which in some species remains closed, and in some opens with a lid. Over 200 species are known. Brazil Nuts (q.v.) and Sapucaia Nuts (q.v.) are the seeds of trees of

this order. The Cannon-ball Tree (q.v.) belongs to it. *Barringtonia*, provided with drift-fruits, extends all over the tropical regions.

Leda, in Greek Mythology, the wife of the Spartan king Tyndareus, whom Jupiter visited in the disguise of a swan. The commonest legend makes her the mother of both Castor and Pollux (q.v.) by the god. The story has supplied a theme for many works of art.

Ledbury, a pleasant, old-fashioned market-town of Herefordshire, 13 miles ESE. of Hereford. It has an interesting church, Romanesque to Perpendicular in style, St Catharine's Hospital (1232; rebuilt 1822), and a clock-tower to the memory of Mrs Browning (q.v.). Pop. 3000.

Ledru-Rollin, ALEXANDRE AUGUSTE, 'the tribune of the revolution of February (1848), as Louis Blanc was its apostle and Lamartine its orator' (Victor Hugo), was born in the house of Scarron at Fontenay, near Paris, 2d February 1807. Admitted to the bar in 1830, he made a name as defender of Republican journalists and men of like views during the reign of Louis-Philippe, and subsequently obtained a great reputation as a democratic agitator and leader of the working-men's party. He was elected in 1841 deputy for Le Mans, and sat of course on the extreme Left. Visiting Ireland at the height of O'Connell's agitation for repeal of the Union, he was present at several of the Liberator's monster meetings, and at Tara was hailed as a delegate from France. In 1846 he published an *Appel aux Travailleurs*, in which he declared 'universal suffrage' to be the only panacea for the miseries of the working-classes. He was an active promoter of the reform-meetings that preceded the commotions of 1848. On the outbreak of the revolution he became a member of the Provisional Government, as minister of the Interior, and in May was elected one of the five in whose hands the Constituent Assembly placed the interim government. But he offended his supporters, his colleagues, and the moderates by his arbitrary and injudicious conduct, and resigned his portfolio on 28th June. He next ventured on a candidature for the presidency against Louis Napoleon in December, but was ignominiously beaten. An unsuccessful attempt to provoke an insurrection against his fortunate rival, on 13th June 1849, put an end to his political activity and his influence. He fled to England, where he became one of the leaders of the party who sought to control from one centre the democratic agitations throughout Europe, and so give unity and consistency of purpose to their efforts. But in less than a year he published a passionate invective against the land which had given him an asylum, *De la Décadence de l'Angleterre*. Amnestied in 1870, he was elected to the Assembly in 1871, and again in 1874. He died on 31st December 1874. His *Discours Politiques et Ecrits Divers* appeared in 1879.

Leduc. See VIOLLET-LE-DUC.

Ledum, a genus of plants of the order Ericaceae, sub-order Rhododendroidae, small evergreen shrubs. The species are natives of Europe and North America; some of them are common to both. The leaves of *L. latifolium*, used in Labrador as a substitute for tea, have been called Labrador Tea. The leaves of other species are used in place of hops and medicinally and, as containing tannin, in making leather.

Lee, a suburban village of London, on the river of the same name, 2 miles S. of Greenwich observatory, is famous as the home of the 'Three Little Maids of Lee.'

Lee, ANN. See SHAKERS.

Lee, FREDERIC RICHARD (1798-1879), landscape-painter, was born at Barnstaple, and was a constant exhibitor at the Royal Academy from 1824 till 1870, his favourite subjects being the river scenery, parks, leafy lanes, and picturesque villages of his native country. He was elected an A.R.A. in 1834 and R.A. in 1838.

Lee, JAMES PARIS (1831-1904), born in Hawick, but taken by his parents to Canada in 1836, was the joint inventor of the Lee-Metford and Lee-Enfield rifles. See RIFLES.

Lee, NATHANIEL (1653?-92), English dramatist, the son of a Presbyterian clergyman of Hertfordshire who conformed at the Restoration, was educated at Westminster School and Trinity College, Cambridge. For a time he was on the stage, but he soon devoted himself to writing tragedies, of which he produced about a dozen. His first successful play was the *Rival Queens* (1677; known afterwards as *Alexander the Great*), in which occurs the famous line 'When Greeks joyned Greeks, then was the tug of war.' He collaborated with Dryden in the *Duke of Guise* (1682). Dryden praised his friend's power to move the passions, but his style often degenerates into bombast. In 1684, as the result of a dissipated and vicious life, he became insane and was confined for five years, and when released lived on precarious charity. Among his plays were *Mithridates*, *Theodosius*, and *Lucius Junius Brutus*.

Lee, RICHARD HENRY (1732-94), born in Virginia, as member of the Continental Congress of 1776 introduced a resolution declaring the colonies of America 'free and independent states,' and was one of the signers of the Declaration of Independence.

Lee, ROBERT, D.D. (1804-68), born at Tweedmouth and bred a boat-builder, studied for the Church of Scotland, and became minister of Old Greyfriars and professor of Biblical Criticism at Edinburgh. In 1857 he began a reform of the Presbyterian church-service; restored the reading of prayers, and introduced an organ and the custom of kneeling at prayer—'innovations' which brought down upon him harassing attacks. He published a service book and a work on *The Reform of the Church*.

Lee, ROBERT EDWARD, commander-in-chief of the Confederate army in the American civil war, was fifth in descent from Richard Lee of Shropshire, England, who emigrated to Virginia in the reign of Charles I. The ancestor of the Lee family in Virginia received large grants of land located between the Potomac and Rappahannock rivers, known as the Northern Neck, and here he built the original Stratford House, which was burned some years after. In the later edifice, erected by his grandson, Thomas Lee of Stratford, were born the distinguished brothers, Richard Henry Lee (1732-94), mover of the resolution in favour of American Independence and a signer of the Declaration; Francis Lightfoot Lee (1734-97), a signer of the Declaration; and William (1737-95) and Arthur Lee (1740-92), diplomats. There also, on 19th January 1807, was born the subject of this sketch, the son of General Henry Lee, a cousin of the preceding. At the age of eleven he lost his father, and at eighteen he entered the Military Academy at West Point. He graduated second in his class in 1829, and received a second-lieutenant's commission in the engineers. In 1832 he married Mary Custis, daughter of George Washington Parke Custis, adopted son of George Washington, and grandson of his wife by her first marriage. He became first-lieutenant in 1836, and captain in 1838. At the beginning of the Mexican war in 1846 he was appointed chief-engineer of the central

army in Mexico. General Winfield Scott praised him highly in official reports for his services at the siege of Vera Cruz. At the storming of Chapultepec he was severely wounded, and for meritorious services received his third brevet promotion in rank. In 1852 Colonel Lee was in command of the United States Military Academy, and in the three years of his administration greatly improved its efficiency as a training school for officers. His next service was as an officer of cavalry on the Texan border in 1855-59. When on a furlough in October 1859, the time of the John Brown raid, he was put in command of a small force and ordered to Harper's Ferry to capture the insurgents. Colonel Lee was in command of the department of Texas in 1860, but was recalled to Washington early in 1861 when the 'irrepressible conflict' between the free and the slave states seemed imminent. When Lee reached the capital in March 1861, seven states had passed ordinances of secession from the Union, and had formed the Southern Confederacy. Virginia seceded from the Union on April 17, and Colonel Lee, believing that his supreme political allegiance was due to his state rather than to the Union, felt compelled to send his resignation to General Scott, which he did on the 20th of April. The bitter struggle between his personal preferences and his high sense of duty is shown in the words of his wife, written to a friend at the time. 'My husband has wept tears of blood over this terrible war; but he must as a man and a Virginian share the destiny of his state, which has solemnly pronounced for independence.' Within two days after his resignation from the United States army he was made commander-in-chief of the military and naval forces of Virginia.

General Lee was devoutly religious, and a life-long member of the Protestant Episcopal Church. His purpose to draw his sword only in defence of his native state was modified by its joining the Southern Confederacy, and the change of the capital from Montgomery, Alabama, to Richmond, Virginia. When the Confederate Congress met in Richmond, with representatives from eleven states, in May 1861, five brigadier-generals were appointed, of whom Lee ranked third. He had at first no active command, but remained at Richmond to superintend the defences of the city till the autumn, when he was sent to oppose General Rosecrans in West Virginia. In the spring of 1862 he was sent to supervise the coast defences of Georgia and South Carolina; but when McClellan's 'on to Richmond' advance with 100,000 men was assured, Lee was summoned to the capital. General Joseph E. Johnston, chief in command, was disabled by a wound at the battle of Seven Pines, May 31, 1862, and Lee was put in command of the army around Richmond. The masterly strategy displayed by Lee, and the desperate fighting of his army in the famous seven days' battles around Richmond, defeated the purposes of McClellan's Peninsular campaign, and belong rather to the history of the war than to personal biography. The same may be said of his battles and strategy in opposing General Pope's movements, his invasion of Maryland and Pennsylvania, and other prominent events of the war. The increasing resources of the North and the decreasing resources of the South could only result in the final success of the former. It was no news to Lee to be told of 'the hopelessness of further resistance' by General Grant in his note of April 7, 1865, and the common desire of both commanders 'to avoid useless effusion of blood' was creditable to both. On April 9, 1865, Lee surrendered his army of about 27,805 men to General Grant at Appomattox Courthouse, Virginia, and

the four years' war was practically ended. That General Lee undertook ill-judged movements, as his advance into Pennsylvania, and that he trusted too much to his lieutenants in matters of importance, has been the opinion of some critics; and probably his unwillingness to throw blame on government officials who planned, and on subordinates to whom he entrusted the execution of the plans or parts of them, has given more apparent than deserved grounds for such criticisms. After the close of the war he frankly accepted the result, and although deprived of his former property at Arlington on the Potomac, and the White House on the Pamunky, he declined proffered offers of pecuniary aid, and accepted the presidency of Washington College, since called the Washington and Lee University, at Lexington, Virginia. Here he devoted himself assiduously to the proper duties of a college president, gaining the affectionate esteem of the faculty and students as he had of the officers and soldiers of two armies in former years.

Exposure in the field in 1863 had resulted in rheumatic inflammation of the pericardium, which became more painful and frequent from exposure to cold or violent exercise, till a severe attack in 1869 greatly impaired his heart's action. From a second attack, in September 1870, he did not recover, but grew weaker till his death, October 12, 1870. His widow died in Lexington, Virginia, November 6, 1873. General Lee had three sons and four daughters. The eldest son, George Washington Custis Lee, graduated at the head of his class at West Point in 1854, resigned as first-lieutenant in the United States army in 1861, was an aide-de-camp to Jefferson Davis, 1861-63, major-general of a division of the army of northern Virginia in 1864, and successor of his father as president of the Washington and Lee University in 1871. William Henry Fitzhugh Lee, the second son, was major-general of cavalry in the Confederate army, and afterwards a member of congress. Captain Robert E. Lee of the Confederate cavalry was the third son.

See *Lives* by J. E. Cooke (1871), Long (1887), his nephew, Fitzhugh Lee (1894), White (1897), Trent (1899), Bradford (1912), Sir F. Maurice (1925); also the *Recollections and Letters* by his son Robert (1904).

Lee, SAMUEL (1783-1852), orientalist, was born at Longnor in Shropshire, studied at Queen's College, Cambridge, in 1819 was chosen professor of Arabic, and in 1831 regius professor of Hebrew, and died rector of Barley in Hertfordshire. His reputation rests upon a Hebrew grammar (1827) and lexicon (1840), translations of Job and of Ibn-Batuta (from the Arabic), books on the visions of St John and Daniel, and on prophecy generally. He edited versions of the Scriptures in many languages for the Bible Society.

Lee, SIR SIDNEY, born at London in 1859, studied at the City of London School and Balliol, Oxford, and was successively assistant-editor, joint-editor, and sole editor of the *Dictionary of National Biography*. He has lectured in England and America on literature and history; edited Lord Herbert of Cherbury's Autobiography, Lord Berners's translation of *Huon of Bordeaux*, a facsimile of the First Folio Shakespeare, Shakespeare's Works (1906), *The Year's Work in English Studies*; written the standard Life of Shakespeare (1898, afterwards enlarged and revised), a Life of Queen Victoria, a book on Stratford-on-Avon (new ed. 1900), a study on Elizabethan Sonnets, *Great Englishmen of the Sixteenth Century* (1904), *Shakespeare and the Modern Stage* (1906), a life of Edward VII., &c.

Leech, JOHN, humorous draughtsman, was born, of Irish descent, in London, 29th August

1817, his father, a cultured and excellent man, being landlord of the London Coffee House, Ludgate Hill. He was educated at the Charterhouse, where he was a fellow-pupil of Thackeray's, his friend throughout life, who at school was deemed the better caricaturist of the two, and who afterwards published an admirable estimate of Leech's art (*Quarterly Review*, December 1854). He next studied medicine and surgery, and during his attendance at St Bartholomew's Hospital his artistic skill found exercise in the production of anatomical drawings. Before long he adopted art as a profession, and at the age of eighteen published *Etchings and Sketchings*, by A. Pen, Esq. About 1838 he was contributing to *Bell's Life*; and in the fourth number of *Punch*, 7th August 1841, we find his first contribution to the journal with which his name is most closely associated, and with which he was connected till the time of his death. The cartoons which he designed for *Punch*, especially those dealing with incidents in the political life of Lord Brougham, Lord Palmerston, and Lord John Russell, and the powerful and terrible 'Général Février turned Traitor,' are full of high qualities, and have been published separately. But even more delightful are the smaller woodcuts, drawn easily and freely, and dealing in gently humorous fashion with subjects of everyday life. In these, as it has been truly said, 'he has entered with genial sympathy into every phase of the many-sided English life of the hunting-field, the seaside, the ballroom, the drawing-room, and the nursery,' 'he has turned caricature into character, and left behind him not a little of the history of his time and its follies sketched with inimitable grace.' Various series of these designs have been collected in volumes entitled *Pictures of Life and Character from the Collection of Mr Punch*; and in 1862 a collection of them, enlarged by a mechanical process, and coloured by the artist himself in a combination of oil- and water-colours, was brought together in the Egyptian Hall, London, and formed an exceptionally popular exhibition. In the intervals of work for *Punch* Leech contributed much to other journals and publications, including woodcuts in *Once a Week* (1859-62) and *The Illustrated London News* (1856), in *The Comic English and Latin Grammars* (1840), Hood's *Comic Annual* (1842), Smith's *Wassail Bowl* (1843), *A Little Tour in Ireland* (1859); etchings in *Bentley's Miscellany* and *Jerrold's Shilling Magazine*, in the Christmas books of Dickens, the *Comic History of England* (1847-48), the *Comic History of Rome* (1852), and the *Handley Cross* sporting novels; and also drew several lithographed series, of which *Portraits of the Children of the Mobility* (1841) is the most important. At length the artist's health began to suffer from incessant overproduction, he fell into a state of nervous irritability and prostration, and died at Kensington, 29th October 1864. See Dr John Brown's *John Leech* (1882), F. G. Kitton's *Biographical Sketch* (1883), and the *Life* by W. P. Frith, R.A. (1891).

Lee-Chee. See LITCHI.

Leeches (*Hirudinea* or *Discophora*), a class of worm-like animals, usually suctorial parasites, sometimes genuinely carnivorous. They are widely distributed in fresh and salt water, and occasionally on land. The body is extensible and ringed, but the superficial rings do not correspond to the true segments; no appendages are present, but there is a posterior attaching sucker, and the mouth is powerfully suctorial; the body-cavity is almost obliterated by a spongy growth of connective tissue; the animals are hermaphrodite.

The Medicinal Leech (*Hirudo medicinalis*), for-

merly much used in blood-letting, has a slightly flattened body 2 or 3 inches in length, greenish-black in colour, mottled on the under side, and with six rows of reddish and yellowish spots along the back. The skin is slimy, and frequently casts its cuticle; there are 102 superficial skin-rings, with sense-spots on every fifth, while ten distinct eye-spots are borne on the head. The animal is very muscular, moves rapidly by alternately fixing its oral and posterior suckers, and swims with graceful undulations. The mouth contains three semi-circular 'saws,' each with eighty to ninety minute teeth of lime and chitin, by the saw-like action of which the leech gives its characteristic triradiate bite. From animals thus bitten the leech sucks blood, and falls off when its many-pouched gut is gorged. A secretion from the pharynx seems to keep the blood from coagulating, and after a heavy meal the leech can fast and digest for a year. Its opportunities are in many circumstances few and far between, but it certainly makes the most of them. About the leech's own blood, it is worth noting that it is coloured red with hæmoglobin.

The Medicinal Leech (*Hirudo medicinalis*).

Leeches are at home in slow streams and in marshes, sometimes venturing ashore in search of victims higher than the insect larvæ, fishes, and amphibians which they may hit upon in the water. The eggs are laid about June in the moist ground by the side of the water, and are enclosed in cocoons which are secreted from the skin. The growth of the young leech is slow, may continue in fact for four or five years, while the total length of life sometimes reaches a score. The medicinal species occurs in Britain, but is much commoner on the Continent. When the medical use of leeches, which is of ancient origin, was a constant practice, the swamps of western France were very important sources of supply. There the vampires were sometimes fed by driving old horses or cattle into the enclosures, and the primitive custom of wading in the water till the leeches fix on the bare legs is still practised by collectors.

Leeching, or the application of leeches for the purpose of abstracting blood, is sometimes used instead of venesection, but the use of leeches in medicine has almost ceased, because of the greater ease with which blood may be abstracted by opening a vein or by using a syringe with hollow needle.

Leeches are divided into *Rhynchobdellæ* (with exsertile proboscis, colourless blood, and no jaws) and *Gnathobdellæ* (without proboscis, with red blood, usually with jaws, and with eggs placed in cocoons). The *Rhynchobdellæ* include *Pontobdella*, the skate-leech, *Piscicola* on fresh-water fishes; *Branchellion*, from the Torpedo, with a row of leaf-like gills on each side; *Ozobranchus*, a similar form, from a river turtle in the Yangtse-kiang; the large Chilean *Macrobdella valdiviana*, about 1½

feet long when extended in locomotion; and the little brook-leeches (*Glossiphonia* or *Clepsine*), which carry their eggs and young on the ventral surface of the body. The *Gnathobdellæ* include the medicinal leech; the horse-leech (*Hæmopsis* or *Aulastomum gulo*), which has minute, blunt

Horse-leech.

teeth, useless for blood-letting; the European land-leech *Trocheta*, which feeds on earthworms; the tropical land-leeches (*Hæmadipsa*), which, though small, are very troublesome with their persistent biting. They move very rapidly along the ground, and fasten on the legs of man and beast; or they may drop down from the branches of trees. Quite by itself is the Siberian fish-leech *Acanthobdella*, which has rows of setæ on its first five segments, a spacious body-cavity, and other peculiarities.

See C. O. Whitman in *Quart. Jour. Micr. Sci.* for 1886; Moquin-Tandon, *Monographie de la Famille des Hirudinées*, with Atlas (2d ed. 1846); Verill, *Fresh-water Leeches* (Washington, 1875); *The Cambridge Natural History* (vol. ii. 1896).

Leeds, the sixth town in England in point of population, is a parliamentary, municipal, and county borough, and an assize town. For parliamentary purposes it is divided into six districts, each returning one member. By rail it is 25½ miles SW. of York and 185½ NNW. of London. It is situated in the heart of the West Riding of Yorkshire, in the valley of the Aire, is the seat of important manufactures, and has large collieries in the neighbourhood. The woollen trade carried on here and in the surrounding district exceeds in extent that of any other part of England. The clothing trade finds employment for 40,000 people, in addition to 15,000 engaged in the textile industries. The engineering works for the manufacture of locomotives, textile machinery, traction-engines, agricultural implements, machine tools, &c., employ over 30,000 persons, and are now as important as the woollen manufactures. In addition to iron and steel making, the manufacture of leather is carried on, and about 7000 persons are engaged in the tanneries, which are amongst the largest in the kingdom, and in making boots and shoes. A leather fair is held four times in the year. The other chief manufactures are glass, tobacco, chemicals, art pottery, earthenware, and worsted. Paper-making and letterpress and artistic colour printing also furnish employment for a large number of hands. It will thus be seen that Leeds depends for its prosperity not upon any one staple industry, but upon the great variety of its manufactured products. It is also an important railway centre; and the goods traffic by rail, canal, and river is immense.

There are in Leeds over seventy churches belonging to the Church of England, nine Roman Catholic churches, including St Anne's Cathedral, eleven Jewish synagogues, and upwards of two hundred places of worship belonging to various dissenting churches. The parish church of St Peter's, rebuilt in 1841, has a pinnacled tower 144 feet high and a peal of thirteen bells; the church contains some fine monuments. The oldest and most interesting church is St John's, New Briggate, built in 1634, a fine example of a 'Laudian' church; it contains a beautifully carved Jacobean screen. The town-hall, completed in 1858, is a palatial building in the classic style, surrounded by Corinthian columns and pilasters, and surmounted by a dome 225 feet

in height. It contains the Assize Courts and the city council chambers. In the great hall, which is richly decorated, and contains one of the largest and most powerful organs in Europe, the Leeds triennial musical festivals are held. Near to the town-hall are the municipal buildings (comprising, besides the municipal offices, a free library and art-gallery), and the education offices, the whole forming two handsome blocks of buildings. In the square opposite the town-hall are statues of Queen Victoria, the Duke of Wellington, and Sir Robert Peel.

The other chief buildings are the General Infirmary, built in 1868 at a cost of £200,000, and enlarged (1891) at a cost of £48,000, the Leeds Institute (1868), founded in 1824 as the Mechanics' Institute, containing a lecture-hall accommodating 1400 persons; the grammar-school (1859), a cruciform Decorated structure; the Corn Exchange; the post-office (fronting the handsome City Square, which is adorned by a magnificent equestrian statue of the Black Prince by Brock); the Coliseum, the largest public hall in the city, capable of seating 3400 people; the Philosophical Hall, with a fine museum; the Wesleyan training-college, erected in 1868. There is also a library of 80,000 volumes, founded by Priestley in 1768. Leeds has also extensive general markets, a cattle-market, three central railway stations, numerous banks, and several theatres and music-halls. The Grand Theatre, with accommodation for 3000 persons, is one of the largest in the provinces. From the centre of the city 120 miles of tram-lines radiate to the suburbs, and also connect Leeds with Bradford and Wakefield. Kirkstall Abbey (q.v.) is about 3 miles from Leeds. Roundhay Park, 3½ miles from the centre of the city, having an area of 713 acres, with extensive woodland and two lakes, was acquired by the corporation in 1872 at a cost of £139,000. Temple Newsam, 4 miles from the centre of the city, comprising 913 acres and a mansion of the time of Charles I., was acquired in 1923. There are several other parks, and a number of extensive recreation grounds locally known as 'moors.' Adel Church, about 4 miles from Leeds, erected 1140, is a fine specimen of Norman work. Near it have been found remains of a Roman station.

Leeds is particularly well equipped educationally. Since the passing of the Education Act of 1870 she has spent on the erection of her elementary and secondary schools upwards of £1,000,000. The West Leeds High School is generally recognised as one of the finest and best-equipped secondary school-buildings in the country. The City of Leeds Training College for teachers, erected in 1912 at a cost of £242,000, is the largest of its kind in Great Britain. It is situated in the centre of a park on the outskirts of the city. In addition to the educational block there are eight halls of residence, providing accommodation for 180 men and 300 women students, and there is an assembly hall capable of holding 800 people. The college grounds extend over 90 acres. The Leeds University was created in 1904 on the dissolution of the Victoria University (q.v.), of which the Yorkshire College was one of the three constituents. The university buildings are an imposing Gothic pile, erected in 1885, as the Yorkshire College, at a cost of £250,000. In its various departments of art, science, technology, and medicine it has upwards of 2300 students. The new School of Medicine, opened in 1894, cost £50,000. Pop. (1851) 172,270; (1881) 309,112; (1911) 445,968; (1921) 458,320. Leeds, incorporated in 1832, sent two members to parliament till 1867, three from 1867 till 1885, five till 1918. It was made a 'county borough' in 1888, a 'city' in 1893, and in 1897 its mayor received the title of Lord Mayor.

Amongst Leeds worthies are Dean Hook (q.v.), the famous vicar of Leeds; Priestley, theologian and chemist; Cope, Rhodes, and Phil May, artists; the Teales, physicians; besides the Becketts, the Baineses, the Gotts, the Fairbairns, the Denisons, the Kitsons, families which have been long identified with the interests of the town, and whose members have been noted for their philanthropy. Among the books on Leeds may be mentioned Ralph Thoresby's *Ducatus Leodiensis, or Topography of Old Leeds* (1715); Baines's *Historic Sketch of Leeds* (1822); and Jackson's *Guide to Leeds* (1908).

Leeds, THOMAS OSBORNE, DUKE OF, better known in history as Earl of Danby, English statesman, was the son of a Yorkshire baronet, and was born in 1631. He entered parliament for York in 1661 as a warm supporter of the king and of the Established Church. He first held office in 1667 as an auditor of the Treasury; after that his promotion was rapid: in 1671 he was appointed Treasurer of the Navy, in 1673 Viscount Latimer and Baron Danby, and in 1674 Lord High Treasurer and Earl of Danby. He endeavoured to enforce the laws against Roman Catholics and Dissenters; and, though he disliked French aggression, and so far favoured the Dutch party that he effectively used his influence to get Princess Mary married to William of Orange in 1677, he lent himself to be the agent of Charles, and on his behalf negotiated with Louis XIV. for bribes to the English king. Louis, however, intrigued successfully for Danby's downfall: the Commons impeached him in 1678 on six different counts, the chief of which were treating traitorously with foreign powers without the consent of council, aiming at the introduction of arbitrary power, and squandering public money. He was not brought to trial, but kept in the Tower until 1684, although Charles gave him at once a full pardon. This the Commons refused to recognise, and, in spite of a dissolution, still persisted in the impeachment. Danby is chiefly remembered in history for the part he played at the revolution of 1688. When James began to threaten the Established Church Danby returned to active political life. He signed the invitation to William of Orange and secured York for him. His reward was a rise in rank from earl to marquis (of Carmarthen) and the presidency of the council, virtually the chief place in the government. But he again bribed as he had done during his first administration, and practised the same unscrupulous methods of government. He was created Duke of Leeds in 1694. But in 1695 he was impeached a second time, for having himself accepted 5000 guineas from the East India Company as the price of his influence in securing an extension of their chartered privileges. He again managed to stave off condemnation; but his power was now virtually gone, and in May 1699 he finally retired. After that his principal public appearance was to speak in defence of Sacheverell in 1710, when he stultified himself by condemning the principle of the revolution. He died at Easton, in Northamptonshire, on 26th July 1712. See *Life* by T. P. Courtenay (1838), and *Essay* by A. Browning (1913).

Leek (*Allium Porrum* of some; see ALLIUM), a biennial plant, believed now by many of the best authorities to be a cultivated variety of the British species *Allium Ampeloprasum*, a well-known biennial species of the Onion family, much esteemed for cooking purposes. In gardens much attention is given to its cultivation. The more liberal the culture the more delicate and tender is the produce; therefore it is generally grown in trenches, which have a liberal supply of manure dug into them in the same way as celery. The stems are blanched

by earthing up, which increases their delicacy. Scotland is famous for the splendid quality of its leeks, and Musselburgh is the centre in which the most approved kinds are grown for seed-saving. Seeds grown there have a special commercial value, which is due entirely to care, year after year, in selecting only the best types for the purpose of seed-saving. St David, patron saint of Wales, is credited with having advised the Britons, on the eve of a battle with the Saxons, to wear leeks in their caps, so as easily to distinguish friends from foes, and thus to have helped to secure a great victory. Hence the Welsh custom of wearing leeks in their hats on St David's Day. See Shakespeare's *Henry V.*

Leek, a manufacturing and market town of Staffordshire, on the Churnet, 13½ miles SSE. of Macclesfield, and 24 NNE. of Stafford. The parish church, dating from 1180, but mainly decorated in style, was restored by Street in 1867-75. The ruined Cistercian abbey (1214) of Dieulacres (De la Croix) is 1½ mile distant. Leek manufactures sewing and embroidery silks and knitted goods, and is one of the chief English centres for dyeing silk (see SILK). The Nicholson Institute comprises a Free Library and Art School, &c. Pop. (urban district) 17,000.

Leer, a commercial town and port on the Leda near where it enters the Ems, in the Prussian province of East Friesland, 32 miles NW. of Oldenburg; pop. 14,000.

Leet. The court leet, in England, was a court of a manor, township, &c., for election of certain officers and trial of minor offences. The importance of these courts is now very small, but there are manors, &c., where they are regularly held.

Leeuwarden, capital of the Dutch province of Friesland, stands on the Harlingen and Groningen Canal, 113 miles by rail NNE. of Utrecht. It contains handsome law-courts and town-hall, has an ancient palace of the Princes of Orange, a library with valuable archives, and a dozen churches. Linen fabrics, mirrors, pianofortes, and wagons are manufactured. Leeuwarden is one of the largest fruit and cattle markets in Holland, and does considerable trade in agricultural produce, groceries, wine, and brandy. Pop. 45,000. In the 13th century it was situated on an arm of the sea, which subsequently sanded up.

Leeuwenhoek, ANTON VAN, one of the most successful pioneer microscopists, was born at Delft on 24th October 1632, enthusiastically pursued microscopic work with self-made instruments in 1654, made many important discoveries, and died at Delft on 27th August 1723. He supplemented Harvey's discovery of the circulation of the blood by tracing the capillaries in the frog's foot, defined the red blood-corpuscles of Vertebrates, was the first to notice definitely what are now called unicellular organisms, and corroborated, though with erroneous interpretation, the discovery of male elements or spermatozoa by his student Ludwig Hamm. His investigations of minute structure led him to detect the fibres of the lens, the fibrils and striping of muscle, the structure of ivory and hair, the scales of the epidermis, the distinctive characters of Rotifers, and many interesting histological facts in regard to insects. Much of his time and attention was given to a long series of investigations into spontaneous generation, of which theory he was a decided opponent. In the course of these studies he ascertained and proved, amongst other results, that oak-galls are primarily caused by the development of an insect's egg deposited in the bark; that weevils are hatched, not from wheat, but from an insect's eggs deposited in wheat; that the flea is propagated in a similar manner to other insects,

not originated from dust, or sand, or the dung of pigeons, as was commonly believed; that Aphides are viviparous; that eels, instead of being produced from dew, are likewise viviparous; and that mussels are not generated from mud or sand, but from spawn. He also extended his inquiries to the growth of trees, and showed the differences that exist in the structure of the stem of monocotyledons and dicotyledons. The greater part of his discoveries and investigations were described in papers (112) contributed to the *Philosophical Transactions* of the Royal Society and papers (26) printed in the *Memoirs of the Paris Academy of Sciences*, of both which bodies Leeuwenhoek was a member. The most complete collection of his *Works* appeared at Leyden in 4 vols. in 1719-22. A selection of these was translated into English by S. Hoole (2 vols. Lond. 1798-1801). See the *Life* in Dutch by Haaxman (Leyden, 1875).

Leeuwin, CAPE, the south-west corner of Australia, notable on account of the tempestuous weather usually encountered there.

Leeward Islands. See ANTIGUA, WEST INDIES.

Lefebvre, FRANÇOIS JOSEPH, Duke of Danzig and Marshal of France, was born at Ruffach, in Alsace, 25th October 1755. He entered the army at the age of eighteen, and was a sergeant in the French Guards when the Revolution broke out. He was engaged for some time on the Moselle and Rhine, fought at Fleurus, Altenkirchen, and Stockach, and rose in rank with wonderful rapidity. In 1799 he took part with Bonaparte in the overthrow of the Directory, and in 1804 was made a Marshal of the Empire. He also conducted the siege of Danzig, and after its capture was created Duke of Danzig. He distinguished himself in the early part of the Peninsular war, and suppressed the insurrection in the Tyrol. During the Russian campaign he had the command of the Imperial Guard, and in 1814 of the left wing of the army which resisted the advance of the allies in France. Submitting to the Bourbons after Napoleon's abdication, he was made a peer, a dignity restored to him in 1819, though he had sided with his old master during the Hundred Days. He died in Paris, 14th September 1820.

Lefkosia. See NICOSIA.

Lefort, FRANÇOIS JACOB, favourite of Peter the Great, was born at Geneva in 1653, being descended from a family of Scottish extraction which had settled in Piedmont, afterwards (1585) in Switzerland. He served for a time with the Swiss Guard at Paris; but went to Russia in 1675, and attracted the notice of Prince Galizyn, who made him a commander of the new troops raised to counteract the influence of the 'strelitzes' or old militia. Having taken a leading part in the intrigues which made Peter sole ruler after the death of his brother Ivan, Lefort was advanced to be first favourite of the tsar, and next to him the most important personage in Russia. A man of great ability, Lefort backed up Peter in his projects of reform, remodelled the army and laid the foundation of the navy, and in 1694 was made admiral and generalissimo. When Peter undertook his visit to foreign countries in 1697 Lefort was made chief of the embassy in the train of which the tsar travelled *incognito*. He died 12th March 1699. See *Lives* (in German) by Posselt (1866) and Blum (1867).

Left-handedness. See RIGHT-HANDEDNESS; BRAIN.

Leg, the lower limb, or, in the usage of anatomists, that part of the lower extremity which lies between the knee and the ankle. It consists of

two bones, the Tibia and Fibula (see SKELETON, FOOT), and of masses of muscles (together with nerves and vessels) which are held in position by coverings of fascia, and are enveloped in the general integument. The shaft of the tibia is of a triangular prismoid form, and presents three surfaces and three borders. The internal surface is smooth, convex, and broader above than below; except at its upper third, it lies directly under the skin, and may be readily traced by the hand. The external and the posterior surfaces are covered by numerous muscles. The muscular mass forming the calf (formed by the *gastrocnemius*, *soleus*, and *plantaris* muscles) is peculiar to man, and is directly connected with his erect attitude and his ordinary mode of progression. The anterior border of the tibia, the most prominent of the three, is popularly known as *the shin*, and may be traced down to the inner ankle. The fibula, or small bone of the leg, lies on the outer surface of the tibia, and articulates with its upper and lower extremities, and with the astragalus inferiorly. It affords attachments to many of the muscles of this region.

This region is nourished by the anterior and posterior tibial arteries into which the popliteal artery divides. Both these arteries occasionally require to be tied by the surgeon in cases of wounds or aneurism. The blood is returned towards the heart by two sets of veins—the deep, which accompany the arteries, and the superficial, which are known as the internal or long saphenous, and the external or short saphenous veins. These superficial veins are very liable to become permanently dilated or varicose (see VARICOSE VEINS), if there is any impediment to the free transmission of the blood, or even from the mere weight of the ascending column of blood, in persons whose occupation requires continuous standing. The nerves of the leg, both sensory and motor, are derived from the great sciatic nerve and from its terminal branches, the internal popliteal and the external popliteal or peroneal nerve.

In cases of fracture or broken leg the two bones are more frequently broken together than singly, and the most common situation is at the lower third. What is known as Pott's fracture consists of fracture through the lower third of the fibula, with fracture of the projecting lower end of the tibia.

Ulceration of the leg is a frequent consequence of varicose veins, and the very condition which causes the veins to dilate (continuous standing) is an effectual preventative of the healing process, to ensure which complete rest, with the leg raised so as to assist the return of the blood, is necessary.

Bandy, or bow, leg is a condition which may appear as the result of muscular contraction before a child has been placed on its feet. In such a case the natural curve of the tibia is merely exaggerated. It is associated with Rickets (i.e. a deficiency of lime salts), in which the child has the habit of sitting tailor-wise, and thus bending the tibia forwards and outwards in its lower third. Sometimes one leg is bandy and the other in-kneed. This is produced in a soft-boned child by the mother or nurse always carrying the child upon the same arm and using the other arm to clasp the child's legs across the front of her body. See FOOT, KNEE, HIP-JOINT, CLUB-FOOT, ACHILLES TENDON, &c.; also AMPUTATION, ARTIFICIAL LIMBS.

Legacy is a bequest or gift of personal property by will. In England it is provided by the Wills Act of 1837 that if a legacy is given to the witness of a will, or to his or her wife or husband, the legacy is void; also bequests to superstitious uses are void, as, for example, to maintain a priest, or an anniversary or obit, or a lamp in a church, or to say masses for the testator's soul,

or to circulate pamphlets inculcating the pope's supremacy. Legacies of money for charitable purposes, as for the use of schools, churches, &c., are valid, but if the money is directed to be laid out in the purchase of land for such purposes the legacy is void by what is called the Mortmain Acts (amended and consolidated by the Mortmain and Charitable Uses Act, 1888). Certain favoured institutions and charities are exempted from the operation of these acts.

Legacies are divided into three classes, *specific*, *general*, and *demonstrative*. A *specific* legacy means a legacy of a definite thing, as a particular horse, picture, silver-plate, &c., or a sum of stock in the funds. A *general* legacy means a sum of money, without it being stated out of what fund it is to come, and it is payable out of the assets generally. The important difference between these two kinds of legacy is this, that if the subject-matter of the specific legacy fail, as if the horse die or be previously sold, &c. (ademption), the legacy is gone, and no compensation is given for it after payment of the testator's debts. But legacies given for valuable consideration do not suffer abatement; while, on the other hand, if there is not enough to pay all the general legacies, then they must abate—i.e. share the loss—whereas the specific legacy, if it exist, must still be paid in full. A *demonstrative* is something like a general legacy, but a particular fund is named from which it is to be satisfied. It is not liable to ademption by any act of the testator, nor is it liable to abatement with general legacies as long as it does not exceed the fund from which it is to be paid. Where a second legacy is given to the same person, the question arises whether it is in addition to or in place of the first. If the former, the legacy is *cumulative*; if the latter, *substitutional*. A legacy is not due from the executor till a year has elapsed after the testator's death, for it is presumed he requires this time to inquire into the state of the property; and this is true even though the testator has ordered the legacy to be paid within six months after the death. Formerly, if the legacy was left to a married woman the husband was entitled to claim it, unless it was left to her separate use, or unless she was unprovided for by the husband; but now in all cases the wife gets for her separate use all property coming to her. Interest is due on legacies from the time when the principal sum is payable—i.e. one year after the death—unless otherwise specified. If the legatee die before the testator the legacy lapses—i.e. becomes void; but there are some exceptions, as where the legatee is a child or grandchild of the testator. A legacy to a creditor, if not less than the debt, is presumed to be in satisfaction thereof; but the court readily infers a contrary intention. If the estate do not exceed £500, an action to compel payment may be brought in the county court. The person to whom the remainder of the property is left after all claims are discharged is called the residuary legatee.—In Scotland the rules as to legacies are mainly the same, but a verbal legacy up to £100 Scots (£8, 6s. 8d.) is valid. In Scotland a legacy can be enforced in six months after the testator's death, and bears interest at the rate earned from such death. A legacy of heritable property, formerly invalid except in special circumstances, was completely validated by the Titles to Land Consolidation Act of 1863, provided that the intention was clear, and subject to the ordinary rules of construction.

In the United Kingdom, where the whole personal estate is under £100 there is no legacy duty, and for under £300 the fixed inventory duty of 30s. 'is deemed to be a full satisfaction of any claim to legacy duty.' In other cases the rate is inversely as the degree of relationship. The husband

or wife of the testator pays no duty; the child or lineal descendant, a parent or lineal ancestor, pays 1 per cent.; a brother or sister, or their descendants, 3 per cent.; others, in proportion to their remoteness, 5 and 6 and 10 per cent. The last is in all cases the maximum rate. The royal family are exempt from legacy duty. Where estate duty (by Act of 1894) has been paid, legacy and succession duties are not payable: (1) where the net value of real and personal property left by the deceased does not exceed £1000; (2) by children and parents (see DEATH DUTIES).

Le Gallienne. See GALLIENNE.

Legate, BARTHOLOMEW, born about 1575, was burned at Smithfield in 1612 for denying Christ's divinity. He was one of the last to suffer in England.

Legates might be: (1) *Legati a latere*, 'legates despatched from the side' of the pontiff, who are commonly cardinals; (2) *Legati missi*, called also 'apostolic nuncios,' and including a lower grade called 'internuncios;' (3) *Legati nati*, 'legates born,' whose office is not personal, but is attached by ancient institution or usage to the see or other ecclesiastical dignity which they hold. Of the last class there were examples in most national churches; thus, the Bishop of Thessalonica was legate born for Illyricum, the Bishop of Arles for Gaul, the Bishop of Mainz for Germany, the Bishop of Toledo (though his claim was often disputed) for Spain, the Archbishop of Canterbury for England, &c. This institution, however, has gone entirely into abeyance; and, indeed, the authority of legates is much modified in the modern church. In the mediæval times the legate claimed full papal jurisdiction in the country assigned to him, even overruling the local jurisdiction of the bishops of the national church. This led to many disputes; to refusals to receive legates, as in France, where the legate was obliged to wait at Lyons till his credentials should have been examined and approved at court; and to counter legislation, as in England to the statute of 16 Richard II., commonly known as the Statute of Premunire. The Council of Trent removed the ground of contention by abolishing all such claims to local jurisdiction as trench upon the authority of the bishops. The legate, in the modern church, is little other than the ambassador, mainly for spiritual purposes, of the pope. He is held as belonging to the diplomatic body, and by the usage of Catholic courts enjoys precedence of all other ambassadors. The legates at the more important courts have the title of *nuncio*, at minor courts of *internuncio*. In the States of the Church (q.v.) the governors of the Legations were called *legates*.

Legato (Ital., 'tied'), in Music, means that the passage is to be performed in a smooth manner, the notes being played as if bound or tied together, or in such a manner that the one note is as it were rounded off, or flows into the following one.

Legend, a name somewhat loosely applied on the one hand to the creations of mythology, and on the other to the more or less historical accretions that ever tend to grow around the names of heroes who impress the popular imagination. Interesting examples of entirely baseless legends in their turn becoming historical may be seen under the names Pope Joan and William Tell. It is ever the fate of a great name to be enshrined in fable, and this fact afforded a basis for Strauss in his famous attempt to reconstruct the history of Christianity. The term legend was early applied to those religious traditions which, in the early days of Christianity, clustered round the gospel history; this tendency

to mythic embellishment having further showed itself in connection with the later saints and martyrs. This curious practice of interweaving truth with fable no doubt arose from a credulous love of the wonderful, an exaggeration of fancy, and an ecclesiastical enthusiasm, at times even pious fraud helping to disseminate such embellished and untrustworthy narratives. But, intermixed with falsehood as these so-called legendary tales were, they gradually crept into the Eastern and Western Churches, and in the course of centuries gained an entrance into the national literature of Christian nations. Already the same process had made the *Talmud* the strange medley of sense and nonsense that it is. It should be added that, in the Roman Catholic Church, the lives of saints and martyrs were commonly known as *legends*, because chapters were to be read (*legenda*) out of them at matins and in the refectories of the religious houses. One of the best-known medieval collections is that known as the Golden Legend (q.v.). Capgrave's *Legenda Anglice*, printed by Caxton in the 15th century, was a kind of precursor of the monumental *Acta Sanctorum* of the Bollandists (q.v.).

See the articles FOLKLORE and MYTHOLOGY. An admirable discussion of the ancient Greek heroic legends and their relation to mythology will be found in the first volume of Grote's history.

Legendre, ADRIEN MARIE, a very distinguished mathematician, was born at Toulouse in 1752. After studying at the Collège Mazarin in Paris he gained the attention of D'Alembert, and through him was appointed professor of Mathematics at the Military School. After several proofs that he had mastered the modern analysis, and especially on account of his memoir on the attraction of spheroids of revolution, Legendre was in 1783 chosen member of the Academy of Sciences. Appointed in 1787 one of the commissioners to connect Greenwich and Paris by triangulation, he was chosen member of the Royal Society of London. In his report Legendre gave the first enunciation of the 'proposition of spherical excess,' now considered an essential theorem of trigonometry, just as in 1806 he gave out the first proposal to use the 'method of least squares' in his *Nouvelles Méthodes pour la Détermination des Orbites des Comètes*. Under the empire Legendre was appointed honorary member of council for life, and member of the Commission of Public Instruction, having already been appointed to the Bureau des Longitudes and examiner at the Polytechnic. In 1827 appeared his *Traité des Fonctions Elliptiques*, a subject with which his name must remain permanently associated. He wrote several other mathematical treatises, some of the highest importance. His *Théorie des Nombres* (1830) is still a classical work and evinces much original power. His best-known book is his *Éléments de Géométrie* (1794), which has been translated into many languages—by Thomas Carlyle into English (1824). It is probably due to an attempt to supersede Euclid as a textbook; and if so it is one of the most successful. Legendre died in Paris on 10th January 1833.

Legge, JAMES, an eminent Chinese scholar, was born at Huntly in Aberdeenshire in 1815, and was educated at King's College, Aberdeen, where he graduated in 1835. He passed afterwards to Highbury Theological College, London, and went out to Malacca, arriving in December 1839, as a missionary to the Chinese in connection with the London Missionary Society. For some time he took charge of Dr R. Morrison's Anglo-Chinese college there; next laboured for thirty years at Hong-kong; and was appointed in 1876 to the newly-founded chair of Chinese Language and Literature at Oxford with a Corpus Christi fellowship.

His greatest works are his editions of *Chinese Classics* and books about Confucius and Mencius (1862-93). The Confucian texts and Taoist texts form six volumes in the *Sacred Books of the East*. A Life of Confucius, the works of Mencius, and the *She-King* are separate publications. He published also a series of lectures on *The Religions of China* (1880), and wrote many important articles (China, Confucius, Lao-Tsze, Mencius, the Taisings, &c.) for *Chambers's Encyclopædia*. Of the *Chinese Classics* (7 vols.), a second ed. of vol. i. appeared in 1893. He died 29th November 1897.

Leghorn (Ital. *Livorno*) claims the rank of third busiest seaport of Italy (Genoa being the first and Naples the second); it is situated on the west coast, by rail 13 miles SW. of Pisa and 62 W. by S. of Florence. Its importance as a commercial emporium dates from the decline of Pisa; its growth was especially rapid after it fell into the hands of Florence in 1421, for the Medici princes encouraged its prosperity in every way. Cosimo I. declared it a free port, the first in the Mediterranean, and invited foreign traders to settle there, and there is still a large foreign element amongst its merchants. Early in the 19th century it was a great depôt for the British trade with the Levant, but slowly lost this position after the 3d decade, because the British merchants began to send their goods to their destinations direct. Leghorn ceased to be a free port in 1868. It is the principal port for the agricultural region of Tuscany, and for the industries of Lucca, Florence, and the Arno valley, as well as its own industries. Exports are olive oil, hemp, hides, marble, wine, mercury, preserved fruits, coral, boric acid, straw-hats (see STRAW). The roadstead is protected by an artificial breakwater, which shelters vessels against all winds except the southerly. There is a lighthouse (since 1303) between the harbour basin and this outer breakwater. The growth of industry has called for several harbour extensions and improvements since 1853. The Victor Emanuel harbour to the north-east doubled the port's capacity. And a scheme was sanctioned in 1922 by which a swamp to the north-east of that again is being turned partly into basins and docks, partly into an industrial quarter. Besides shipbuilding important industries are glass-making, iron and brass founding. The manufacture of coral ornaments, by women working in their own homes, has dwindled. The houses of Leghorn are for the most part modern and well-built, lofty and roomy; the streets are broad and clean; and there are some fine squares adorned with statues of the grand-dukes of Tuscany. The north-western portion of the city is intersected by numerous canals; hence it is called 'New Venice.' Interesting public buildings are the cathedral (17th century), its façade designed by Inigo Jones, a great Jewish synagogue, and the former grand-ducal palace (1605). The Academy of Sciences, with its library, and the naval academy deserve mention. The sulphur-springs and sea-bathing attract a large concourse of visitors in the season. The forts, bastions, and other fortifications were constructed for the most part in 1835-37. Mascagni was born in Leghorn. Pop. (1881) 97,615; (1901) 98,321; (1911) 105,322; (1921) 114,809.

Legion, in the Roman military system, corresponded in force and organisation to what in modern times we should call a *corps d'armée*. It differed in constitution at different periods of Roman history. In the time of the republic a legion comprised 4500 men, thus divided: 1200 *hastati*, or inexperienced troops; 1200 *principes*, or well-trained soldiers; 1200 *velites*, or skirmishers; 600 *triarii*, or *pilani*, veterans forming a reserve; and 300 *equites*, knights who acted as cavalry, and

belonged to families of rank. During this period the legions were formed only for the season; standing armies being of later growth. The *hastati*, *principes*, and *triarii* formed three separate lines, each divided into 10 *maniples* or companies, of 120 men each in the case of the two front lines, and of 60 men in the *triarii*. A *maniple* was commanded by a centurion or captain, who had a second-centurion, or lieutenant, and two sub-officers, or sergeants, under him: as non-commissioned officer there was a *decanus*, or corporal, to every squad or tent of ten men. The *primipilus*, or senior centurion of the *triarii*, was the most important regimental officer, and commanded the legion in the absence of the tribunes. The 300 cavalry formed a regiment of ten *turme*, or troops of 30 horsemen, each under three *decurions*, of whom the senior had the command. The staff of the legion consisted of six tribunes, who managed the paying, quartering, provisioning, &c. of the troops, and who commanded the legion in turns for a period each of two months. This changing command, although inconvenient, lasted till the times of the civil wars, when a *legatus*, or lieutenant-general, was appointed as permanent commandant of the legion. In the time of Marius the manipular formation was abolished, the three lines were assimilated, and the legion was divided into 10 cohorts, each of 3 maniples. Soon the cohorts were raised to 600 men, making the legion 6000 infantry, besides cavalry and velites. It was ranged in 2 lines of 5 cohorts each; but Cæsar altered the formation to 3 lines, of respectively 4, 3, and 3 cohorts. During the later empire the legion became complex and unmanageable; many sorts of arms being thrown together, and balistæ, catapults, and onagers added by way of artillery.

Legion of Honour, an order of merit instituted by Napoleon in 1802 as a reward for military and civil services. It was ostensibly founded for the protection of republican principles and the laws of equality, every social grade being equally eligible. The constitution and incidents of the order were repeatedly changed by the successive executive powers of France during the course of the 19th century. At its first institution the order embraced four classes; to these a fifth was added in 1852. The five classes are grand crosses, grand officers, commanders, officers, chevaliers. On the obverse of the five-rayed white enamelled cross is a female head representing the republic, surrounded by the words *République Française*, 1870; on the reverse are two crossed flags and the motto *Honneur et Patrie*. The cross is suspended by a wreath half of oak, half of laurel, leaves. The ribbon is watered scarlet silk. Candidates in time of peace must ordinarily have served with distinction in some military or civil capacity for twenty years; exploits in the field or severe wounds constitute a claim in time of war. To rise to a superior rank it is indispensable, at least for natives of France, to have passed a fixed number of years in each of the inferior grades.

Legitim, or **BAIRN'S PART**, in Scots law, is the legal provision which a child is entitled to out of the moveable or personal estate of the deceased father. The extent of the provision varies according as the wife of the father of the child survives or not. If a wife survive, and also children survive, the moveable estate is divided into three equal parts. One is the widow's *Jus Relictæ* (see **HUSBAND AND WIFE**), another is the children's legitim, the other third is the Dead's Part (q.v.), which the father may bequeath by will if he pleases; but if he make no will, then it goes to the children as next of kin. If the wife is dead, then half is legitim, and the other half is dead's part. The legitim fund is the free

moveable estate after deducting debts and provisions to spouse or children by antenuptial marriage-contract, qualified by an antenuptial contract of marriage, which provides some other provision to the children in lieu of legitim; but, as a general rule, the children's claim cannot be defeated by anything the father can do by means of a will or what is equivalent to a will. The legitim is claimable by all the children who survive the father, but not by the issue of those children who have predeceased. It is immaterial what the age of the child may be, and whether married or not. Children claiming legitim are bound to give credit for certain kinds of advances made by the father out of his moveable estate in his lifetime. All the children, though of different marriages, share in the legitim. In England and Ireland there is no similar right to legitim, for the father can bequeath all his property to strangers if he please; but a similar custom, now abolished, once existed in the city of London and York. By the Married Women's Property Act, 1881, the children of any woman who dies domiciled in Scotland have the same right of legitim in regard to her moveable estate as they have in the moveable estate of their father.

Legitimation, in Law, is the act by which children born Bastards (q.v.) are made lawful children. By the common law of England bastardy is indelible. The maxim is 'Once a bastard, always a bastard.' By the civil and canon law, on the other hand, the subsequent marriage of parents who have children begotten and born out of lawful wedlock legitimates the children. This principle of legitimation by subsequent marriage prevails, with modifications, in the law of France, of Germany, of Holland, and of Scotland. It also prevails in most of the states of the American Union; in some it has been adopted by statute. In the reign of Henry III. the bishops of England sought to introduce the rule of the canon law into the law of England, and petitioned the lords to consent that persons born before wedlock should be legitimate so far as regarded inheritance. The earls and barons returned the famous answer of the Statute of Merton, 1235: 'We will not change the laws of England, which up to now have been used and approved.' The Legitimacy Declaration Act of 1858 provided that any native-born British subject, domiciled in England or Ireland, or claiming any estate in England or Ireland, may apply to the High Court of Justice for a decree declaring that the petitioner is the legitimate child of his parents. In the United States cases have occurred in which bastards were legitimated by special acts of the legislature.—There is another kind of legitimation, known as legitimation by royal letters. This does not confer upon bastards the full rights of lawful children, but only gives up such rights to the property of bastards as the law confers upon the crown.

Legitimists, the followers of the elder Bourbon line, as opposed to the Orleanists. See **BOURBON**, **FRANCE**.

Legnago, one of the four fortified towns of Northern Italy known as the Quadrilateral (q.v.), is situated on the Adige, 33 miles by rail SE. from Verona. Pop. 20,000. The fortifications were razed by Napoleon in 1801, but rebuilt by the Austrians fourteen years later.

Legnano, a town of 27,000 inhabitants, 16 miles NW. of Milan, was the scene of the defeat of the Emperor Frederick I. (q.v.) in 1176.

Legouvé, **ERNEST** (1807-1903), dramatist, essayist, and academician, was the son of the poet and dramatist Jean Baptiste Legouvé (1764-1812). Ernest's best work was done in collaboration with Scribe (q.v.), *Médée* his only other name-

worthy drama. He wrote much on the education of women.

Legros, ALPHONSE (1837-1911), painter and etcher, was born at Dijon, and apprenticed to a house-painter, but attracted attention by pictures exhibited in the Paris Salon in 1859-63. Three years later he settled in London, and was in 1876-1894 Slade Professor of Fine Arts in University College.

Legume (*Legumen*), in Botany, a fruit consisting of a single carpel, two-valved, and with the seeds—one or many—attached to the ventral suture only. It is commonly called a *pod*, and occurs in most of the species of the great natural order Leguminosæ (q.v.), of which the bean and pea are familiar examples.

Legumin. See CASEIN.

Leguminosæ, a great natural order of dicotyledons, containing herbaceous plants, shrubs, and trees, many of the latter of the greatest magnitude. The leaves are alternate, usually compound, and have two stipules at the base of the leaf-stalk, which often soon fall off. The inflorescence is various. The calyx is inferior, five-parted, toothed or cleft, the segments often unequal. The petals are five, or, by abortion, fewer, inserted into the base of the calyx, usually unequal, often papilionaceous. The stamens are few or many, distinct or variously united. The ovary is one-celled, generally of a single carpel; the style simple, the stigma simple. The fruit is a Legume (q.v.). The seeds are generally numerous, rarely solitary, occasionally with an aril, often curved: the cotyledons very large.—There are three sub-orders: (1) Papilionaceæ (q.v.), with papilionaceous flowers; (2) Cæsalpinieæ, with irregular flowers and spreading petals; (3) Mimoseæ, with small regular flowers.—This natural order contains some 7000 known species, of which about 5000 belong to the sub-order Papilionaceæ; it is therefore, after the great order Compositæ, the most extensive of all the natural orders of flowering plants. They are spread over all parts of the world, from the equator to the polar regions, but their number is greatest in tropical and subtropical climates. They are applied to a great variety of purposes, and some of them are of great importance in domestic economy, the arts, medicine, &c. To this order belong the Bean, Pea, Kidney-bean, and all kinds of *pulse*; Clover, Liquorice, Broom, Laburnum, Lupine, Senna, and many other familiar and useful plants, Tamarind, Logwood, Indigo, and many others which afford dyes; the Acacias, Mimosas, &c. In the seeds of many is found *Legumin* or *Vegetable Casein* (see CASEIN). The root nodules contain bacteria which enrich the soil by fixing atmospheric nitrogen. See NITROGEN FIXATION.

Leh. See LE.

Lehigh, a river which flows 120 miles through eastern Pennsylvania to the Delaware River. Some of its scenery is very picturesque, but the valley is more famous for its rich mines of anthracite coal.

Leibniz (less accurately but more commonly LEIBNITZ), GOTTFRIED WILHELM, distinguished for almost universal scholarship, especially in philosophy and mathematics, was born on 1st July 1646 at Leipzig, where his father (died 1652) was professor of Moral Philosophy. He attended the Nicolai school in Leipzig, but learned much more from independent study—he taught himself to read Livy whilst still a boy of eight—and at fifteen entered the university of Leipzig to study law. He spent some time also at Jena working at mathematics. Being refused his doctor's degree at Leipzig on account of his youth in 1666, he graduated at Altdorf, the university town of Nürnberg. In the

following year he gained a warm and admiring patron in Baron von Boineburg, formerly chief minister to the archbishop-elect of Mainz. At Boineburg's suggestion he presented to the elector his *Nova Methodus Docendi Discendique Juris*, containing a proposed reform of the *Corpus Juris* and of the teaching of jurisprudence; and the elector took the young scholar into his service. Amongst other duties in which Leibniz employed his pen was to advocate, in 1669, the claims of the count palatine of Neuburg to the crown of Poland. Three years later he was summoned to Paris to explain at greater length the views he had laid down in an essay entitled *Consilium Egyptiacum*, which elaborated a plan for the conquest of Egypt; though the real object of the work was to divert the attention of Louis from projects in and upon the German states. This plan of Leibniz is believed to have suggested the invasion of Egypt which Napoleon attempted in 1798. The tour was extended to London, where Leibniz became acquainted with Oldenburg, Boyle, and Newton; in Paris he had already learned to know Arnauld, Malebranche, and Huygens. His intercourse with Huygens and Newton stimulated his interest in mechanical and mathematical questions; he invented a calculating machine and devised what was in many respects a novel method of the Calculus (q.v.; and see NEWTON, FLUXIONS). This gave rise to a controversy with Newton as to which of them first invented this valuable mathematical method. In 1676 Leibniz quitted the service of Mainz, and entered that of Hanover. The duke appointed him custodian of the library at Hanover; and this city was henceforth Leibniz's headquarters. But his energies found scope outside the library: he effected improvements in the drainage of the mines in the Harz and in the coinage, arranged the library of Wolfenbüttel (where Lessing afterwards laboured), and in 1687 visited various cities in Germany, Austria, and Italy to gather materials for an exhaustive history of the Brunswick ducal house. The pope offered him the headship of the Vatican Library; but Leibniz declined the offer, since the acceptance of it would have compelled him to become a Roman Catholic. The task of working up his materials into connected history employed a good deal of his time in subsequent years. Philosophy, too, absorbed a large proportion of his most serious thought. And in the discussions that were carried on with a view to the reconciliation of the Protestant and Roman Catholic churches Leibniz took a prominent part, his principal correspondent being Bossuet. In 1686 there was published from his pen the *Systema Theologicum*, composed as a response—conciliatory—from the Protestant side to Bossuet's *Exposition de la Foi*. Subsequently, on the failure of these negotiations, Leibniz endeavoured, but with the same want of success, to reconcile the Lutheran and the Reformed churches of Prussia. He was more successful in enlisting the interests of reigning princes in scientific societies. He induced Frederick I. of Prussia to found (in 1700) the Academy of Sciences at Berlin, and was himself made first president; and he suggested the establishment of similar societies in St Petersburg, Dresden, and Vienna, which were afterwards instituted in those capitals. Whilst on a visit to Vienna in 1712-14 he was created a privy-councillor of the empire; he was also made a baron (Freiherr) of the empire. When George of Hanover ascended the throne of England Leibniz, who some years before had vigorously supported his father's claims to the elector's hat, was disappointed at not being invited to accompany him. But shortly afterwards he died, on 14th November 1716, at Hanover.

The philosophy of Leibniz holds an inter-

mediate place between the dualism of Descartes and the monism of Spinoza (whom he visited at Amsterdam in 1676). His system is individualistic and dogmatic. He taught that the primary and essential quality of all substance is active force. Substance exists only in the form of atoms or monads, which are simple and similar in constitution, but differ qualitatively; each is a self-contained individuality. All monads possess two intrinsic properties—perception, or the capacity to mirror the universe, and appetite or striving. The degree of perfection with which each monad reflects the universe depends upon its individual character—i.e. upon the peculiar consensus or balance of relations that exist between the active and the passive elements in its nature. And the entire series of monads, from the very highest (God) to the very lowest, was so constituted, and so arranged from the first, that, whilst each obeys the laws of its own self-determined development independently of all others, it is at every moment in complete accord and harmony with all the rest. The body of man is a complex of separate monads; his soul is a single monad, the substantial centre of his being. Yet no monad can act upon another monad; the active force of each cannot pass out of itself. But the doctrine of general 'pre-established harmony' explains how and what relations do subsist between them, and so between body and soul. He compares body and soul to two clocks which have been constructed in the beginning in such a way, and so perfectly, that both can be depended upon to keep exact time with each other without any bond of connection or any interference from without. God is the primary, supreme, perfect monad; from him all others proceed as 'fulgurations' or radiations. Plants and stones are likewise monads; but in their case the perceptive capacity is more or less blurred or slumbering—an adumbration of the modern doctrine of unconscious perception. Since God is the contriver of the universal harmony that prevails amongst all created things, this world must be the best of all possible worlds (see OPTIMISM). The real cogency of Leibniz's argument depends upon his great logical instrument, the principle of sufficient reason; there is a sufficient reason why this world should be the best of all possible worlds, and there is no sufficient reason why it should be otherwise. His theory allowed him to demonstrate that there is a substantial agreement between faith and the deliverances of reason. The Leibnizian ethics are deduced from the property of striving inherent in every monad—the final aim being perfection, reached through individual freedom.

Leibniz was also a pioneer in the science of comparative philology. He took steps to collect specimens of various distant languages, in Asia and elsewhere, and studied them in a scientific manner. He recognised two great divisions of speech, the Aramaic, which included Arabic and Hebrew, and the Japhetic or Celto-Scythian, which coincided pretty nearly with what was subsequently called the Indo-Germanic or Aryan family of speech.

Leibniz left no complete systematic account of his philosophical views. They have to be gathered from several collections of letters, essays contributed to the *Acta Eruditorum*, *Journal des Savants*, &c., and a few treatises, such as *De Principio Individui* (1663); *Essai de Théodicée sur la Bonté de Dieu, la Liberté de l'Homme, et l'Origine du Mal* (1710); *Principes de la Nature et de la Grâce* (1718); *Monadologie* (1714); and *Nouveaux Essais sur l'Entendement* (1765). In this last work he closely criticises Locke, and supplements the English philosopher's maxim of *Nihil est in intellectu quod non fuerit in sensu*, by adding *nisi ipse intellectus*. Modern 'pluralism' has affinities with monadology. A really complete edition of his work to run to 40 volumes

began to appear at Darmstadt in 1923. There are Lives by Guhrauer (1842-46) and E. Pfeiderer (1870), and books on his philosophy by Feuerbach, Nourrisson, Kuno Fischer, Merz, Russell (1900), and others. *The Monadology and other Philosophical Writings* have been Englished by Latta (1898), the *Nouveaux Essais* by Langley (1894), and other treatises by Duncan (New Haven, 1890) and Montgomery (Chicago, 1902).

Leicester, the county town of Leicestershire, a city (1919), municipal, parliamentary, and county borough, is situated on the Soar, a tributary of the Trent, 22 miles S. of Nottingham, 38 E.N.E. of Birmingham, 20 N.N.E. of Rugby, and 97 NN.W. of London. Traditionally founded by the British king Lear, it occupies the site of the Roman *Ratae*; and pavements, urns, and other Roman relics have been found, while the 'Jewry Wall,' 20 feet high and 75 long, which got its name from the medieval ghetto, is composed of rubble and Roman bricks. Its present name comes from the Old English *Leirceastre*, or 'fortress of the Leire,' as the river was called of old. The Norman castle, dismantled by Charles I. in 1645, is represented chiefly by the banqueting hall, now the modernised assize hall, the dungeon or cellar underneath, and an artificial earthwork, the Mount or Castle View, on which stood the donjon-keep; the Abbey of Black Canons (1143), where Wolsey died in 1530, is an insignificant if picturesque ruin. The abbey grounds and ruins have been presented to the city. In the Blue Boar Inn, demolished about 1829, Richard III. slept the night before Bosworth (1485); and his corpse was brought back hither for burial. A handsome memorial cross or clock-tower (1868) bears the effigies of Simon de Montfort, Earl of Leicester, Sir Thomas White, Alderman Newton, and William of Wyggeston. There is a statue also of Robert Hall; and among the other edifices are the old town-hall, with good carving and stained glass of Henry VII.'s time; the Trinity Hospital built and endowed by Henry, Earl of Lancaster (1331); the municipal buildings (1876), Queen Anne in style, with a clock-tower 134 feet high; the post-office (1887), public baths (1879), Central Municipal Library (1905), technical and art schools (1897), opera-house (1877), poor-law offices (1883), corn exchange (1852), lunatic asylum (1836-1900), the museum and art gallery (1848-1909), rich in local antiquities; the Wyggeston Hospital Schools (1513; rebuilt 1877-78); Alderman Newton's School (rebuilt 1809); the Leicester, Leicestershire, and Rutland College (1921); wholesale market, 1902, and five interesting old churches—St Nicholas, St Mary's, All Saints, St Margaret's, and St Martin's. The last, with a spire 218 feet high, and now a collegiate church, has been selected as cathedral for a new diocese. Leicester has already a bishop-suffragan under Peterborough. The New Walk is a pleasant tree-shaded promenade; the race-course of 1806 is now the Victoria Park, its successor being at Oadby, 3½ miles distant; other parks are the Abbey Park, the Spinney Hill Park, and the Western Park. The abnormally rapid growth of Leicester has been due to its central position, to its transit facilities by railway and by water, and to the great extension of its industries. The manufacture of plain and fancy hosiery was introduced in 1680; in that of pegged and riveted boots and shoes Leicester vies with Northampton; there are also iron-founding, joinery, shoe and hosiery machinery works, production of high-class photographic lenses and scientific instruments, and manufactures of thread, elastic, woollen yarns, laces, &c. Chartered by King John, the town returned two members to parliament from Edward I.'s time, three since 1918. Pop. (1801) 17,005; (1861) 68,056; (1871) 95,084; (1881) 122,351; (1901) 211,574; (1921) 234,190.

See local histories by Throsby (1777-91), T. Robinson (1793), James Thompson (1849-71), Hollings (1855), Robert Read (1881), Mrs T. Fielding Johnstone (1892), Chas. J. Billson (1920), and S. H. Skillington (1923); also the *Records* of the borough, admirably edited by Miss Bateson (3 vols. 1899-1905), and Miss Helen Stocks (1 vol. 1923).

Leicester, ROBERT DUDLEY, EARL OF, born about 1532, was fifth son of John Dudley, Duke of Northumberland, and grandson of the notorious Edmund Dudley, who was beheaded for treason by Henry VIII. His father was executed for supporting Lady Jane Grey (q.v.), and he was himself sentenced to death. He was liberated in 1554; and in 1558, on the accession of Elizabeth, a great career opened before him. He was made Master of the Horse, Knight of the Garter, a Privy-councillor, High Steward of the university of Cambridge, Baron Dudley, and finally in 1564 Earl of Leicester. For these high honours he seems to have been indebted mainly to a handsome person and a courtly manner. In 1550 he had married Amy, daughter of Sir John Robsart. She lived in the country, and early in 1560 removed to Cumnor Place, Berkshire, the house of Anthony Forster, a creature of her husband's, where, on 8th September, she was found lying dead, with her neck broken, at the foot of a staircase. It was generally believed at the time that she was murdered, and that Dudley, if not Elizabeth herself, was an accessory to the crime. This belief receives some support from certain discoveries made in the archives at Simancas, which indicate that a plot to poison her was actually entered into before her death. Elizabeth continued to favour Leicester in spite of his unpopularity in the country and of his secret marriage in 1573 to the Dowager Lady Sheffield. In 1563 she had suggested him as a husband for Mary, Queen of Scots, and in 1575 she consented to be magnificently entertained by him at his castle of Kenilworth (q.v.). In 1578 he bigamously married the widow of Walter, Earl of Essex, and when the fact was revealed to Elizabeth, she was greatly, but only temporarily, offended. In 1585 he commanded an expedition to the Low Countries, of which next year he was appointed governor—an expedition that is notable chiefly for the unsuccessful siege of Zutphen, in the course of which Sir Philip Sidney, his nephew, met with his death. In 1587 he again showed his military incapacity in the same field, and had to be recalled. Yet in 1588 he was appointed to command the forces assembled at Tilbury, to defend England against the Spanish Armada. He died suddenly on 4th September of the same year at Cornbury, in Oxfordshire, of poison, said rumour, intended for his wife.

See ELIZABETH; *Leicester's Commonwealth* (republished 1904); F. G. Burgoyne, *Queen Elizabeth, Amy Robsart, and the Earl of Leicester* (1904); Mrs Aubrey Richardson, *The Lover of Queen Elizabeth* (1907).

Leicester of Holkham, THOMAS WILLIAM COKE, EARL OF (1752-1842), a descendant of Chief-Justice Coke, was a great agriculturist; by his efforts, north-west Norfolk was converted from a rye-growing into a wheat-growing district, its system of cultivation was entirely revolutionised for the better, and more stock and of better breeds was kept on the farms. When in 1776 he succeeded to his estates they yielded an annual rental of £2200; at his death they brought in £20,000 and more. The sheep-shearing festivals at Holkham were celebrated the country over. Coke represented Norfolk in the House of Commons during the greater part of the period from 1776 to 1833. He was a staunch Whig, and a strong supporter of Fox. In 1837 he was created Earl of Leicester of Holkham, to distinguish the title from the Earldom of Leicester, already held by the Townshend family. Coke refused every

other title except that of Earl of Leicester, because that title had been borne by his great-uncle, but on his death in 1759 had become extinct. See Mrs A. M. W. Stirling, *Coke of Norfolk and his Friends* (1908; new ed. 1912).

Leicestershire, a midland county of England, surrounded by Nottingham, Lincoln, Rutland, Northampton, Warwick, and Derby shires. It has a maximum length and breadth of 44 miles by 40, and contains 833 sq. m. Pop. (1801) 131,081; (1841) 215,867; (1881) 321,258; (1901) 433,994; (1921) 494,522. Its surface is mainly undulating tableland, the highest ground being at Charnwood Forest in the north-west, where Bardon Hill rises to a height of 853 feet above sea-level. The Soar, itself an affluent of the Trent, which for a short distance borders the county on the north, is, with its tributary the Wreak, the principal river. The soil, varying in fertility, is generally loamy; in the north-west are valuable coal-mines, also granite, slate, and limestone quarries, but, the greater part of the county being under pasture, the quantity of corn grown is comparatively small. The principal objects of agriculture are grazing and sheep and cattle breeding, Leicestershire being especially noted for its breed of the former. Of manufactures the principal are those of hosiery and boots and shoes; basket-making is carried on at Castle Donnington; and Stilton cheeses are for the most part made in this county. Leicester is the assize town, and other towns are Ashby-de-la-Zouch, Hinckley, Loughborough, Lutterworth, Market Harborough, and Melton Mowbray, the last two being great hunting centres. Four members are returned to parliament, besides three for the borough of Leicester. In historical annals the principal event associated with the county is the battle of Bosworth Field (1485), in which Richard III. lost his life. Amongst persons of note identified with Leicestershire may be mentioned Wyclif, Cardinal Wolsey, Lady Jane Grey, Mary, Queen of Scots, Beaumont the dramatist, George Villiers, Duke of Buckingham, Cleveland the poet, George Fox, Simpson the mathematician, Dr Johnson, Lord Macaulay, Hobart Pasha, Colonel Burnaby, and last, but not least, Daniel Lambert. See county histories by Burton (1622; 2d ed. 1777), Nichols (4 vols. 1795-1815), Curtis (1831), and the *Victoria History* (1907, &c.).

Leichhardt, LUDWIG, explorer, was born in Brandenburg in 1813, and studied at Göttingen and Berlin. In Australia he conducted an expedition (1843-45) from Moreton Bay to the Gulf of Carpentaria, and along its south and west shores. In November 1847 he again started from Moreton Bay to cross the continent from east to west, but nothing was heard of him after 3d April 1848. The *Journal* of his first journey was published in London in 1847, and his Letters in German in 1881.

Leidy, JOSEPH (1823-91), born in Philadelphia, and from 1853 professor of anatomy in the university of Pennsylvania, gained distinction by his studies of the extinct mammalian fauna of the western states, and his works on biological and palaeontological subjects. For his influence in science, see the centenary addresses published in the *Scientific Monthly*, April 1924.

Leigh, a town of Lancashire, 21 miles N.E. of Liverpool and 12 W. of Manchester. Silks and cotton goods are extensively manufactured; iron-foundries, breweries, and malt-kilns count amongst the principal industrial establishments. In Leigh are productive coal-mines. Pop. (mun. borough) 45,500; (parl. borough, including Atherton and Tyldesley-with-Shakerley) 81,000.

Leighton, FREDERICK, LORD, P.R.A., was born at Scarborough 3d December 1830. His

early years were spent in a series of grand tours. He visited Rome, Florence, Frankfurt, Berlin, Paris, and Brussels, and everywhere he received instruction from the most distinguished masters. At fourteen he was already a promising student at the Accademia di Belle Arti at Florence. At Frankfurt he came under the frigid influence of Steinle, the friend and disciple of Overbeck; and there remained a certain coldness in his colour which proved that he never quite lived down the results of Steinle's tuition. He made his first appearance at the Royal Academy in 1855 with his famous picture 'Cimabue's Madonna carried in Procession through the Streets of Florence.' This work was an immediate success, and was purchased by the Queen. Five years later he settled in London, and his career henceforth was an unbroken success. His paintings of Italian subjects reached a very high level in such pictures as 'Paola and Francesca' and 'Dante in Exile,' but it is in Greek history and legend that he reached his best. 'Ariadne,' 'The Daphnephoria,' 'Andromache,' and 'The Return of Persephone' are works where Leighton's amazing draughtsmanship is fully displayed. 'The Bath of Psyche,' a beautiful study in the nude, where his almost waxen flesh tints are shown; and 'Wedded,' are other familiar examples of his art. He also won considerable distinction as a sculptor, and in 1877 his 'Athlete struggling with a Python' was purchased out of the funds of the Chantrey Bequest. In 1864 he was elected Associate of the Royal Academy. Five years later he took his place among the forty, and in 1878 he was elected President and knighted. He was created a baronet in 1886. A few days before his death in 1896 he was made a peer, the first British artist to be given such an honour. Lord Leighton was a scholar and a man of the world as well as a painter, and discharged the duties of his onerous position with marvellous tact and success. Under his presidency the Academy enjoyed a material prosperity and social influence which it attained under no one of his predecessors. Coming at a time when Greek excavations were causing interest, and when the pre-Raphaelites were at the height of their powers, Leighton's work attracted very much attention. Many artists—among others, Sir E. Poynter—were greatly influenced by his work.

See a book on him by Ernest Rhys (1900), and the authorised (and unorthodox) *Life and Letters* by Mrs Russell Barrington (1906).

Leighton, ROBERT, perhaps the rarest flower that has grown out of Scottish theology, was born in 1611, but where is as yet quite uncertain. He was the second son of Dr Alexander Leighton (1568–c. 1649), Presbyterian minister in London and Utrecht, the author of *An Appeal to the Parliament; or Sion's Plea against the Prelacie* (1628), which earned him from the tender mercies of Laud the cruel punishment of scourging, the pillory, branding and mutilation, heavy fine, and close imprisonment. At sixteen the boy went to the university of Edinburgh, where he graduated M.A. in 1631. The only record of his college days is a sarcastic and obvious epigram on Aikenhead, the provost of Edinburgh. He next spent some years in France, and widened his spiritual sympathies by living some time with Roman Catholic relatives at Douai. He was ordained Presbyterian minister of Newbattle in 1641, signed the Covenant along with his parishioners two years later, and, in spite of Burnet's account of his lack of sympathy with his brethren, appears to have taken his part in all the Presbyterian policy of the time, and even to have represented the Synod of Lothian in a mission to London. The famous story of his being questioned 'whether he preached to the times' and of his

retort that surely they might 'permit a poor brother to preach Jesus Christ and eternity' is unauthenticated. At this period he was a frequent visitor to London, and after 1646 he went thither once a year. About the close of 1652 he applied for leave to resign his charge, on the plea of inability to perform its duties from ill-health and weakness of voice, and early next year he was allowed to do so on being appointed Principal of the university of Edinburgh.

Here he remained nine years, and Burnet testifies to his remarkable influence over the students. Elsewhere he tells us of the wonderful effect of his preaching, which yet displeased Presbyterian zealots from its haranguing method, without heads. Leighton's *Prælectiones Theologicae* are extant to show the kind of Latin orations which he delivered weekly. Most of the *Sermons* and the *Commentary on the First Epistle of Peter* were the work of the Newbattle period. The Restoration placed on the throne an absolute king with a rooted determination to force Episcopacy on Scotland. Leighton after much reluctance was forced by the king himself to become one of the bishops of the new ecclesiastical regime, but with characteristic modesty chose for himself Dunblane, the poorest of the new dioceses, although the elevation was to him 'a mortification greater than a cell and hair-cloth.' The worldly-minded Sharp at first had his scruples about receiving new ordination; to the saintly Leighton, indifferent to the mere externals of religion, this was a detail of no great moment. On the northward journey he discovered the true motives of Sharp and his brother bishops, and left them at Morpeth to avoid their hateful triumphal entry into Edinburgh. For the next ten years the beautiful little town of Dunblane was his home, and here he laboured with a sinking heart to build up the shattered walls of the church, although he soon lost all hope of success, while his work 'seemed to him a fighting against God.' It was characteristic of the man that he never would permit himself to be addressed as 'my lord,' and that he only appeared in parliament when church matters were in dispute. His conception of Episcopacy was similar to that suggested by Archbishop Ussher, and his aim was to preserve what was best in the two systems as a basis for comprehensive union, 'reconciling the devout on different sides.' But nowhere among his unworthy associates did he find any 'such appearance of seriousness or piety as became the new-modelling of a church,' and he only succeeded in being misunderstood by both sides, his moderation being misread by the fiercer Presbyterians as 'pretended holiness, humility, and crucifixion to the world,' assumed as 'a cloak under which to creep toward promotion'—'a mere betrayal of religion with a kiss.' The severity of his life, his unworldliness, and even his celibacy, were thought to savour of Romanism, and already his recommendation of his favourite book, *The Imitation*, to the Edinburgh students, had given offence to rigid Presbyterians like Dickson, who refused it because 'self and merits run through it.' Row characterises him as 'carrying like a pawky prelate,' and says that his condescensions made the Dunblane clergy think 'he was but *straking* cream in their mouths at first.' The continued persecutions of the government, bent on playing out 'a forlorn after-game,' drove him to London in 1665 to resign his see. He told the king he 'could not concur in the planting the Christian religion itself in such a manner, much less a form of government.' Charles apparently listened with respect, and the good bishop was persuaded to return. Again in 1669 he went to London to advocate his scheme of Accommodation,

and after his return voted in favour of the unjustifiable Assentory Act—a weak piece of compliance which he repented all his life. Immediately after he assumed the duties of commendator of the archdiocese of Glasgow, while still continuing for some time Bishop of Dunblane. Next followed his fruitless conferences at Edinburgh in 1670 and 1671 with leading Presbyterians on behalf of Accommodation, and his sending through the western counties itinerant advocates of the cause. In despair of success he begged for permission to retire, and at length about the close of 1674 was permitted to lay down his archbishopric. His letter to Lauderdale (December 17, 1674) describes his sickness and sense of his own unworthiness, and his desire to spend the remainder of his life in quiet retirement, as well as ‘pity to see a poor church doing its utmost to destroy both itself and religion in furious zeal and endless debates about the empty name and shadow of a difference in government, and in the meanwhile not having of solemn and orderly public worship so much as a shadow.’ His last ten years he spent in calm preparation for his end, in the house of his widowed sister, Mrs Lightmaker, at Broadhurst Manor in Sussex, frequently preaching in the church of Horsted Keynes, in the south transept of which he lies. His death, which was the result of an attack of pleurisy, came suddenly, 25th June 1684, in an inn—as he often said he wished it should—in Warwick Lane, London, whither he had been summoned by Burnet to an interview with Lord Perth, just appointed Lord Chancellor of Scotland.

No man ever lived more intensely absorbed in the love of God than Leighton: no saint was ever filled with a greater measure of the spirit of Christ. It was characteristic of him that he never thought his writings of any value, that he printed nothing himself, and that he left orders for his MSS. to be destroyed; yet no religious books reveal a deeper spirituality, a more heavenly exaltation and devotion. And no less wonderful is their sweetness and beauty, wedded to sincerity and intellectual strength, as well as their broad catholicity of spirit—the direct outcome of a large mind moulded in Christian charity. He saw the good that underlay all ecclesiastical systems, and yet recognised how profitless all might become if allowed to interpose between the human soul and God. Love of peace was with him a passion, though unhappily he fell on evil days and unhappy methods of conciliation. The best tribute to his memory is from the pen of Burnet, who says at the conclusion of his *Pastoral Care*, ‘in a free and frequent conversation with him for above two and twenty years, I never knew him say an idle word that had not a direct tendency to edification; and I never once saw him in any other temper but that which I wished to be in in the last moments of my life.’ And again in the *History of His Own Time* he says: ‘I bear still the greatest veneration for the memory of that man that I do for any person; and reckon my early knowledge of him, which happened the year after this [Leighton’s promotion to a bishopric], and my long and intimate conversation with him, that continued to his death, for twenty-three years, among the greatest blessings of my life; and for which I know I must give account to God, in the great day, in a most particular manner.’ Of great modern Englishmen none has esteemed Leighton more highly than Coleridge, whose *Aids to Reflection* indeed is based on aphorisms culled from his writings.

Leighton left his library to Dunblane, which has another memorial of its great bishop in the ‘Bishop’s Walk’ along the banks of the Allan Water. In the *Bibliotheca Leightoniana* there were originally more than 1500 volumes, and upwards of 1200 still remain, more than 200 of which

have interesting marginalia. His first editor was his friend Dr Fall, who printed most of the works from 1692 to 1708. The chief later editions are those of Doddridge (1748), Jerment (1805-8), Pearson (1825), and Alkman (1831). The last three editions have lives of the author, of which Pearson’s is full and good. The best and most complete edition is that of the Rev. William West, although the method of editing is not entirely to be commended, and the anti-Presbyterian prejudice ill befits the subject. The work was the labour of a quarter of a century, and vols. ii.-vi. were issued 1869-70; vol. vii., ‘Remains,’ in 1875. Vol. i., to include the Life and Letters, remained unpublished. There is an admirable volume of *Selections from the Writings*, with a brief Memoir (1883), by Dr Blair of Dunblane; and a fuller and more adequate *Life and Letters*, by the Rev. D. Butler, appeared in 1903.

Leighton-Buzzard, a market-town of Bedfordshire, on the Ouse, 41 miles by rail N.W. of London. Its fine cruciform church, mainly Early English, has a spire of 193 feet, and was restored in 1886; in the market-place is a pentangular cross. Straw-plait is the staple industry. The suffix *Buzzard* is from Beaudésert or Bosard, a great family here in the 14th century. Pop. 7000.

Leiningen, a mediatised princely House of Germany, dating back to 1096. In 1779 the head of one of its branches, the Count of Leiningen-Dachsburg-Hardenburg, was made a prince of the empire; but the peace of Lunéville deprived him of his ancient possessions, about 252 square miles in extent, on the left bank of the Rhine.

Leinster, the south-eastern province of Ireland (q.v.).

Leipa, a town of Bohemia, 40 miles N. by E. of Prague. It has some manufactures of woollens, cotton, glass, and steel. Pop. 12,000.

Leipzig (Fr. *Leipsic*), the fifth largest city of Germany, is situated in a large and fertile plain in the republic of Saxony, 80 miles by rail WNW. of Dresden, and 101 SSW. of Berlin, within 6½ miles of the Prussian border, and 3 miles above the junction of the three small streams, Elster, Pleisse, and Parthe. The inner or ancient town, the centre of the business activity, with narrow and crooked streets and quaint houses, is separated by a broad, tree-shaded promenade (laid out since 1784 on the site of the old walls) from the much more extensive modern suburbs, bounded in their turn by a girdle of busy manufacturing ‘villages.’ Of these last, Reudnitz, Eutritzsch, Gohlis, and others were incorporated with the city in 1889 and 1890. The pop. within the official city limits was in 1800, 32,146; in 1860, 85,394; in 1880, 149,081; in 1900, 456,089; in 1910, 587,635; in 1919, 604,357. Many handsome edifices were erected, numerous fine streets laid out and built, and great civic improvements effected at Leipzig in the last quarter of the 19th century; but few of the public buildings are specially remarkable. The two principal city churches, the Thomaskirche and the Nicolaikirche, date respectively from 1496 and 1525; the quaint old Rathaus, now a municipal museum, from 1556. The old Pleissenburg (1213, rebuilt 1551), repeatedly besieged and taken, has disappeared, except the tower, now part of the huge new Rathaus (1898-1908). Amongst modern buildings are the large and handsome Municipal Theatre (1868); the Museum (1856-58; enlarged in 1883-86); the Exchange (1884-86); the Observatory (1861); the Booksellers’ Exchange (1888), with an interesting museum; St Peter’s Church (1885), a fine specimen of modern German Gothic; and the magnificent law-courts of the German Reich, opened in 1895. The noble New Gewandhaus has since 1884 superseded the old Gewandhaus (so called because originally a drapers’ hall), in which, from 1781, some of the best concerts in Europe were given. Leipzig contains numerous squares and open spaces,

affording ample room for the stalls and booths of the retail dealers at the fairs. The largest is the Augustus-Platz; the quaintest the Market-place, in which a large war monument for 1870-71 was unveiled in 1888. The Rosenthal, with a zoological garden, and the Johanna-Park are fine 'parks on the outskirts; while farther out are fine oak and beech woods. The monuments include a great obelisk beside the Napoleonstein on the battlefield, to commemorate the centenary (1913) of the Völkerschlacht; and Klinger's Wagner monument (1913).

Leipzig is a great legal, educational, and book-publishing centre, and has other large commercial interests (furs, paper, leather, machinery, textiles, pianos, chemicals, cigars, &c.). It has been the seat of the supreme court of the German Reich since 1879. The university, founded in 1409 by a secession from Prague, has more students (over 4500) than any other German university except Berlin and Munich. The Augusteum, or main building, is in the old town; but it is supplemented by spacious medical and physical laboratories and other 'institutes' in other parts of the town, including a new library-building containing well over half a million volumes and many MSS. The City Library is of considerable magnitude. Among the numerous other educational establishments are two gymnasia, a justly famous School of Commerce, a conservatory of music, reckoned amongst the first in Europe, and many literary, artistic, and scientific institutions. The hospital system of Leipzig is one of the best developed in Europe, and has largely benefited the medical faculty of the university. As a seat of trade Leipzig is inferior only to Hamburg and Berlin among the towns of Germany. The chief articles of commerce are furs and skins, cloth, leather, and books. The famous Leipzig fairs are held three times a year, and last from three to five weeks. Their origin is traced as far back as 1180; their importance dates from about 1500, and they reached their greatest prosperity at the end of the 17th and the end of the 18th century. The accession of Saxony in 1833 to the German Customs Union (Zollverein) gave another fillip to the business of these fairs; but since 1865 the growth of railways and telegraphs, and the greater number of commercial travellers, have gradually reduced their importance, though they are still attended by many thousands of strangers from all parts of the world. Leipzig ranks next to London and Paris as a seat of the bookselling and publishing trade. About 1000 houses are engaged in the book-trade, and there are also numerous printing establishments; while type-founding has here its chief centre in Germany. The German booksellers have established a common exchange and clearing-house at Leipzig. The wool-market, in June, is still much frequented, though of much less importance than formerly. Among the chief manufactures (carried on mainly in the 'villages') are pianofortes, paper, chemicals, oils, scientific instruments, spirits, beer, tobacco, and some textiles. Iron-founding is also carried on.

Leipzig, formerly Libzk or Lipzk (from the Slavonic *Lip* or *Lipa*, a 'lime-tree'), originally a Wendish settlement, is first mentioned as a town in 1015. In the latter part of the 12th century it had from 5000 to 6000 inhabitants, and it rapidly grew in importance and prosperity under the fostering care of the margraves of Meissen, who granted it numerous commercial privileges. Leipzig suffered greatly in the Thirty Years' War, in which it was five times besieged and taken, and again in the Seven Years' War; and although the commercial changes connected with the French Revolution at first affected it very favourably, yet it suffered not a little amidst the terrible struggles of the years

1812 and 1813, when it was alternately in possession of the French and of the allies. In 1866 it was occupied for some months by Prussian troops. Leipzig has been noted as the headquarters of Socialism in Germany. The famous Leipzig Conference between Luther, Eck, and Carlstadt, which took place in the Pleissenburg in 1519, and the Leipzig Interim (see INTERIM) of 1548 are important in the history of the Reformation. Leipzig was the birthplace of Leibniz and of Wagner; J. S. Bach was director of music in the two chief churches, and 'cantor' in the Thomasschule from 1724 till 1750; and Mendelssohn was director of the Gewandhaus Concerts from 1835 till 1841. In literary history Leipzig is famous as the seat of the Saxon or Leipzig school of criticism, headed by Gottsched (q.v.). One of the scenes in Goethe's *Faust* is placed in Auerbach's Keller, in Leipzig, still shown, with old frescoes illustrating the legend used by the poet.

The immediate neighbourhood of Leipzig has been the scene of two battles of great importance in the history of Germany and of Europe—the battle of Leipzig, or of Breitenfeld (q.v.) on 7th September 1631; and the great battle of Leipzig—called the *Battle of Nations*—from the 16th to the 18th of October 1813. The latter was one of the most bloody and decisive of those which effected the deliverance of Europe from French domination. The troops under Napoleon in this battle amounted to about 180,000 men, and those of the allies, commanded by Prince Schwarzenberg, Marshal Blücher, and Bernadotte, Crown-prince of Sweden, to almost 300,000. The loss of the French was reckoned at about 30,000 killed and wounded, and 38,000 prisoners; that of the allies at about 52,000. The victory of the allies was complete, and the French had to evacuate Leipzig.

Leith, a parliamentary burgh in Midlothian, the second seaport of Scotland and an important commercial centre, on the Firth of Forth, at the mouth of the Water of Leith, was a municipal burgh till 1920, when it was annexed to Edinburgh. It is even less attractive than most seaport towns; still, great improvements have been effected since 1877, and some of the public buildings are not bad. Among them are the court-house or town-hall, custom-house, exchange, corn exchange, Trinity House, hospital, Sailors' Home, and St James's Episcopal Church, by Sir G. G. Scott, with a spire 180 feet high. Leith Fort (1779) is now military offices. The open harbour is the mouth of Water of Leith. The harbour-works comprise five docks, constructed between 1801 and 1881, with an area of 43 acres, besides a sixth (1892-1904), larger than any of the others; eight dry docks; and two piers, 1177 and 1041 yards long. A seventh dock, greatest of all, is to be made to the north-east. The small and ancient fishing-harbour of Newhaven lies within Leith's boundaries. Ship-building has become a large and important industry; and extensive employment is also afforded by large flour-mills, engineering-works, sawmills, rope-works, chemical works, &c. Leith was constituted a parliamentary burgh in 1833, and (since 1918) returns one member. Its nine months' siege by the Protestants (1559-60), and the surprise of its citadel by the Jacobites (1715), are the chief events in its history. Home, the author of *Douglas*, was a native; John Logan was a minister in Leith. Pop. 81,654. See EDINBURGH.

Leitha, a stream rising in Lower Austria, and flowing NE. to join the Danube nearly along the former frontier of Lower Austria and Hungary. After the reorganisation of the monarchy in 1867, it became common to speak of Hungary and the lands belonging to the Hungarian crown as *Trans-*

leithan, and the Austrian Empire as *Cis-leithan*—thus giving the stream a factitious importance. It is now (since 1919) mostly Austrian.

Leitmeritz (Czech. *Litoměřice*), an old town, partly walled, of Bohemia, at the head of steam-boat navigation on the Elbe, here crossed by a bridge 1805 feet wide, $\frac{5}{8}$ 4 miles W. by N. of Prague. Here are a cathedral (1671) and a bishop's palace; and in the town-house (1535) valuable archives are preserved. Brewing is the staple industry. Fruit, wine, and hops are extensively grown. Pop. 17,000.

Leitmotiv. See MOTIF, WAGNER.

Leitomischl, an old town of Bohemia, 85 miles ESE. of Prague, with a fine castle, a Piarist college, and manufactures of linens, woollens, jute, &c.; pop. 8000.

Leitrim, a county in the north-east of the province of Connaught, in Ireland. Its greatest length, north-east to south-west, 51 miles; greatest width, 21 miles. Area, 588 sq. m., 11 per cent. barren, and 7 per cent. bog. The county touches the ocean on the north, and is divided into two parts by Lough Allen (q.v.), from which the Shannon forms the south-west boundary of the county. The southern division contains numerous small lakes. The northern division is intersected by several ridges. To the north of Lough Allen the soil, except at rare intervals, is unfavourable for agriculture, and the climate damp and ungenial. Leitrim is more a grazing than a tillage district, more than half of its area being grass-land. Potatoes and oats are the only crops of consequence. Coal is found in the Lough Allen basin; and iron and lead ores are abundant, although very sparingly mined. Linens and coarse woollens are manufactured for domestic use. The county town is Carrick-on-Shannon. Pop. (1841) 155,297; (1861) 104,744; (1881) 90,372; (1911) 63,557. Leitrim was reduced by the English in the reign of Elizabeth, but revolted in 1588, submitting once more in 1603. The confiscations which followed the Civil War practically extinguished the family of O'Rourk and the other native proprietors.

Leixões, the seaport of Oporto (q.v.).

Leland, CHARLES GODFREY (1824–1903), humorist and folklorist, was born at Philadelphia, graduated at Princeton in 1845, and afterwards studied at Heidelberg, Munich, and Paris. He was admitted to the Philadelphia bar in 1851, but turned from law to journalism. From 1869 he resided chiefly in England, writing in 1873–90 four works on the language and customs of the Gypsies. He is most widely known for his dialect poems in 'Pennsylvania Dutch,' the famous *Hans Breitmann Ballads* (1871). Other works are *The Poetry and Mystery of Dreams* (1855), *Meister Karl's Sketch-book* (1855), *Legends of Birds* (1864), *Fu-Sang* (1875), *Algonquin Legends* (1884), *Etruscan Remains* (1892), *Hans Breitmann in Tyrol* (1895), *Flavius* (1902), besides a translation of Heine, and a book on the Virgil legend (1900). See his autobiographical *Memoirs* (1893), and his *Life and Letters*, by Mrs Pennell (1906).

Leland, JOHN, born in London about 1506, was educated at St Paul's, then at Christ's, Cambridge, and All Souls', Oxford. He became chaplain to Henry VIII., who in 1533 commissioned him as 'king's antiquary,' with power to search for records of antiquity in the cathedrals, colleges, abbeys, and priories of England. The next six years he devoted to his tour with unrelenting diligence, and collected 'a whole world of things very memorable,' to the arrangement of which he gave the remainder of his life. His church preferments

were the rectories of Pofeling, in the marches of Calais, and Haseley in Oxfordshire, a canonry of King's College (now Christ Church), Oxford, and a prebend of Salisbury. His last five years were darkened by insanity, from which he found relief in death, 18th April 1552. He had laboured in vain with gigantic industry to arrange and digest his vast collection of materials, into which burrowed his successors, Stow, Camden, William Burton, and Dugdale.

Most of his papers are now in the Bodleian and British Museum. Besides his *Commentarii de Scriptoribus Britannicis* (ed. by Anthony Hall, 2 vols. 1709), his chief remaining works are *The Itinerary* (ed. Hearne, 1710–12; ed. L. T. Smith 1905–10) and *De Rebus Britannicis Collectanea* (ed. by Hearne, 6 vols. 1715). For his life, see the *Lives of Leland, Hearne, and Wood*, edited by W. Huddesford (2 vols. 1772).

Lely, SIR PETER, painter, was the son of Captain Van der Faes, nicknamed Du Lys, or Lely, from having been born in a house the front of which was decorated with a fleur-de-lis. The painter was born at Soest, probably in Westphalia, in 1618. He settled in London in 1641 and took to portrait-painting, having hitherto essayed landscapes and historical subjects. He was employed successively by Charles I., Cromwell, and Charles II., the last of whom nominated him court-painter and conferred on him the honour of knighthood. From the death of Vandyck he was the first painter of the day in England down to the arrival of Kneller. Lely, 'a mighty proud man, and full of state' (Pepys), had great skill in execution, especially in painting female portraits, though he failed to master the secrets of individuality. His best-known pieces, apart from portraits of his royal patrons, are the beauties of the court of Charles II. at Hampton Court. He died in 1680.

Lemaitre, JULES (1853–1914), born at Vennecy (Loiret), was for a time professor at Grenoble, but became known as poet and dramatist, and Parisian dramatic and literary critic. See book by H. Bordeaux (1920).

Leman, LAKE. See GENEVA (LAKE OF).

Le Mans. See MANS.

Lemberg (formerly *Löwenburg*; Polish name *Lwów*, Ruthenian *Львів*, capital of the former Austrian land of Galicia and Lodomeria, and now of a Polish voivodship), is situated among hills on a tributary of the Bug, 212 miles E. of Cracow. Pop. (1869) 87,109; (1900) 159,618; (1910) 206,574; (1921) 219,391. It has a Roman Catholic, a Greek United, and an Armenian archbishop, and has some thirty churches and several monasteries. Several of the churches are fine buildings, as the Dominican, which contains a greatly venerated image of the Virgin; the Greek cathedral, built in the Italian style in 1740–79; the Gothic Roman Catholic cathedral (1350–1460); and the Armenian cathedral, dating from the 14th century. The university, founded in 1784 was reorganised in 1917. A people's university was inaugurated in 1919. Here also is the seat of the national institute founded (1817) by Ossolinski, with a library chiefly of Polish literature, and large collections of medals, coins, antiquities, paintings, engravings, &c. There is a considerable trade in flax, hemp, cloth, leather, and agricultural products. The manufactures embrace machinery, earthenware, oil, beer, &c. Founded in 1259, Lemberg was an important city of Poland from 1340. It has been several times besieged. It fell to Austria at the first partition of Poland. It was taken by the Russians after a battle 4th September 1914, and recovered by the Austrians 22d June 1915.

Lemming, a name applied to the members of two genera of rodents, nearly related to voles and

the North American 'musquash' or Fiber. The one genus is *Myodes* or *Lemmus*, in circumpolar regions both in the Old World and the New; the other is *Cuniculus* or *Dicrostonyx*, inhabiting North America, Greenland, and Siberia. The members of both genera are small, short-eared creatures, somewhat like short-tailed water voles, with the soles of the feet furred. The Scandinavian Lemming (*M.* or *L. lemmus*) with variegated black and tawny fur, abounds on the lofty tablelands, feeding on reindeer-moss and other lichens, grass, birch catkins, and the like. It breeds several times in the year, with four or five in a litter, and becomes at irregular intervals so abundant that movements on a large scale are imperative. In these so-called migrations, there is a display of great persistence; the lemmings swim across rivers and lakes, traverse mountains, and march through villages. They move chiefly at night and in the early morning, and their ranks are thinned by many enemies such as wolves and foxes, hawks

Lemming (*Myodes lemmus*).

and owls. Those that reach the shore swim out to sea in obedience to their instinct to go forward, and are drowned in great numbers. The Banded Lemming (*C.* or *D. torquatus*) has very thick fur which turns white in winter, and exaggerated fore claws which are partially shed. In Pleistocene times both these lemmings occurred in Britain.

Lemnos, a Greek island in the northern part of the Aegean Sea, is situated 40 miles SE. of Mount Athos and about the same distance SW. of the Dardanelles. It is nearly split in two by a large bay on the south coast and another on the north coast. The interior consists of an undulating plateau. None of the hills exceed 1400 feet in height. Area, 180 sq. m.; pop. about 27,000. The principal products are corn, wine, and tobacco. In antiquity and all through the middle ages the most notable product of the island was 'Lemnian earth' or 'sealed earth' (see **BOLE**), which was in general request as an antidote against snake-bites, also as a remedy in cases of plague, dysentery, &c. It was extracted only on one day in the year, 6th August, with an accompaniment of religious ceremonies, from a spot near the site of the ancient city Hephæstia, in the north-east of the island. It has now gone out of repute. It consisted of silex to the extent of two parts in three, with some alumina, oxide of iron, water, and natron. In ancient times the island is stated to have possessed an active volcano; at the present date there exist no traces of volcanic action. Lesbos was regarded by the Greeks as sacred to Hephæstus. It was conquered by the Persians in the reign of Darius Hystaspes; but Miltiades wrested it from them for the Athenians. In 1657 it passed into the hands of the Turks, from the Venetians, and in

the war of 1912-13 to the Greeks. The chief town is Kastro (the ancient Myrina), a small fortified place on the west coast.

Le Moine, SIR JAMES MACPHERSON (1825-1912), Canadian author, was born in Quebec, and practised as a successful barrister there for some years, but quitted the active work of his profession in 1858, on being appointed superintendent of Inland Revenue at Quebec. One of the most prolific authors that Canada has produced, he wrote with equal facility in English and French. He studied ornithology, archæology, and other branches of science; and his works—over thirty in number—include some valuable sketches of Canadian history. He was knighted in 1897.

Lemoine, JOHN ÉMILE, French journalist, was born in London on 17th October 1815, and joined the staff of the *Journal des Débats* as English correspondent in 1840. Subsequently he was appointed editor of that newspaper, and guided it skilfully and successfully through all the vicissitudes of political strife. In 1875 he was elected a member of the Academy, and in 1888 a life senator. He died 14th December 1892. His *Études Critiques* (1852) and *Nouvelles Études* (1862) contain specimens of his best style.

Lemon, the fruit of a small tree (*Citrus medica*, var. *Limon*) belonging to the same order (Rutaceæ) and genus as the orange. The general character of the leaves and flowers and fruit of the

Lemon.

lemon-tree is so well illustrated in the accompanying cut that description may be dispensed with. The ordinary sour kind is sub-var. *acris*, cultivated in many sorts. The sweet lemon is the sub-var. *Lametta*. *Citrus trifoliata*, with inedible small fruit, is planted often for hedges, on account of its long thorns, but this Japanese species is the host of divers insects and fungous diseases.

The peculiar and grateful flavour of the juice of the lemon is mainly due to citric acid (see **LEMONADE**). As an antiscorbutic lemon juice is much better than lime juice, under whose name it has commonly passed. The uses of the rind, fresh or preserved, in the cook's and confectioner's arts, need only be mentioned. The essential oil (see below) is obtained from the rind. The lemon is largely cultivated in all the warmer countries of the south of Europe and those bordering on the Mediterranean, especially in Sicily, and it is naturalised in some parts of South America and in the East and West Indies, and in parts of Australia.

The Oil or Essence of Lemons is extracted from the fresh lemon peel either by pressure or by distillation. The former is the usual method. The peel, removed from the fruit, is bent so as to rupture the oil vesicles, and the oil is collected in sponges, or the peel is sometimes rasped with short needles, and the exuding oil collected. The yield is variable, amounting on the average to 10 oz. of oil from 400 fruits. The oil has a very complex composition; the colour and odour, however, are mainly due to citral, but it contains a small quantity of citratene and other oils; it is often adulterated with turpentine. The fragrant portion, even in genuine oil, can be removed, leaving about 90 per cent. of liquid having a decided turpentine odour. Its chief use is as a flavouring agent, the ordinary essence of lemon of the shops consisting of a solution of the oil in alcohol. It also enters into most perfumes, such as eau-de-Cologne, &c.

The so-called *Salt of Lemons*, or *Salt of Sorrel*, is the binoxalate of potash. See OXALIC ACID.

Lemon, MARK, born in London, 30th November 1809, was educated at Cheam near Epsom, and in 1835 wrote a farce, the first of a long series of melodramas, operettas, &c. He produced, moreover, several novels (the best, perhaps, *Falkner Lytle*, 1866), children's stories, and essays, and appeared as a lecturer and public reader. In 1841 he helped to establish *Punch* (q.v.), of which for the first two years he was joint-editor with Henry Mayhew, and thereafter sole editor till his death, at Crawley, Sussex, 23d May 1870. See J. Hatton's *Reminiscences of Mark Lemon* (1871).

Lemonade is formed by adding two lemons sliced, and two ounces of white sugar, to a quart of boiling water, and digesting till cold. It is a useful drink for allaying thirst, and as a refrigerant in febrile and inflammatory complaints, and in hæmorrhage, in which cases it should be given iced. Aërated Water (q.v.) flavoured with sugar and essence of lemons is also called lemonade.

Lemon-grass, a name applied to grasses of the genus *Cymbopogon* (or *Andropogon*), cultivated in India, Ceylon, &c., possessing a strong lemon-like fragrance. An essential oil is obtained, especially from *C. flexuosus* and *C. citratus*, for perfumery; but oil of verbena, citronella oil, and lemon-grass oil are often confused. See GRASS-OIL.

Lemonnier, CAMILLE (1841-1913), Belgian ultra-realist novelist, born in Brussels. His works include *Happe-chair* and *Au Cœur frais de la Forêt*.

Le Moyne, CHARLES, French pioneer, was born in Normandy in 1626, and, proceeding to Canada in 1641, lived among the Huron tribe of Indians, and fought with the Iroquois. In 1668 Louis XIV. made him Seigneur de Longueuil, and afterwards also de Chateauguay. He was for some years captain of Montreal, and died in 1683. Of his eleven sons, nearly all became distinguished. The eldest, Charles, Baron de Longueuil, was born in 1656, and in his youth served in the French army. He was made governor of Montreal and Baron in 1700, and became commandant-general of the colony. He died at Montreal in 1729. His descendant, Charles Colmor Grant, had his Canadian title of seventh Baron de Longueuil officially recognised by Queen Victoria (1880). Another son, Joseph, became an officer in the French navy, and in 1694-97 brought vessels to Hudson Bay to co-operate with land forces under his brother Iberville. He subsequently conveyed colonists to Louisiana, surveyed its coast, and aided in capturing Pensacola.

Lemprière, JOHN, was born in Jersey about 1765, and educated at Winchester and Pembroke College, Oxford. He was in turn head-master of Abingdon and Exeter grammar-schools, rector of

Meeth in Devonshire and of Newton-Petrock, and died 1st February 1824. His famous *Classical Dictionary* (1788) remained for many years the standard work of reference in England on ancient mythology, biography, and geography. Another work of Lemprière's was *Universal Biography* (1808).

Lemur (Lat. *lemur*, 'a ghost'), a genus which has given its name to a large group of mammals, the lemurs. These animals appear to stand between the Insectivora and the monkeys. The hand and foot, with an opposable thumb, are fashioned after those of the monkeys, but in most structural features—e.g. the skull, the brain, the long but non-prehensile tail of most, the marked 'sublingua' beneath the tongue—they either show affinities to lower groups or are peculiar. The German name, 'Halb-Affen' ('Half-Apes'), as also the term 'Prosimii,' which has been applied to the group, indicates its position near the base of the Primates. The Lemurs are forest-dwellers, and mainly nocturnal in their habits. They can be for the most part readily tamed. One of the chief points of

Ring-tailed Lemur (*Lemur catta*).

interest attaching to the group is its peculiar geographical distribution. By far the majority of the genera are confined to the island of Madagascar; a few forms are found in the Orient, and on the African continent. Their range from Malaya to Madagascar has been accounted for by the supposed former existence of a continent (for which the name 'Lemuria' was proposed by Mr Sclater) connecting these now widely-separated regions. Undoubted remains of these animals have also been found in Europe and in America, as well as in Madagascar. Besides Lemur, the genera Indris, Propithecus, Hapalemur, Lepilemur, Cheirogaleus, and the curious and aberrant Cheiromys (see AYE-AYE) are confined to Madagascar. The Angwantibo (*Arctocebus*) and Perodicticus and Galago (q.v.) are African. The Tarsier and Nycticebus are found in Malaya, and the Loris in Ceylon. Some of the numerous extinct species and genera show affinities to the extinct group Creodonta, while others more resemble Primates.

Lemur, FLYING. See FLYING ANIMALS, INSECTIVORA.

Le'mures, the general designation given by the Romans to all spirits of departed persons, of whom the good were honoured as *Lares* (q.v.), and the bad (*Larvæ*) were feared as capable in their night journeys of exerting a malignant influence upon mortals. The festival called *Lemuria* was held on

the 9th, 11th, and 13th of May, and was accompanied by ceremonies of washing hands, throwing black beans over the head, &c., and the pronunciation nine times of these words: 'Begone, you spectres of the house!' which deprived the lemures of their power to harm. Ovid describes the Lemuria in the fifth book of his *Fasti*.

Lemuria. See LEMUR; also LEMURES.

Lena, a river of eastern Siberia, rises amid the mountains near Lake Baikal, flows NE. to Yakutsk, where it is 6½ miles wide, then north to the Arctic Ocean, into which it falls by several mouths, forming a delta 250 miles wide. It is 3000 miles in length, the area of its basin 772,000 sq. m. Its chief affluents are the Vilui (1300 miles) on the left, and the Vitim (1400), the Olekma (800), and the Aldan (1300) on the right. The Lena is a principal artery of the trade of eastern Siberia. The riverine sand of the Vitim and Olekma yields richly in gold; salt, coal, iron, copper, and argentiferous lead exist. Large quantities of mammoth ivory have been found in the delta. See G. W. Melville's *In the Lena Delta* (1885).

Lenau, NICOLAUS, the pen-name of NICOLAUS NIEMBSCH VON STREHLENAU, German poet, who was born at Csatád, near Temesvár, 13th August 1802, and studied law, then medicine, at Vienna and at Pressburg; but his life was rendered unhappy by his morbid poetic discontent. In 1832 he travelled to the United States, hoping to find there the peace and satisfaction which he could not get in Europe; but he returned in the following year a still further disappointed man. From this time he lived alternately in Vienna and in Stuttgart, and engaged in literary work, an ally of the Swabian school. On the eve of his marriage in 1844, he was suddenly struck down by insanity; he lived in an asylum at Oberdöbling near Vienna until his death, on 22d August 1850. Lenau's poetic power is shown to best advantage in his short lyrics, but some of his longer pieces, as *Faust* (1836), *Savonarola* (1837), *Die Albigenser* (1842), show rich fancy and feeling. There are Lives by Anastasius Grün, Schurz (1855), and Frankl (1885).

Lenbach, FRANZ VON (1836-1904), born at Schrolenhausen, Bavaria, the son of a stone-mason, studied art and became a pupil of Piloty. His earlier pictures were *Peasants taking Refuge in a Storm* (1857), *The Arch of Titus* (1858), and the *Shepherd Boy* (1860), treated in a powerfully realistic manner. For a time he painted copies from Titian, Rubens, Velasquez, and other masters for the collection of Count Schack. He afterwards confined himself to portrait-painting, and became by far the foremost in Germany, among his most famous works in this kind being the Empress of Austria; the Emperors William I., Frederick III., and William II.; Bismarck, Moltke, Döllinger, Wagner, Gladstone, Liszt, and Bülow. A collection of his portraits was reproduced in heliogravure at Munich in 1891-96.

Lenclos, NINON DE (1616-1706) born of good family at Paris, was even as a child remarkable for her beauty and grace. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays*. Six years later she commenced her long career of licentious gallantry by an amour with the Comte de Châtillon—to whom succeeded innumerable favourites, but never more than one at a time. Among her lovers we may mention the Marquis de Villarceaux, the Marquis de Sévigné, the great Condé, the Duc de Laroche-foucauld, Marshal d'Albret, Marshal d'Estrées, the Abbé d'Effiat, and La Châtre. She had two sons, but never showed the slightest instinct of maternity. One, brought

up in ignorance of his mother, followed the rest of the world, and conceived a passion for her. When she informed him of the relation between them, he was seized with horror, and blew out his brains—a calamity which did not seriously affect Ninon. She was nearly as celebrated for her manners as for her beauty. The most respectable women sent their children to her house to acquire taste, style, politeness. So great was her reputation that, when Queen Christina of Sweden came to Paris, she said she wished particularly to visit the French Academy and Ninon de Lenclos. We may gather some idea of her wit and sense from the fact that Laroche-foucauld consulted her upon his maxims, Molière upon his comedies, and Scarron upon his romances. Mirecourt's *Mémoires* is a romance; the letters attributed to her are mostly spurious, but there is a notice of her letters to Saint Evremond in Sainte-Beuve's *Causeries du Lundi*. See books by Capefigue (Paris, 1864), Miss M. Rowsell (1910), and Émile Magne (1925).

Lenin, NIKOLAI, the name under which VLADIMIR ILICH ULIANOV, Bolshevik revolutionary, is best known to the world. He was born 10th April 1870 at Simbirsk, where his father was an official. From the high school there he passed to the university of Kazan as a student of law. Expelled because of his revolutionary opinions, he continued his studies privately and at St Petersburg university. He took a prominent part in Socialist organisation, published a book on *Capitalism in Russia*, and was an exile in East Siberia for a few years. When the split occurred, Lenin was the chief leader of the extreme Marxian 'majority party' (Bolsheviks), Social Democrats, or Communists (see COMMUNISM, SOCIALISM), very scornful of the mild methods of the Social Revolutionaries. He left the periodical *Iskra* and started several others, including at a later time the famous *Pravda* ('Truth'). His part in the 1905 revolution was obscure. On its failure he lived mostly abroad till 1917. The outbreak of the Great War found him in Galicia, when the Austrian authorities arrested him as a Russian. He was soon sent to Switzerland, where he attended the conferences at Zimmerwald and Kienthal, and wrought for the transformation of the war of nations into a war of classes. Like other exiles, he returned to Russia in 1917, where, with the Soviets, he overthrew Kerensky (7th November). Thereafter he dominated the Russian republic as president of the council, a theoretic idealist in alliance with that man of action Trotsky. For Russia's misfortunes—terror, red and white; war, civil and international; invasion, famine, disorganisation, loss of territory—and for the aggressive vigour with which the Communist government faced them, see RUSSIA. In June 1922 Lenin's health, already for some time failing, compelled him to withdraw from active dictatorship; and on 21st January 1924 he died. The city of St Petersburg, for some time known as Petrograd, was thereupon renamed Leningrad.

Leningrad. See ST PETERSBURG.

Lenkoran, a seaport of the Azerbaijan republic, on the Caspian Sea, 130 miles S. of Baku. Near it are celebrated sulphur-springs. Pop. 12,000. It was surrendered to Russia by Persia in 1813. Important prehistoric remains have been found.

Lennep, JACOB VAN, born at Amsterdam, 25th March 1802, has been called the 'Walter Scott of Holland.' The son of a professor of rhetoric who was distinguished as a Latinist and as a poet, he became a barrister, and soon achieved a great reputation for legal knowledge. Yet with an extensive practice he for more than thirty years cultivated literature with assiduity and success. Lennep first

appeared as an author shortly before 1830 in a work on national legends, immediately followed by his comedies. His most popular works have been comedies, *Het Dorp aan die Grenzen* and *Het Dorp over die Grenzen*. Of his numerous novels several (including *The Rose of Dekama* and *The Adopted Son*) have been translated into English, French, and German. He translated from English poets, and published a Dutch history for the young. He died 25th August 1868.

Lennox (*Levenachs*, 'fields of the Leven'), an ancient Scottish territory, comprising the basin of the Leven and Loch Lomond—the whole of Dumbartonshire, great part of Stirlingshire, and portions of Perth and Renfrew shires. It gave name to an earldom (1174–1581), and then to a dukedom, conferred by Charles II. (q.v.) in 1680 on one of his illegitimate sons, Charles, Duke of Richmond and Lennox, who in 1702 sold the Lennox estates to the Marquis of Montrose. See GORDON; and *The Lennox*, by Sir W. Fraser (3 vols. 1874).

Lenormant, FRANÇOIS, an archaeologist and scholar of altogether exceptional genius, was born in Paris, 17th January 1837, the son of Charles Lenormant (1802–59), himself profoundly learned in Egyptology, numismatics, and archaeology generally, moreover, a fearless defender of the faith. The boy was early initiated into the studies of his life, at twenty carrying off the prize in numismatics of the Académie des Inscriptions with his *Essai sur la Classification des Monnaies des Lagides* (1856). At twenty-three he was digging at Eleusis, and his explorations he continued, in the intervals of his work as sub-librarian at the Institute (1862–72), and professor of Archaeology at the Bibliothèque Nationale (1874–83), until his robust health finally broke down in Calabria from sheer over-work, together with the effects of a wound received when serving as a volunteer during the siege of Paris. He returned to Paris to die—a true martyr to science—December 9, 1883. Perhaps there was never a scholar who gained laurels on so many fields as Lenormant, and certainly no man ever brought to the study of the past a greater combination of exhaustive learning, wide grasp of detail, and brilliant intuition, with unwearied enthusiasm and luminous power of exposition. From numismatics and archaeology proper he passed perhaps too easily to Assyriology, comparative philology, ancient history, and biblical antiquities; still, he has left behind works of the greatest interest and value in these widely different fields. His divination rather than discovery of the existence of a non-Semitic element in the language of the cuneiform inscriptions—the Accadian—was perhaps his greatest contribution to science, but it would be difficult to overpraise his essay on the propagation of the Phœnician alphabet, and his great and brilliant constructive work—one of the best attempts ever made to buttress the historical value of the early books of the Bible—*Les Origines de l'Histoire d'après la Bible* (3 vols. 1880–84).

Other works are *Manuel d'Histoire Ancienne de l'Orient* (3 vols. 1868–69; 9th ed. 1881, with a 4th vol. by Babelon, 1885); *Lettres Assyriologiques* (5 vols. 1871–79); *Les Premières Civilisations* (2 vols. 1874); *Les Sciences Occultes en Asie* (2 vols. 1874–75); *La Monnaie dans l'Antiquité* (3 vols. 1878–79); *Monnaies et Médailles* (1883); and *La Grande Grèce* (3 vols. 1881–84) and *A travers l'Asie et la Lucanie* (2 vols. 1883).

Lens, a coal-mining town of France, in the department of Pas-de-Calais, 17 miles by rail SW. from Lille. At Lens Condé defeated the Archduke Leopold on 20th August 1648. The greatest coal-dust explosion in history took place in one of its mines in 1906. In the Great War the town, which had a population of 32,000, was destroyed.

Lenses. A lens is a piece of glass so shaped as to refract rays of light really or apparently radiating from a point, and make them deviate so as to pass, or to travel on as if they had passed, through another point. Every system of lenses, however complicated and whatever be the mutual distances of the lenses, will, if the whole be centred on a common axis, produce a real image somewhere in front of, or else will appear to produce a virtual image somewhere behind, the last refracting surface. The rays on being traced through the complex combination—e.g. a telescope—undergo numerous deviations: ultimately there is a deviation which might have been equally produced by an *equivalent lens*; equivalent, however, in no other sense than as producing an equal ultimate deviation, for the image is not formed in the same place as the single 'equivalent lens' would have formed it in. The system of lenses is approximately equivalent in its action to a simple lens *plus* a determinate shifting of the focus. Hence a simple lens-diagram, modified so as to represent this shifting, will represent the aggregate effect of the most complex system of lenses. When the subject was looked at from this point of view it was found by Gauss, followed up by Listing, that the whole theory of lenses can be treated generally; the most complex system of lenses can be replaced in every case by a region of space traversed by the common axis of the lenses, at right angles to which axis there are six characteristic planes, the relative positions of which to some extent depend upon the refracting media and their forms and mutual distances, but which also present certain invariable properties and mutual relations. These six planes are (1) the incidental focal plane (F, fig. 1); (2) the incidental principal plane, P, and (3) the incidental nodal plane, N; (4, 5, and 6) the refractive principal, nodal, and focal planes, P', N', and F'. The principal properties of these planes are: all pencils of rays

Fig. 1.

converging from any point on the incidental focal plane F (provided in this as in all other cases that no ray is so far from the axis as to give rise to spherical aberration) emerge parallel to one another; conversely, all rays incident parallel to one another come to a focus at a point in the second focal plane F'. An object on one principal plane, P, has an equal-sized image on the other, P'. Any ray appearing on incidence to make for the point where one nodal plane, N, cuts the axis, emerges parallel to its former course, but apparently coming from the corresponding point in the second nodal plane, N'. Rays arriving parallel to the axis pass on emergence through the axial point of the focal plane F'; rays passing through the corresponding point in plane F emerge parallel to the axis. These axial points are the Foci of the lens-system. These properties are diagrammatically

shown, with exaggeration of the distances of the rays from the axis, in fig. 1.

In this diagram the six planes are represented as equidistant; they are generally not so; their

Fig. 2.

position has to be calculated. The calculation (see Pendlebury, *Lenses and Systems of Lenses*) necessitates the use of standard formulæ involving continued fractions; the physical principle underlying these is that the image (real or virtual) produced by one refracting surface is taken as the object of the next, and so on in succession until the position and deviation of the emergent rays is established. The fixed relations between the mutual distances of these planes are: $FN = P'F'$; $F'N' = PF$; and $PF = P'F'/\mu$, where μ is the ratio between the refractive index of the final and that of the original medium. The matter is greatly simplified when, as in the ordinary case, the final and the original media are the same (lens or telescope in *air*); then $\mu = 1$, each nodal plane coincides with the corresponding principal plane, and $FP = F'P'$. The diagram takes the form indicated by fig. 2. If we come now to the simplest case, that of a single thick lens in *air* (fig. 3), the standard formulæ, according to this method, are $AF = -\mu r r' - (\mu - 1) t r / \Delta(\mu - 1)$; $A'F' = \mu r r' - (\mu - 1) t r' / \Delta(\mu - 1)$; $AP = -t r / \Delta$; $A'P' = -t r' / \Delta$ and $PF = -P'F' = -\mu r r' / \Delta(\mu - 1)$; where Δ stands for $\{u(r' - r) + (\mu - 1)t\}$. In these formulæ r is the radius of the A surface, measured towards the centre and towards the right; r' that

Fig. 3.

of the A' surface, measured in the same way; t is AA' , the thickness of the lens; μ is its refractive index as compared with that of the surrounding medium, e.g. *air*. As an example, let us apply these formulæ to a biconvex lens of crown-glass, $\mu = 1.500$: let the radii be $r = +4$ inches at A and $r' = -6$ (negative because measured to the left) at A'; and let the thickness be 1 inch. Putting these numerical values instead of the letters in the formulæ, we get $AF = -4.69$ inches; F is 4.69 inches from (to the left of) the A surface. $A'F' = +4.55$ inches; F' is 4.55 inches from A'. $AP = +0.28$; the principal plane is to the right of A, inside the lens. $A'P' = -0.41$; the second principal plane is to the left of A', inside the lens. The two principal planes are therefore both inside

the lens, 0.31 inch apart, and are nearer the more curved face of the lens. The distance $FP = F'P'$, between either focus and the corresponding principal plane, is 4.96 inches, and this is the *focal distance* or the focal length of the lens; this, not the distance between the focus and the centre or the surface of the lens. The two focal distances are equal; hence if we could by reversing the lens make the principal planes exchange places, the action of the lens would be the same in both positions; but this cannot be done with an unsymmetrical thick lens by simply reversing it in its setting, on account of the unsymmetrical position of the planes within the lens. If we take the ten

Fig. 4.

cases in which the lenses are respectively: (1) biconvex (r positive, r' negative; equiconvex if $-r = r'$); (2) plano-convex ($r = \infty$ and $1/r = 0$; r' negative); (3) convexo-plane ($r +, r' = \infty$, $1/r' = 0$); (4) biconcave ($r -, r' +$); (5) plano-concave ($r = \infty$, $r' +$); (6) concavo-plane ($r -, r' \infty$); (7) convex meniscus ($r +, r' +, r'$ greater than r); (8) concave meniscus ($r -, r' -, r$ numerically greater than r'); (9) convexo-concave ($r +, r' +, r$ greater than r'); (10) concavo-convex ($r -, r' -, r'$ numerically greater than r)—we find, on giving the proper signs to the respective terms in the standard formulæ above, that in lenses with a flat face one of the principal planes coincides with the vertex of the curved surface; that in all double concave and practically in all double convex lenses the principal planes are within the lens itself; that in lenses 7 and 8 the planes lie outside the convex face until the concave face is flattened so far as to draw one of them upon the lens; and that in lenses 9 and 10 the planes lie outside the concave surface until its curvature increases so far as to draw the nearer plane into the lens. We also find that in all simple lenses whose edges are thinner than their centres PF is negative (i.e. F is to the left of P), and the lens makes parallel rays incident upon it to converge upon some point in the opposite focal plane; while in thick-edged lenses PF is positive and $P'F'$ negative, and the planes lie in the order $F'P'P'F$; those rays which were parallel before incidence being divergent on

Fig. 5.

emergence, and holding a course as if they had come from some point on that focal plane which lies on the same side of the lens as the source itself. When the incident rays are parallel to the axis and to each other, on emergence they converge really upon the opposite focus of a thin-edged lens or appear to diverge from the virtual focus of a thick-edged lens.

When the incident rays diverge from a point not on the focal plane they come to a focus at a definite point elsewhere than on the second focal plane. Fig. 5 diagrammatically illustrates this for a convergent lens. A pencil from X converges on X' : the geometry of the figure shows (by similar triangles) that $FP/XP + F'P'/X'P' = 1$. Hence, if PF or $P'F'$, the focal length, be written f , and the distances XP and $X'P'$ be written d and d' , then, numerically, $f(1/d + 1/d') = 1$. Fig. 6 illustrates

Fig. 6.

the same thing for a divergent lens: $FP/XP - F'P'/X'P' = -1$, or, numerically, $f/d - f/d' = -1$. These equations give, numerically, the relations between d and d' , the distances of the object X and the image X' respectively from the corresponding principal planes P and P' . The general numerical formula which covers these relations is that if $d = XP$ and $d' = X'P'$ and $PF = P'F' = f$, f being taken as numerically negative in convergent and positive in divergent lenses, then

$$f\left\{\frac{1}{d} + \frac{1}{d'}\right\} = -1.$$

If an object occupy a plane passing through X at right angles to the axis, the corresponding image will (aberration apart) be in a similar plane passing through X' . Fig. 7 shows rays from three points of an object passing through the nodal points P and P' and emerging parallel to their former courses.

Fig. 7.

The size of the image is easily seen to be to that of the object as d' is to d . In a convergent lens the image of a distant object is inverted and *real*; there is a real crossing of rays in the image, and the real image is formed suspended, as it were, in space, invisible from points not in the path of the rays; a screen of card, of ground glass, or of tissue paper may be placed so as to coincide with the real image, which then becomes visible on the screen: if the eye be removed to a sufficient distance in the path of the rays the inverted real image in space itself becomes visible as an object in space between the lens and the observer, an inverted reproduction of the original object; and this inverted copy is, for all distances between the object and the lens exceeding twice the focal length, smaller than the original object, and for all such distances between twice and once the focal length it is greater than it. When the object is placed within the focal distance d is less than f , and d' is therefore numer-

ically negative; the image is *virtual*; no screen will at any place receive an image; but the rays come to the eye as if they had proceeded from a larger object more remote from the lens on the original side of it; whence such lenses are commonly employed as magnifying glasses. Whenever the image formed is a real one the object and the image are interchangeable; an object placed in the position of the real image will produce a real image on a screen placed in the position of the original object. A comparison of fig. 6 with figs. 5 and 7 will show that the virtual image formed by a divergent lens is smaller than the object and is not inverted.

In all these cases the lenses are supposed to have an appreciable thickness. If, however, we assume that the thickness is negligible, the formulæ given above are modified by suppression of all terms containing t ; they become simply $PF = AF = f = -rr'/(μ - 1)(r' - r)$, or $1/f = -(\mu - 1)(1/r - 1/r')$; and $AP = 0$. Whence the principal planes coalesce and blend with the surfaces; and the ordinary lens-formulæ are obtained, in which f , the focal distance, means half the distance between the two focal points. The result is only approximate, as the numerical example already discussed will show when treated in this way. There $r = +4$; $r' = -6$; $\mu = 1.500$; whence $f = -\{ \frac{1}{4}(\frac{1}{4} + \frac{1}{6}) \}^{-1} = -4.8$ inches, and the distance between the two foci is inferred to be 9.6 inches; whereas we have previously seen this distance (including PP') to be 10.24 inches. On the assumption now made, a lens is reversible; for in the formula we find that when the radii exchange places both change their signs, the result being the same. On giving the proper signs and numerical values to r and r' in the simplified formula, it is easy to arrive at the numerical value of f for a lens of any form: if f be negative, the lens is convergent (thin-edged); if positive, it is divergent. Then, f having been found, the relation between f , d , and d' can be found by giving d and f their proper signs and numerical values in the general equation $f/d + f/d' = -1$. If we find d' negative we infer a virtual, if positive a real image. For example, a crown-glass lens ($\mu = 1.500$), biconcave; $r = -4$ inches; $r' = +4$; $1/f = -(1.5 - 1)(\frac{1}{-4} - \frac{1}{4}) = +\frac{1}{4}$; $f =$

$+4$, a divergent lens. Object at distance, say, $d = 196$ inches; $\therefore d' = -196/50 = -3.92$ inches; a virtual image, smaller than the object in the ratio of 3.92 to 196, or one to fifty. Again, a similar lens, but biconvex; $r = 4$; $r' = -4$; $\therefore f = -4$ inches, a convergent lens. Let the object be at 204 inches; $d = 204$; $f = -4$; $\therefore d' = 4.08$ inches—a real image, smaller in the ratio of 4.08 to 204, or one to fifty. Let the object be at $d = 3\frac{1}{2}$ inches; $\therefore d' = -28$ and the image is virtual, enlarged in the ratio of $28/3\frac{1}{2}$, or eightfold, by the use of the lens as a magnifying glass. The nearer the object to the focus the greater the enlargement. To make the image equal in size to the object, d must be equal to d' ; then $-f/d + -f/d = -1 = -2f/d$; and $d' = d = 2f$. With a convergent lens adjust the positions so that the object and its image on a screen are of the same size; then they are at a distance of four times the focal length from each other. In this way, neglecting the thickness, the focal length of a convergent lens may be ascertained. But we may find the *true* focal length of a convergent lens, say of a camera lens; focus on an object of known size, say a scale, at any distance; the real image on the screen (or the developed photographic plate) reproduces the original on the scale of $m:1$. Mark the amount of extension of the camera. Repeat this with the object at some other distance; the reproduction is now on the scale $m':1$; the camera-extension has been altered by e inches, which we can readily

measure. Then this $e = (m' - m)f$, which gives f in inches. If the first focussing be on infinity, we need only one plate; then the additional extension required for focussing on this, e inches, $= mf$, and $f = (e/m)$ inches, from nodal point to screen. A divergent lens has its focal length approximately measured by conjoining it with a convergent one, which neutralises or overbalances its effect: if $-F$ be the focal length of the convergent combination, $-f$ that of the convergent lens, and f (unknown) that of the divergent lens,

$$-\frac{1}{f} + \frac{1}{f} = -\frac{1}{F};$$

the deviation produced by a lens is inversely proportional to its focal length, and the equation states the proposition, approximately, that the convergence produced by the one, together with the divergence produced by the other, is equal to the convergence produced by the combination.

When the light from an object is mixed the refractive index μ differs for each colour; the distance of the image is different for each spectral colour; thus a series of images are formed behind one another, the violet in front and the red behind; those behind are larger and overlap, and therefore the image appears to have a spectral fringe of colour, red outside. To prevent this chromatic aberration images of two or more colours, say the blue and orange, should be brought to the same plane and be of the same size; this is done for two colours or wave-lengths by combining a crown-glass convergent of excessive power with a flint-glass divergent lens; the curvatures are so chosen that the spectral dispersion produced by the one is compensated by the re-combination produced by the other; but, since in the two materials the refractions and dispersions are not proportional to one another, there remains a balance of deviation accomplished without chromatic dispersion. Newton thought dispersion and deviation to be always proportional to one another, and achromatism therefore impossible; Dr Hall in 1733 found this not to be so, and made achromatic lenses, but did not publish his discovery. Dollond in 1757 first introduced achromatic lenses. When two colours are achromatised there is still some chromatic aberration as regards the rest; to bring a greater number of colours to the same focus requires a greater number of refracting surfaces.

In all the preceding it has been assumed that the lenses are narrow, or that the pencils of rays fall on the centre of the face, and that the objects are small. When the object is viewed by the lens under a wide angle a plane object gives an ellipsoidal, paraboloidal, or hyperboloidal image, which, when real, cannot be wholly received in focus upon a plane screen; and oblique rays fail to converge upon precise points, and hence, even on a screen so curved as to receive the oblique pencils of rays when at their greatest concentration, the image will not be equally distinct all over. Further (spherical aberration), if the lens be too wide, or its curvature too considerable, the rays falling on different zones of the lens are, as it were, received by prisms of different angle; those incident on exterior zones are more sharply refracted than those nearer the axis, and their focus lies at a point some distance nearer the lens than the geometrical focus (longitudinal aberration), and the image is thus distorted, so that the image of a square object formed by a single convex lens appears to be drawn out at the corners, and that formed by a concave lens appears to have its corners squeezed in; besides which there is blurring, for pencils incident near the edge have their foci not even on the axis, but short of it. To remedy these defects, which cannot all be thoroughly dealt with at the same

time, various 'aplanatic' combinations of lenses of different curvatures have to be employed to build up a compound 'equivalent lens'; and these combinations have to be adapted to the particular purpose for which the lens-system is to be used (see Southall, *Geometrical Optics*, 1911). The property of refracting light-rays possessed by lenses necessarily applies also to heat and actinic rays; whence the use of lenses as burning-glasses (in which parallel heat-rays from the sun are brought to a focus at the principal heat-focus of the lens) and photographic lenses. The heat-focus is somewhat farther from, the actinic focus nearer to, the lens than the light-focus is; but, by the application of the principles of correction for chromatic aberration, the visual and the actinic foci are, in the last case, made to coincide.

Lent (O.E. *Lencten* = Ger. *Lenz*, 'spring'; Gr. *Tessarakostē*; Lat. *Quadragesima*—hence Ital. *Quaresima*, Sp. *Cuaresma*, Fr. *Carême*), the period of fasting before Easter. Such an observance was old even in the days of Irenæus, but without any uniformity—some fasted one day, others two; but the period was gradually extended by the 4th century to about forty days. The Greeks from the 6th century have commenced their abstinence from meat on the Monday in Sexagesima week, and from cheese, &c., on the Monday in Quinquagesima week; Sundays and Saturdays and the Feast of the Annunciation being deducted. In the West only Sundays were excepted from the fast, which sometimes began with Sexagesima or Quinquagesima, until, in the 8th or 9th century, it was finally fixed to commence with Ash Wednesday (q.v.), between which day and Easter-Sunday (omitting the Sundays, on which the fast is not observed) forty clear days intervene. The rigour of the ancient observance, which excluded all flesh, and even the so-called 'white meats,' is now much relaxed; but the principle of permitting but one meal, with a slight refectory or collation, is everywhere retained. In the Anglican Church Lent is retained as a church season of the calendar, with special services, and proper collects and prayers; but the observance of the fast is left to the discretion of each individual. See FAST; also HOLY WEEK.

Lenthall, WILLIAM (1591–1662), barrister, was born in Henley, entered St Alban Hall, Oxford, and was Speaker of the Long Parliament (1640–53). He was again made Speaker in 1654, and in 1657 became one of Cromwell's peers.

Lentibulariaceæ, an order of dicotyledonous plants, with lipped flowers. It has intimate relations with Scrophulariaceæ. It contains nearly 300 known species, all herbaceous, and all living in water or marshes. They abound chiefly in the tropics. A few species of Bladderwort (see INSECTIVOROUS PLANTS) and Butterwort (q.v.) are its only representatives in Britain.

Lenticels. See BARK.

Lentil (*Lens esculenta*), an annual plant belonging to the order Leguminosæ. It is a native of the countries bordering on the Mediterranean, and has been cultivated from the very earliest times. In Egypt and Syria it is still made into pottage, and another favourite mode of cooking it in those countries is by parching it in a frying-pan. The lentil is extensively cultivated in the warmer parts of Germany, France, and the south of Europe generally. It is also cultivated to some extent in Asia. The Hindus, in common with the Egyptians, regard it as the best food on which to undertake long journeys or laborious work. Flour of lentils is highly nutritious, and contains, according to Playfair, more nitrogenous matter than any other edible leguminous plant. Einhoff found in 3840 parts of lentils 1260 parts

starch and 1433 parts analogous to animal matter. The foods known as *Revalenta arabica* and *Ervalenta arabica* (words compounded of the botanical names *Errum*, *Lens*) are simply specially prepared forms of the flour of

lentils, in no way superior to the ordinary flour which can be purchased at greatly less prices. Mixed with peas in the making of pea-soup, lentils diminish the tendency to flatulence, and lentil soup is much esteemed by vegetarians and others in Britain. By Roman Catholics lentils are eaten during Lent, both in soups and in the form of haricots, as a substitute for flesh-food. The lentil is a weak, straggling plant, rarely exceeding 18 inches high, often much more dwarfed, having pinnate leaves terminating in tendrils. The flowers are white, lilac, or pale blue, small, and formed like those of a pea. There are

Lentil.

three varieties of lentil recognised in the countries in which it is cultivated: the small brown, which is the lightest flavoured and the best esteemed for soups and haricots; the yellow variety, which is slightly larger; and the lentil of Provence, which has seeds as large as a small pea, but is better appreciated as fodder for cattle than for the grain as food for man. It has been frequently suggested that lentil might be grown as an agricultural crop in Britain, and its cultivation has been attempted, but without success, not so much from deficiency of warmth as from excess of atmospheric moisture. It is sown at the rate of about 1½ bushel per acre, and its cultivation and harvesting are similar to those of the Tare (q.v.), to which it is related. The produce in grain is fully a fourth less than that of the tare, and in respect of straw it does not yield a third of the weight of that crop. The grain, however, on the Continent sells at twice the price of peas.

Lentini, a town of Sicily, stands east of Lake Lentini, near the site of the ancient Leontini, 17 miles by rail S. by W. of Catania. Pop. 26,000.

Leo, the fifth sign of the Zodiac (q.v.).

Leo, the name of thirteen among the popes of the Roman Catholic Church, of whom the following call for particular notice.—**LEO I.**, surnamed 'the Great,' who is held a saint of the Roman Catholic Church, and is one of the most eminent of the Latin Fathers, was born of a distinguished family at Rome about the end of the 4th century. On the death of Sixtus III. in 440 Leo was chosen as his successor. It is in his pontificate that the regular series of papal letters and decretals may be said to commence. Leo's letters, addressed to all parts of the church, exhibit prodigious activity and zeal, and are used by Roman controversialists as an evidence of the extent of the jurisdiction of the Roman see. In a council held at Rome in 449 he set aside the proceedings of the Council of Ephesus, which had pronounced in favour of Eutyches (q.v.), summoned a new council at Chalcedon, in which his legates presided, and in which Leo's celebrated 'Dogmatical Letter' was accepted 'as the voice of

Peter.' He interposed with Attila (q.v.) in defence of the Roman city and people, and subsequently with Genseric (q.v.). Leo died at Rome in 461. His works, the most important of which are his Letters and Sermons, were first printed in 1479, and afterwards by Quesnel (2 vols. Paris, 1675); but much better editions are those of Cacciari (1753-55) and Ballerini (1757). See books by Arendt (1835), Perthel (1843), Saint-Cheron (1846), Gore (1880), and Feltoe (*Lib. Fathers*, xii., 1896).

The pontificate of **LEO III.** is chiefly noticeable as the epoch of the formal establishment of the Empire of the West. He was a native of Rome, and succeeded Hadrian I. in 795. During the greater part of the 8th century the popes, through the practical withdrawal of the Eastern emperors, had exercised a temporal supremacy in Rome, which was fully recognised by the gift of Pepin, and placed under the protectorate of the Frank sovereigns, who received the title of Patrician. The pontificate of Leo, however, was a troubled one, and in 799 he was treated with much violence, and obliged to flee to Spoleto, whence he afterwards repaired to Paderborn, in order to hold a conference with Charlemagne. On his return to Rome he was received with much honour by the Romans, and the chiefs of the conspiracy against him were sentenced to banishment. In the following year (800) Charlemagne, having come to Rome, was solemnly crowned and saluted emperor by the pope, and the temporal sovereignty of the pope over the Roman city and state was formally established, under the suzerainty, however, of the emperor. In 804 Leo visited Charlemagne at his court at Aix-la-Chapelle. With Charlemagne's successor, Louis le Débonnaire, Leo was embroiled in a dispute about the right of sovereign jurisdiction in Rome, which had not been brought to a conclusion when Leo died in 816.

LEO X., Giovanni de' Medici, the second son of Lorenzo the Magnificent, was born at Florence in December 1475. From his cradle he was destined to the ecclesiastical career. His education was entrusted to the ablest scholars of the age; and through the influence of his father with Pope Innocent VIII. he was created cardinal at the unprecedented age of thirteen years, in 1488. In the expulsion of the Medici from Florence, after the death of Lorenzo, the young cardinal was included, and he used the occasion as an opportunity for foreign travel. He was employed as legate by Julius II.; and during the war with the French he was taken prisoner in the battle of Ravenna, but soon afterwards effected his escape. On the death of Julius II., in 1513, Cardinal de' Medici was chosen pope at the early age of thirty-seven, under the name of **Leo X.** His first appointment of the two great scholars Bembo and Sadoleto as his secretaries was a pledge of the favour towards learning which was the characteristic of his pontificate; but he did not neglect the more material interests of the church and the Roman see. He brought to a successful conclusion the fifth Council of the Lateran (see **COUNCIL**) and the schism which was threatened by the rival Council of Pisa. He concluded a concordat with Francis I. of France, which continued to regulate the French church till the Revolution. In the political relations of the Roman see he consolidated and, in some degree, extended the re-conquests of his warlike predecessor, Julius II., although he also used his position and his influence for the aggrandisement of his family. His desertion of the alliance of Francis I. for that of his rival, Charles V., although the subject of much criticism, was dictated by a sound consideration of the interests of Italy. But it is most of all as a patron of learning and art that the reputation of Leo has lived with

posterity. Himself a scholar, he loved learning for its own sake; and his court was the meeting-point of all the scholars of Italy and the world. He founded a Greek college in Rome, and established a Greek press, which he endowed munificently (see *RENAISSANCE*). In the encouragement of art he was no less munificent. Painting, sculpture, architecture were equally favoured; and it is to his vast project for the rebuilding of St Peter's, and to the step to which he had recourse for procuring the necessary funds—his permitting the preaching of an indulgence, one of the conditions of obtaining which was the contribution to this work—that the first rise of the Reformation in Germany is ascribed. He himself seems to have regarded the movement as of little importance, describing it as 'a squabble among the friars'; and though he condemned the propositions of Luther, and issued a commission to inquire into his doctrines, his measures on the whole were not marked by much severity. His personal habits were in keeping with his taste—splendid and munificent in the highest degree; but in his moral conduct he maintained a strict propriety, and his character, although not free from the stain of nepotism, the vice of that age, and more modelled on the ideal of an enlightened prince than on that of a zealous and ascetic churchman, was beyond all imputation of unworthiness or irregularity. His death, which occurred rather suddenly on 1st December 1521, during the public rejoicings in Rome for the taking of Milan, was by some ascribed to poison; but there seems no solid reason for the suspicion.

See Roscoe, *Life and Pontificate of Leo X.* (1805); Audin, *Histoire de Léon X.* (6th ed. 1886); Hergenröther, *Leonis X. Regesta* (1884 et seq.); Ranke, *History of the Popes*; Symonds, *Renaissance in Italy* (1875-86); M. Creighton, *History of the Papacy during the Reformation* (vols. iii.-v. 1887-94); H. M. Vaughan, *The Medici Popes* (1908).

LEO XIII., the 258th Roman pontiff, was born at Carpineto, the son of Count Ludovico Pecci, 2d March 1810. From the Jesuit College of Viterbo and the schools of the Collegio Romano, Joachim Pecci proceeded to the College of Noble Ecclesiastics, where he greatly distinguished himself in mathematics, physics, and philosophy. In 1830 he sustained a public disputation in the last-named branch of learning, and carried off the first prize. He also frequented the schools of the Roman University to learn canon and civil law. Having become Doctor of Laws, he was appointed by Pope Gregory XVI. a domestic prelate and Referendary of the Segnatura in 1837. He then took holy orders, received from the pope the title of prothonotary apostolic, and was appointed in succession apostolic delegate at Benevento, Perugia, and Spoleto. He was a vigorous administrator, and while at Benevento put a stop to brigandage. Sent to Belgium as nuncio in 1843, he was created archbishop of Damietta to qualify him for the office. Three years later he was nominated archbishop of Perugia, and in the consistory of December 19, 1853, he was created a cardinal by Pius IX. He was a member of several of the congregations of cardinals—including those of the Council of Rites and of Bishops and Regulars—and in September 1877 he was selected by the pope to fill the office of Cardinal Camerlengo of the Holy Roman Church. In that important capacity he had control of all business except foreign affairs. Upon the death of Pius IX. in 1878 Cardinal Pecci was elected as the representative of the Moderates. He assumed the title of Leo XIII., and adopted an opposite policy to that of his predecessor. He restored the hierarchy in Scotland, and composed the religious difficulty with Germany, so that when

a dispute arose in 1885 between Germany and Spain as to the ownership of the Caroline Islands he was requested by Prince Bismarck to act as arbitrator. In political matters Leo permitted the Irish bishops to indulge their own views; but in May 1888 he issued a decree denouncing the methods adopted in the Irish Plan of Campaign. He manifested enlightened views in many directions, but on questions affecting the church and his own status as pontiff he held staunchly to his rights. He regarded himself as the despoiled sovereign of Rome, and as a prisoner at the Vatican; refused the income voted him by the Italian parliament; and persistently declined to recognise the law of guarantees. He protested against heresy and 'godless' schools, and in his encyclicals affirmed that the only solution of the socialistic problem is the influence of the papacy. He constrained the French clergy and the French monarchists to accept the republic, but encouraged the Hungarian Catholics to oppose the civil marriage law (1894). In 1883 he opened the archives of the Vatican for historical investigations, and he made himself personally known as a poet, chiefly in the Latin tongue. The jubilee of his episcopate in 1893 was celebrated even more heartily than that of his priesthood in 1887. In 1896 he issued an encyclical pronouncing Anglican orders null and void; and his encyclical of 1902 condemned the atheism and materialism of modern philosophical systems. He died 20th July 1903, at the patriarchal age of ninety-three.

See *Leonis XIII. Pont. Max. Carmina* (1883), and the *Lives* by De Waal (Münster, 1878), Vidien (Paris, 1879), O'Reilly (Cologne, 1887), Serclaes (Paris, 1894), Jeyes (1896), M'Carthy (1896), Narfon (trans. 1899); see also his *Addresses*, &c., in *The Pope and the People* (1895).

Leo III., 'the Isaurian,' ruler (718-41) of the Byzantine Empire (q.v.).

Leo Africanus (properly ALHASSAN IBN MOHAMMED ALWAZZAN), a Cordovan Moor, who at the close of the 15th century made extensive travels in northern Africa and Asia Minor. Falling into the hands of pirates, he was sent to Rome, and accepted Christianity; but is said to have returned to his old faith. He left an account of his African travels in Italian, which, first printed by Ramusio in 1550, was for long the chief source of information as to the Sudan.

Leobschütz, a town in German Upper Silesia, 24 miles by rail NW. of Ratibor, has large corn-markets; pop. 13,000.

Leocharēs, one of the most distinguished sculptors of the Attic school of the 4th century B.C., was a pupil of Scopas, and Pliny ascribes to him the sculptures on the west side of the Mausoleum (q.v.). He was one of the privileged artists who were permitted to make portraits of Alexander the Great. Three statues of Zeus are known to have been executed by him. His 'Ganymede carried off by an Eagle' was famous throughout the ancient world. In collaboration with Lysippus he produced a colossal group in bronze, which represented Alexander at a lion-hunt, while he himself was responsible for chryselephantine statues of Alexander and his family. The works of Leocharēs are all lost, but there is a copy of the Ganymede in the Vatican; and a bust of Alexander may be a copy of one of his.

Leo Hebræus. See ABARBANEL.

Leominster (pronounced *Lemster*), a market-town of Herefordshire, on the Lug, 13 miles N. of Hereford. A monastery was founded here in 658; and the fine church of a later priory presents every style from Norman to Perpendicular. It was restored in 1866, and enlarged in 1879. The quaint old timber Butter Cross or Markethall (1633) was

in 1855 transferred to a new site to make room for an Italian town-hall; there is also a corn exchange. There is a great trade in cattle, sheep, pigs, fruit, hops, and cider. Incorporated as a municipal borough by Queen Mary, Leominster till 1868 returned two members, and till 1885 one. Pop. 5500.

León, an ancient kingdom of Spain, equivalent generally to the modern provinces of León, Palencia, Valladolid, Zamora, and Salamanca. It was the earliest Christian kingdom, next after Asturias, to be formed in Spain, after the Moorish wave of conquest began to recede. It dates from the 10th century, and was united with Castile first by Ferdinand the Great in 1037, and finally in 1230.—The modern province has an area of 6000 sq. m. and a population of 436,000. The country, which is intersected by the Douro and the Minho, is mountainous, being invaded on the north by the Cantabrian Mountains. The soil is generally fertile. The inhabitants are for the most part uneducated and lazy, but honourable, hospitable, and good-natured; they have many peculiar customs, and all the pride of pure Spanish descent. In the high districts south of Salamanca there are remnants, as is believed, of the old Gothic tribes, and at Astorga the *Maragatos* are variously supposed to be descendants of the Celtiberi, the Visigoths, or the Moors.

León (the *Legio septima gemina* of the Romans), capital of the former kingdom and of the modern province of the same name, but now a sleepy agricultural town, is situated in a plain, 256 miles by rail NW. of Madrid. The beautiful cathedral (c. 1195–1512), a specimen of the purest Early Pointed, is French in character and probably in origin, but was so much 'restored' during 1855–86 that it is hard to say what is old and what modern; it contains the tombs of many sovereigns of León, saints, and martyrs. León is the centre of the Spanish linen-manufacture, and has a celebrated horse-fair; it was formerly the chief seat of the Spanish wool-trade. Pop. 22,000.

León, a city of Nicaragua, on an extensive plain, 35 miles SE. of its port, Corinto. Once the boast of Spanish America, founded at the head of Lake Managua in 1523, removed hither in 1610, and sacked by Dampier in 1685, it is now partly in ruins. The massive cathedral has been several times employed as a citadel during the civil wars, but has suffered very little. There is a university. Pop. 30,000.

León. See PONCE DE LEÓN.

Leonardo da Vinci, painter, sculptor, architect, and engineer, was born in 1452, at Vinci, a village in the Val d'Arno, between Pisa and Florence, the natural son of Ser Piero Antonio da Vinci, notary to the Signoria of Florence. His mother, named Caterina, afterwards married a villager of Vinci. He was educated in his father's house, and soon began to show signs of that bright and versatile genius which distinguished him through life. As a child he was especially remarkable for his aptitude for arithmetic, and for his skill in music and drawing. About 1470 he was placed by his father in the studio of Andrea del Verrocchio, by whom he was instructed in painting and modelling, and where he had Perugino and Lorenzo di Credi as fellow-pupils. So rapid was his progress that before long he began to take part in the production of his master's pictures, and his hand can still be traced in Verrocchio's 'Baptism of our Lord,' in the Academy at Florence. In 1472 his name appears in the books of the guild of painters as an independent artist, and he was patronised by Lorenzo de' Medici. His cartoon of 'The Fall,' mentioned by Vasari as designed for tapestry, has disappeared; indeed of his work of

this period, which included various marble figures and terra-cotta heads, all that now remains is an unfinished canvas of 'The Adoration of the Kings,' in the Uffizi, and a kneeling figure of 'St Jerome,' in the Vatican.

He would appear to have been about twenty-eight when he visited the East, serving as engineer to the sultan of 'Babylon' or Cairo, and visiting Cyprus, Constantinople, and Armenia; and in 1482 he settled in Milan, and attached himself to Lodovico Sforza, then guardian of his nephew the Duke Gian Galeazzo, whom he afterwards supplanted. An autograph memorandum, intended for presentation to his patron, still exists, in which, after stating his various qualifications as an architect and engineer, he concludes, 'I can execute sculpture, whether in marble, bronze, or terra-cotta; also in painting I can do as much as any other, be he who he may,' and particularly specifies his readiness to undertake the execution of a bronze equestrian statue of Lodovico's father, Francesco Sforza, the celebrated condottiere. Drawings for the general design and various details of this statue exist in the royal collection at Windsor. The model was exhibited in 1493; but the statue was destined never to be completed in metal, for the 100,000 pounds of bronze which Leonardo required for its casting were never forthcoming. The model still existed in 1501, but since then all trace of the work has been lost.

During the progress of this statue Leonardo was also engaged upon a picture which, even in its present faded and dilapidated condition, remains the best monument of his genius and one of the masterpieces of the world. This is the famous 'Last Supper,' commissioned jointly by the Duke and the monks of Santa Maria delle Grazie, to be painted on a wall of the refectory of the convent. It was completed in 1498, but its execution probably extended over several previous years. Bandonello, in one of his novels, has given us a vivid glimpse of Leonardo at work upon this great subject; of the hushed voices of the monks and their visitors as they watched the busy figure painting there from early dawn, wholly absorbed in his pursuit, and forgetting even to eat; and of how the artist would sometimes leave the mounted figure of Francesco which he was modelling in the citadel and return to the convent by the shortest way, merely that he might add to his picture a single touch or two. The moment of his chosen scene upon which the painter has seized is that when Christ has just pronounced the words 'One of you shall betray me,' and their effect upon the disciples is portrayed with the most delicate and subtle truth. There is an elaborate description and criticism of the work from the pen of Goethe. The after-history of the 'Last Supper' is a sad one. Owing to the dampness of the wall, and to the method of tempera-painting—not fresco and not oil—upon plaster that had been adopted, it soon showed signs of deterioration, and it has repeatedly been found necessary to retouch it (especially in 1904–8); yet still the profound feeling and dignified composition of the master do not fail to assert themselves. His sketches for various of its parts still exist at Windsor, in the Brera Gallery at Milan, and in the Louvre. It has been very frequently copied, and it was chiefly from a drawing made by Matteini from the copy by Marco d'Oggionno that Raphael Morghen executed his celebrated line-engraving, published in 1800.

Among other paintings done in Milan were portraits of Lucrezia Crivelli and Cecilia Gallerani, mistresses of the duke, works that cannot now be identified, though 'La Belle Ferronnière' of the Louvre has been regarded by some as the former likeness. The influence of Leonardo upon art in

Milan was clearly marked and lasting, for he founded an academy there in which Beltraffio and Andrea Salai, his favourite pupil, received instruction; and the great Bernardino Luini, whether or not he actually studied under the master, certainly imbibed and turned to his own uses many of the characteristics of his method. Leonardo was also much employed by his patron as an engineer. He devised a system of hydraulic irrigation of the plains of Lombardy, and acted as director of the court festivities and pageants.

After the fall and imprisonment of the Duke Lodovico in 1500 Leonardo retired to Florence, and by 1502 he had entered the service of Caesar Borgia, then Duke of Romagna, as architect and engineer, in which capacity he was entrusted with the most ample authority. Records of his work during this period appear in the note-books and maps preserved at Windsor. In the following year he returned to Florence, when he commenced a Madonna and Child with St Anne for the Servite monks, a subject, however, of which only the noble cartoon now in the Diploma Gallery of the Royal Academy, London, was completed.

We now reach the period of Leonardo's famous contest with Michelangelo, an artist who appears always to have regarded his elder rival with dislike and jealousy. Both painters received commissions to decorate the Sala del Consiglio in the Palazzo della Signoria with important historical compositions. Michelangelo chose a subject of 'Soldiers surprised while Bathing,' an incident from the Florentine wars with the Pisans. Leonardo dealt with 'The Battle of Anghiari,' 1440, in which the Florentines vanquished the armies of Milan. Two years were spent in the preparation of his cartoon; but, having employed a method of painting upon the plaster—probably with wax—which proved a failure, he in 1506 abandoned the work. The cartoon is now lost, but its general composition may be gathered from Lucens's engraving (1558), and from 'The Battle of the Standard,' engraved by Edelinck from a free copy by Rubens of its principal group. About 1504 was completed the most celebrated of Leonardo's easel-pictures, the half-length of Mona Lisa, third wife of Zanobi del Giocondo, upon which he had been engaged at intervals during four years—a work purchased by Francis I. for 4000 gold florins, and now one of the chief treasures of the Louvre. The colour here, as not seldom in the artist's work, has darkened with time, but still the picture remains a triumph of subtle and refined portraiture. Another work, now lost, portrayed the celebrated beauty Ginevra Benci; and Pacioli's *De divina Proportione*, published in 1509, contained sixty geometrical figures from Leonardo's hand. As had been the case in Milan, so here in Florence he powerfully influenced contemporary artists. Fra Bartolommeo, Jacopo da Pontormo, Ghirlandajo, and the sculptor Bandinelli all profited by his example.

The final period of Leonardo's life was spent in the service of France. In 1506 he visited Milan; and in the same year he was employed by Louis XII., who died in 1515, when Leonardo was in Rome, competing with Michelangelo for the execution of the façade of San Lorenzo in Florence. The young French king, Francis I., bestowed on him, in 1516, a yearly allowance of seven hundred scudi, and assigned to his use the Château Cloux, near Amboise; and it was here that the great artist expired, 2d May 1519. The well-known story that he died in the royal arms is untrue. Among his later works is 'The Virgin of the Rocks,' now in the National Gallery, London, of which a varying version is preserved in the Louvre, where also is another of his works of the time, a figure of 'St John the Baptist,' and a 'Saint Anne,'

somewhat similar in design to the Royal Academy cartoon.

In his art Leonardo was hardly at all influenced by the antique; his practice was founded upon the most patient and searching study of nature. He occupies a supreme place as an artist in virtue of his unrivalled power of delicate draughtsmanship, of his nobility of style and command over the subtleties of expression, of his skill in chiaroscuro and easy mastery of the complexities of light and shade, of modelling and relief, and of aerial perspective. So few in number are the authentic, completed, and well-preserved works by his hand that have reached us that he may be most fully studied in his drawings. Rich collections of these are preserved in the Ambrosian Library, Milan; the Louvre, Paris; the Royal Gallery, Florence; the Albertina Gallery, Vienna; the Academy, Venice; the British Museum; and the Royal Library, Windsor. His celebrated 'Trattato della Pittura,' dealing with all departments of the painter's art, was published in Italian in 1651, translated into French in the same year, and into English in 1721; but a more complete manuscript was discovered by Manzi in the Vatican, and by him published in 1817. His contemporaries bear witness to the splendid personal appearance of Leonardo; but the only undoubted portrait of him that survives is the noble bearded head in the Royal Library, Turin, a red chalk drawing by his own hand.

See fac-similes of his manuscripts (1889-95), and books on him by Richter (1880-83), Mrs Heaton (1874), Uzielli (1872-85), Séailles (1892), Müntz (trans. 1898), Rosenberg (1903), Gronau (trans. 1915), M'Curdy (1905), Von Seidlitz (1909), This (1913), and Siren (1911; trans. 1916).

Leoncavallo, RUGGIERO (1858-1919), born at Naples, was educated mainly there, but shows marked traces of German influence. His *Crepusculum* was praised by Wagner, but he is best known by his opera *I Pagliacci* (1892). *Lu Bohème* and *Tommaso Chatterton* are other works.

Leonforte, a walled Sicilian town, 49 miles by rail W. by N. of Catania; pop. 20,000.

Leoni, LEONE (1699-90), goldsmith, medallist, and sculptor, worked at Milan, Genoa, Brussels, and Madrid, and was the rival of Benvenuto Cellini in talent, in vice, and in violence. See the monograph by Plon (Paris, 1886).

Leonidas I., son of Anaxandrides, king of Sparta, succeeded his half-brother, Cleomenes I., about 491 B.C. When the Persian monarch Xerxes approached with an immense army Leonidas opposed him at the narrow pass of Thermopylæ (480 B.C.) with a force of 300 Spartans, and rather more than 5000 auxiliaries. The Persians attempted in vain to win over Leonidas by the promise of making him ruler of the whole of Greece; and when Xerxes sent a herald calling the Greeks to lay down their arms, the Spartan answered: 'Let him come and take them.' The treachery of one Ephialtes having made it impossible to bar any longer the progress of the foe, Leonidas and his little band, having sent away the auxiliary force, threw themselves on the swarming myriads, and found a heroic death.

Leonine City. See ITALY.

Leonine Verses, irregular forms of Latin verse which arose in the middle ages under the influence of the minstrels, who applied the accentual system of verse to Latin in defiance of quantity. They were used for epigrams, satires, and also for the hymns of the church, and were fairly naturalised in Europe by the end of the 11th century. The name specially applies to verses rhymed as well as accentual, and more especially to groups

of alternate hexameter and pentameter verses, rhymed at the middle and end. They owe their name to Leoninus, a canon of the church of St Victor, in Paris, about the middle of the 12th century, or, as others say, to Pope Leo II., who was a lover and improver of music. The finest poem in this form is the famous *De Contemptu Mundi* of Bernard of Morlaix. A familiar example is the couplet :

*Dæmon languebat, monachus tunc esse volebat,
Ast ubi convuluit, mansit ut ante fuit.*

Another is the famous epitaph of Bede in the Galilee Chapel of Durham Cathedral :

Hæc sunt in fossâ Bædæ venerabilis ossa.

Traces of this kind of versification appear here and there in the Roman poets, especially in Ovid, in some of whose Epistles, indeed, they are as common on an average as once in every eight lines. An example from Ovid is

Quot cælum stellæ, tot habet tua Roma puellæ.

Camden gives some curious specimens from Walter de Mapes, Michael, the Cornish poet, and Dan Elingham, a monk of Linton. The story of the Jew who, having fallen into a refuse-pit on Saturday, would not be helped out, because it was *his* Sabbath, while the Christian, who offered him assistance, refused to do so *next* day, because it was *his*, runs thus in Leonine verse :

*Tende manus, Salomon, ego te de stercore tollam;
Sabbata nostra colo, de stercore surgere nolo.
Sabbata nostra quidem, Salomon, celebrabis ibidem.*

Leontini. See LENTINI.

Leontius of Byzantium, a monk who wrote against various heresies in the 6th century. There is a monograph on him (in German) by Loofs (1887).

Leontopodium, a small genus of Compositæ spread over the Alpine regions of Europe and Asia, and of the Andes, but descending in Siberia and Northern China with *L. sibiricum* into the plains. The best known species is *L. alpinum*, the Edelweiss (q.v.). From Mount Everest are recorded *L. fimbriligerum*, *L. Stracheyi*, and *L. monocephalum*, ranging from 4800 to 6000 metres. *L. microphyllum* is found in the Formosan Mountains.

Leopard (*Felis pardus*), one of the larger Felidæ (q.v.), now generally supposed to be identical with the panther. Great confusion has prevailed in the nomenclature: the *panther* and *pardalis* of the ancients are not certainly known; the jaguar was erroneously described as the panther by Buffon; the puma is often called panther in America; the leopard is known by the name of tiger in Africa; and, as Sir J. E. Tennent tells us, it is by mistake often called cheetah in Ceylon. The leopard is at home in Africa, from Algeria to the Cape Province; it is also found in Asia, from Palestine through Central Asia to Manchuria. The ancients, distinguishing the leopard by non-existent attributes from the panther, gave it the name on the supposition that it was a hybrid between the lion (*leo*) and the pard or panther (*pardus*); as the giraffe or camelopard was thought to be a hybrid of the camel and the pard.

Suppose the leopard and panther to be one species, we may describe it as characterised by a peculiar gracefulness, slenderness and flexibility of form, with a very long tail, and spotted fur, the spots being arranged in numerous rows along the sides, and each spot composed of five or six small spots arranged in a circle or rosette. The general colour is yellowish; the lower parts lighter; the spots darker than the general colour of the fur. A black variety is known which is not a distinct species. The leopard is extremely agile, and possesses the power of leaping and also that of climbing trees in great perfection. It haunts

wooded places, and is seldom to be found in open regions of long grass, like the tiger. Deer and antelopes are its habitual prey; but it is equally ready to feed on pigs, poultry, or whatever animals

Leopard (*Felis pardus*).

may be found in the vicinity of a farm or village. The size and strength of the leopard render it as dangerous to man as any of the Felidæ; but it generally seems to dread and flee from man, unless assailed. It is very capable of domestication.

Leopardi, GIACOMO, the most distinguished poet of modern Italy, was born at Recanati, in the March of Ancona, 29th June 1798. Both his parents were noble; but both were poor. The conditions of Leopardi's early life were certainly uncongenial, though his inherited temper disposed him to exaggerate everything distasteful to his own instincts. His father had the predilections of a scholar; but in religion and politics he was a reactionary, and in the management of his family unsympathetic and arbitrary. From the first there was no real bond of sympathy between father and son, and the mother, though kindly and conscientious in the discharge of her duties, does not seem to have touched her son's heart. All through his boyhood Leopardi was an omnivorous reader; and his faculty of acquisition can be compared only to that of the younger Scaliger. By the age of sixteen he had read through all the Latin and Greek classics, and could write with accuracy French, Spanish, English, and Hebrew. That he also read with insight is proved by the fact that at sixteen he wrote a commentary on Plotinus, of which Sainte-Beuve could say that 'one who had studied Plotinus all his life could find something useful in this work of a boy.'

Leopardi was unhappy at home; and, conscious of his own extraordinary gifts, he eagerly desired to visit Rome, where he hoped to find the ideal world of the scholar and man of letters. From conscientious though petty scruples, his father long opposed this wish; but at length, in the strangely mistaken hope that Giacomo might at Rome be led to enter the church (for which he had been originally intended), he gave his permission (1822). A year's residence in Rome wrought in Leopardi a disillusion, which gave the final bent to his fundamental views of life. It was the time, it is to be remembered, when Italy was demoralised by the French domination; and in Rome itself the tone even of the best society was despicable. An acquaintance with Niebuhr and Bunsen, both of whom spoke of him as a prodigy, was almost the sole redeeming experience in the capital of Italy. It was with feelings of relief, therefore, that in 1823 he returned to Recanati. For the next ten years, partly of choice, but also largely of necessity, he devoted himself to literature. From his earliest days he had been of feeble and sickly constitution,

and as he grew older his ill-health became more frequent and overmastering. As a confirmed invalid, he lived successively in Bologna, Florence, Milan, and Pisa, and finally quitted Recanati in 1830. In 1833 he accompanied his devoted friend Ranieri to his house in Naples, and there in constant bodily anguish and hopeless despondency he lived till 1837. He died on the 14th of June in that year.

Leopardi claims recognition at once as a scholar, a poet, and a thinker. Had his health permitted, and had he so chosen to devote his powers, there can be no question that he would have taken his place in the front rank of the students of antiquity. Immediately subsequent to his death the original productions of Leopardi were classed with the highest creative efforts the world has seen. His *Operette Morali*, consisting mainly of dialogues in which he expounds his peculiar philosophy, were compared for originality and power with the writings of Pascal, the writer whom he at least most closely resembles in tone of mind as well as in physical constitution. As a poet it was asserted that Dante alone of all the Italians was his equal in expressiveness of character and genius. Of late years, however, a more sober estimate has been formed of Leopardi's claims both as a poet and thinker. It is now generally recognised that his narrow range of sympathy and the essentially feeble spring of his nature debarred him from the highest creative effort. The pessimism of which he is the recognised exponent in poetry, and which is equally the burden of his prose, was unquestionably the genuine expression of Leopardi's deepest nature as well as of his reasoned conviction. The note of pessimism has often been sounded by other poets besides Leopardi; but it remained for him to extract its full poetic context from a philosophy, the first and last word of which is the 'void and nothingness' of all human life and effort.

The works of Leopardi were edited in 1845 at Florence by Ranieri in six volumes, in 1923 at Oxford by G. Bickelsteth, with verse translation. The most noteworthy of his writings are, in poetry, his *Cante and Canzoni*, and a piece entitled 'Continuation of the Battle of the Frogs and Mice'; and, in prose, the Dialogues and Essays classed under the title *Operette Morali*. See Gladstone's *Gleanings*, vol. ii.; Sainte-Beuve, *Portraits Contemporains*, tom. iii.; and books by Carducci (1898), De Roberto (1898), and Bertacchi (1917).

Leopold I., king of the Belgians, son of Francis, Duke of Saxe-Coburg, and uncle of Queen Victoria, was born at Coburg on 16th December 1790. After receiving an excellent literary and scientific education he became a general in the Russian army, and was present at the battles of Lützen, Bautzen, and Leipzig. Whilst on a visit to England after the peace of 1815 he won the affections of the Princess Charlotte (q.v.), the heiress of the throne, married her, and was naturalised by act of parliament in 1816. The princess died in 1817; and Leopold twelve years later marriedmorganatically Caroline Bauer (q.v.). He received in February 1830 the offer of the crown of Greece, accepted it under conditions, but abdicated in May. In June 1831 he was elected king of the Belgians, and crowned at Brussels 21st July. As a monarch he conducted himself with great prudence, firmness, and moderation, with constant regard to the principles of the Belgian constitution. He died 10th December 1865, and was succeeded by his son, Leopold II. See BELGIUM, CONGO, and a book by Corti (trans. 1923).

Léopoldville, since 1923 capital of Belgian Congo, just below Stanley Pool, includes Kinshasa to the east; pop. 6000. Nearly opposite is Brazzaville, in French Congo.

Lepage. See BASTIEN-LEPAGE.

Lepanto (anc. *Naupactus*), now called by the Greeks Epakto, a small town of Greece, and the seat of a bishop, is situated on the north side of the entrance to the Gulf of Corinth. During the Peloponnesian war it was one of the chief naval stations of the Athenians. In the middle ages it was given by the Byzantine emperor to the Venetians, who fortified it so strongly that in 1477 it stood a siege of four months by 30,000 Turks, and in 1499 was only taken by Bajazet II. at the head of 150,000 men. Near Lepanto took place the celebrated naval battle between the Turks on the one side and the Papal galleys, and those of the Venetians and the Spaniards, on the other, on 7th October 1571, in which the Christians, commanded by Don John of Austria (q.v.), achieved a decisive victory. Of the Turks 30,000 fell or were taken prisoners, whilst 130 Turkish vessels were captured, and 12,000 Christian slaves liberated; the Christians lost 8000 men and 15 galleys. In this battle Cervantes lost an arm. The town became Greek in 1829.

L'Epée. See EPÉE.

Lepidodendron, a genus of fossil plants confined to Devonian, Carboniferous, and Permian strata. Several species are recognised, most of which attained a large size—40 or 50 feet long and more than 4 feet in diameter. They were tree-like lycopods—their living representatives being the low-growing club-mosses of our mountains. The stem tapered upwards and branched dichotomously, and was either covered with linear one-nerved leaves, or where these had fallen was marked with more or less prominent ovate or lozenge-shaped cushions, arranged in a spiral manner. The fruits, which were either terminal or lateral, were elongated, cylindrical bodies, composed of a conical axis, around which a great quantity of scales were compactly imbricated. The fossils described under the name *Knorria* are now known to be the decorticated stems of *Lepidodendron*. So again the fruiting branches were formerly included under the genus *Halonia*, while the cones were named *Lepidostrobus*. Some of the roots (*Stigmaria*) met with in the underclays of the Coal-measures also appear to belong to *Lepidodendron*. See SIGILLARIA.

Lepidoptera (Gr., 'scaly-winged'), an order of Insects (q.v.). See also BUTTERFLY, CATERPILLAR, MOTH.

Lepidosiren (Gr., 'scaly siren'; *L. paradoxa*), one of the Mud-fishes (q.v.), along with *Protopterus* and *Ceratodus* (q.v.). It lives sluggishly in the marshes and swamps of the Amazon, feeds on water-snails and confervoid algæ, and lies dormant in a burrow during the dry season. It attains a length of about 4 feet. The flesh is esteemed by the Indians.

Lepidosteus. See BONY PIKE.

Lepidus, an illustrious Roman family of the ancient Æmilian gens. MARCUS ÆMILIUS LEPIDUS, when war broke out (49 B.C.) between Cæsar and Pompey, declared for Cæsar. During his own absence in Spain, Cæsar made Lepidus dictator of Rome and his colleague in the consulate (46 B.C.). He afterwards supported Antony, and became one of the triumvirate with Octavianus and Antony; but his weakness of character made him inferior to the other two, who assigned him Africa as his province (40–39 B.C.). Ultimately his legions deserted to Octavian, who allowed him to retain his wealth and the dignity of pontifex maximus. He died 13 B.C.

Le Play, FRÉDÉRIC (1806–82), engineer and economist, was professor in the School of Mines at Paris, and a senator. He was a commissioner at

several exhibitions, and wrote *Les Ouvriers Européens* (1855), *La Réforme Sociale* (1864; 7th ed. 1887), *L'Organisation du Travail* (1870; 5th ed. 1888), on the family, on the English constitution, *La Constitution essentielle de l'Humanité* (1881), &c.

Leprosy. The terminology of this disease is somewhat confused; it was called by the ancients *elephantiasis* and *lepra*, but the latter term at least was also used of other forms of disease (of psoriasis, for example). In modern times, too, both these names have been applied to other diseases as well; *Elephantiasis Arabum* (q.v.) is distinct from leprosy, which is distinguished as *Elephantiasis Græcorum*, or *Lepa Arabum*. It is also sometimes called *Leontiasis*.

History and Distribution.—It is highly probable that what is now known as leprosy was one of the diseases, though certainly not the only one, spoken of by that name in the English Bible; Leviticus xiii. deals specially with the rules for the detection and isolation of cases of leprosy. It is not mentioned there prior to the sojourn of the Israelites in Egypt. It is worthy of note that it was regarded by the earlier Greek and Roman writers as an Egyptian disease. But it certainly existed in India and China at very early periods. Regarding its first appearance in Europe nothing is known. It has been supposed that it was brought from the East by the Crusaders; but there is evidence that it was prevalent long before the first crusade. During the middle ages it was extremely common; leper-houses, dedicated to St Lazarus (from whom lepers were called also lazars), existed throughout Europe, including the British Islands, for the reception of lepers, though in all likelihood not for them exclusively. Efforts were made to secure stringent isolation. The old Jewish leper with his rent garments and melancholy cry, 'Unclean! unclean!' was reproduced in the medieval leper, with a gray gown and a clapper to announce his approach. Since about the 14th century leprosy has been steadily declining in Europe. From Shetland, where (as also in Cornwall) it lingered long, a leper, of a leprosy stock, was sent to Edinburgh Infirmary in 1798, and a few cases occurred in the beginning of the 19th century. Liberton, near Edinburgh, is believed to take its name from the leper-house established there.

At the present day the only part of Europe where it is common is Norway; but it also occurs in Iceland, on the Russian coasts of the Baltic and Gulf of Finland, in south Russia, in Portugal, Spain, Italy, the Balkan States, and many of the Mediterranean islands. Everywhere in Europe, however, it is found only in limited districts. In Africa it is met with almost all round the coast and in the adjacent islands, on Tanganyika shores and other lakes. In Asia it occurs in all the countries and most of the islands on the south, from Arabia and Persia to China and Japan. In America it occurs in New Brunswick, in Central America, the West Indies, and the northern and eastern parts of South America. In the United States and in Australia cases have occurred, but almost all among the Chinese immigrants; in New Zealand it is much more common among the natives. In Hawaii it seems to have first appeared about 1850, but has spread with alarming rapidity; it is also met with in some others of the Pacific islands (see MOLOKAI). The seclusion of lepers is in most places carefully aimed at. Larger or smaller leper-hospitals are found in all countries where lepers are numerous; notable ones being at Bergen, Tracadie (in New Brunswick; administered by devoted religious sisters), Robben Island (near Cape Town); there are upwards of a dozen in India.

Cause and Mode of Spreading.—The above list of

localities is enough to show that the disease is not dependent upon climate. There has been a general belief from time immemorial in countries where it occurs that it is contagious; but, though numerous cases are met with of persons temporarily residing in districts where the disease is prevalent who have become affected by it, instances are extremely rare in which they have communicated the disease to others in countries where it is not endemic; and if it is contagious, it must be under very rare and exceptional conditions. Many well-qualified observers, however, believe that the disease, or a constitutional tendency to it, is strongly hereditary. Evidence has recently been adduced which seems to show that it may be communicated by vaccination from a leprosy child. Insanitary conditions, filthy habits, and unwholesome food are generally believed to favour its occurrence; though persons in comfortable circumstances are by no means exempt. Some authorities, among whom Mr Jonathan Hutchinson was prominent, think that 'in some way fish-food, and especially when either salted or decomposed,' is the main cause of its origin. In 1874 Hansen of Bergen found a bacillus, extremely like the bacillus of tubercle, afterwards discovered, in the affected tissues; and his observations have been confirmed by many other observers, so that there is no doubt that this organism is a constant feature of the disease.

Symptoms and Course.—The disease is usually very slow and insidious in its appearance and progress. The earliest symptoms are debility, depression, loss of appetite, and general constitutional disturbance. Two forms of the disease are recognised, *tubercular* and *anaesthetic* leprosy, according to the tissues first and chiefly involved. In the tubercular form the earliest recognisable change consists in the appearance of reddish-brown spots on the skin, usually of the limbs, tender to the touch, and somewhat swollen. They may disappear, leaving the skin only slightly thickened; but repeated attacks occur and affect wider areas; ultimately the skin of the face becomes thickened, puckered, and nodulated, giving a 'peculiar, heavy, morose expression'; the hands and feet become similarly affected; some of the nodulated spots form into deep intractable ulcers; owing to changes in the cornea the sight is dimmed or lost; the mucous membrane of the mouth and throat becomes thickened, and the voice reduced to a hoarse whisper. In the anaesthetic form certain of the nerves are chiefly affected, and before any visible changes occur sensation is lost in the areas of skin supplied by them. Mutilation of the fingers and toes often occurs, the bones being destroyed, or the whole parts dropping off, often without pain. This form is generally slower in its progress than the tubercular form, but frequently leads to the development of the latter. In whatever way the disease begins, the constitution is slowly enfeebled, and the sufferer falls a ready victim to some intercurrent malady; for leprosy is seldom itself the direct cause of death.

Treatment.—The disease may under favourable conditions remain quiescent for long periods, and life may be prolonged even for fifty years. Improvement has long been attributed to the use of chaulmoogra oil, and recently great benefit and even complete cures have been reported from the intravenous injection of sodium chaulmoograte, and of ethyl esters of the fatty acids of the oil. These substances have the power of destroying the leprosy bacilli.

See the works on Skin Diseases by Wilson, Hutchinson, and others. For mediæval leprosy, see Sir J. Y. Simpson in *Edin. Med. and Surg. Jour.* (1846-47); for leprosy in India (where there are over 100,000 lepers), see Vandyke Carter's work (1873). And see also *Blackwood's Maga-*

zine for 1889, the *Quarterly* for April 1903, Hutchinson's *Fish and Fish-eating* (1906); and recent works on *Tropical Medicine*, e.g. that of Manson-Bahr (1921).

Lepsius, KARL RICHARD, Egyptologist, was born at Naumburg, 23d December 1810. His father, Karl Peter Lepsius (1775-1853), a magistrate there, was himself a zealous antiquary, and published learned treatises on the local antiquities. The younger Lepsius studied at Leipzig, Göttingen, Berlin, and Paris. His first work was *Die Palaeographie als Mittel der Sprachforschung* (1834), for which he obtained the Volney prize of the French Institute. This was followed by works on the most ancient alphabets and other kindred subjects. In 1836 he associated himself intimately with Bunsen at Rome, and eagerly prosecuted his favourite studies there. Between 1834 and 1842 he published his *Lettre à M. Rosellini sur l'Alphabet hiéroglyphique*, and, in the *Transactions* of the Archaeological Institute, a number of dissertations on the monuments of Egyptian art and their general architectural style. He also applied himself to the study of the ancient Etruscan and Oscan languages, the remains of which he published in his *Inscriptiones Umbricae et Oscae* (1841) and other works. In 1842 he was placed at the head of an antiquarian expedition sent to Egypt by the king of Prussia, and on his return three years later was appointed ordinary professor in Berlin. His *Denkmäler aus Aegypten und Aethiopien* (12 vols. folio, with 963 plates, 1849-60) was published at the expense of the king of Prussia, and remains a masterpiece of patient genius and erudition. His *Chronologie der Aegypter und Ueber den ersten Aegypt. Gotterkreis* laid the foundation for a scientific treatment of the earlier parts of Egyptian history. To the study of Egyptian archaeology he joined the investigation of the languages, history, and monuments of the regions farther up the Nile. Other works are his letters from Egypt, Ethiopia, and Sinai (1852); a communication on the Egyptian monuments (1853); the work in which he expounds the *Standard Alphabet*, a modified Roman alphabet for hitherto unwritten languages, now used in many cases (1855; in its second edition, published in English in 1863, adapted to 120 languages); a work on the Egyptian ell and other measures; the *Königsbuch*, a list of kings (1858); the *Todtenbuch* (1867), the Egyptian Book of the Dead (q.v.). He wrote also on Chinese, Arabic, and Assyrian philology; was editor of the Berlin *Zeitschrift* of Egyptology, member of the Royal Academy, director of the Egyptian section of the Royal Museum, and chief-librarian of the Royal Library at Berlin. He was a creator of Egyptology as a scientific study, and a devoted and single-minded scholar of the best type. He died 10th July 1884. See Ebers, *Richard Lepsius, ein Lebensbild* (1885; trans. 1887).

Leptocephalus, a larval stage of Eel (q.v.). See FISHERIES.

Leptospermum, a genus of trees and shrubs, natives of Australia, New Zealand, &c., of the natural order Myrtaceae, sub-order Leptospermeae. They are evergreen, with leaves somewhat resembling those of myrtles. Some bear the name of Tea-tree, as *L. pubescens*, *L. arachnoideum*, and *L. flavescens*, because the leaves have been used as a substitute for tea. *L. scoparium* is sometimes called the *New Zealand Tea-plant*, sometimes the *Broom-tree* or *Dogwood-tree*. It is common both in New Zealand and Australia.

Lérída, a town of Spain, capital of the province of Lérída (area, 4700 sq. m.; population, 325,000), on a tributary of the Ebro, 114 miles by rail W. by N. of Barcelona. The second city of Catalonia, Lérída has a castle and two cathedral churches, one an ancient Byzantino-Moorish edifice, turned

into barracks; the other a modern Græco-Roman building. It manufactures sugar, woollens, cottons, leather, paper, and glass, and has a population of 38,000. Near Lérída, the Celtiberian *Ilerda*, Scipio Africanus defeated Hanno (216 B.C.), and Caesar the lieutenants of Pompey (49 B.C.). The Goths made it a bishop's see and held here a council of the church in the 6th century. In 1300 a university was founded here; it is now extinct. The town has been several times besieged, on the last occasion by the French in 1810.

Lérins, a small group of French islands in the Mediterranean, 2½ miles S.E. of Cannes. On Sainte-Margueite (the ancient *Lerona*), 4 miles in circumference, stands a fortress in which the Man with the Iron Mask and Marshal Bazaine were at different times confined, and from which Bazaine escaped in 1874. On Saint-Honorat (anciently *Lerina*), 2 miles in circuit, are the ruins of the once famous monastic school. Vincentius Lerinensis, a monk here (died 450), was the author of the famous definition of Catholicism (see CATHOLIC CHURCH). See a history by Canon Cooper-Marsdin (1913).

Lermontoff, MIKHAIL YUREVICH, called the 'poet of the Caucasus,' was born, of Scottish extraction (Learmont; possibly traceable to Thomas the Rhymer), in Moscow on 15th October 1814. He was educated at Moscow and in the school of pages at St Petersburg, and, entering the army, was sent on active service in the Caucasus. There he was shot dead in a duel on 15th July 1841. The death of Pushkin gave him his first poetic inspiration, which took shape in an impassioned appeal for vengeance on Pushkin's slayer. But it was the sublime scenery of the Caucasus that inspired his best poetic pieces, such as *The Novice*, *The Demon*, *Ismail Bey*, *Valerik*, &c. One poem from his pen, *The Song of the Tsar Ivan Vasilievich*, is highly praised as a successful attempt to reproduce the spirit of Little Russian popular poetry. A Byronic note runs through most of Lermontoff's poetic work. In 1839 he published a good novel, *A Hero of Our Time*; this is said to have occasioned the duel that cost him his life. See Brückner's *Literary History of Russia* (1908).

Leroux, PIERRE (1797-1871), an ultra-radical publicist and (1848) delegate to the National Assembly, was born near Paris, wrote on humanity, Christianity, and Malthus from a democratic, pantheist, visionary point of view. He influenced George Sand, but not national polity or thought.

Leroy-Beaulieu, ANATOLE (1843-1912), born at Lisieux, wrote on French politics, anti-Semitism, papal influences, and Catholic liberalism, and on matters Russian. His *Empire of the Tsars* was translated in 1893-96.—His brother, PIERRE PAUL (1843-1916), wrote largely on political economy, and, as the principal French exponent of free trade, was a keen critic both of protectionism and of collectivist socialism. His works on *Collectivism* and *The United States in the 20th Century* were translated in 1905-8.

Lerwick, the county town of Shetland, on the east coast of Mainland and on Bressay Sound, 116 miles N.E. of Kirkwall, has a fine harbour, and is the centre of great fisheries. It has a town-hall (1883) and county buildings (1872). Pop. 4800.

Le Sage, ALAIN-RENÉ, was born in 1668 at Sarzeau in Brittany, and from the Jesuit school at Vannes went to Paris to study law, but an early marriage drove him to seek a livelihood in literature. A friend, Lionne, made him free of a good Spanish library, and he projected a *Théâtre Espagnol*; but all that came of it was one volume in 1700 containing two plays, the *Traître puni* and *Don Félix de Mendocce*, imitated from Rojas and Lope de Vega. In 1702 *Le point d'honneur*, from *No hay*

amigo para amigo of Rojas, failed on the stage. His next venture (1704) was a rifacimento of Avellaneda's *Don Quixote*. The year 1707 was the turning-point in his fortunes. *Don César Ursin*, from Calderon's *Peor está que estaba*, was played with success at court, and *Crispin rival de son maître* in the city; and more successful than either was the *Diablo Boiteux*, the framework, title, and first chapter of which he took from the *Diablo Cojuelo* of L. V. de Guevara. In 1708 he offered the Théâtre Français two plays; *La Tontine* was accepted, but shelved, and not produced until 1732; *Les Étrennes* was rejected, as rules did not allow one-act pieces before Easter. Le Sage took it back, and altered and expanded it into *Turcaret*; but the financiers it satirised, after an attempt to buy him off with 100,000 livres, organised such an opposition against it that it was saved only by an order from the Dauphin. Le Sage was not a man to submit to caprice. It is told of him that when the Duchesse de Bouillon, at whose house he was to have read *Turcaret*, received him with a haughty reprimand for keeping her waiting, he replied, 'Very well, madame, if I have made you lose an hour I will make you gain two,' and with a bow walked out; and it was no doubt the same spirit of independence that made him go over in 1709 from the Théâtre Français to the opposition Théâtre de la Foire. Unless the *Amants Jaloux* of 1736 be his, he made no attempt after this to return to the regular drama, but continued to supply the Foire stage with slight pieces of the kind it was restricted to, which he published from time to time in the volumes composing the *Théâtre de la Foire*. For these the Persian tales which he helped his friend Pétis de la Croix to put into shape in the *Mille et un jours* were of great service to him. But the success of the *Diablo Boiteux* was too encouraging to allow him to neglect the Spanish. In 1715 *Gil Blas* (vols. i. and ii.) came out, followed in 1717-21 by an attempt at an Orlando. In 1724 came the third and, as it seemed, last vol. of *Gil Blas*, and in 1726 a new edition of the *Diablo Boiteux*, doubled in bulk by additions of his own and from Santos. In 1732 he gave his *Guzman de Alfarache*, 'purged of superfluous moralities,' and *Robert Chevalier de Beauchêne*, the life of a buccaneer whose widow, he says, furnished the memoirs. In 1734 he took the title of *Estebanillo Gonzalez*, but very little else, from the original Spanish. In 1735 the fourth vol. of *Gil Blas* appeared, and also the *Journée des Parques*; in 1736-38 the *Bachelier de Salamanca*, the 'remainder biscuit' of *Gil Blas*; in 1739 his plays, in two vols.; in 1740 *La Valise trouvée*, a volume of letters; and in 1743 the *Mélange Amusant*, a collection of facetiæ from his memory or his notebook. That year brought his first sorrow, the death of his eldest son René, otherwise Montménil the comedian. Le Sage had a contempt for actors and their calling, and when his son adopted it he disowned him. But in time, brought round to see him in *Turcaret*, he was conquered by his own creation alive in the genius of his son, and the estrangement ended in their being drawn together more closely than ever. The death of his son and his own increasing infirmities, particularly his deafness, made him abandon Paris and literary life, and retreat with his wife and daughter to Boulogne, where his second son, Julien, held a canonry in the cathedral; and there, in the Rue du Château, he died in 1747, in his eightieth year. Of himself, personally, there is very little on record. He was withdrawn from society by his deafness, from which he was a sufferer as early as 1709, and lived a quiet, retired, industrious life, surrounded by his family; and perhaps their devotion and the loving care with which they tended him in his last

days are more eloquent than any eulogy of his character and virtues that preacher could pronounce.

Le Sage's reputation as a dramatist and as a novelist rests in each case on one work. The author of *Turcaret* might, under favouring circumstances, have done anything in comedy short of dethroning Molière, but as it is he has no claim to a place in the first order of dramatists. But whatever severe critics may say, the author of *Gil Blas* stands in the front rank of the novelists by the common consent of the great mass of readers of all nations. On the other hand there are some who deny originality to one who borrowed ideas, incidents, and tales from others—Espinél, Rojas, Mendoza, Quevedo—as Le Sage did; and some who go still further, and deny that the author of *Gil Blas* was anything more than a translator. The question of what constitutes originality would be out of place here, but the other is simply a question of evidence which may be briefly summed up. It was primarily Voltaire who raised the issue. Le Sage had put him into *Gil Blas* as Don Gabriel Triaquero, and he in return said in his *Siccle de Louis XIV.* that *Gil Blas* was 'entirely taken from *La Vida de lo Escudiero Don Marcos d'Obrego*,' showing that he had never seen the book he quoted, and could not read it if he had. Backed by his name, the figment had a wide circulation, especially in Spain, and the Padre Isla was set on to develop it, which he did in his own peculiar fashion (see ISLA). The Comte de Neufchâteau having taken up Isla seriously, was replied to by Llorente, who maintained that though Isla was in jest he had truth on his side. His own theory was that in the Lionne library Le Sage found a MS. novel, called the *Bachelor of Salamanca*, written, probably by Solís the historian, in 1655, and that out of this he carved *Gil Blas*, serving up the remainder afterwards under the original title. The argument, in brief, is that *Gil Blas* is crowded with details of a kind that Le Sage, who never was in Spain, could have had no knowledge of, and could not have got from books. Of these details, however, a good many need not have had any more recondite source than *Don Quixote*; and for the rest Le Sage would have said that he only wondered at his own moderation, for he could have taken ten times as many from the plays and picaresque novels in the abbé's library, and from books of travellers like Aarssens van Sommelsdyck, Bertaut, and Mme D'Aulnoy. But Llorente points out that over a hundred places, often obscure hamlets that few Spaniards even ever heard of, are named, in general correctly, which is a proof of some exceptional source of information; but sometimes incorrectly, a proof that the source was a MS. not a printed one. But a plain tale will put him down; the names are in old French maps. Of a score picked out as manifest misreadings from a MS.—Grajal, Rodillas, Luceno, Castil Blazo, &c., all but one are in the map of Spain printed in Paris by Jaillot circa 1695, and all the notable ones in that of 1713, just two years before *Gil Blas* appeared. From maps, too, come Le Sage's blunders in topography—e.g. putting Peñafior on the road to Salamanca, Alcalá between Madrid and Segovia, Peñafiel between Segovia and Valladolid, Liria 'sur les bords du Guadalquivir.' Finally he urges Le Sage's familiarity with secret history and the private affairs of Olivares, his daughter's marriage (xi. 9), and his adoption of Margarita Spinola's son (xii. 4); and asks how could he have known matters and names not to be found in print, save from a contemporary MS.; which, as before, his misreadings, Niebles for Niebla, Abrados for Abiados, Valeasar for Valcarcel, bear witness to!

But again the answer is simple. He found 'Niebles' and 'Abrados,' as well as the marriage story in the translated *Anecdotes du ministère d'Olivares* (Paris, 1722), and put the very words of the book into the mouth of Olivares, whose portrait (xi. 2) is word for word from the *Anecdotes*. 'Valeasar' he found in the *Relation de ce qui s'est passé à la disgrâce d'Olivares* (Paris, 1650), from which he took the Count Duke's curious 'confidence' to Gil Blas, and, also, sundry names cited by Llorente. One by one, in short, the supports give way, and the MS. theory falls to the ground. Nevertheless, in the absence of rebutting evidence, its plausibility imposed upon some good critics, the author of 'Who Wrote *Gil Blas*?' in *Blackwood* (1844), A. H. Everett, and Ford, among others. All admit, however, that the translator has left the stamp of his nationality indelibly impressed upon the work; the mystery lies in its wealth of detail. Llorente puts the matter in a nutshell when he asks why did Le Sage, if he was the original author, give himself so much needless trouble? Why so particular to name 'Torralva,' when it would have done just as well to say 'a village near Cuenca?' The answer is that Le Sage was before all things an artist, and knew the value of details in producing the verisimilitude he aimed at. In this respect and many others he was like his great contemporary Defoe. He spared no pains to make his conception a reality to his reader. When he sent Gil Blas on a journey he was not content to generalise his road, but looked up the villages he had to pass through on the best map he could find. When he brought him to an inn, he went to the novels and plays for inn furniture and company and conversation. This is the rationale of his borrowings, and it is this, as much as his delightful style, that makes him the prince of raconteurs. He was the first to perceive the capabilities of the picaresque novel, and with the culinary genius of his nation (by no means confined to artists like him who could make a savoury ragout out of an old boot) he got rid of its crudities, brought out its flavour, and served it up with a *sauce piquante* of his own. In so doing he advanced the novel of real life an important stage, and, to his honour be it said, no abuse of realism can be laid to his charge. In the words of Scott, 'His muse moved with an unpolluted step, even where the path was somewhat miry.'

Lesbos, or MYTILENE, a Greek island in the Aegean Sea, lies 10 miles from the coast of Asia Minor, north of the Gulf of Smyrna. It is triangular in shape, with two deep inlets on the south-east and south-west, and is for the most part mountainous, reaching 3079 feet in Hagios Elias (Olympus). The soil is fertile and yields good crops of olives, the oil being the chief export. Soap is the chief manufacture. In ancient times wine was a specialty. The climate is delightful. The chief drawback of the island is the earthquakes, which occur pretty frequently. Area, 676 sq. m.; pop. 142,000, mostly Greeks. The ancient capital was Mitylene (on coins Mytilene); the existing town, also called Castro, 'a straggling dirty village,' has a population of about 18,000. It stands on a peninsula on the east coast, is defended by a mediæval castle, and has a shallow harbour. Other ancient cities were Methymna, Pyrrha, Antissa, and Eresus. The island was early colonised by Æolian immigrants. Between 700 and 500 B.C. it was the flourishing home of poets and literary men, as the names of Alcæus, Sappho, Terpander, Pittacus, Theophrastus, Theophanes, and others will attest. The Lesbians made themselves masters of considerable territory on the opposite

mainland of Asia Minor. But in the 6th century B.C. it was for about sixty years subject to Persia. In 476 it joined the Athenian league, but, revolting in 429, was promptly reduced to obedience again. Then it belonged successively to Macedonia, Pontus, Rome, and Byzantium. From 1355 to 1462 it was owned by a Genoese merchant family, who lost it to Sultan Mohammed II. It remained Turkish till the Greeks regained it in the war of 1912-13. Off its shores the Turks were defeated by the Venetians in 1690 and 1698, and by the Greeks in 1821. The island has been called Mytilene from the middle ages down to the present time.

Lese Majesty. See LEZE MAJESTY.

Lesghians. See CAUCASUS.

Leslie, a town of Fife, 12 miles SW. of Cupar, has flax-spinning, bleaching, and paper works; pop. 3700.

Leslie, Lesly, or LESLEY, THE FAMILY OF, is first found between 1171 and 1199, when Malcolm, son of Bartholf, obtained Lesslyn or Leslie, a wild pastoral parish in Aberdeenshire. His descendants took their surname from their lands.

Earls and Duke of Rothes.—The family was ennobled in 1457, when George Leslie of Rothes was made Earl of Rothes and Lord Leslie. The fourth earl was father of Norman Leslie, Master of Rothes, the chief actor in the murder of Cardinal Beaton. John, the sixth earl, who died in 1641, distinguished himself as one of the ablest of the Covenanted leaders. His son became Lord Chancellor of Scotland in 1667, and in 1680 was created Duke of Rothes, Marquis of Ballinbreich, Earl of Leslie, &c. These honours became extinct upon his death without male issue in 1681. The earldom of Rothes went to his elder daughter, in whose family the title has continued.

Earls of Leven.—Before the family left Aberdeenshire it had thrown off branches, some of which still flourish there. The chief, that of Balquhain, gave birth to several men of mark, such as the learned John Leslie, Bishop of Ross (1527-96), the devoted champion of Mary Queen of Scots; Sir Alexander Leslie of Auchintoul, a general in the Muscovite service, who died governor of Smolensko in 1663; and Charles Leslie (q.v.). A still more distinguished man was Alexander Leslie, who rose to be a field-marshal of Sweden under Gustavus Adolphus. Recalled to Scotland in 1639, he took command of the Covenanted army, and in 1641 was made Earl of Leven and Lord Balgony. He died in 1661, and his honours and lands eventually passed to his great-grandson, David Melville, third Earl of Leven and second Earl of Melville. See Sanford Terry, *Life and Campaigns of Alexander Leslie* (1899).

Lords Lindores.—The second son of the fifth Earl of Rothes was created Lord Lindores in 1600. The title has been dormant since the death of the seventh lord in 1775.

Lords Newark.—David Leslie, fifth son of the first Lord Lindores, served with distinction under Gustavus Adolphus, and, returning to Scotland in 1640, acted as lieutenant-general to the Earl of Leven. He was present at Marston Moor, and surprised and routed Montrose at Philiphaugh. Routed by Cromwell at Dunbar in 1650, and taken prisoner by him at Worcester in 1651, he suffered imprisonment in the Tower till the Restoration. He was made Lord Newark in 1661, and died in 1682. The title has been dormant since the death of his great-grandson, the fourth lord, in 1791.

Counts Leslie.—Walter Leslie, a younger son of the House of Balquhain, distinguished himself in the Austrian army, and in 1637 was created a

count of the empire, as a reward for his services in the murder of Wallenstein. He died without issue in 1667, when he was succeeded by his nephew, James, a field-marshal in the Austrian service, who died in 1694. The title became extinct in 1844.

Leslie, CHARLES (1650-1722), nonjuring divine, was born at Dublin, studied at Trinity College, Dublin, and, having taken orders in 1680, became chancellor of the cathedral of Connor in 1687. Deprived at the Revolution for declining the oath of allegiance, he retired to England and wrote against Papists, Deists, Socinians, Jews, and Quakers, as well as in support of the nonjuring interests. He went with the Pretender to Italy after 1715, but returned to Ireland in 1721. See a *Life* by R. J. Leslie (1885).

Leslie, CHARLES ROBERT (1794-1859), genre-painter, born in London of American parents, was educated at Philadelphia, and the Royal Academy. 'Sancho Panza and the Duchess,' exhibited in 1824, obtained for him the rank of Academician. Leslie's principal pictures are scenes from the works of Shakespeare, Cervantes, Le Sage, Molière, Addison, Swift, Sterne, Fielding, Smollett. He published a *Handbook for Young Painters*; he also wrote an *able Life of Constable* (1843), and began the *Life and Times of Sir Joshua Reynolds*, completed by Tom Taylor. The *Autobiographical Recollections* of Leslie were edited by Tom Taylor (1860).

Leslie, SIR JOHN, a celebrated natural philosopher, was born at Largo, Fife, 16th April 1766. He studied at St Andrews and Edinburgh universities, and in 1788 became tutor to two young Americans, with whom he proceeded to Virginia and other parts of America, returning to London in 1790. During the next fifteen years he was variously employed in scientific writing or travelling on the continent with pupils, but all the while engaged in experimental research. The fruits of his labours during this period of his career were a translation of Buffon's *Natural History of Birds* (1793), the invention of a differential thermometer, a hygrometer, and a photometer, and the publication of his important *Experimental Inquiry into the Nature and Propagation of Heat* (1804). For this latter work the Royal Society awarded Leslie the Rumford medal for scientific research. In 1805 he obtained the chair of Mathematics at Edinburgh, in spite of a good deal of opposition from the clergy, who objected to his approval of Hume's theory of causation. He occupied it for fourteen years, but most of his leisure time was occupied in scientific experiments. In 1810 he invented the process of artificial refrigeration, which has since been put to so many practical uses. In 1819 he was transferred to the chair of Natural Philosophy, where his peculiar talents found their proper sphere. During the next few years he wrote numerous articles and published several works on natural philosophy and mathematics; but his chief claim to the gratitude of the scientific world lies in his useful inventions, such as the pyroscope, atmometer, athrioscope, and the prominence which he gave to experimental illustration in his university lectures. In 1832 he was created a Knight of the Guelphic Order; on 3d November of the same year he died, at his estate of Coates, in Fife, near his birthplace. See *Memoir* by Macvey Napier (1838).

Leslie, THOMAS EDWARD CLIFFE, political economist, was born in County Down, Ireland, in 1827, and educated at Trinity College, Dublin. He qualified for the bar, but in 1853 was appointed to the chair of Economics and Jurisprudence at Belfast. In that city he died on 27th January

1882. His writings, mostly fragmentary in character, were collected in two books entitled *The Land Systems* (1870), containing studies on the land question in Ireland, Belgium, and France, and *Essays in Political and Moral Philosophy* (1879), which treat principally of the gold question and economic method. Leslie was a strenuous advocate for the study of economic problems in the light of the historic method, instead of the purely analytic method of Ricardo. He introduced the works of continental economists, such as Roscher and Laveleye, to the notice of English students.

Lespinasse, CLAIRE FRANÇOISE, or **JULIE JEANNE ÉLÉONORE**, was born 9th Nov. 1732 at Lyons, an illegitimate daughter of the Comtesse d'Albon. At first a teacher, she became in 1754 a companion to Madame du Deffand, whose friends, especially D'Alembert, she quickly attached to herself. After the inevitable rupture that followed, she was enabled by the bounty of her friends to maintain a modest salon of her own. The charm she exercised was in no wise due to beauty, for she was plain in face, and, moreover, disfigured by smallpox; yet conversation was brighter and more harmonious, and wit more brilliant in her circle than anywhere else in Paris. Unfortunately for her peace she had a heart sensitive to love, and the passion she was capable of at forty for the young Spaniard, the Marquis de Mora, and two years later for M. de Guibert, cost her the deepest pangs, when the first died and the second was separated by marriage. The famous D'Alembert had long admired and loved her, but her affection for the philosopher never cost her tears. She died at Paris, 23d May 1776. Many of her letters to her two lovers have been published, and these are aglow with fire and passion. Indeed, in their first editor's metaphor, her phrases burn the paper on which they are written.

The famous *Lettres* were published in two volumes in 1809. Later editions are by J. Janin (1847) and Isambert (1877). M. Charles Henry's *Lettres inédites* (1887) were mostly addressed to Condorcet. A juster judgment will be found in Sainte-Beuve's *Causeries du Lundi*; and see monograph by the Marquis de Ségur (1906; new ed. 1913).

Lesseps, FERDINAND, VICOMTE DE, engineer, was born at Versailles, November 19, 1805. Educated for the diplomatic profession, he filled successive appointments at Lisbon, Cairo, Barcelona, and Madrid. In 1854 he conceived his great scheme for cutting the Suez Canal, and in January 1856 he received a letter of concession from the Viceroy of Egypt. Robert Stephenson and other English engineers questioned the practicability of the scheme, but De Lesseps overcame all obstacles. A company was formed, and the works were begun in 1860. The great undertaking was completed (see CANAL, and SUEZ) in August 1869, the canal being formally opened on 17th November following. The successful engineer was created K.C.S.I. by Queen Victoria, and received the honorary freedom of the city of London in 1870. The Paris Société de Géographie awarded him 10,000 francs; he was appointed a Grand Cross of the Legion of Honour; and after the publication of his *History of the Canal* he was awarded 5000 francs by the French Academy. In 1873 the Paris Academy of Sciences elected him a free member, and in 1881 he was elected president of the French Geographical Society. In 1883 he sought to conclude an arrangement with the British government for a second Suez Canal. Meanwhile, work had begun on his stupendous scheme for a Panama Canal (see CANAL), a scheme destined to issue in disaster and disgrace. For in 1892-93 the management was charged with breach of trust, and five directors were condemned—Lesseps, now a broken old man, to five years' imprisonment and a fine,

as was also his son Charles. The sentence was ultimately quashed; but he fell into dotage, and died 7th December 1894. He wrote *Documents pour servir à l'Histoire du Canal de Suez* (4 vols. 1875-79; trans. 1876), and *Souvenirs de Quarante Ans* (1887; trans. 1887). See books by Ferrier (1887), G. B. Smith (2d. ed. 1895), Bridier (1899).

Lessing, GOTTHOLD EPHRAIM, reformer of German literature, was born, the son of the pastor of Kamenz, in Saxony, on 22d January 1729. From the school of St Äfra, at Meissen, where he had spent five years, he entered in 1746 as a theological student at Leipzig. But, instead of studying theology, he made haste to acquire a knowledge of men and of the world, to polish his manners, to learn bodily and social accomplishments, and to improve his taste, and developed that strong, manly independence which was always one of the most striking traits in his character. Moreover, he cultivated a love for the stage, and began to write plays, mostly comedies, in the French style. All this sorely grieved his strictly orthodox parents. And yet, both at Meissen and at Leipzig, Lessing manifested an ardent thirst for knowledge and truth; he had great intellectual parts, and read hard. But his mode of life at the university ran him into debt—a state that was more or less chronic to him throughout his life; then in 1748 the theatre was closed; and he suffered from an innate restlessness that never let him abide long in one place. Accordingly, braving his father's serious displeasure, he quitted Leipzig, having resolved to earn a living by his pen, notwithstanding that the calling of author was held in little or no repute. After a few months' stay in Wittenberg, he travelled to Berlin to join Mylius, a clever man, but branded as a freethinker by the orthodox. Along with him Lessing published *Beiträge zur Historie des Theaters* (1750), and independently wrote plays, translated, did literary hack-work; but his chief stay was the *Vossische Zeitung*, to which he contributed criticisms. He soon felt, however, that he himself stood in need of greater culture, and in the end of 1751 he withdrew to Wittenberg to study at leisure; at the same time he pleased his father by taking his master's degree. The result of his toil in the Wittenberg library was a series of *Vindications* (1751) of unjustly maligned or forgotten writers, such as Cardan, Lemnius, &c., in which he gave bold utterance to his strong love of justice and his scorn of narrow intolerance. Later, in *Ein Vademecum für Herrn S. G. Lange* (1754) he displayed as unrelenting an hostility to pretentious and self-satisfied ignorance. Returning to Berlin after a year's absence, he resumed his former occupations. At this time too he became intimate with Moses Mendelssohn, Nicolai, and Ramler. He also published four volumes of his collected writings, and, along with Mendelssohn, an essay on *Pope, ein Metaphysiker* (1755). But he still strove to make the theatre an engine of popular culture: he wrote the tragedy *Miss Sara Sampson* (1755), in which he revolted against French theatrical traditions in favour of English models. For *dramatis personæ* he took people of middle-class life, and so carried on the movement begun by Lillo, the dramatist, and Richardson, the novelist, in England, and by Diderot in France. The success of this work tempted Lessing back to the theatre, reopened, at Leipzig; but he only stayed there a short time. In May 1756 he set off, as companion to a young gentleman (Winkler) of that city, on an extended tour; but they had only reached Holland when they were hastily summoned home by the outbreak of the Seven Years' War. Lessing then remained some time in Leipzig, to be near his friend the poet Ewald von Kleist.

In 1758 he was once more in Berlin, assisting

Mendelssohn and Nicolai to bring out a new critical journal, *Litteraturbriefe*. In the work he did for this publication Lessing takes a distinctively higher place: he refuses any longer to submit to the degrading dictatorship of French literary taste, combats the inflated pedantry of the Gottsched school, and extols Shakespeare above Corneille as the highest type of dramatic writer. In these letters he displays most of the admirable qualities of his mature style: his insight is penetrating and sure; his manner vivacious, often ironical or satirical; his intellect is strong and logical, yet supple, and works easily; and his language is clear, forcible, and elegant. He always possessed the power of making dry subjects interesting. From November 1760 to the spring of 1765 Lessing enlarged his knowledge of men by acting as secretary to General von Tauentzien, governor of Breslau. During these years he wrote two of his greatest works, *Laokoon* (1766) and *Minna von Barnhelm* (1767). The former is a critical treatise defining the limits of poetry and the plastic arts. It affords an admirable illustration of Lessing's critical procedure. He plunges at once into the midst of the argument, takes up various views one after another, examines them, contrasts them, searches and sifts them from all sides, and exhausts upon them the resources of the dialectical method; then out of what survives this intellectual conflict he constructs his final conclusions. Yet the movement of thought is simple, natural, and logical; we are led to discover the truth by the same paths by which the author arrived at it originally. His essays on the *Fable* (1759) and the *Epigram* (1771) are both admirable instances of the same method. The comedy *Minna von Barnhelm* shows no trace of imitation of foreign models: it is the first national comedy of the Germans on the grand scale, and is a great advance on Lessing's early dramatic efforts. After Frederick the Great had refused to nominate him keeper of the Royal Library at Berlin, Lessing was glad to accept the post of critic to the new national theatre at Hamburg in 1767. Out of these new duties grew the celebrated *Hamburgische Dramaturgie* (1769), in which he overthrew finally the dictatorship of the French drama and worked out the thoughts that had for many years been ripening in his mind. This theatre too soon failed, and Lessing was again left without fixed occupation. Yet he was never long idle, especially so long as there was error to combat, and ignorance and pedantic vanity to expose. For, though a scholar himself, he always regarded learning not as an end in itself, but as a means: he always accounted truth superior to mere knowledge. He was naturally fond of disputation, and so we soon find him in the thick of another controversy, this time with Klotz, a young Halle professor. On this occasion he had a double purpose to serve—to defend his *Laokoon* and to expose the pretensions of the men who set themselves up as leaders of German scholarship. The chief fruits of this controversy from Lessing's pen were *Briefe antiquarischen Inhalts* (1769) and *Wie die Alten den Tod gebildet* (1769).

In October 1769 the Duke of Brunswick offered Lessing the librarianship of the Wolfenbüttel library; he accepted it and entered upon his duties in the following May. Here at last he settled for good, and in 1776 married Eva König, the widow of a Hamburg merchant, but lost her after little more than a year of happy married life. He at once began to publish some of the less-known treasures of the library in a series of volumes entitled *Zur Geschichte und Litteratur* (6 vols. 1773-81). But in 1772 he wrote the tragedy *Emilia Galotti*, which in spite of grave faults, notably the absence of dramatic necessity for the catastrophe, is one of the greatest

tragedies in German literature, certainly the greatest Lessing wrote. Shortly before his marriage he carried out a long-cherished desire, by spending eight months in Italy, though as companion to the hereditary Duke of Brunswick. His last years were occupied with theological controversies. In 1777 he published the famous *Wolfenbüttelsche Fragmente*, a rationalist attack on Christianity from the pen of Reimarus (q.v.). This book, which was almost universally attributed to Lessing, provoked a storm of replies from orthodox Lutherans. The best of Lessing's counter-attacks were the polemical *Anti-Goeze* (1778), directed against his chief assailant, and the fine dramatic poem, *Nathan der Weise* (1779), one of the noblest pleas for tolerant humanity ever penned. This last was supplemented by *Die Erziehung des Menschengeschlechts* (1780), which is extremely rich in suggestive thought. Lessing's last work was *Ernst und Falk* (1778-80), five dialogues on freemasonry. He died 15th February 1781.

The best edition of his *Sämmtliche Schriften* is Lachmann's, reissued by Muncker in 1886 seq. His chief works have been often translated into English. See *Lives* by Dünzer (1882), Stahr (10th ed. 1900), Danzel and Guhrauer (2d ed. 1881), Erich Schmidt (3d ed. 1910), Borinski (1900), Sime (1877), Helen Zimmern (1878), and Rolleston (1889)—the last three in English.

Lesson (Lat. *lectio*), a reading, especially a portion of Scripture appointed to be read, as in the Common Prayer-book. The oldest Latin lectionary—a service-book, either containing the lessons for the year in full, or noting their beginning and end—was called the *Comes* ('companion'), and dates from the 5th century. The Roman Lectionary was remodelled in the 8th century. The changes in the Anglican calendar of lessons were sanctioned by act of parliament in 1871. Formerly the lessons consisted invariably of full chapters—a rule that was sometimes embarrassing, as in the case of Acts xxi.—but in the revised lectionary they are frequently shortened and differently arranged; also, nearly all the lessons from the Apocrypha have been left out.

L'Estrange, SIR ROGER, a busy royalist pamphleteer under Charles II., was born at Hunstanton in Norfolk in 1616. He narrowly escaped hanging as a spy for a plot to seize Lynn in 1644, and was instead imprisoned in Newgate, whence he escaped after four years. Pardonned by Cromwell in 1653 through personal entreaty, he lived quietly till the Restoration made him licenser of the press. He fought in all the quarrels of the time with a shower of pamphlets, as vigorous and not coarser than those of his antagonists; he holds a place in the history of journalism by his successive papers, *The Public Intelligencer* (afterwards *The London Gazette*), and *The Observer*; and he translated Æsop, Seneca's *Morals*, Cicero's *Offices*, the *Colloquies* of Erasmus, Quevedo's *Visions*, and Josephus. He died in 1704. See *Life* by Kitchin (1912).

Le Sueur, EUSTACHE (1617-55), born in Paris, painted religious and mythological subjects.

Leszczynski. See POLAND, LOUIS XV.

Leszczynski, STANISLAS (1677-1766), born at Lemberg of a noble Polish family, was elected king of Poland in 1704 by the help of Charles XII., but in 1709 was driven out by Peter the Great to make room for Augustus II. (q.v.). Again elected in 1733, he formally abdicated in 1736, after the war of the Polish Succession, receiving the duchies of Lorraine and Bar. He died of a burning accident at Lunéville.

Letchworth, founded by a company in 1903 as a 'garden city,' stands on undulating ground in the north of Herts, 2 miles from Hitchin. Building

began in 1904, and by 1921 10,000 persons were housed there; not more than 12 even of the smallest houses being allowed to the acre. It is not intended that the town shall ever have more than 35,000 inhabitants.

Lethbridge, a coal-mining town in a wheat-growing district of Alberta, near the Belly River, 109 miles W. of Medicine Hat; pop. 38,000.

Lethe, in Greek mythology, the stream of forgetfulness in the lower world, from which souls drank before passing into the Elysian Fields, that they might lose all recollection of earthly sorrows.

Lethington. See MAITLAND.

Leto. See APOLLO.

Letter of Marque (Fr. *lettre de marque*, 'a commission to plunder'; cf. Littré, iii. 456), the commission authorising a privateer to make war upon, or seize the property of, another nation. Letters of marque were abolished among European nations at the treaty of Paris in 1856. See PRIVATEER.

Letters. See ALPHABET, SPELLING, and articles on each of the letters of the alphabet.

Letters form one of the most delightful branches of literature, and one moreover in which English possesses abundance of the finest examples. Most biographies that are now written contain the letters of the hero, and these usually open up his heart to the reader far better than pages of description of his qualities; while they also supply, by conscious or unconscious self-revelation, something of the peculiar interest that belongs to autobiography. But here may be remembered the warning words of Dr Johnson written *à propos* of Pope: 'There is no transaction which offers stronger temptations to fallacy and sophistication than epistolary intercourse. In the eagerness of conversation the first emotions of the mind often burst out before they are considered; in the tumult of business interest and passion have their genuine effect; but a friendly letter is a calm and deliberate performance in the cool of leisure, in the stillness of solitude, and surely no man sits down to depreciate by design his own character.' It is unhappily the fact that the conditions of modern life are generally unfavourable to the production of letters of the best class, which are the fruit of calm and ample leisure no less than of sympathy. The railway, the penny post, the telegram, and the postcard combined to destroy letter-writing as a pursuit and an art. There is nowadays scarcely such a thing as *correspondence* in its good old sense—what Southey calls 'perhaps the greatest gratification which the progress of civilisation has given us;' letters are only written when necessary, and consequently are too often completely impersonal and entirely uninteresting. Hence familiar letters, intimate and easy in tone, fluent and seemingly careless in style, have almost disappeared, and in their stead we have only the ephemeral, bald, disjointed, essentially unliterary, and it may even be ungrammatical productions, which, the moment their immediate purpose is served, are straightway consigned to the extinction for which they are fitted, and to which end indeed they were designed.

Of letters Bacon says 'such as are written from wise men are of all the words of man, in my judgment, the best; for they are more natural than orations and public speeches, and more advised than conferences or present speeches. So again letters of state from such as manage them, or are privy to them, are of all others the best instructions for history, and to a diligent reader the best histories in themselves.' Undoubtedly this is true, and the letters of such men as Cassiodorus, Crom-

well, Marlborough, Nelson, Washington, and Wellington, as well as such vast collections as the Cecil Correspondence, and the like, will remain documents of the first importance to the historian; while the theologian will never cease to count the epistles of Gregory Nazianzen, Basil, Chrysostom, Ambrose, Augustine, and Jerome among the richest sources available for a close study of the development of dogma and the movement of ecclesiastical history. Again, such collections as Pascal's *Provincial Letters*, Swift's *Draper's Letters*, and the *Letters of Junius* only belong in a secondary sense to this department of literature, and lack the peculiar personal charm that belongs to such letters as those of Cicero, Horace Walpole, or Madame de Sévigné.

Of all the favourite letter-writers of the world Cicero is both the earliest and remains almost the greatest. More than 800 of his letters are extant; and all are natural, sincere, outspoken. The very frankness of his vanity and an almost feminine desire to please give a singular pleasure to his reader; and his own phrase in one of his letters—'fit enim nescio quid ut quasi coram adesse videar cum scribo aliquid ad te'—reveals in a single sentence the secret of his perennial charm. And he was singularly happy in a correspondent so sympathetic and intelligent as Atticus, to whom alone he sent as many as 400 letters, for Montaigne tells us how the want of such a judicious and indulgent friend to whom to address kept him from adopting the epistolary method for publishing his whimsies which otherwise he would have preferred. The only other important Latin letter-writers are Seneca and Pliny, but the one offends by prosy and tedious moralising, the other by a prolix and grandiose manner that soon proves tiresome.

The Paston letters, over 1000 in number, are lucid and unaffected and give us our best insight into the inner domestic life of the 15th century; but the earliest English letter-writer of high rank is James Howell, whose *Familiar Letters* shared with Montaigne the honour of being one of Thackeray's two 'bedside books.' Howell says 'familiar letters may be called the 'larum bells of love,' and elsewhere admirably describes his own compositions in the sentence—'that's a true familiar letter which expresseth one's mind, as if he were discoursing with the party to whom he writes, in succinct and short terms.' Nowhere can we find more shrewdness, wit, wisdom, and keenness of observation, all combined with heartiness and sincerity; none knows better how to brighten his page with a merry quip or a lively story.

But our greatest letter-writers remain but three, or at most four: Gray, Horace Walpole, Cowper, and Charles Lamb. Gray's work is fastidious, precise perfect, but never laboured, and always completely sincere. It suggests the finished scholar unbending to please a friend, and the perfection is a consummation that came of itself, unstudied and unsought. Pope and Bolingbroke wrote for fame—their writing ever suggests an intellectual exercise, and even the letters between Pope and Swift are never entirely free from consciousness; but Gray wrote for love, and his letters, with those of Cowper and Charles Lamb, stand by themselves. Horace Walpole said of himself that he lived 'a life of letter-writing,' and he remains pre-eminent alike in the number and the remarkable felicity of his letters. He is by turns gay, good-humoured, piquant, keen, sarcastic, but is always clever and often even genial, although not seldom the reader detects the presence of effort and affectation. Still, all defects apart, judged in respect of both quantity and quality, and of the extraordinary range of subjects handled, he remains without a rival the prince of English letter-writers.

Lady Mary Wortley Montagu's letters are

unusually lively, clever, and amusing, but are marred by a constitutional indelicacy of tone as well as a vanity and a consciousness of skill that will not hide. Chesterfield's letters to his natural son show great shrewdness and powers of observation in a finished if over-elaborated style, but reveal a moral meanness of view that stamps the finished man of the world as but a sorry gentleman. The letters to his godson, written in later life, and first published by the late Lord Carnarvon in 1889, show a higher tone, but are poor performances if judged from the point of view of letters written to a child. The letters of Dorothy Osborne to Sir William Temple are delightful beyond most; those of Sir William himself, so long admired as models of serene and stately English, have ceased to interest the modern reader. But Lady Rachel Russell's letters, the apologetic scraps written by Steele to his wife Prue, and Swift's letters to Stella preserve a charm that defies the touch of time. Other 18th-century letters of interest are those of Mrs Delaney, covering half a century, Fanny Burney, Miss Berry, one of Walpole's later correspondents, and Hannah More. Dr Johnson's letters are always admirably vigorous and direct, and one at least is among the most memorable things in English literature; but he never put his strength into this form, and indeed disliked to write freely in letters from the after-use that might be made of them. Jane Austen's letters are not characteristic of her unique genius; Burns's are artificial and disappointing; Sterne's mawkish and unreal; Goldsmith's good, but few and unimportant. But the century closes well with the inimitable masterpieces of Cowper, throughout full of tenderness, grace, vivacity, wit, and sense.

Of 19th-century letters the characteristic examples of Charles Lamb stand first. Even the slightest show the peculiar charm of his touch, and all are stamped with the sign-manual of genius. Scott's letters are hearty, genial, and honest; Byron's clever, trenchant, and somewhat unreal. There are many good letters of Southey, Crabbe, Sydney Smith, Leigh Hunt, De Quincey, Lockhart, Macaulay, Dr Arnold, Hood, Washington Irving, Emerson, Carlyle, Lady Duff Gordon, and Ruskin. Thirlwall's *Letters to a Friend*, and Thackeray's *Letters*, published in 1887, are unusually good collections. Shelley is an author not yet judged sensibly by either set of readers, but it is enough to say of his letters that they are neither so much above his poetry as Matthew Arnold would place them nor as far below it as they appeared to Swinburne. The letters of Mary Godwin to Imlay, written towards the close of the 18th century, are deeply interesting; those of Keats to Fanny Brawne do injustice to the memory of a sovereign poet, and should never have been printed. But indeed the love-letter is almost always a flower that will not bear being plucked from the stalk on which it grew, and those that are nowadays too often read aloud in breach-of-promise cases are almost always as unreal as the short-lived passion that inspired them. Of later 19th-century English letters none stand out greater than those of Mrs Carlyle and Edward FitzGerald, and perhaps Stevenson, which have indeed already been lifted into the rank of the English classics in this kind.

Of German letter-writers it may be enough to name Schiller, Goethe, and Humboldt; of French, Voiture, Madame de Maintenon, Madame du Defand, Sainte-Beuve, George Sand, Mérimée, and the unapproachable name of Madame de Sévigné. The sovereign quality of this great letter-writer is her naturalness and goodness of heart, combined with an unmatched facility of sympathetically realising the emotional experiences of others, and of adding reality and life to everything she touched. None ever possessed in richer measure the woman's gift

of that warmer interest in the smaller commerce of life, and that aptitude for treating social or public matters from the private and personal point of view which give half their charm to the letters of women. She tells her daughter, to whom she wrote with overflowing affection for twenty-five years, that she lets her pen 'run on and take its own way. . . . I commence always without knowing how far I shall go; I know not whether my letter will be long or short.' Horace Walpole says of her, 'She has the art of making you acquainted with all her acquaintance, and attaches you even to the spots she inhabited.' There is no writer whose inherent goodness has been repaid with a warmer love than Madame de Sévigné, or whose supremacy upon an intellectual throne is less likely ever to be shaken.

The English reader will find the form of the ancient Roman letter in the example preserved in Acts xxiii. The modern English letter differs from the older only in being somewhat less ceremonious and less varied in form. Thus, 'sir' alone was once nearly universal as the form of address, but is now considered cold. Again, 'honoured sir' and 'respected sir' have almost disappeared, and unhappily also such beautiful forms as 'heart' and 'sweet-heart.' Howell often ends with 'yours inviolably,' 'yours entirely,' 'yours in no vulgar way of friendship'; Horace Walpole says 'yours very much,' 'yours most cordially,' and once, to Hannah More in 1789, 'yours more and more.' Puritan writers often used forms strange to modern ears, such as 'yours in the bowels of Christ.' Baxter in his *certainen epistolare* with Peter Heylin delightfully subscribes himself 'yours in so far as you are for the truth.' In earlier times it was customary to add on the outside directions to the bearer, as 'Haste, haste,' and in official letters even such pointed provocatives of speed as 'Ride, ride, for your life.' Underlining is a detestable practice, equivalent to a confession of weakness in being forced to borrow strength from adventitious aid, and crossing is a device happily practised by but few men at least, although it had its use in days of dear postage. Many, however, indulge in a *postscript*, without which it is said no lady's letter is complete.

The earliest guide to letter-writing extant is Angel Day's *English Secretary* (1599). Another, by Gervase Markham, is entitled *Conceited Letters; or a most Excellent Bundle of New Wit* (1618). Forms of letters, with much else, were also given in the popular *Academy of Compliments* (1671). Of such books there is now great abundance; but, while occasionally helpful, they are by no means an unmixed blessing, being no doubt responsible for many ridiculous phrases that are in too common use. But to them the world owes the masterpieces of Richardson, who, in his labours upon a guide to correspondence, discovered that he could write novels that could melt the hearts of the women.

See William Roberts. *History of Letter-writing, from the Earliest Period to the Fifth Century* (1843); Mumby, *Letters of Literary Men*. There is a collection of *Love Letters of Famous Men and Women of Past and Present Centuries* (2 vols. 1888) by Merydew. The copyright of letters remains with the writer (see COPYRIGHT).

Letter-wood. See BREAD-NUT.

Lettland or LATVIA (Lettish, *Latvija*), a republic of Europe, formed in 1918 out of the Russian government of Courland, southern Livonia, and western Vitebsk, lies between Esthonia and Lithuania, and between the Baltic (including the southern part of the Gulf of Riga) and Russia. The country is mostly level or undulating, with forests, lakes, and peat-bogs. Its rivers are the Windau, Dvina, and Aa. There are four provinces—Vidzeme (Livonia), Kurzeme (western Courland), Zemgale (eastern Courland), and Latgale (Vitebsk).

The area is about 25,000 square miles; the population 1,500,000, mostly Letts, with considerable Russian, Jewish, White Russian, German,

Polish, and Lithuanian minorities, and a few Esths. About 58 per cent. are Protestants, about 23 per cent. Roman Catholics. There is a university at Riga (till 1919 a polytechnic).

The people are mostly employed in agriculture, growing oats, rye, barley, and flax. An agrarian law of 1920 broke up the large estates which had been held by the Russian state, the Baltic barons, the church, and others, and parcelled them out among landless peasants. The forests are productive. A little brown coal occurs; otherwise the mineral resources are slight. Manufactures are growing, and will develop with electric power from the Dvina. The position of Lettland is commercially important. It is the natural outlet for a great part of Russia. It has a relatively long seacoast; and the Russian railways make for its ports—Riga (the capital; pop. 280,000), Windau (Lettish, Vintspils; pop. 18,000), and Libau (Liepaja; 77,000). Other towns are Dünaburg or Dvinsk (Daugavpils; 45,000) and Mitau (Jelgawa; 25,000).

The earlier history of the country will be found under the headings COURLAND and LIVONIA. In the Great War Lettland was occupied by the Germans, who already formed the land-owning class. Independence was declared in November 1918. Complicated military movements followed, involving Germans, Bolsheviks (Russian and Lettish), anti-Bolsheviks, Poles, Esthonians and others. Peace was made in 1920. The constitution, which came into force in 1922, provides for a parliament (*Saeima*) elected by equal vote of all citizens of 21 years, by proportional representation. The president is chosen by parliament.

The Lettish language belongs to the same group as Lithuanian and the extinct Old Prussian. It is not so archaic as Lithuanian; but it possesses valuable treasures of popular poetry, proverbs, riddles, &c. See Ulmann, *Lettische Volkslieder* (1874), and Bielenstein, *Ein Tausend Lettische Rätsel* (1881); C. F. Watson, *Ueber den lettischen Volksstamm* (1822); Andreyanov, *Lettische Volkslieder und Mythen* (1896); Endzelin, *Lettische Grammatik*.

Lettres de Cachet, the name given to the famous warrants of imprisonment issued by the kings of France before the Revolution. All royal letters (*lettres royales*) were either *lettres patentes* or *lettres de cachet*. The former were open, signed by the king, and countersigned by a minister, and had the great seal of state appended. Of this kind were all ordinances, grants of privilege, &c. But these checks on arbitrary power did not exist with regard to *lettres de cachet*, which were folded up and sealed with the king's little seal (*cachet*), and by which the royal pleasure was made known to individuals or to corporations and the administration of justice was often interfered with. The use of *lettres de cachet* became much more frequent after the accession of Louis XIV. than it had been before, and it was very common for persons to be arrested upon such warrant, and clapped into the Bastille (q.v.) or some other state-prison; where some of them remained for a very long time, and some for life, either because it was so intended, or, in other cases, because they were forgotten. It was not always for political reasons that *lettres de cachet* were obtained; sometimes private persons got troublesome members of their families brought to reason in this way. The lieutenant-general of the police kept forms of *lettres de cachet* ready, in which it was only necessary to insert the name of the individual to be arrested. Sometimes an arrestment on *lettres de cachet* was a resource to shield criminals from justice.

Letts. See LETTLAND.

Lettuce (*Lactuca*), a genus of plants belonging to the natural order Compositæ, sub-order Cichoraceæ. The Garden Lettuce (*L. sativa*) is supposed to be a native of the East Indies, but is not known to exist anywhere in a wild state, and from remote antiquity has been cultivated in Europe as an esculent, and particularly as a salad. It has a leafy stem, oblong leaves, a spreading, flat-topped panicle, somewhat resembling a corymb, with yellow flowers, and a fruit without margin. It is now generally cultivated in all parts of the world where the climate admits of it; and there are many varieties, all of which may, however, be regarded as sub-varieties of the Cos Lettuce and the Cabbage Lettuce, the former having the leaves more oblong and upright, requiring to be tied together for blanching—the latter with rounder leaves, which spread out nearer the ground, and afterwards *bol* or roll together into a head like a small cabbage. The lettuce is easy of digestion, gently laxative, and moderately nutritious. The white and somewhat narcotic milky juice of this plant is inspissated, and used under the name of *Lactucarium* or *Thuridace* as an anodyne, sedative, opiate medicine. The best and most useful kind of this juice is obtained by making incisions in the flowering stems, and allowing the juice which flows to dry upon them. In mild winters they may be kept ready for planting out in spring. The other species of this genus exhibit nothing of the bland quality of the garden lettuce. The Strong-scented Lettuce (*L. virosa*) is distinguished by the prickly keel of the leaves, and by a black, smooth seed, with a rather broad margin. It is found in some parts of Britain. *Lactucarium* is prepared from its fresh-gathered leaves in the flowering season. The leaves have a strong and nauseous, narcotic and opium-like smell. *L. perennis*, a Mediterranean species, adorns with beautiful blue flowers the stony declivities of mountains and clefts of rocks in some parts of Germany, as in the Harz, &c., but is not a native of Britain, which, however, possesses one or two other species in qualities resembling *L. virosa*. *L. macrantha*, *L. Dubya*, and *L. Lessertiana* grow on Mount Everest. Korea and Formosa are particularly rich in species.

Leucadia. LEUKAS.

Leuchtenberg. See BEAUHARNAIS.

Leucine, or AMIDO-ISOBUTYLACETIC ACID, a product of the decomposition of albuminous materials occurring in many of the juices of the animal body: formula $C_6H_{11}O_2NH_2$. A substance isomeric, but not identical, with natural leucine can be prepared artificially.

Leucippus, the founder of the Atomic School of Greek philosophy, and forerunner of Democritus (q.v.), was born possibly in Abdera, and flourished in the 6th or 5th century B.C.

Leuciscus, a genus of fresh-water fishes, of the family Cyprinidæ, containing a great number of species, among which are the Roach, Dace, Chub, Minnow, &c.

Leucite (Gr. *leukos*, 'white'), a rock-forming mineral which occurs in the form of icositetrahedra belonging to the cubical system. It has a hardness = 5.5–6, and a specific gravity = 2.45–2.50. The colour is white, ash-gray, or smoke-gray. It usually contains many inclusions of other minerals and of glass, gas bubbles, and fluid cavities, which show a regular, usually concentric, arrangement within the crystals. Unlike cubical minerals, it exhibits a certain degree of double refraction, believed to be due to conditions of unequal tension existing within the crystals. When exposed to a tem-

perature of 500° C. the crystals become perfectly isotropic. Leucite occurs chiefly in volcanic rocks, and those in which it occurs have a restricted distribution.

Leuckart, RUDOLF, zoologist, was born 7th October 1822 at Helmstädt, and studied at Göttingen. In 1850 he became professor of Zoology at Giessen, and in 1869 at Leipzig; he specially distinguished himself by his study of the Entozoa. His great work is *The Parasites of Man* (Eng. trans. by Hoyle, 1886). He died 6th February 1898.

Leucocythæmia (Gr. *leukos*, 'white,' *kytos*, 'a cell,' and *haima*, 'blood') is a disease in which the number of white corpuscles in the blood is greatly increased, while there is a simultaneous diminution of the red corpuscles. The disease was noticed almost at the same time (in 1845) by John Hughes Bennett of Edinburgh and Virchow of Würzburg; the former giving in 1852 the name *Leucocythæmia*, while the latter gave it in 1847 the less expressive name of *Leukæmia* or *White Blood*. The increase of the white or colourless corpuscles is associated with changes in the lymphatic glands, spleen, and marrow of the bones. Of these the most noticeable is enlargement of the spleen, which sometimes attains an enormous size. The glands may or may not be visibly enlarged. The disease is classed as spleno-medullary (myelocythæmia), or lymphatic (lymphocythæmia), according to the type of white corpuscles predominating in the blood. There are also other, more uncommon, forms.

The first symptom usually noticed by the patient is enlargement of the abdomen, in consequence of the increase in size of the spleen. Weakness, breathlessness, hæmorrhages in various situations, and often enlargement of the liver succeed; and the disease almost always proves fatal in two or three years at most. It may occur at any age; but is most common between twenty and fifty, and in the male sex. Nothing is known of its cause, except that a proportion of those affected have at some previous time suffered from ague, or from some suppurative condition. Treatment seems sometimes to have proved effectual in the early stages; cases have been recorded where arsenic and the application of X-rays or radium to the region of the spleen and over the long bones have arrested what appeared to be commencing leucocythæmia. But after the disease is fully established all treatment has as yet proved unavailing.

Leucoline, C_9H_7N , is an organic base obtained by the distillation of coal-tar, and is isomeric with quinoline.

Leucoma is the term applied to a white opacity of the cornea (see EYE). It is the result of acute inflammation, giving rise to the formation of cicatricial tissue on the ulcerated surface, or between the layers of the cornea. It is sometimes re-absorbed on the cessation of the inflammation, and the cornea recovers its transparency; but in many cases it is persistent and incurable.

Leucorrhœa (Gr. *leukos*, 'white,' and *rheō*, 'I flow'), popularly called *whites*, is the name applied to an abnormal mucous or mucopurulent discharge from the female generative organs. It is a prominent symptom in many forms of female disease; and the treatment must be directed to the morbid condition on which it depends. Antiseptic or astringent vaginal douches are generally of use in diminishing the excessive secretion and the annoyance caused by it.

Leuctra, a village of Bœotia, in ancient Greece, famous for the great victory which the Thebans under Epaminondas (q.v.) here won over the Spartan king Cleombrotus (371 B.C.).

Leuk (Fr. *Loèche*), a small town in the Swiss canton of Valais, on the right bank of the Rhone, 15 miles above Sion. Five miles northward are the *Baths* of Leuk (4643 feet above sea-level), at the head of the Dala gorge and the foot of the ascent over the Gemmi pass. The springs have a high temperature (124° – 129° F.), are saline, chalybeate, and sulphureous, and are used both for drinking and bathing, chiefly in skin and stomachic diseases. The natives are mostly German-speaking Catholics.

Leukas, LEUCADIA, or SANTA MAURA, one of the Ionian Islands, lies close to the west coast of Greece; about 660 B.C. the Corinthians cut through the sandbank between it and the mainland. It resembles the Isle of Man in shape, and is 20 miles long by 8 wide, with an area of 110 sq. m. The backbone of the island is a ridge of white limestone; hence the name (*leukos*, 'white'). Wine, olive-oil, and currants are the principal products. The island is much subject to earthquakes. Pop. 30,000, chiefly Greeks. The west coast is bold and precipitous, and terminates south in the abrupt headland (Dukato) known to the ancients as the Leucadian rock, on which stood a temple to Apollo, and from which once a year a criminal was hurled into the sea by way of sacrifice. From the same point Sappho, the poetess, and Artemisia of Halicarnassus were said to have thrown themselves.—The capital, Amaxichi or Leukas, on the east coast, is the seat of an archbishop, and has a population of 5000. It was nearly destroyed by an earthquake in 1825. Venice was mostly mistress of this island from 1684 to 1800; it was occupied by Britain in 1810. Dörpfeld thinks Leucadia was the Ithaca (q.v.) of Ulysses; and from it Lafcadio Hearn took his first name. See IONIAN ISLANDS.

Leuthen, a village of Prussia, in Lower Silesia, 10 miles W. of Breslau, celebrated for the victory won there, 5th December 1757, by Frederick the Great, with 34,000 men, over the Austrians under Prince Charles of Lorraine at the head of 90,000. The Austrians lost 10,000 killed and wounded, 12,000 prisoners, and 116 pieces of artillery; the Prussians, 6500 killed and wounded. The result was the reconquest of the greater part of Silesia by the Prussians.

Leutze, EMANUEL, painter, was born at Gmünd, in Württemberg in 1816, was brought up by his parents in America (at Philadelphia and at Fredericksburg, Virginia), and afterwards studied and painted in Europe from 1841 to 1859, his home for fourteen years being at Düsseldorf. He settled in New York city in 1859, and died at Washington, 18th July 1868. His works include three scenes from the life of Columbus, several from English history, and a number depicting events in the war of the Revolution, including 'Washington crossing the Delaware.' One of his last works was the 'Westward Ho' mural picture for the staircase of the capitol at Washington.

Leuwenhoek. See LEEUWENHOEK.

Levaillant, FRANÇOIS, traveller and ornithologist, was born in 1753 of French parents living at Paramaribo, in Dutch Guiana. In 1777–80 he studied natural history in Paris, and then spent more than two years in exploring the southern parts of South Africa (1781–84). His death occurred at Sézanne, south of Epernay, on 22d November 1824. He published accounts of two of these expeditions, not altogether free from imaginative details and exaggerations, under the title *Voyages dans l'Intérieur de l'Afrique* (1790–96). Several books by him on birds are marred by the same faulty tendencies; those on African birds, on the new and rare birds of America

and India, and on paroquets are the most valuable.

Levant (from the Ital. *Levante*, the 'Orient,' or 'Rising'—i.e. the East), a name employed to designate the eastern parts of the Mediterranean Sea and the coast regions of Syria, Asia Minor, and Egypt. In a wider sense, it is applied to all the regions eastward from Italy, as far as the Euphrates and the Nile.—*Levantine* is a name given to persons mainly of Frank extraction born in Turkey and the towns of the Levant.—*Levanter* is a stormy wind blowing up the Mediterranean from the Levant.

Levée, the French name, used also on the Lower Mississippi (q.v.), for an embankment.

Lev'ee, originally a reception held in the monarch's bedchamber at the hour of rising (Fr. *lever*). See COURT (PRESENTATION AT).

Levellers, an ultra-republican sect or party which became noticeable in the parliamentary army in 1647, and two years later produced a formidable mutinous outbreak. The chief leader was John Lilburne (c. 1614–57), who, whipped and imprisoned by the Star Chamber in 1638, had risen in the army to be lieutenant-colonel. He became an indefatigable agitator; thought Cromwell's republic too aristocratic, and demanded greater liberty of conscience and numerous parliamentary reforms; and was repeatedly imprisoned for the treason in his pamphlets. A part of the army mutinied in April 1649 in support of like views, and soon there were a thousand insurgents, who were speedily surrounded near London and forced by Cromwell to surrender. Similar risings elsewhere were also swiftly dealt with. See Page, *The Leveller Movement* (Wash. 1916).

Levelling. Level is a term applied to surfaces that are parallel to that of still water, or perpendicular to the direction of the plumb-line; it is also applied to the instrument employed in determining the amount of variation from perfect levelness. The instrument is a cylindrical glass tube very slightly convex on one side, and so nearly filled with water, or, what is better, with alcohol, that only a small bubble of air remains inside. The level is then mounted on a three or four legged stand, with its convex side upwards, and by means of a pivot and elevating screws is made capable of assuming any required position. If the level be properly constructed the bubble should lie *exactly* in the middle of the tube when the instrument is properly adjusted, and at the same time the line of sight of the telescope attached to the level should be accurately parallel to the surface of still water. In ordinary levels this first condition is seldom seen, and, instead, two notches are made on the glass to mark the position

of the two extremities of the bubble when the instrument is level. The tube and bubble should be of considerable length to ensure accuracy. The leveller requires two assistants, each furnished with a pole from 10 to 14 feet high, and graduated to

feet and inches, or feet and tenths of feet. If he wishes to measure the height of A above B, he may do this by beginning either at A or B. Let the latter be the case: then one assistant is placed at B, holding his pole upright; the other is sent forward to C (which must be below the level of the top of the pole at B); the surveyor, who places himself between them, reads off the height Bb, which he puts down in the back-sight column of his book, and then turns the level to C, reading off Cm, which is entered in the front-sight column. The surveyor and his assistant at B then take up new positions, the latter at D; the back-sight Cc and the front-sight Dn are read off, and the process is repeated till one of the assistants reaches A. The excess of the sum of the back-sights over that of the front-sights gives the height of A above B. A little consideration shows that this method only holds true when practised on a small scale, and consequently in extensive surveys the level (as found by the above method) must be reduced by an allowance for the earth's curvature.

Leven, a small seaport and police-burgh (1867) of Fife, with golf-links, on the Firth of Forth, at the mouth of the Leven, 11 miles NE. of Kirkcaldy; pop. 7000.

Leven, Loch, a salt-water loch, between Argyll and Inverness shires, extending 11½ miles to Loch Linnhe, near Ballachulish. At Kinlochleven several fresh water lochs have (since 1901) been impounded to generate electricity for manufacturing purposes. See also **LOCHLEVEN**.

Lever, an inflexible rod—straight or bent, as the case may be—supported at some point of its length on a prop which is called the *fulcrum*, and having applied at two other points a *resistance* to be overcome and *power* to overcome it. The general principle governing levers of all sorts is

Fig. 1.

that the power and the resistance must tend to produce opposite rotations round the fulcrum, and that their moments—the product of either of them into the shortest distance between the line of the direction of its application and the fulcrum—must be numerically

Fig. 2.

equal; or, in other words, the power and the resistance are in the inverse ratio of their respective shortest distances from the fulcrum. When this is the case there is equilibrium; when either 'moment' predominates there will be rotation.

These conditions may be fulfilled whether the power P, the fulcrum F, and the resistance W stand in the order PFW, PWF, or WPF; and hence levers are popularly divided into three classes. In the first class (PFW)—fig. 1 for a straight lever, fig. 2 for a bent one, equivalent to a straight lever since P and W are parallel—we have the Balance (q.v.), the spade (when used for raising earth), the seesaw; or, as double levers, scissors and pincers, such as coal pincettes. In the second class (PWF, fig. 3) we have crow-

Fig. 3.

bars (P the hand, W the resistance of the body pushed, F the ground), boat-oars (P the hands, W at the rowlock, the resistance of the boat, F the com-

paratively fixed position of the oar-tip in the water), wheelbarrows; and, as double levers, nutcrackers (P the hand, W the nut, F the hinge). In the third class (WPF, fig. 4) we have fishing-rods, whips, umbrellas, and most instruments used with the hand alone, and coal- and sugar-tongs; and many instances in the muscular system—e.g. the biceps muscle and forearm of man (fig. 5), his deltoid muscle and shoulder, the pectoral muscle and wing of birds.

Fig. 4.

Levers of the third class always work at a mechanical disadvantage as regards power; but what is lost in power is gained in speed and range of movement—e.g. the biceps muscle, since CA, fig. 5, is about one-sixth of the distance between the elbow-joint and the palm of the hand, must exert a 6 lb. pull on A in order to raise a 1 lb. mass in the hand (setting aside the weight of the forearm itself). Levers of the second order always act at a mechanical advantage as regards power; and in those of the first order a given pressure may overcome a greater, an equal, or a less resistance, according to the ratio of the arms. A subsidiary advantage of levers of the second order is that when a man lifts weight by one of the first order his power is limited to his own weight hung on the lever, whereas with one of the second order his push or pull is upward, and he is thus able to exert his full muscular strength.

Fig. 5.

When a large mechanical advantage is required this may be obtained, without using bars inordinately long, by means of a combination of them (as in fig. 6). Here the levers have their arms in the ratio of 3 to 1, and a little consideration will make it plain that a power, P, of 1 lb. will balance the weight of 27 lb. But in this instance the particular defect of the lever as a mechanical power shows itself prominently; for if the 27 lb.

Fig. 6.

mass has to be lifted two inches, the power requires to act downwards through (2 × 27 or) 54 inches; and, as the extent of sweep of the power cannot be largely increased without inconvenience, the advantages of this contrivance are confined within narrow limits.

Lever, CHARLES, a popular novelist, chiefly remembered for the rollicking fun of his Irish stories, was born in Dublin, 31st August 1806. He graduated at Trinity College, Dublin, in 1827, and then removed to Göttingen, where he studied medicine, and subsequently returned to Dublin to complete his academic career. His most popular work, *Charles O'Malley*, is a reflex of his own college life in Dublin, and many of the incidents in the novel, as in many of his late productions, are drawn from his own experiences of the world. Probably in 1824, and certainly at some time between 1827 and 1832, he spent a considerable time in the backwoods of Canada and North America, and subsequently embodied his experiences in *Con Oregan* and *Arthur O'Leary*. Returned to Ireland, he practised medicine first at Kilkee in County Clare, and afterwards at various other country towns, collecting material for his stories of Irish country life. Having married a Miss Baker, he went in 1837 to practise medicine at Brussels, and while there wrote *Harry Lorrequer*, and afterwards *Charles O'Malley* for the *Dublin University Magazine*, then recently started. Returning to Dublin, he published *Jack Hinton* in 1841, and from 1842 to 1845 acted as editor of the *Dublin University Magazine*, and wrote *Nuts and Nutcrackers*, *Arthur O'Leary*, *Tom Burke of Ours*, and *The O'Donoghue*. In 1845 he again went off to the Continent, going first to Brussels, then to Bonn and Carlsruhe, where he lived for some time, and published the *Knight of Gwynne*. He then moved on to Florence, and wrote *Roland Cashel*, and thence to Spezzia, where *Luttrell of Arran*, *Con Oregan*, *Sir Jasper Carew*, and *The Dodd Family Abroad* were produced in rapid succession. Then, suddenly and completely changing his style, he wrote the *Fortunes of Glencore*, followed by a truly Irish story, *The Martins of Cro-Martin*, and *The Daltons*, the hero of which is an Englishman travelling on the Continent. Lever was then, in 1858, appointed by Lord Derby to be British vice-consul at Spezzia, and continued to write, publishing *Davenport Dunn*, *One of Them*, *Gerald Fitzgerald*, *Sir Brooke Fosbrooke*, *That Boy of Norcotts*, and contributing some racy papers to *Blackwood's Magazine* under the sobriquet of 'Cornelius O'Dowd.' On May 2, 1867, he was promoted by his old patron Lord Derby to the consulship at Trieste, where he died 1st June 1872. Lever's later books, though marked by greater care and more thought than those of the *Lorrequer* school, and even that strange and brilliant composition entitled *A Day's Ride*, are already dead; and it is only by his brilliant and racy sketches of a phase of Irish life which was passing away even as the sympathetic young chronicler caught its features that Lever still lives, and may continue to live when Ireland is as dull as Lincolnshire and as orderly as Clapham. Lever's wandering life on the continent of Europe, and especially in Belgium, where he fell in with a great number of Peninsular and Waterloo officers, and collected a vast store of traditions of the great battles and of those who fought them, gives an additional zest to many of his books. They are all something more than mere sketches of rollicking in Ireland, and their boisterous fun is relieved, and even refined, by constant changes of scene, the reflex of Lever's own wandering and wayward life, and of his own restless genius.

One unfortunate result of Lever's novels has been to create a false idea of Irish society, and still more of the Irish character. The Irish of to-day at least are singularly unlike those portrayed in the novels of the *O'Malley* type, and, much as the social conditions of the country have altered in the last sixty years, a great deal of what was carelessly

dashed off by Lever, and which at any time was but brilliant caricature, has been curiously enough accepted by most of his readers as an accurate representation of life in Ireland. Apart from his powers as a writer, Lever was one of the most brilliant conversationalists and agreeable companions of his time; he was at home everywhere, a welcome guest in all societies. He had a great faculty for humorous verse; and the songs scattered through his novels are bright and racy.

See *Memoirs* by Fitzpatrick (1879; new ed. 1896) and by Downey (better, 1906). Of this 'disappearing author' there were an edition (33 vols.) in 1876-78, one edited by his daughter (37 vols.) in 1897-99, and another at Boston, U.S. (32 vols.), in 1902.

Leveret. See **HARE**.

Leverrier, URBAIN JEAN JOSEPH, a great French astronomer, was born at St Lô, in Normandy, 11th March 1811. He was admitted into the École Polytechnique in 1831, was subsequently employed for some time under the board for the administration of tobaccos, and as early as 1836 distinguished himself by his papers on the combinations of phosphorus with hydrogen and oxygen. Next year the place of teacher of astronomy at the Polytechnique was offered him, and in this way Leverrier was led to become an astronomer. His *Tables de Mercure*, and several memoirs on 'the secular inequalities,' opened to him the door of the Academy in 1846. At the instigation of Arago he applied himself to the examination of the disturbances in the motions of the planets, from which the existence of an undiscovered planet could be inferred; and, as the result of his laborious calculations, directed the attention of astronomers to the point in the heavens where, a few days afterwards, the planet Neptune was actually discovered by Galle at Berlin (see also ADAMS, J. C.). For this Leverrier was rewarded with the Grand Cross of the Legion of Honour, a professorship of astronomy in the Faculty of Sciences at Paris, and various lesser honours. When the revolution of 1848 broke out Leverrier sought distinction as a democratic politician; the department of La Manche chose him in May 1849 to be a member of the Legislative Assembly, where he at once became counter-revolutionary; and in 1852 Louis Napoleon made him a senator. In 1854 Leverrier succeeded Arago as director of the Observatory of Paris, an office which, save during an interval of three years (1870-73), he held till his death, 23d September 1877. See Bertrand's *Éloge* in the *Mém. de l'Acad. des Sciences*.

Levi, the third son of Jacob and Leah (Gen. xxix. 34). He is conspicuous through the part he took with his brother Simeon in the slaughter of the inhabitants of Shechem (Gen. xxxiv.). Jacob pronounced this curse on them both, that they should be scattered among Israel (Gen. xlix. 7). In Egypt the House of Levi had divided itself into three families, those of Gershon, Kohath, and Merari. At the distribution of Palestine no tribal territory was allotted to them, but only forty-eight scattered cities. In the Pentateuch they are set apart as the servants of the sanctuary, but they might not perform any priestly function, the priesthood being reserved for one Levitical family, that of Aaron. The history of the Levites has been matter of controversy. Some have assumed that Levi is simply the eponymous ancestor of the Levitical caste, and it has been denied that Levi was originally a tribe at all.

Levirate (Heb. *levir*, 'husband's brother'), a usage wide-spread in ancient times and in some places common now, which constrained a brother to marry his brother's widow. Amongst Jews and Hindus, the duty of 'raising up seed to his brother' was imperative only when the first marriage had

proved childless. The custom has been referred to polyandry, to religious horror of childlessness, and to mere economic or agrarian considerations. See FAMILY, MARRIAGE.

Levita, ELIAS (1465-1549), a Jew born near Nurnberg, had to seek refuge in Italy, where he held a high position as teacher of Hebrew in Venice, Padua, and Rome. His principal exegetical works are on Job, the Psalms, Proverbs, and Amos. Other important works are his *Massoreth Hammasoreth*, a treatise on the vowel-points; a Hebrew grammar; and a Talmudic and Targumic Dictionary. Most of his works have been repeatedly edited and partly translated by Buxtorf, Münster, Fagius, and others, who owed most of their Hebrew knowledge to Levita exclusively. He is called not only *Halevi*, but *Ashkenasi* ('the German'), *Habachur* ('the master'), &c.

Levites. See LEVI.

Leviticus. See PENTATEUCH.

Levkosia. See NICOSIA.

Levuka, till 1882 the capital of Fiji (q.v.).

Levulose. See SUGAR.

Levy (Fr. *levée*) is the compulsory raising of a body of troops from any specified class in the community for purposes of general defence or offence when the existing military forces are insufficient to meet the necessities of the case. When a country is in danger of instant invasion a *levée en masse* is sometimes made—i.e. every man capable of bearing arms is required to contribute in person towards the common defence. On less urgent occasions the levy may be restricted to a class, as to men between eighteen and forty years of age.

Lewald, FANNY, German novelist, was born of Jewish parents at Königsberg, on 24th March 1811, but professed Christianity in her seventeenth year. She began to write when about thirty, and from 1840 lived in Berlin; in 1855 she married Adolf Stahr (1805-76), the literary critic. She died at Dresden on 5th August 1889. Fanny Lewald was perhaps the most important woman novelist in Germany during the middle of the 19th century. She was possessed of keen powers of observation, and wrote in a sober, matter-of-fact style, which, however, was not incompatible with a strong undercurrent of restrained feeling. She was an especially enthusiastic champion of the emancipation of her sex. Her realistic tendencies brought her into conflict with the Countess von Hahn-Hahn, whose unreal sentimentalism she successfully parodied in *Diogenes* (1847). Her best book is perhaps *Von Geschlecht zu Geschlecht* (1863-65). An English translation of *Stella* (1884) appeared in the same year. At different times she visited many parts of Europe with her father and her husband; her books on Italy (1847) and Great Britain (1852) were the most valuable outcome of these journeys. See her *Meine Lebensgeschichte* (6 vols. 1861-63).

Lewes, the county town of Sussex, 50 miles S. of London, is picturesquely situated on the eastern declivity of one of the South Downs, at the foot of which flows the navigable river Ouse on its course to the sea at Newhaven, 7 miles distant. Pop. (1801) 4909; (1881) 11,199; (1921) 10,798. The chief objects of interest are the ruins of a priory and castle, the former built (1072-78) by William de Warenne, Earl of Surrey, who with his wife Gundreda, a daughter of William the Conqueror, was buried within its precincts. Of the castle which stood on high ground in the centre of the town, the keep and gateway, the only portions now remaining, are held in trust for the nation (1920) by the Sussex Archaeological Society, which has a museum in the adjoining Barbican House.

Lewes had seven churches, mostly Perpendicular in style, a county hall (1812), free library (1862), school of science and art (1868), and a town-hall (1893). The chief trade is in corn, malt, coals, lime, and cement, whilst printing is extensively carried on. Till 1867 the town returned two members to parliament, till 1885 one. A charter of incorporation was granted in 1881. Race-meetings are held near Mount Harry on the Downs, where, on the 14th May 1264 a great battle was fought between Henry III. and the insurgent barons under Simon de Montfort. The Piltdown skull was found near Lewes. See EOANTHROPUS.

Lewes, GEORGE HENRY, man of letters, was born in London, a popular comedian's grandson, 18th April 1817. Educated partly at Greenwich under Dr Burney, and partly in Jersey and Brittany, he left school early to enter first a notary's office, and then the house of a Russian merchant. He next tried walking the hospitals, but could not stand the horrors of the operating-room; so in 1838 he proceeded to Germany, and remained there nearly two years, studying the life, language, and literature of the country. On his return to London he fell to work writing about anything and everything as a Penny Encyclopædist and Morning Chronicle, as a contributor afterwards to a dozen more journals, reviews, and magazines, and as editor of the *Leader* (1851-54), and of the *Fortnightly* (1865-66), which he himself had founded. He 'began life,' says Frederic Harrison, 'as a journalist, a critic, a novelist, a dramatist, a biographer, and an essayist; he closed it as a mathematician, a physicist, a chemist, a biologist, a psychologist, and the author of a system of abstract general philosophy.' The change was rendered possible, Sir Leslie Stephen points out, by George Eliot's literary successes. Lewes was married unhappily and had children, when his connection with her began in July 1854; it ended only with his death at their house in Regent's Park, 30th November 1878. An intellect clear rather than strong or deep, a wit lively rather than rich, and a firm and graceful style made Lewes a popular critic and interesting biographer. In philosophy he was originally positivist and always anti-metaphysical; sought to harmonise psychology and science, and popularise both; and was suggestive rather than systematic or satisfying.

His works, besides a tragedy and a couple of novels (1841-48), include the *Biographical History of Philosophy* (1845; recast in the 3d edition of 1867 as *The History of Philosophy from Thales to Comte*); *The Spanish Drama, Lope de Vega and Calderon* (1846); a *Life of Robespierre* (1848); *Comte's Philosophy of the Sciences* (1853), which is much more than a mere translation; the admirable *Life and Works of Goethe* (1855); *Seaside Studies at Ilfracombe* (1858); *Physiology of Common Life* (1859-60); *Studies in Animal Life* (1862); *Aristotle* (1864); *On Actors and the Art of Acting* (1875); and *Problems of Life and Mind* (1874-79), its five volumes dealing with 'The Foundations of a Creed,' 'The Physical Basis of Mind,' 'The Study of Psychology,' and 'Mind as a Function of the Organism.' See ELIOT (GEORGE), with works there cited, and Professor Sully's article in the *Encyclopædia Britannica* (1911).

Lewis, or SNAKE RIVER, the great southern branch of the Columbia (q.v.). See IDAHO.

Lewis. See LOUIS, and LEWIS-WITH-HARRIS.

Lewis, SIR GEORGE CORNEWALL, statesman and author, was born in London, 21st April 1806, son of Sir T. F. Lewis, Bart., of Harpton Court, Radnorshire; and was educated at Eton and Christ Church, Oxford, where in 1828 he took a first-class in classics and a second-class in mathematics. A pupil of Austin's, he was called to the bar of the Middle Temple in 1831, and succeeded his father as Poor-law Commissioner in 1839. He sat for Herefordshire from

1847 to 1852, and for the Radnor Boroughs from 1855. After holding minor government offices, he rose rapidly to be financial secretary to the Treasury, Chancellor of the Exchequer under Palmerston (1855-58), Home Secretary (1859-61), and Secretary at War. He succeeded his father as second baronet in 1855, and died 13th April 1863. He was an earnest and sincere politician, and his business capacity, sound sense, varied knowledge, and moral and intellectual qualities made him a notable figure in the public and political life in England.

His extraordinary versatility may be gathered from a list of his works, which include a treatise on the *Origin and Formation of the Romance Languages* (1835), *The Fables of Bædrius, The Use and Abuse of Political Terms, The Influence of Authority in Matters of Opinion* (1850), his famous *Inquiry into the Credibility of Ancient Roman History* (1855—against Niebuhr), *The Method of Observation and Reasoning in Politics, Local Disturbances and the Irish Church Question* (1836), *The Government of Dependencies, Herefordshire Glossary, The Astronomy of the Ancients* (1859), and *Dialogue on the Best Form of Government* (1859). He was editor of the *Edinburgh Review* from 1852 to 1855. See his *Letters* (1870), and Bagehot's *Literary Studies* (1879).

Lewis, MATTHEW GREGORY ('Monk Lewis'), was born in London, 9th July 1775, and educated at Westminster, at Christ Church College, Oxford, and at Weimar, where he was introduced to Goethe. In 1794 he went as an attaché to the Hague, and there, inspired by Glanvill (his mother's favourite author) and the *Mysteries of Udolpho*, wrote at nineteen *Ambrosio, or the Monk* (1795), the gruesome, unclean romance which made him so famous that in 1798 his invitation to dine at an Edinburgh hotel could elate Scott as nothing before or afterwards. A musical drama, *The Castle Spectre* (1796), *The Bravo of Venice* (1804), and a host more of blood-and-thunder plays, novels, and tales are happily forgotten; but two lines at least survive of one of his ballads, *Alonso the Brave*. In 1796 he entered parliament as a silent member, and in 1812 he inherited from his father two large estates in Jamaica. So to better the condition of his slaves there, good-hearted, lachrymose, clever little 'Mat' forsook the society of the Prince Regent, Byron, and all his other great friends, and made the two voyages, in 1815 and 1817, which furnished materials for his one really valuable work, the posthumous *Journal of a West India Proprietor* (1834). On his way home, in the Gulf of Florida, he died of yellow fever, 13th May 1818, and was buried at sea. See his *Life and Correspondence* (2 vols. 1839).

Lewis, SINCLAIR, born at Sauk Center, Minn., 7th February 1885, graduated at Yale, and, after following the careers of journalist and magazine editor, turned to the writing of novels. He had published several books—*Our Mr Wrenn, The Trail of the Hawk* (1915), and others—when in 1920 *Main Street* appeared and created an immediate sensation in America, and later in other countries. In it is depicted a small community in the Middle West—'America in Little.' *Babbitt* (1920) expresses the new American revolt against materialism. *Martin Arrowsmith* (1925), the life of a doctor, brilliantly written, shows further his love of dissection.

Lewisham, a metropolitan borough of London, 6 miles SSE. of Charing Cross, with 182,000 inhabitants and two parliamentary divisions.

Lewisia, a genus of plants, of the natural order Portulacaceæ (see PURSLANE), named in honour of the American traveller, Meriwether Lewis (1774-1809). *L. rediviva* is found in the regions of his explorations, on the west side of the Rocky

Mountains. Its thick, branching roots are highly valued by the Indians as nutritive and restorative. It has a showy rose-coloured flower. Another species, *L. brachycalyx*, is found in Utah.

Lewiston, a city of Maine, on the Androscoggin River, 35 miles N. of Portland. The river, which is crossed by several bridges, has here a fall of 50 feet, and furnishes water-power to numerous mills and factories, especially for woollens and cottons. At Lewiston is Bates College. Pop. 32,000.

Lewis-with-Harris, an island of Scotland, the largest and most northerly of the Outer Hebrides, separated from the mainland by the Minch, and containing the town of Stornoway (q.v.), 43 miles NW. of Poolewe and 180 N. by W. of Oban. Its length is 60 miles; its greatest breadth is 28 miles; and its area is 859 square miles, of which 683 belong to Lewis, the Ross-shire portion, in the north, and 176 to Harris, the Inverness-shire portion, in the south. The coasts are wild and rugged, the chief indentations being Broad Bay and Lochs Erisort, Seaforth, Resort, and Roag. The Butt of Lewis, a promontory at the extreme north, rises sheer from the sea to a height of 142 feet. Gneiss is the predominant rock; and the surface, attaining 2662 feet in Harris and 1750 in Lewis, consists mainly of hill, moor, and moss, treeless and almost shrubless, with much peat and fresh-water lakes innumerable. Less than 4 per cent. of the entire area is in cultivation. In 1844 'The Lews' was purchased from the Mackenzies of Seaforth by Sir James Matheson (1796-1878), who expended £330,000 on improvements. Lord Leverhulme bought it in 1918. Pop. (1801) 12,164; (1831) 18,440; (1901) 32,886; (1921) 31,687, mostly Gaelic-speaking. See CALLERNISH, CROFTERS, HEBRIDES; Smith, *Lewisiana* (1875); Mackenzie, *Book of the Lews* (1919).

Lexicon. See DICTIONARY.

Lexington, (1) capital of Fayette county, Kentucky, stands in the fertile blue-grass region, at the junction of four railways, 77 miles S. of Cincinnati. It is a handsome city, its principal edifices the court-house, the state university, and the state lunatic asylum. The fine Henry Clay monument also is noteworthy. There are manufactures of hemp and, especially, of tobacco. Pop. 41,500.—(2) A village of Massachusetts, 11 miles WNW. of Boston, where the first blood of the Revolution was shed, April 19, 1775. A monument has been erected in memory of the eight minute-men who fell in this first conflict.—(3) Capital of Lafayette county, Missouri, on the Missouri River, 42 miles by rail (84 by water) E. of Kansas City. It contains some colleges, and has manufactures of furniture and cigars. Pop. 5000.—(4) A pretty village of Virginia, on the North River, 32 miles NNW. of Lynchburg, is the terminus of the James River and the Kanawha Canal, and contains the Washington and Lee University and the Virginia Military Institute. Here Robert E. Lee and 'Stonewall' Jackson are buried. Pop. 3000.

Lex Talionis, the law of retaliation, common among all ancient and barbarous nations, by which an eye for an eye and a tooth for a tooth was considered the appropriate punishment.

Leyden, or LEIDEN, a town of Holland, stands on the Old Rhine, 5 miles from the North Sea, and by rail 9 miles N. by W. of The Hague and 31 W. of Utrecht. It is a typical Dutch town, spotlessly clean, with canals bordered by avenues of trees, and sleepy squares and streets. Its predominant characteristic is an air of academic repose; and the town is the seat of a celebrated university, which formerly attracted students from all parts

of Europe, including Sir Thomas Browne, Evelyn, Boswell, Goldsmith, John Wilkes, Alexander Carlyle, Alexander Monro, and several other distinguished Scottish surgeons, and numbered amongst its professors some of the greatest names in the world of learning: Grotius, Descartes, Salmasius, Scaliger, Boerhaave, Hemsterhuis, Ruhnken, Valckenauer, &c., besides Arminius and Gomarus, all either studied or taught at Leyden, as have in modern times such men as Einstein and Lorentz. It was founded in 1575 by William of Orange as a reward to the citizens (they themselves selecting this boon in preference to a remission of taxes) for their heroic defence against the Spaniards from October 1573 to October 1574. Its library has many valuable oriental and Greek MSS.; its botanic garden has counted Linnæus and Boerhaave amongst its directors. It has a museum of natural history, one of the finest and best arranged in Europe; a museum of antiquities, with especially valuable Egyptian monuments; an ethnographical museum, the nucleus of which was Siebold's Japanese collection; and an observatory. The senate-hall is hung with the portraits of more than a hundred celebrated Leyden professors. The town art museum contains pictures by Rembrandt, Jan Steen, Gerard Douw, Lucas of Leyden, the family Mieris—all natives of the town, and others. Here too were born some of the Elzevirs, the celebrated printers, who carried on a branch of their business in Leyden, and John of Leyden, the Anabaptist. The quaint and picturesque town-hall dates from 1574-98. There are nearly a score of churches, the most notable among them being St Peter's, with monuments to Boerhaave, Scaliger, Camper, Arminius, &c., and St Pancras, with a monument to Van der Werf, the hero of the siege. In the centre of the town stands an old round tower, which is said to date from the Roman occupation. Leyden was in the 15th century famous all over Europe for its manufactured cloth, baize, and camlet. The same industries, but to a much less extent, together with the manufacture of cotton, twine, and yarn, the dyeing of cloth and leather, &c., are still carried on. Leyden is the seat of a school of navigation. In 1650 the population numbered 100,000; but a century later it had fallen to three-quarters of that number, and by the beginning of the 19th century to 30,000. In 1876 it was 40,724, and 65,694 in 1920. In 1807 a portion of Leyden was destroyed by the explosion of a barge laden with gunpowder on one of the canals.

Leyden, JOHN, poet and oriental scholar, was born, the son of a shepherd, at Denholm, Roxburghshire, 8th September 1775. In 1790 he entered Edinburgh University, and was licensed as a probationer of the Church of Scotland in 1798. He studied medicine in 1796-1800. He proved an ardent and enthusiastic student with a hunger for knowledge, which led him into studies out of the routine, including many European and oriental languages. His strong native talent and varied gifts and attainments, in spite of his uncouth manners, secured him the attention, among others, of Scott, whom he aided in gathering materials for his *Border Minstrelsy*, contributing an article on fairy superstitions, and on one occasion he walked between 40 and 50 miles to procure the words of a ballad which were wanting. He was also a contributor to Lewis's *Tales of Wonder*. His first prose work was *Discoveries and Settlements of Europeans in Northern and Western Africa* (1799). Meanwhile his translations and original poetical contributions to the *Edinburgh Magazine* had attracted attention. For a period of six months (1801) he edited the *Scots Magazine*. Before leaving his native country he had completed his *Scenes*

of Infancy, descriptive of Teviotdale (1803). In 1803 he sailed for India as assistant-surgeon on the Madras establishment. After four months' service in Madras general hospital he was appointed surgeon and naturalist to the commission for the survey of Mysore and Travancore (1804). His health gave way, he was five times given up by the physician, but sick or well he continued his acquisition of languages. He resided for a time at Penang; came back to Calcutta (1806); wrote an essay on Hindustani dialects; was appointed professor in the Bengal College, and afterwards judge at Calcutta. Through the influence of Lord Minto he was appointed commissioner of the Court of Requests, then assay master of the mint. Meanwhile he translated the Gospels into five different languages. When the expedition against Java was undertaken Leyden accompanied Lord Minto thither as interpreter; and at Batavia, in the exploration of a musty, unventilated library, which contained many Indian manuscripts, he contracted a fever, of which he died, August 27, 1811.

Leyden's versification is soft and musical, but his ballads with their marvellous melody have taken a higher place than his longer poems. Next after Scott and Hogg, says Principal Shairp, he has done most to illustrate his native region. His attainments as an orientalist were extraordinary; he had a greater or less acquaintance with at least thirty-four languages or dialects. Lord Cockburn speaks of him as ever in a state of excitement, and ever panting for things unattainable by ordinary mortals. Leyden's chief literary remains are a preliminary dissertation to an edition of the *Complaynt of Scotland* (1801); an essay on the 'Languages and Literature of the Indo-Chinese Nations,' printed in *Asiatic Researches*, vol. xix.; his translation of *Memoirs of Baber* (q.v.), partly by Erskine (1826); and of *Malay Annals* (1821); *Journal of a Tour in the Highlands* (ed. J. Sinton, with bibliography, 1903). See his *Poetical Remains*, by Morton (1819); *Poems and Ballads*, with reprint of memoir by Scott (1875); *Poetical Works*, with memoir by T. Brown (1875); and *Life* by Reith (1908).

Leyden, LUCAS VAN. See LUCAS.

Leydenburg, or LYDENBURG, a town in the Transvaal (pop. 2000), on an elevated plateau, about 150 miles NW. of Delagoa Bay. The district is rich in minerals, and gold has been worked since 1873.

Leyden Jar. See ELECTRICITY.

Leys, HENRI JEAN AUGUSTE, Belgian painter, was born on 18th February 1815 at Antwerp, in which city most of his life was spent, and where he died on 26th August 1869. He was created baron by Leopold I. in 1862. Leys is one of the best modern artists in the style of the old Flemish masters. His most valuable and most characteristic pictures are inspired by the private life and stirring history of his native land—'Rembrandt's Studio' (1837), 'A Flemish Wedding' (1839), 'Public Worship in Antwerp Cathedral,' 'A Village Fête,' 'A Musical Party' (1846), 'Rubens Feasted by the Gunsmiths of Antwerp' (1851), 'New-year's Day in Flanders,' 'Luther Singing in the Streets of Eisenach' (1862), 'Erasmus in his Study,' 'Institution of the Golden Fleece,' and a series of frescoes in his own dining-room representing the history of a 'Flemish Festival.' The last years of his life were occupied in painting six scenes from the history of Antwerp in the 16th century on the walls of the great hall in the town-house of Antwerp. Alma Tadema studied under Baron Leys. See Sulzberger's *Henri Leys* (Brus. 1885).

Leze Majesty, or LESE MAJESTY (Norman-French; Lat. *lesa majestas*), an offence against sovereign power. See TREASON.

Lhasa (pronounced *hlassa*, from *Lha*, 'god'; *sa*, 'place' = the abode of the gods) is the political capital of Tibet, and the ecclesiastical capital of Lamaism (q.v.), one of the principal forms of Buddhism. The city stands in 29° 39' N. lat. and 90° 57' E. long., about 45 miles N.E. of the junction of the Kyichu (lit. water of happiness) with the Brahmaputra River, and about 300 miles from the Indian frontier. It stands a trifle under 12,000 feet above sea-level, but this is considered low for Tibet, and the Kyichu valley is one of the most fruitful portions of the country. Two or three miles to the north and south run ranges of mountains, some 4000 or 5000 feet above the level of the plain. The city lies on the north bank of the Kyichu, on low ground, and in the rainy season the river frequently overflows its banks and inundates the streets. Lhasa may be divided into two portions, one the city proper, the centre of which is the Chokang or cathedral, and the other called Potalashol, about a mile to the north-west, a suburb which has grown up around the foot of the great Potala palace, which is built on a hill. There is a fine avenue flanked by walled pleasure-gardens uniting the two parts of the city. The Potala, which ranks as one of the finest palaces anywhere in the world, and which hides most of the hill on which it is built, is 70 feet higher than St Paul's Cathedral. It is the official residence of the Dalai Lama, who is the temporal ruler of Tibet and the spiritual head of Lamaism. There are about 500 monk-chamberlains resident in the palace, and one wing is used as a training-college for monks training for high government service. If the Potala is the Vatican of Lamaism, the Chokang is its St Peter's. It is, however, not a very imposing-looking building, and a good part of it is hidden from sight by the houses which have been built up around it. It is an enormously wealthy institution. One wing of the building is used for secular purposes, containing the offices of the Lönchen or prime-minister, and the four Shapés (lit. lotus foot) or secretaries of state, who together constitute the *Kashak* or council of state, appointed by and responsible to the Dalai Lama. There is also a large room, in which meets the *Tsong-du* or National Assembly, the Tibetan parliament, the principal members of which are the representatives of the great monasteries in and around Lhasa. One of the buildings immediately adjacent to the cathedral is the Palace of Justice, used by the two *Mipöns* or city magistrates, who also perform the functions of joint mayors. There is no local self-government. The block of buildings comprising the cathedral and adjoining edifices forms the heart of the city, called the inner square. A broad road, called the Parkhor or inner circle, runs round this block. It is the duty of all pious pilgrims to Lhasa to circumnavigate the Chokang by means of this road, or by means of the Chikhor, the outer circle, a roadway which runs around the whole of greater Lhasa including Potalashol. For this reason the Parkhor is nearly always crowded. The wider parts of the road are used as a market-place, and are filled with stalls, which largely take the place of shops. Most of the important Lhasa streets run out of this inner circle. The city proper is only about half a mile in diameter, and the number of individual houses comparatively small, as huge families and groups of families will live inside of one house. Many of the houses are two, some three, stories high, and nearly all are built round a large, square, unpaved courtyard. The roofs are practically all flat, as Lhasa, in common with most other parts of Tibet, is very dry, and the roofs need no slope to dispose of rain and snow. Nearly all the houses are surmounted by prayer-flags. Many aristocratic Tibetan families have

either city mansions inside the city, or semi-country estates in the near neighbourhood. The most famous of these suburban palaces is Norbulinga, to the west, where the Dalai Lama spends most of his time in preference to the Potala.

As befits a city so dominated by ecclesiasticism as Lhasa, a great number of its larger buildings are temples or monasteries. In the northern part are *Muru-gompa*, the largest city monastery, and *Ramoche*, a temple, the oldest building in Lhasa, parts of which supposedly date back to the 7th century A.D., when the city was definitely founded, though the site was probably the headquarters of the savage ruling chiefs of Tibet for some centuries earlier. Very important are the four *Lings* or royal temples (two in the city and two in the suburbs), small and with a strictly limited number of monks, but owning vast stretches of the richest agricultural land all over Tibet, and of importance politically because in the past the regent, during the minority of the Dalai Lama, was chosen from the abbots of these four institutions. The greatest of these, Tengyeling, is now partly in ruins owing to the displeasure of the thirteenth Dalai Lama, who suspected its monks of conspiring against his throne. In the neighbourhood of Lhasa are the three supreme monasteries of Tibet, the greatest in size and repute, fulfilling the functions of universities as well, preparing monk students who come from every part of Tibet and Mongolia for various theological degrees. Drepung is 3 or 4 miles to the north-west, Sera 2 miles to the north, and Ganden 25 miles to the north-east. Nominally the first has 7000, the second 5000, and the third 3000 inhabitants, but in practice this number is considerably exceeded. The resident population of Lhasa proper, apart from monks and the soldiers of the new army, is estimated to be 20,000. This number is greatly augmented, however, by a floating population of pilgrims and traders, and at festival times the city contains more than 100,000. The women of Lhasa go about with perfect freedom, but there is still a good deal of brigandage, owing to the lack of a police force, and after special fire-crackers have been fired (at about 8.30 P.M.) all citizens are supposed to keep to their houses. A curious section of the people are the Ragypas, outcast scavengers, condemned by custom to live in huts made of horn, but many of them wealthy.

From 1720 to 1912 the Chinese exercised suzerainty over Tibet, and maintained two *Ambans* and a garrison of soldiers in Lhasa. But in 1912 the Tibetans expelled their overlords, and since then have remained independent, so the present number of Chinese in Lhasa is negligible. The Tibetans in general, and the Lhasa authorities in particular, have long been distinguished by their dislike of foreigners, and most of the European explorers who set out for Lhasa were turned back before getting there; only three Europeans reached Lhasa during the 19th century, the Englishman Manning (in 1811-12) and the Frenchmen Huc and Gabet (1846). Eventually in 1904 the Young-husband Military Expedition, despatched by the Indian government, reached the city by force of arms, only to find the Dalai Lama had fled, and the expedition was withdrawn shortly afterwards. There is now a more friendly attitude of the Dalai Lama and his court towards England, but the unofficial European is still as rigidly excluded as ever. Mongolians, Sikkimese, and Bhutanese are permitted free access. Most of the Lhasa craftsmen and metal-workers are Nepalese, and there is a small colony of Kashmiris, who, though Mohammedans, are tolerated because of their usefulness as traders, because though Lhasa is something more than an ecclesiastical centre, it is

also the centre for caravans to and from Kashmir, India, China, and Mongolia. The principal exports are wool, furs, sheep, and musk. The principal imports are tea, silk, European and Indian manufactured goods.

See LAMAISM, TIBET, and books there mentioned; Huc's *Travels*; Sarat Chandra Das, *A Journey to Lhasa*; E. Candler, *The Unveiling of Lhasa*, McGovern, *To Lhasa in Disguise*.

Lherzolite, an igneous rock consisting of a granular aggregate of olivine, diopside, and enstatite with accessory picotite. It derives its name from Lake Lherz in the Pyrenees.

L'Hôpital, MICHEL DE, French statesman, was born at Aigueperse in Auvergne in 1504, studied law at Toulouse and Padua, and settled as an advocate in Paris when about thirty years of age. In 1547-48 he represented Henry II. at the Council of Trent; then for some years he held high office in the household of Margaret of Valois, Duchess of Berri. His appointment in 1554 as superintendent of finances was but the preliminary to his nomination as chancellor of France six years later. His policy was one of moderation; especially did he endeavour to assuage the fierce rancour of the religious quarrel by staying the hand of the Catholic persecutors, by resisting the introduction of the Inquisition, and by promoting such conferences, &c., as that of Poissy. But after the peace of Amboise (1563) he lost ground with Catharine de' Medici, and in 1568 he resigned the chancellorship. He spent the rest of his life in retirement on his estate of Vignay near Nîmes, and died there (or at Bélesbat) on 13th March 1573. His Latin poems, speeches, memoirs, &c., were published in 5 vols. in 1824-25. See Life by Villemain (new ed. 1874) and monographs by Taillandier (1861) and Dupré-Lasale (1875).

Lianas, a term first used in the French colonies, in the form *lianes* (from *lier*, to bind), for the woody, climbing, and twining plants which abound in tropical forests. Such plants are comparatively rare in colder climates, although the honeysuckles and some species of *Clematis* afford familiar examples of them; but the lianas of tropical countries overtop the tallest trees, and descend again to the ground in vast festoons, pass from one tree to another, and bind the whole forest together in a maze of living network, and often by cables as thick as those of a man-of-war. Many parts of the forest, as in the alluvial regions of the Amazons and Orinoco, thus become impenetrable without the aid of the hatchet, and the beasts which inhabit them either pass through narrow covered paths; kept open by continual use, or from bough to bough far above the ground. Many lianas—as some of the species of *Wrightia*—become tree-like in the thickness of their stems, and often kill by constriction the trees which originally supported them; and when these have decayed the convolutions of the lianas exhibit a wonderful mass of confusion magnificent in the luxuriance of foliage and flowers. No tropical flowers excel in splendour those of some lianas. Among them are found also some valuable medicinal plants, as sarsaparilla (*Smilax*, order Liliaceæ). The rattans (*Calamus*, order Palmaceæ) and vanilla (order Orchidaceæ) are lianas. Botanically considered, lianas belong to orders which are often quite different. Tropical plants of this description are seldom seen in

our hothouses owing to the difficulty of their cultivation.

Lias is the lowest division of the Jurassic System (q.v.). The beds composing it may be considered as the argillaceous basis of that series of rocks, consisting of more than a thousand feet of alternations of clay and limestone, with but a few unimportant deposits of sand. It consists of the following groups: Upper Lias (200 feet), Middle Lias or 'Marlstone' (300), Lower Lias (900).

The Upper Lias consists of thin limestone beds scattered through a great thickness of blue clay, more or less indurated, and pyritiferous. It has been wrought for alum at Whitby. Above this clay come sandy deposits. The Marlstone is an arenaceous deposit, bound together either by a calcareous or ferruginous cement, in the one case passing into a coarse shelly limestone, and in the other into an ironstone, which has been extensively wrought both in the north and south of England. The Lower Lias beds consist of an extensive thickness of blue clays, intermingled with layers of argillaceous limestone. In weathering, the thin beds of blue or gray limestone become light brown; while the inter-stratified shales retain their dark colour, giving the quarries of this rock at a distance a striped or ribbon-like appearance, whence it is supposed the miner's name lias or layers is derived.

The Lias is highly fossiliferous, the contained organisms being well preserved. It is divided by palæontologists into seventeen zones, each of which is characterised by a particular species of ammonite. Numerous remains of plants occur in the lignite and in the shales. The name Gryphite Limestone has been given to the Lias, from the great quantities of *Gryphæa incurva*, a kind of oyster, found in it. Fish-remains are frequently met with; the reptiles, however, are the most striking forms. They are remarkable for the great numbers in which they occur, for the size which many of the species attain, and for the adaptations in their structure which fitted them to live in water. The most noteworthy are species of *Ichthyosaurus* and *Plesiosaurus* (q.v.).

The Liassic rocks extend in a belt of varying breadth across England, from Whitby, on the coast of Yorkshire, south to Leicester, then south-west by Gloucester to Lyme Regis in Dorsetshire.

Libanius, a Greek sophist or rhetorician, was born at Antioch, in Syria, about 314 A.D. He studied at Athens, and began to teach there so successfully that he soon moved to Constantinople. There his prelections were so attractive that he emptied the benches of the other teachers of rhetoric, who had him expelled from the city on a charge of 'magic.' He then proceeded to Nicomedia; but after five years returned to Constantinople. Ultimately, in 354, he settled down in his native city, where he died about 393. Libanius was the instructor of St Chrysostom and St Basil, who always remained his friends, though Libanius was himself a pagan, and a great friend of the Emperor Julian. His works, which are mostly extant, consist of orations, declamations, letters, &c. See Lives by Petit (Paris, 1866) and Sievers (Berlin, 1868).

Libanon. See LEBANON.

Libation (Lat. *libare*, 'to pour out'), literally, anything poured out before the gods as an act of homage or worship; a drink-offering. The term was often extended in signification, however, to the whole offering of which this formed a part, and in which not only a little wine was poured upon the altar, but a small cake was laid upon it. This custom prevailed even in the houses of the Romans,

who at their meals made an offering to the Lares in the fire which burned upon the hearth. The libation was thus a sort of heathen 'grace before meat.' Even so late as the last quarter of the 19th century Mr Bent found at Samos the *spondē* or libation poured out on the floor before drinking.

Libau (Lettish, *Liepāja*), a seaport of Courland, Lettland, on the Baltic and a lagoon, 123 miles W. by S. of Riga. It possesses a fine harbour, admitting large vessels, and free from ice except for less than a fortnight in the year. Its exports consist of grain, linseed and linseed oil-cake, eggs, skins, hides, and meat, wool, lumber, flax, hemp, &c.; its imports are chiefly coals, herrings, artificial manures, cotton, dyewood, and iron (largely from Great Britain). In 1890-1906 the Russian government at great expense constructed a first-class naval and commercial harbour. There already existed shipbuilding-yards and a school of navigation. The Lettish government decided in 1921 to convert the naval harbour into a free port, and to cut a canal to the Memel River. The industries include iron-founding, brewing, oil-pressing, &c. Libau is much frequented as a seaside resort. One of the churches contains one of the largest organs in the world. A cathedral in memory of Alexander III. was still incomplete when Russian domination ended, and the town was occupied by the Germans (May 1915). Pop. 77,000, mostly of German nationality.

Libel is any publication by printing, writing, painting, or the like signs, tending to injure the reputation of any one or expose him to hatred or contempt. A blasphemous, treasonable, or seditious publication is also termed a libel. Slander (q.v.), on the other hand, is defamatory spoken matter. An action for libel will lie though it cannot be shown that any appreciable pecuniary loss or damage has resulted from the publication; such loss or damage is an inference of law when the writing, &c., either is obviously defamatory or was so in the circumstances. Any definite loss is called special damage, and if properly brought before the court is taken into account when compensation is awarded.

In England the libelled party may seek redress civilly or criminally. If civilly he must prove that the statement made and published concerning him was false, for the truth of the alleged libel (*justification*) is an absolute defence to a civil action. The defendant, besides repelling these pleas, may also bring forward some special defences. Thus, he may allege privilege, which is either *qualified* or *absolute*. Qualified privilege arises where matters of private interest are concerned. So a communication between employers as to the character of a servant is, if made in good faith and without express malice, protected. Absolute privilege arises where the administration of justice or affairs relating to the public service are involved. Thus, statements in a judicial affidavit, or in a report properly made by an officer to his superior, cannot afford a cause of action (see **CONFIDENTIALITY**). The Statute of Limitations also provides that actions for libel must be commenced within six years of the occurrence of the act complained of. Criminally, the remedy for a libel is by indictment (usually after proceedings before a magistrate), or (though more rarely) by criminal information. This last is either filed by the Attorney-general himself, in which case it is called an *ex officio* information, or by the king's coroner and attorney by the direction of the King's Bench Division on the application of some private individual. An *ex officio* information is usually for a libel that seems to threaten some danger to the state; in the other kind of criminal information, as the alleged offence is against a private person,

it must be shown that the ordinary remedy is inapplicable.

The net, so to speak, of the criminal law is much more comprehensive than that of the civil law. Thus, a prisoner may be prosecuted for libelling a dead person, if an attempt to bring contempt and scandal on the deceased's relatives can be proved; the libel need not have been published to a third party; it may have been directed against a company or sect, and not against any particular individual; it may be quite true, but unless its publication was for the public advantage (even this limited defence was only introduced by Lord Campbell's Act of 1843) this is no answer. In all these cases the civil law affords no remedy. Previous to 1792 the judges took upon themselves to decide whether the matter was libellous or no, leaving merely to the jury the question of publication; but in that year Fox's Act declared and enacted that the jury should have power to 'give a general verdict of guilty or not guilty upon the whole matter put in issue upon the indictment or information.' Besides the common law various statutes make libels against private persons, and also seditious and blasphemous libels, punishable by fine or imprisonment. But prosecutions for the last kind, except under very special circumstances, are not at the present day of probable occurrence. 'If,' said Lord Coleridge, in the modern case (1883) of the *Queen v. Ramsay and Foote*, 'the decencies of controversy are observed, even the fundamentals of religion may be attacked without a person being guilty of blasphemous libel.' Though this dictum has been questioned, it may safely be taken as a correct exposition of the present state of the matter. See **BLASPHEMY, SEDITION**.

The law of libel as it affects newspapers requires some special notice. Under Lord Campbell's Libel Act of 1843 the defendant in any action for libel contained in a public newspaper may plead absence of gross negligence and malice, and that he published an apology at the earliest moment possible. He is also at liberty, on filing such plea, to pay into court a sum of money by way of amends. The Newspaper Libel and Registration Act, 1881, as amended by the Law of Libel Amendment Act, 1888, provides that fair reports of proceedings at public meetings and in the law-courts shall be privileged; that actions against various defendants for libels practically the same may be consolidated; that before criminal proceedings are taken against persons connected with a newspaper for a libel therein the leave of a judge at chambers must be obtained; that defendants in libel actions and their wives are competent, though not compellable, witnesses; that in proceedings before magistrates matters of justification may be gone into, and that there may be a summary conviction followed by a fine not exceeding £50 for libels 'of a trivial character.' In Scotland the law of libel is different in some important respects from that of England. The chief points are: (1) there is no radical distinction between libel and slander, both are equally defamatory; (2) damages are awarded as a solatium for wounded feelings; (3) libel and slander are actionable, though not what is technically termed in England *published*—i.e. communicated to a third person; (4) reports of public meetings are more protected by the common law of Scotland than by the common law of England, though the exact limit has not yet been judicially settled; (5) the Scottish system of public prosecution rendered criminal charges for libel on individuals extremely rare, and they are now obsolete.

In the United States the law of libel follows the common law of England, except that the so-called Seditious Law (1798) expired in 1801, and has never been renewed, and that, generally speaking, it is a

valid defence, whether in civil or criminal prosecutions, to show that the matter complained of was true and was published for justifiable ends. Privilege, however, is much further extended than in England.

Libel has several special legal meanings. In the English spiritual courts it is 'a declaration or charge drawn up in writing on the part of the plaintiff which the defendant is obliged to answer.' In the civil and criminal courts of Scotland it is the form into which the complaint against the defender or panel is put. It is also the name for the written charge against an accused person in a church court in Scotland.

The leading English text-book on libel is Odgers, and then another on a similar scale by Folkard. An earlier treatise by Starkie is now out of date. A shorter work is Fraser's *Law of Libel and Slander*; and Shortt's *Law relating to works of Literature and Art* is useful for reference. In Scotland the special treatise by Borthwick (1826) is antiquated, and the only one now in use is Cooper on *Defamation*. The general works of Erskine and Bell also supply information. Guthrie Smith's *Law of Damages* may also be consulted.

Liberec, Czech name of Reichenberg (q.v.).

Liberia, a Negro republic on the Pepper Coast (Guinea) of West Africa, extending north and west of Cape Palmas. Area, about 43,000 sq. m. The coast-line measures about 340 miles. The boundaries in the interior were determined by agreements with France and Britain, 1905-11. The maximum width of Liberia is 200 miles. The coast-region consists of mangrove swamps, lying behind a belt of sand-dunes, is traversed by numerous rivers, and interrupted by projecting headlands of rock. About 20 miles or so inland the surface begins to rise into undulating uplands. The climate and vegetation are tropical. The temperature is pretty even, scarcely ever less than 75° F. or more than 88° F. The rainy season lasts about seven and the dry season five months. The soil is well adapted for the cultivation of coffee, the principal crop grown after the food-plants rice and manioc. Other products are sugar, palm-oil and palm-kernels, cocoa, arrowroot, piassava fibre, spices, coconuts, rubber, kola nuts, Calabar beans. The population is estimated at 2,000,000, of whom 15,000 are descendants of liberated American slaves, the remainder indigenous Negroes, including the Kroomen (q.v.). Some 50,000 in all are civilised. Capital, Monrovia (pop. 6000, including Kru-town), now greatly decayed. Liberia owes its origin to the American Colonising Society, which in 1821 bought land on the coast and settled a small body of freed African slaves. In 1847 the free and independent republic of Liberia was constituted; and it has enlarged its boundaries several times, being joined ten years later by the Negro republic Maryland (founded as a colony in 1821, as a republic in 1854), about Cape Palmas. The constitution of Liberia is modelled on that of the United States, with a president, House of Representatives, and Senate. No white man is allowed to acquire citizen's rights or to hold property. The prevailing religion among the civilised Liberians is Methodism; and schools are numerous in the towns and villages near the coast. There are magnificent forests in the interior, and much mineral wealth, some of it worked. The United States has become the sole adviser in Liberian affairs.

See an exhaustive work on Liberia by Sir H. H. Johnston (2 vols. 1906), and books by Delafosse (Paris, 1900, 1904), Jore (Paris, 1912), Reeve (1923); Maughan (London, 1920).

Liberius, a native of Rome, succeeded to the see of his native city in 352, on the death of Pope Julius I. For refusing to confirm the decree which condemned Athanasius he was in 355 banished to Thrace by the Emperor Constantius. But three years later he returned to Rome, expelled his rival, Felix II., and resealed himself on the papal throne. He died on 24th September 366. See ARIUS, and ATHANASIUS.

Liberty, Equality, Fraternity (*Liberté, Égalité, Fraternité*), the motto of the French Republic, dates from the time of the first Revolution. Equality, it should be noted, merely means equality before the law and the absence of class privileges. For the Cap of Liberty, see BONNET. The custom of planting trees of liberty, crowned with a *bonnet rouge*, became common during the Revolution.

Libidibi. See DIVIDIVI.

Libourne, a town in the French department of Gironde, at the confluence of the Isle with the tidal Dordogne, 22 miles by rail N.E. of Bordeaux. It is one of the ancient free towns founded by the English about 1269. Pop. 18,000.

Libra, the seventh sign of the Zodiac (q.v.).

Library. As soon as men were so far advanced in civilisation as to commit their thoughts to writing in any portable form, whether on papyrus, bricks, parchment, or paper, there were books and consequently libraries. The first of such libraries would probably be the collection of sacred books belonging to the temples of the gods, and under the care of priests. The archives of the state would also be gathered together in the palaces of princes accessible only to a privileged few. But public libraries in the modern sense of the term—instituted for the purposes of research in all branches of knowledge—have existed in the most remote antiquity. As early as 3800 years B.C., according to Professor Sayce, Sargon I., the Semitic ruler of Akkad, founded such a library in that city. Here was deposited the great work of Babylonian astronomy, *The Observations of Bel*, which in later recensions has come down to our day. The name of the keeper of Sargon's library, Ibbi-sarru, the most ancient librarian on record, is preserved to us on his seal, which is still extant. Libraries of a similar kind were formed in all the chief cities of Babylonia. Their contents, or copies and translations made from them, were finally gathered together to enrich the more famous Assyrian library established in the palace of Kuyunjik at Nineveh by Assur-bani-pal in the 7th century B.C. This great library was rich in history, astronomy, grammar, sacred hymns, and legends, and the science of divination and demonology. The books were on brick tablets, papyrus, and leather. The number of tablets is estimated by M. Ménant at about 10,000, making some 500 of our modern volumes of 500 pages in 4to. The greater portion of these tablets, as is well known, have been recovered and deposited in the British Museum. The library of Assur-bani-pal was intended for the public good. In a note appended to a grammatical treatise the king says: 'I have written it upon tablets . . . I have placed it in my palace for the instruction of my subjects.' The books were methodically arranged and numbered, and the reader requiring a volume handed to the librarian a ticket inscribed with the requisite number.

In ancient Egypt there was an immense literature, and Diodorus Siculus describes the library of King Osymandyas, identified with Rameses II., as

having over its door the inscription, 'Dispensary of the Soul.' At a later period the Ptolemies of Egypt vied with the kings of Pergamus in forming magnificent collections. An account of those established in Alexandria has already been given (see ALEXANDRIAN LIBRARY). Of the libraries in Greece we know very little. Pisistratus is the most ancient collector named by Greek historians; and Aristotle, who left behind him a large library, is said, by Strabo, to have inspired the sovereigns of Egypt with the taste for collecting.

It is characteristic of ancient Rome that the first great libraries of the city should have been formed of the spoils of war. Æmilius Paulus brought to Rome about 168 B.C. the library of Perseus, king of Macedonia. Lucullus formed a large collection of books which he liberally threw open to all scholars; but the first public library, properly so called, appears to have been that established by Asinius Pollio, 39 B.C., which he appropriately placed in the temple of Liberty. Julius Cæsar intended to erect a public library, but left his design to be carried out by Augustus, who founded two, the Octavian and the Palatine. Other emperors were zealous in adding to the number. The chief of these was the Ulpian Library, instituted by Trajan. At Byzantium Constantine began to collect the Christian books which had escaped the destructive inquisition of Diocletian.

After the irruption of the barbarians the work of building up libraries had to be begun *de novo*. The ravages of fire and war had substantially destroyed the ancient collections. The classical literature was naturally neglected by the Christians, whose own literature had suffered largely from the hostility of the pagans. But the germs of our modern libraries are to be found in the cloister, and it is notable that in many cases liberal regulations were framed for rendering the books in such monastic collections accessible to the reading public. The monks of the order of St Benedict especially were the collectors, translators, and bookmakers of the early middle ages. England may be said in this matter to have led the way. The monasteries of Canterbury, York, Croyland, Whitby, and Durham were at an early date possessed of good libraries. Alcuin, when at Tours, urged Charlemagne, who was zealous in the restoration of learning, to send into Britain for books. Among the more famous libraries abroad may be mentioned those of the monastic communities at Fulda, Corvei, and St Gall in Germany, Monte Cassino in Italy, Fleury and Cluny in France. The books here stored were naturally in large part theological, though the Latin classics were not neglected. A good idea of the contents of such libraries may be gathered from the catalogue of Christ Church, Canterbury, and some other similar lists printed by Edwards in his *Memoirs of Libraries*, or from Montague Rhodes James's *The Ancient Libraries of Canterbury and Dover* (1903).

The period of decline in monastic learning in Europe generally coincided with the revival of classical studies and of secular literature; and the collecting of books once more became the honourable ambition of princes and private persons. Italy was in this respect especially distinguished. Coluccio, chancellor of Florence, himself a great collector, wrote a treatise urging the establishment of public libraries. Niccolò Niccoli at his death in 1436 bequeathed his library for public use. Following these examples Lorenzo de' Medici formed a magnificent library. Frederick, Duke of Urbino, did the same; and Corvinus, king of Hungary, is said to have left at his death in 1490 a collection of 50,000 volumes. Among private collectors, at an earlier date in Great Britain, Richard Aungerville (q.v.), Bishop of Durham, must not be omitted, nor

Guy de Beauchamp, Earl of Warwick, who in 1315 bequeathed a collection, chiefly of romances, to Bordesley Abbey, Worcestershire.

Britain was, however, but slightly touched with the spirit of the literary revival which elsewhere led to the zealous gathering together of the relics of antiquity. The destruction of monasteries and the prejudices of the Reformers led rather to a reckless destruction of books, and the 16th century was a dark age in the library history of the nation. Henry VII. had possessed a collection of three or four hundred choice volumes, to which Henry VIII. made considerable additions. Edward VI., Mary, and Elizabeth seem to have done little towards increasing the royal library. Archbishop Parker and others made a great effort to induce Queen Elizabeth to form a public library after the pattern 'set us by the more civilised nations, as Germany, Italy, and France,' but without success. The want of a national library continued to be felt for another century and a half. In the reign of William III. the writer of a pamphlet, said to be Richard Bentley, then Keeper of the Royal Library, describes it as having been in a flourishing condition in the time of James I., and since 'fallen into decay to the great dishonour of the crown and the whole nation.' He proposes that there should be a new royal library erected and supported by a yearly revenue settled on it by parliament. The proposal was not carried out, but in 1759 George II. incorporated the library, then containing about 12,000 volumes, with the recently-founded collection of the British Museum (q.v.).

Meanwhile, during the 17th century, many important collegiate and local libraries were founded throughout the kingdom. Sir Thomas Bodley founded in 1602 the great library which bears his name at Oxford University; and while he was ransacking the London bookstalls for his purpose he encountered Archbishop Ussher, who was bent on the same errand on behalf of the newly-established library of Trinity College, Dublin (1601). The Bodleian Library contains upwards of a million printed volumes irrespective of pamphlets, and more than 40,000 MSS. The University of Edinburgh, a little later (1626), received a valuable accession to its collection from Drummond of Hawthornden, and at the close of the century (1682) the Faculty of Advocates entrusted to Sir George Mackenzie the task of building up their library. The University Library of Cambridge was founded in the 15th century, but received a considerable addition by a benefaction of George I. It is now estimated to contain some 900,000 volumes. In London Archbishop Bancroft founded the Lambeth Library in 1610; and Sion College, a guild of the clergy of London and its suburbs, founded a library in 1629. Good libraries were also established in some of the English towns—Leicester, Norwich, Bristol, and notably Manchester, where Humphrey Chetham in 1653 founded for public use a library which at one time was larger than any out of London and the two university cities. The minor libraries of the several colleges of the universities, and of the Inns of Court, also deserve mention, for, though not always large in number of volumes, they often contain valuable collections on special subjects, manuscripts, rare printed books, and incunabula.

These libraries, as a rule, possessed few or no endowments, and thus depended largely for their growth upon private donations. Bodley, however, obtained from the Stationers' Hall in 1610 a grant of all books there entered. By an act of parliament, 14 Chas. II. chap. 33 (1682), printers were ordered to present copies of such books to both universities and the Royal Library. The Copyright Act of 8 Anne, chap. 20 (1710) required nine copies to be

provided—for the Royal Library, then at St James's, the two English universities, the four Scottish universities, the Faculty of Advocates, Edinburgh, and Sion College, London. The privilege attached to the Royal Library passed, with the gift of its books, to the British Museum. After the legislative union with Ireland it was extended (41 Geo. III. chap. 107) to the libraries of Trinity College, and the King's Inn, Dublin—thus making in all a tax upon publishers of eleven copies. The number was, however, in 1835 reduced to five; and a yearly grant in compensation was made to the other six libraries, based on a calculation of the average value of the books received by them through the copyright tax during the three preceding years. From this grant Edinburgh University was allotted £575; Glasgow, £707; St Andrews, £630; Aberdeen, £320; King's Inn, Dublin, £435; and Sion College, £363.

About the middle of the 18th century we hear of the first circulating library established in London. One was opened in Birmingham by Hutton in 1757. About the same time a proprietary library made its appearance in Liverpool. The Leeds library, in the establishment of which Dr Priestley took a prominent part, dates from 1768. Great Britain still remained in the early years of the 19th century far behind the rest of Europe in the number and value as well as the accessibility of its libraries. More than three hundred years ago Bishop Bale lamented that there was not in each county at least one library 'for the preservation of noble works, and preferment of good learning.' In the next century John Evelyn declared that Paris alone was able to show more libraries than all the three nations of Great Britain; and, even after the foundation of the British Museum, Gibbon was so little contented with its abundance that he recorded his opinion that 'the greatest city in the world is still destitute of a public library.' But in the middle of the 19th century interest in the subject was awakened, and a great movement took place in the direction of extending and popularising libraries. While a royal commission was inquiring into the management of the British Museum, in 1849 a select committee, on the motion of William Ewart, M.P. for Dumfries, was appointed by the House of Commons to report on the best means of 'extending the establishment of libraries freely open to the public, especially in large towns in Great Britain and Ireland.' Before this committee was laid a map of Europe (printed in the report) exhibiting by various shades the relative provision of books, in libraries publicly accessible, as compared with the population of the several countries. On this map the smaller German states are marked with the lightest lines, indicating the richest supply, and Great Britain with the darkest shade or poorest provision. The statistics furnished in illustration showed that in Saxony for every hundred inhabitants there were 417 books; in Denmark, 412; in Bavaria, 339; in Tuscany, 261; in Prussia, 200; in Austria, 167; in France, 129; in Belgium, 95; while in Great Britain there were only 53 books to every hundred inhabitants. It may be remarked that in 1850 the British Museum in point of magnitude stood fourth in the list of European libraries. It now holds the second place, the Paris National Library ranking as first.

Mr Ewart's bill, giving power to certain districts to establish free libraries and to tax the inhabitants for that purpose, passed into law in 1850. It was subsequently supplemented, amended, and extended by various acts, the principal of which are that of 1855 (for Ireland), that of 1887 (for Scotland), and that of 1892 (for England and Wales). In 1921, owing largely to the efforts of the Library Association, certain disabilities inherited from the

old Ewart acts were finally removed by a government bill, notably the limitation of the library rate, which had hitherto been fixed at one penny in the pound. By this bill the way was opened up to an expansion of the library service throughout the country and more particularly in the rural districts, and to a better co-ordination between the library and the educational authorities, so that the public library may now fairly be regarded as forming an integral part of the national education machinery.

Some of the larger English towns at once took advantage of the 1850 act. Manchester led the way in 1852. The libraries of Liverpool and Birmingham were opened in 1860. Yet the movement did not become general for many years. In 1868 there were only fourteen libraries established under the acts. Ten years later the number had increased to eighty-one. A complete list of places where the acts had been adopted, with the dates of their adoption, furnished by Mr Greenwood in his *Public Libraries*, brings the number in June 1890 up to 208. The numbers at present are, roughly speaking, some 400 for England, 75 for Scotland, and 50 apiece for Wales and Ireland.

The English act was extended to Scotland in 1854, and the first town to profit by it was Airdrie. The free library of Dundee was founded in 1869, and has now some 200,000 volumes. Edinburgh was comparatively rich in libraries belonging to professional bodies and learned societies, and was slow to adopt the acts. There has not hitherto been in Edinburgh or elsewhere in Scotland a National Library supported by the Exchequer, but the Advocates' Library, which contains upwards of 700,000 volumes, has for long served many of the purposes of such an institution and is now actually to become the National Library of Scotland. In 1921 the Faculty of Advocates made an offer to the government to transfer their library to the nation; a year or two later the Scottish National Library Endowment Trust was constituted, and shortly afterwards a sum of £100,000 was offered by an Edinburgh citizen, Mr (now Sir) Alexander Grant, as a permanent endowment of the National Library. The result of this gift was the acceptance of the Faculty's offer by the government, and it may be hoped that in a very short time the business of giving effect to this arrangement will be completed. Of the other libraries in Edinburgh, the University Library, which possesses over 300,000 volumes, and the Signet Library, which is a general as well as a legal library, founded and maintained by the Society of Writers to H.M. Signet, and numbering some 130,000 volumes, deserve special mention. In 1886 the city was persuaded by the munificent donation of Mr Andrew Carnegie to establish the Free Public Library, which was opened with 50,000 volumes in June 1890. Glasgow possesses in the Mitchell Library, founded by a bequest of the late Stephen Mitchell, and opened in 1877, the largest reference library in Scotland. It is specially rich in local literature and Scottish poetry, and now contains some 600,000 volumes.

Wales possesses a National Library at Aberystwyth, numbering over 400,000 printed books and over 5000 manuscripts. Founded by Royal Charter in 1907, the National Library of Wales secured a permanent building in 1909, and the Copyright Act of 1911 conferred upon it the right to claim a copy of all books published in Great Britain.

In Dublin the library of Trinity College retains the copyright privilege, and has about 400,000 volumes. The King's Inn Library, founded in 1787, which, as has been said, had the copyright tax commuted for an annual sum, is comparatively small (60,000), and restricted to members of the legal profession.

The National Library of Ireland, established in Dublin in 1877, and transferred to a new building in 1890, was formed in part by the collection of the Royal Dublin Society, and now numbers 300,000 volumes.

France is remarkable for the number and excellence of its provincial libraries open to the public, while its capital is better provided than any other city in Europe. The Bibliothèque Nationale is of ancient origin, and contains the collections of many French kings. Its modern history may be said to date from the librarianship of De Thou. In 1617 it obtained the right of two copies of every book published in the kingdom, and at the end of the century it was thrown open to the public. At the beginning of the 19th century it contained 250,000 printed books, 83,000 MSS., and 1,500,000 engravings. The Revolution enriched it with many forfeited collections of private persons and religious communities; and Napoleon augmented the government grant for purchases. The number of its volumes is now well over three million. A dozen or so other libraries, most of which are open to the public, and to all of which access can be obtained without difficulty, would easily add as many volumes again to the number available to the Parisian reader. There are, moreover, several municipal libraries in the city. Of the provincial libraries, from many of which books are lent out, several can now count more than 200,000 volumes; among the more notable may be mentioned those of Aix, Bordeaux, Grenoble, Lyons, and Toulouse. The Strasbourg University Library, burned in 1870, now numbers about 1,200,000 volumes. An important feature of the bibliothecal system of France is the school and the educational library. In 1862 it was ordered that to every primary school in the country there should be attached a library, under the care of the schoolmaster, for the use of the children, their parents, and others, and twenty years later there had been established under this system 20,000 of these school libraries.

Throughout Germany the several state libraries and the universities are well provided with books, which in many cases can be borrowed for use outside the libraries. In Berlin the State Library of Prussia (formerly the Royal Library), founded in 1659, was opened to the public in 1661, and in 1699 it became entitled to a copy of every book published within the royal dominion. It now contains about 1,777,000 volumes. The State Library (formerly the Royal Library) at Munich owes its origin to Albert V., Duke of Bavaria, in the middle of the 16th century. It is particularly rich in incunabula. The number of printed volumes contained in it is given as about 1,400,000, and it possesses some 50,000 MSS. In Dresden the Sächsische Landesbibliothek (formerly the Royal Library), founded in the 16th century, now contains about 640,000 volumes. The Landesbibliothek (formerly the Royal Library) of Stuttgart is an example of rapid growth. It was established in 1765, and can now boast of possessing about 700,000 printed books and about 6000 MSS. In the Darmstadt library there are about 650,000 volumes, and the universities of Göttingen, Heidelberg, Leipzig, Tübingen, and Würzburg can all boast of libraries containing more than half a million volumes.

The most important of the Austrian libraries is the National Library (formerly the Imperial Library) at Vienna. Founded by the Emperor Frederick III. in 1440, it acquired a large portion of the famous library collected by Corvinus, and is now estimated to contain about a million printed books and 280,000 manuscripts. The University Library in the same city also possesses about a million volumes, while the University Library of Graz has upwards of 300,000. In Hungary the

University Library of Budapest and in Poland the University Library of Cracow both number half a million volumes.

Italy, as might be expected, is rich in old libraries, in incunabula, and manuscripts. The National Library of Florence has over 700,000 volumes, the National Library of Milan has about 300,000, and the Library of St Mark at Venice has over 450,000. The Palatine Library of Parma has upwards of 300,000. The universities of Bologna, Genoa, Naples, Pisa, and Turin have libraries of the first class. But all these yield in interest to the Vatican Library at Rome, which is probably the oldest in Europe. In mere number of books it is exceeded by many, but its 500,000 printed volumes are of the greatest value, and its 50,000 MSS. include some of the most precious in the world. The Vatican is the private library of the Pope, but scholars can gain access to it by permission. It has as yet, unfortunately, not been fully catalogued, but various catalogues of special sections have been published. In Rome, also, the Public Library, Vittorio Emanuele, to which has been joined the Biblioteca Casanatense, founded by Cardinal Casanata in 1698, was made up in great part from the old Jesuit library of the Collegio Romano and other suppressed religious institutions, and now contains about half a million printed volumes and over 6000 MSS. The confiscated monastic libraries helped largely to swell the aggregate number of volumes available for public use. In 1875 it appears that 650 of these collections were added to the contents of public libraries already in existence, while as many as 1050 were used for the formation of more than 400 new communal libraries. In Italy the governmental libraries, including national libraries, university libraries, and the collections of certain academies, are under the authority of the Minister of Public Instruction, and their internal management, even to the compilation of their catalogues, the keeping of registers, and the purchase of books, is regulated by a code of rules emanating from the state.

In Spain the National Library at Madrid is of the largest class, with 30,000 MSS. and over a million printed volumes. It enjoys the copyright privilege for all books published in Spain. The Escorial, though much smaller, is valuable, and the same may be said of the University Library of Salamanca. The National Library of Lisbon has 16,000 MSS. and 600,000 printed books. The large municipal library of Oporto, founded in 1833, was enriched by the collections of suppressed religious houses. Both these libraries claim copies of all books published in Portugal.

In Belgium there are several large libraries open to the public. The Bibliothèque Royale at Brussels (with which were incorporated the ancient library of the dukes of Burgundy and a large part of the Bollandists' collection) contains roughly 700,000 printed books, 30,000 MSS., and 175,000 prints. The privilege of copyright is accorded to publishers only on the condition of their presenting copies of their publication to this library. The University Libraries of Ghent and Liège contain about 400,000 volumes apiece; that of Louvain, which numbered about 250,000 volumes, many of them of great value, was destroyed by the Germans in 1914, and is now in the process of reconstruction.

Among the great libraries of Holland mention should be made of the Hague Royal Library, which is said to contain some 2,000,000 books and pamphlets; the Amsterdam University Library, which numbers about 800,000 printed books and 60,000 MSS.; and the University Libraries of Leyden and Utrecht, numbering 400,000 and 275,000 volumes respectively.

In Denmark the Royal Library of Copenhagen,

begun in the middle of the 16th century, has about 1,000,000 volumes, including a rich collection of incunabula and 35,000 MSS. It was opened to the public in 1793, and exacts two copies of all books published in the kingdom. The University Library in the same city has about 500,000 printed volumes and 6600 MSS., and also enjoys the privilege of the national copy tax.

The two largest collections in Sweden are the Royal Library of Stockholm with over 500,000 volumes, and the University Library of Uppsala with about 600,000. The University Library of Christiania, in Norway, contains nearly 700,000 volumes.

Much the most interesting and extensive of the Russian libraries is the Public Library of Petrograd, formerly the Imperial Library of St Petersburg. Its nucleus was the famous library collected by the Polish aristocrats and statesmen, the two brothers Zaluski, and subsequently carried off to Petrograd by the Russians after the capture of Warsaw by Suwarrow in 1794. The Imperial Library, however, was not officially opened to the public until the year 1814. In the course of the following century it was enriched by a great number of exceedingly valuable collections, including a large portion of the magnificent Hermitage Library; few libraries, indeed, can have increased so rapidly, for its inventory, taken shortly before the outbreak of the Great War, gives the number of its printed books and pamphlets as more than 2,600,000, and of its MSS. as more than 200,000. Under the Bolshevik rule the library evidently receives a large measure of state support; it is granted the right to receive gratis copies of all works printed within the Russian state, and enjoys exceptional privileges in the remission of postal and transport expenses. Its direction has been placed under the control of a council, which includes a great number of representatives from various official bodies and learned societies, as well as the members of the library committee, and the organisation of which would appear to be somewhat impracticably elaborate; the internal organisation of the library, however, does not seem to have been essentially altered from what it was. The University Libraries of Moscow and Kieff are both extensive, numbering about half a million volumes apiece. That of Helsingfors in Finland numbers 300,000.

The United States of America have not had the opportunities of Europe in the gradual accumulation of princely collections in the course of centuries, or the advantages possessed by France or Italy in the more recent appropriation of the books and treasures of monastic houses. Moreover, the States, until 1850, showed comparatively little interest in the institution of public libraries outside the universities. In that year the total number of libraries containing 5000 volumes or upwards which could be said to be accessible to the public was estimated at eighty-one, containing among them an aggregate of 980,413 volumes. The movement in favour of free public libraries took place in America about the same time as in England, and nowhere since that date has the accumulation of books been so rapid as in the States, and nowhere have the economy and management of free public libraries been carried to greater perfection: the modern library movement is held to date from the foundation of the American Library Association in 1876. In the middle of the 19th century there was no library in the States with as many as 75,000 volumes. There are now several with over a million, the largest being the Library of Congress, with upwards of 3,000,000 volumes. Among the older collections the most notable is that of Harvard University, established in 1638. In 1850 it was estimated to contain in all 72,000 volumes; the number has now

risen to more than 2,000,000 books and pamphlets. Yale College, New Haven, which had in 1850 some 21,000 volumes, now has over 1,000,000 books and pamphlets. Official libraries have been formed in connection with every state, admission to them being free. The largest of these is the Library of the State of New York at Albany, numbering some 600,000 volumes and 500,000 pamphlets. The Library of Congress at Washington, which includes the scientific collection of the Smithsonian Institution, is the national library of the United States. It claims, under the copyright laws, two copies of every publication, and has in addition a large annual grant from Congress. Its enormous collection of MSS.—over a million in number—supplies the research-student in American history with an invaluable and indispensable store of material. Its buildings, completed in 1897 at a cost of \$6,500,000, rank as amongst the best of their kind. Washington also possesses a huge number of minor government libraries, among which special mention may be made of the Surgeon-General's Library, probably the finest medical library in the world: it numbers about 700,000 volumes. Of the free town libraries the most important is that of Boston, founded in 1852. In 1881 it had 395,000 volumes, and now has about 1,200,000. Many great libraries have been established and endowed for public use by the munificence of private individuals. The Astor Library at New York, founded by Jacob Astor and augmented by his son and grandson, was opened in 1854; the Lenox Library, also at New York, was established in 1870 by Mr James Lenox, who left an endowment of over a million dollars. The Astor, Lenox, and Tilden Libraries were merged by a law of 1895 into the New York Public Library, which, with its branch libraries, numbers over two million and a half volumes. Another notable donation was the Newberry bequest, which became available in 1885, of more than two million dollars for the establishment of a free public library in the north division of Chicago: this Newberry Library, which is for reference use only, contains about 400,000 volumes and pamphlets. Mr Carnegie's generosity in founding and supporting libraries is well known; he is said to have given more than £10,000,000 for these objects.

In Canada the public libraries are now numerous, well managed, and adequately supported by government. The Library of Parliament at Ottawa contains about 400,000 volumes. In the Commonwealth of Australia each of the capital cities now possess a well-equipped public library. The Public Library of Victoria at Melbourne, with some 370,000 volumes, and the Public Library of New South Wales at Sydney, with some 350,000, are the most important of these; the latter contains the Mitchell Library of books, manuscripts, and maps relating to Australia, probably the finest collection of its kind in the world. The National Library of Brazil at Rio de Janeiro has about 450,000 volumes. The most important of the Japanese libraries, that of the Imperial University of Tokio, which contained some 500,000 volumes, was almost completely destroyed by the disastrous fire following on the great earthquake on 1st September 1923, and is now in course of reconstruction. Of the other University Libraries in Japan, that of Kyoto, which numbers nearly half a million volumes, deserves mention.

The literature of the subject is very extensive. Monographs have been written on the principal libraries, ancient and modern; and reports on the national libraries have been issued from time to time by the governments of France, Italy, United States, &c. The following books may be recommended as of interest in connection with the history of libraries: E. Edwards, *Memoirs of Libraries* (1859), and *Libraries and Founders of Libraries* (1865);

T. Greenwood, *Free Public Libraries* (4th ed. 1891); J. J. Ogle, *The Free Library* (1897); H. W. Fovargue, *The Law relating to Public Libraries* (4th ed. 1899); A. E. Bostwick, *The American Public Library* (1910); E. A. Savage, *The Story of Libraries and Book Collectors* (1909), and *Old English Libraries* (1911); J. W. Clark, *The Care of Books* (1909); E. A. Baker, *The Public Library* (1922). Of works dealing with library management and cognate subjects it will be sufficient to mention J. D. Brown, *Manual of Library Economy* (1920); John C. Dana, *A Library Primer* (1910); Armin Graesel, *Handbuch der Bibliothekslehre* (1902); and V. Gardthausen, *Handbuch der wissenschaftlichen Bibliothekskunde* (1920); and among the journals devoted to library matters, *The Library* (1889 *et seq.*; now incorporated with the *Transactions of the Bibliographical Society*); *The Library Association Record* (1899 *et seq.*); *The Library Journal* (1876 *et seq.*); *The Library World* (1898 *et seq.*); and *Public Libraries* (1896 *et seq.*). Compare also the articles BIBLIOGRAPHY, BOOKS, BOOKBINDING, INDEXING, &c.

Libration (from Lat. *libra*, 'a balance,' meaning an oscillating motion), a term denoting certain movements of the moon, chiefly *apparent*, which have an important effect on the apparent position of the lunar formations. A short study of these reveals puzzling changes in their place from night to night. Those near the edge of the disc disappear and reappear in a seemingly irregular way, while central formations approach or leave the centre in harmony with this motion. These appearances are due to an apparent motion of the moon by which its globe seems to turn slightly round to each side alternately, so that we see a little further round her globe on all sides in turn than we would do if she kept absolutely the same face towards us. This motion, as it refers to the north and south edges of the moon's disc, is called *libration in latitude*; as it refers to the east and west edges, it is called *libration in longitude*. The libration in latitude arises from the inclination of both the lunar equator and orbit to the ecliptic. From the relation between these two factors their effects always reinforce each other, so that when the moon rises above the ecliptic in her orbit she also inclines her under side to us, and when below the ecliptic, her upper side. The libration in longitude arises from the unequal speed of the moon in her orbit (see MOON) combined with her sensibly uniform rotation. She is thus sometimes before or behind her mean place, and we can see a little round her west or east edge respectively. An observer at the north or south pole of the earth will also from his position see a little round the north or south edge of the moon's disc, and for intermediate positions the effect has intermediate values. In the same way an observer in the tropics will see further round the west or east edges of the moon, as he is carried from west to east by the earth's rotation. These effects are known as the *diurnal* or *parallactic* libration. The maximum libration in longitude is nearly $6^{\circ} 50'$. That in latitude equals $7^{\circ} 53'$. The diurnal libration may rise to $1^{\circ} 2'$. These numbers refer to the apparent displacement of lunar markings in lunar latitude and longitude.

Libretto (Ital., 'little book'), the book of an opera. In too many cases it is deplorable, from the absence of any literary quality, plot, or consistency; and this largely because, almost from the beginning, any poetic or dramatic powers were forced into the Procrustes' bed formed by the requirements of the musician's art. The Italian librettos are especially poor, but many of their English and German rivals run them hard in this respect. Among the most noteworthy librettists have been Metastasio, Calzabigi, and Felice Romano in Italy; Quinault, Marmontel, Scribe, Barbier, Meilhac and Halévy, as well as Sardou, in France; the poet Geibel (who wrote *Loreley* for Mendels-

sohn), Schikaneder (who wrote *Zauberflöte*, &c.), and Hugo v. Hofmannsthal, in Germany; Gay, Alfred Bunn, Edward Fitzball, Theodore Hook, Planché, and Gilbert in England. Wagner stands almost alone, in that, after the *Flying Dutchman*, he himself wrote the librettos of his great music-dramas, becoming, to use his own words, 'first of all a poet.' Dryden, Addison, Fielding, Chatterton, 'Monk' Lewis, Voltaire, and Rousseau, besides Sheridan and Dickens, attempted libretto-writing; while subjects for operas have been taken from the works of Euripides, Shakespeare, Goethe, Scott, Hugo, Maeterlinck, and many poets and prose-writers.

Libreville. See CONGO (FRENCH).

Libri-Carrucci, GUILLAUME BRUTUS ICIUS TIMOLÉON, COUNT (1803-69), mathematician and bibliographer, was born at Florence. When only twenty years of age he was appointed professor of Mathematics in the university of Pisa. But in 1830, being compromised in the Liberal political movement, he fled to France, and there found a patron in Arago (whom he afterwards attacked in a most spiteful manner). He was naturalised, and in 1833 elected member of the Academy of Sciences, professor at the Sorbonne, Chief Inspector of Public Instruction, and Superintendent of the State Libraries. He was, moreover, decorated with the Legion of Honour, and appointed editor of the *Journal des Savants*, &c. An enthusiastic bibliomaniac, he found means to collect a magnificent library for himself; but, being accused of abstracting books and valuable MSS. from the public libraries, he fled to England. In his absence he was tried and condemned, in June 1850, to ten years' imprisonment. Libri-Carrucci was the author of a learned *Histoire des Sciences Mathématiques en Italie* (4 vols. 1838-41), of *Mémoires de Mathématiques et de Physique* (1829), and other works. He died at Fiesole.

Libris, EX. See BOOKPLATES.

Libya, the Greek name for North Africa exclusive of Egypt (originally accounted part of Asia); under Diocletian and later Roman emperors, specially Cyrenaica (q.v.). For Libia Italiana, see TRIPOLI, BARCA, BENGAZI.

Lice (*Anoplura* or *Pediculidae*), small, wingless, flat-bodied, parasitic insects, with a thin integument, the three thoracic segments indistinctly separated, the legs with a single claw adapted to grasp a hair, simple eyes, a hooked attaching beak in front of the head, and inside this a protrusible sucking tube, no metamorphoses. They live on the skin of mammals and suck the blood. The eggs or 'nits' are attached to the hair. Three lice occur on man: (1) the hair-louse (*Pediculus capitis*), hatched from the egg in 6 days, mature on the 18th; (2) the body-louse (*P. vestimenti*), usually fastened to the side of the underclothing next the skin, hatching in a variable period, fully formed on the 11th day after hatching, mature 4 or 5 days after, living as an adult 3 to 4 weeks; (3) *Phthirus inguinalis*, found about the pubic region. The body-louse has been shown to be a carrier of typhus. Lice are best dealt with by securing cleanness of body and clothes. For clothes the best recommendation is immersion in petrol or benzene; for the body certain soaps, or a solution (1 in 4) of petrol in vaseline. Most mammals have their own peculiar lice; monkeys have *Pedicinus*, elephants *Hæmatomyzus*, seals *Echinophthirius*, the dog *Hæmatopinus*, and so on. Bird-lice, or

Biting-lice, are entirely different insects (Mallophaga). See A. E. Shipley, *Minor Horrors of War* (1915); for treatment, J. P. Kinloch in *British Medical Journal*, 19th June 1915.

Licence. See GAME-LAWS, DOG, GUN LICENSE, MARRIAGE, EXCISE, &c.

Licensing Laws. From an early period the English parliament devoted attention to the trade in intoxicating liquors as one that required restrictive measures. In 1604 James I., in a Privy Council letter, pointed out that, 'By the law and statutes of this our realm, the keeping of ale-houses and victualling-houses is none of those trades which it is free and lawful for any subject to set up and exercise, but inhibited to all save such as are thereto licensed.' The first of such statutes (5 and 6 Edw. VI. chap. 25, 1552) indicates in its preamble the ground for such special treatment, saying: 'Forasmuche as intollerable hurtes and trobles to the Comon Wealthe of this Realme, doth daylie growe and encrease through such abuses and disorders as are had and used in comon alehouses and other houses called Tipling houses,' and empowered the justices (following earlier Acts of 1495 and 1504) to 'putt away comon selling of ale and beere' where they thought fit, and authorised them to select from time to time, at their discretion, certain persons in each county or borough who were alone to exercise the trade of keeping a common ale-house. The principle of all licensing legislation from its outset has been to limit the number of licences to the supposed needs of the neighbourhood, and (1729) provision was made that licences should not be granted 'by justices who, living remote from the places of abode' of the applicants, 'may not be truly informed as to the occasion or want of such inns or ale-houses.'

It has been estimated that 400 Acts of Parliament, dealing with the subject, have been enacted during the last four centuries. The principal landmarks are:

1753. (26 Geo. II. chap. 31). An act providing that all licences should be issued annually, and only at a general session of justices acting in the division where the applicants resided.

1828. The Alehouse Act (9 George IV. chap. 61), which codified the law as to justices' procedure in licensing, repealed a mass of old statutes, and still forms the basis of the law.

1830. The Beer Act (1 William IV. chap. 64), permitting an excise licence for the sale and consumption of malt liquors and cider to be taken out without application to the justices: a disastrous measure which led to such orgies of drinking that restrictions were imposed in 1834 (4 and 5 Will. IV. chap. 85).

1861. The Revenue (No. 2) Act (24 Vict. chap. 21), enabling any shopkeeper who had taken out a wholesale wine and spirit licence to take out a retail excise licence for the retail off-sale of wine or spirits in reputed quart bottles—thus creating what are popularly but erroneously called 'grocers' licences.'

1869. The Wine and Beer House Act (32 and 33 Vict. chap. 27), requiring all new applicants for beer and wine licences after 1st May to obtain magisterial certificates, but protecting existing licences, now known as 'pre-69' beer-houses.

1872. The Licensing Act (35 and 36 Vict. chap. 94), regulating the licensing procedure: reduced the hours of drink sale from twenty-one to an average of seventeen per day; gave magistrates discretion to fix opening and closing hours within limits; and made other changes. In the same session two acts were passed prohibiting payment of miners' wages in public-houses (extended to all wages in 1883).

1881. The Sunday Closing (Wales) Act was passed.

1882. The protection granted by the Act of 1869 to 'pre-69' beer-off licences was removed at the instance of the retail trade (45 and 46 Vict. chap. 34).

In 1888 the important case of *Sharp v. Wakefield* was first decided, but was carried to the House of Lords, which in 1891 held, affirming the general practice since 1552, that upon the hearing of an application for the renewal of a licence under the Licensing Acts, 1828, 1872, and 1874, the licensing justices had a discretion to refuse the renewal on the ground of remoteness from police supervision and the character and necessities of the neighbourhood; that is to say, that they had the same discretion on the application for a renewal as on an application for a new licence, subject to an appeal to Quarter Sessions. Between 1896 and 1899 much interest was aroused in the proceedings of the Royal Commission on Liquor Licensing Laws, which, in 1899, issued Majority and Minority Reports that gave rise to great discussion. The eight representatives of the licensed trade supported the Majority Report with reservations; the Minority Report represented the moderate temperance view. In 1902 the Licensing Act (2 Edw. VII. chap. 28) made some important changes in procedure, embodying some of the recommendations of Lord Peel's Commission. Alterations to premises must have the sanction of the justices; clubs where liquor is distributed must be registered; retail 'off' spirit and wine licences were placed under control of the justices (with certain exceptions).

The interest aroused by *Sharp v. Wakefield* led a number of licensing authorities to initiate schemes for reducing redundant licences in their areas. Political pressure by the licensed trade brought about, however, the passing of the Licensing Act, 1904, which deprived the local justices of the power to refuse renewals of full licences (except for misconduct or unfitness of premises), and vested such power in Quarter Sessions, to be exercised, however, only on payment of compensation out of funds levied on on-licences in the compensation area. The act provided that on the grant of any new on-licence the monopoly value must be secured to the state, and empowered the justices to grant such licences for a maximum term of seven years. 'Pre-69' on-beer licences were brought under the act.

The Licensing Bill of 1908 contemplated the reduction in the number of on-licences to a statutory maximum. It contained numerous miscellaneous reforms, including the exclusion of children from the drinking-bar of licensed premises, which is now the law under section 120 of the Children Act, 1908; the reduction in England of the hours of trading on Sunday; local option as to new licences; the restoration of the power of the justices to impose conditions upon the renewal of on-licences; restrictions on beer-hawking; closing on election days, &c. It also imposed a time limit, to expire in 1923, at the end of which compensation should cease to be payable in respect of existing on-licences, and the application for the re-grant of any on-licence should be treated as the application for the grant of a new licence; and also gave local option powers at such period; seven years later the provisions in the Act of 1904 as to monopoly value were to apply to renewed old on-licences. The bill, which had a third-reading majority of 237 in the House of Commons, was rejected on second reading in the House of Lords by a majority of 176.

In 1910 the Licensing (Consolidation) Act was passed, which codified the licensing laws for England and Wales.

In Scotland new licensing arrangements were introduced by the Home Drummond Act of 1828.

The Forbes Mackenzie Act of 1853 introduced a new form of magistrates' certificate (amended 1862 and 1887), the effect of which is to prohibit the sale of liquor between the hours of 11 P.M. in large towns, or 10 P.M. in the country, and 8 A.M., and during the whole of Sunday. The Licensing (Scotland) Act of 1903 consolidates all the Scottish licensing legislation from 1828 to 1901, makes many new provisions, and adds extensively to the powers of licensing courts in granting licences. It provides for the closing of licensed premises, wholly or partially, on New Year's Day and other four days annually; the modification of the opening and closing hours (between 6 and 8 A.M. and 9 and 11 P.M. respectively); forbids the hawking of liquor without licence, or the sale of liquor from vans unless previously ordered; forbids the sale of liquor to children under fourteen, or for consumption on the premises to children under sixteen. The 'black list' regulation for habitual drunkards, the protection of husbands or wives of habituals, 'drunk and incapable' offences, and the registration of clubs, are in harmony with the English Act of 1902. Separate licensing courts are provided for every burgh of over 7000 inhabitants, but existing burghs of over 4000 inhabitants retain their own courts. Courts for appeal and confirmation of new certificates are provided, one-half elected by justices of the peace, and one-half burgh magistrates or county councillors respectively.

In 1913 the Temperance (Scotland) Act was passed, giving to the people of Scotland the right of Local Veto on the expiration of eight years from 1st June 1912. The right was to be exercised as follows: On receipt of a requisition signed by not less than one-tenth of the electors in the area the local authority to take a poll of the electors. The questions submitted to be:

(1) **NO-CHANGE RESOLUTION**, which means that the powers and discretion of the existing licensing court remain unchanged.

(2) **LIMITING RESOLUTION**, which means that the number of licences for the sale of drink be reduced by at least one-quarter.

(3) **NO-LICENCE RESOLUTION**, which means that no licence for the sale of drink be granted except for inns and hotels or restaurants in special cases.

As a result of the poll—

(1) **No-Licence** to be carried if 55 per cent. at least of the recorded votes are cast for it by not less than 35 per cent. of the electors on the register.

(2) The **Limiting resolution** to be carried if a bare majority at least of the recorded votes are cast for it by not less than 35 per cent. of the electors.

(3) **No-Change resolution** to be carried if it secures a majority of the votes recorded, or if no other resolution is carried.

If a **No-Licence resolution** is not carried, the votes cast for it to be added to those in favour of the **Limiting resolution**.

A resolution once carried to remain in force until it is superseded by a resolution carried at a further poll, but no further poll to be taken for three years, and then only on the requisition of 10 per cent. of the electors who desire a change. When once a **Limiting resolution** or a **No-Licence resolution** has been carried a bare majority of the votes recorded will prevent it from being repealed on any further poll.

The area enjoying this right of Veto—

(1) In a town of 25,000 (according to the census of 1911), to be the ward, but if the population of the ward is under 4000 the Town Council may add an adjoining ward.

(2) In other towns, the whole town.

(3) In counties, the parish.

The act came into operation on 1st June 1920.

In Ireland, as a rule, the Licensing Law has followed England, but it is in some points more favourable to the publican, and has been laxly administered. 'Six-day licences' were introduced by an Act of 1874; and in 1878 total closing on Sunday was made part of the law for Ireland, except in the five largest cities in the island. In 1902 the Irish Liquor Licence Suspensory Act was passed, suspending for five years the grant of additional licences; this was renewed in 1907, and has since been renewed annually. In 1904 the Irish Clubs Registration Act made the registration of liquor-distributing clubs compulsory. In 1906 the Intoxicating Liquors (Ireland) Act made the Sunday Closing Act of 1878 permanent; closed public-houses on Saturday night at 10 P.M. in towns and cities, and 9 P.M. in other places; and reduced the hours of Sunday opening in the five exempted cities from 5 to 3 hours.

In 1923 the Northern Ireland Government passed the Intoxicating Liquor Act, extending Sunday closing to the cities, abolishing 'mixed trading' by spirit grocers, and reducing off-licences, raising the age of supply to eighteen years, restricting purchases of methylated spirits. Compensation for closing off-licences is paid out of a fund levied on 'the Trade.'

The outbreak of the war in 1914 was immediately followed by increased restrictions on the sale and, later, on the manufacture of drink. Briefly summarised they were: (1) On the 31st August 1914 the Intoxicating Liquor (Temporary Restriction) Act, 1914, was passed, under which numerous orders suspending the sale, supply, and consumption of liquor in licensed premises and clubs during certain hours of the day were made. (2) Orders affecting licensed premises were made by the Competent Military and Naval Authorities under the provisions of the Defence of the Realm Regulations. (3) In 1915 and onwards new and more comprehensive restrictions were imposed by orders made from time to time by the Central Control Board (Liquor Traffic), which was constituted on the 10th June 1915, and eventually Orders made by the Board covered by far the greater part of Great Britain.

The pre-war hours of on-sale in England and Wales of liquor were, for the Metropolis, 19½ hours; for populous places, 17 hours; and elsewhere, 16 hours, and these were reduced to 5½ hours; and the Sunday hours, which were 7 in the Metropolis and 6 outside, were reduced to 4½ hours. Early morning and afternoon sale of liquor was prohibited, and the dilution of spirits made compulsory. As the submarine peril increased limits were from time to time placed by the Food Controller on the quantities of liquor available for consumption. The output of beer, which in 1914, before the war, was at the rate of 36,000,000 standard barrels per annum, was progressively reduced to 26,000,000, 18,200,000, and 12,790,000 barrels in 1918. The consumption of spirits, which in 1915 was 35,000,000 proof gallons, was reduced in 1917 to 18,500,000 and in 1918 to 15,110,000; and wine from 10,630,000 gallons in 1914 to 7,100,000 in 1917. The tax on beer was raised from 7s. 9d. per standard barrel to 50s. in 1918; and on spirits from 14s. 9d. in 1914 to 30s. in 1918. The remarkable social effects of these restrictions will be found under **TEMPERANCE**.

In 1919 certain relaxations took place in the restrictions of the Control Board, and a complete relaxation of the restrictions on output.

In 1921 the Licensing Act was passed as a compromise, by which the statutory maximum permitted hours of sale or supply in public-houses or clubs were fixed at 9 for London on week-days and 8 for the provinces, with 5 hours on Sunday for the whole country.

In 1923 the Intoxicating Liquor (Sale to Young Persons) Act, introduced by Viscountess Astor, M.P., was passed, preventing the sale or supply to young persons under eighteen of intoxicants in a public bar with certain exceptions. The taxation on beer and spirits was increased after the war as follows:

	Beer (Standard Barrel).	Spirits (Proof Gallon).
April 1919	70s.	50s.
" 1920	100s.	72s. 6d.

In 1923, however, a rebate of £1 per barrel actually sold was given by parliament, which was followed by a rise in consumption.

In 1920 a Local Option measure for Wales was read a second time, but did not proceed further; and in February 1924 a similar measure was defeated on second reading by 26. In the House of Lords the Liquor (Popular Control) Bill, giving Local Option powers to the people, was rejected by 166 to 50. The options were No-Change, No-Licence, and 'Re-organisation'—a form of local state purchase. The Lords also passed a Public-House Improvement Bill, aimed at crippling the control of licensing justices over licensed premises, but it did not proceed further.

LICENCES (England and Wales).—Manufacturers' Licences relate to (a) spirits; (b) beer; or (c) 'sweets'—that is British wines, mead, &c. These are obtained from the excise authorities, and authorise the manufacture of the special liquor and wholesale dealing therein, and are subject to duties varying with the quantities manufactured.

2. **Wholesale Dealers' Licences** authorise the sale at any one time to one person of not less than 2 gallons (or 12 reputed quart bottles) of spirits, wines, or sweets, or not less than 4½ gallons (24 reputed quart bottles) of beer or cider. These are granted by the excise, the duties being, spirits, £15, 15s.; beer or wine, £10, 10s.; sweets, £5, 5s.

3. **Retail Licences.**—These are of two kinds—'on,' where the liquor may be bought or consumed on or off the licensed premises; and 'off,' where the liquor may be bought, but not consumed on the licensed premises.

'On' licences are of two kinds: 'full,' or publicans' licences, authorising the sale for consumption 'on' or 'off' the premises of spirits, beer, wine, &c.; and 'beer-on' or 'beer-and-wine-on-licences' for the similar sale of intoxicants other than spirits. Off-licences are of various kinds. On the 1st January 1923 there were in England and Wales 11,894 shops where other goods besides liquor were sold, and 10,203 other premises where liquor only was obtainable.

The grant of 'new' on or off licences is in the absolute discretion of the licensing justices. The discretion as to renewal of off-licences is (with certain exceptions) also with the licensing justices, subject to appeal. The discretion as to renewal of publicans' licences for misconduct or unsuitability of premises is with the licensing justices, subject to appeal; 'on-beer' licences can only be refused on special grounds; and publicans' and 'on-beer' licences can only be refused for redundancy by the compensation authority on a reference from the licensing justices. The reduction of on-licences under the compensation provisions has been less than was anticipated by the promoters of the Act of 1904.

Clubs where liquor is sold to members were first dealt with by the legislature in the Licensing Act, 1902, now embodied in the Licensing (Consolidation) Act, 1910. All such clubs must be registered, and registers of these clubs, with all particulars, must be kept by the clerk to the justices. Regulations are made for their conduct, and returns of membership and other particulars must be sub-

mitted every January. Clubs may be struck off the register if not conducted in accordance with the act.

Lichen, a name now restricted to *L. ruber*, a dry papular disease of the skin, the result usually of violent nervous emotions, and often accompanied by insomnia and headache.

Lichenin is a starch-like body found in Iceland moss and other lichens, from which it is extracted by digesting the moss in a cold, weak solution of carbonate of soda for some time, and then boiling. In most of its relations it corresponds with ordinary starch.

Lichens, familiar plants which form encrusting growths on rocks and stones, on the stems and branches of trees, on walls and fences, and on the earth itself. They are common in every zone, and at all levels from the seashore to the mountain summit. Usually the first plants to settle on a bare, stony surface, they slowly hide the nakedness of the rock with their flat incrustations or shaggy tufts, generally gray or greenish, yellow or red in colour. Especially familiar are the yellow patches which beautify old walls, the hoary tufts which grace decaying trees, and the gray clumps which raise their cup-like fructifications on damp rocks. They are hardy, long-lived plants, able to survive prolonged desiccation.

In 1866 De Bary hinted that lichens were not single plants in a class by themselves, but that they were double plants, each made up of an intimate combination of an alga and a fungus.

Two years later Schwendener virtually established this so-called 'dual hypothesis.' 'As the result of my researches,' he says, 'all these growths (lichens) are not simple plants, not individuals in the ordinary sense of the word; they are rather colonies, consisting of hundreds and thousands of individuals, among which, however, one kind dominates, while the rest in perpetual captivity prepare the nutriment for themselves and their master. This master is a fungus, a parasite which is accustomed to live upon others' work; its slaves are green algae, which it has sought out, or indeed caught hold of and compelled into its service. It surrounds them, as a spider its prey, with a fibrous net of narrow meshes, which is gradually converted into a protective covering; but, while the spider sucks its prey and leaves it dead, the fungus incites the algae found in its net to more rapid activity, indeed to more vigorous increase.' This view has been corroborated by many botanists, especially by Bornet, Treub, Rees, and Stahl, and is accepted by most, though it is only fair to say that it is still denied and resented by some of the older lichen-

Fig. 1.—*Umea barbata*, a fruticose lichen, natural size:

a, fructifications; f, disc by which it is attached to the bark of the tree.

logists. The proof of the theory is twofold: the two component sets of cells have been studied apart and referred to their position among Algae and Fungi; while, on the other hand, it is possible to manufacture lichens by bringing together the respective algae and fungi which in nature are wont to grow in partnership. For these reasons

Fig. 2.—Section through *Collema pulposum*, magnified 350 diameters: The threads are the fungus; the round cells the algae.

lichens are regarded not as single, but as dual organisms—as an intimate union of algal and fungal cells, living in mutual helpfulness or *symbiosis*. Some at least of the algal cells can live apart, and some become associated with several fungi to form different lichens; but it must be clearly recognised that the customary combinations are of long standing, since the partner fungi do not generally live independently. As to the physiological conditions of the partnership, it is enough here to notice that root-like filaments from the fungal cells absorb water and salts from the rain and the substratum, and pass this inorganic material to the algae; that the latter, like all green plants, are able in sunlight to split up the carbonic acid absorbed from the air, and to build up organic compounds like dextrose; that these organic products pass by osmosis from the algal-cells to the fungus, while it is likely enough that the waste products of the fungus are in turn utilised by the algae. (It is, however, quite probable that the fungi of some lichens in favourable situations among decomposing vegetable matter absorb this in the usual fungal fashion.) To the curious complementary association of fungi and algae to form lichens a parallel has been demonstrated by Geddes, Keeble, and others in regard to Radiolarians and some other animals, with which 'yellow cells,' or 'symbiotic algae,' live in habitual partnership (see SYMBIOSIS). Lichens propagate by spores developed in various ways from the component fungus, but with these the partner algae must be speedily associated. In some cases, indeed, fungal-spores and algal-cells are liberated together. Another frequent mode of multiplication is by means of soredia, which consist of a few algal-cells plus a separated portion of the fungus.

Most of the lichen-forming fungi are Discomycetes or Pyrenomycetes; the associated algae are unicellular and filamentous Blue-green, Yellow-green, and True-green Algae. There are about 6000 species of lichens, for the classification of which reference must be made to the cited literature.

Lichens assist in weathering the surfaces of rocks, into the substance of which the fungi sometimes send numerous filaments, and they are thus the preparers of soil and the forerunners of higher vegetation. 'Isleland Moss' (*Cetraria islandica*) is used for food and medicine; 'Reindeer Moss' (*Cladonia rangiferina*) is the fodder of the reindeer, and is also utilised in Scandinavia for the manufacture of a sort of brandy; pigments known as Litmus, Orseille, &c., are procured from *Rocella tinctoria* and *R. fuciformis*, both maritime.

Lichfield, a municipal (and till 1885 parliamentary) borough of Staffordshire, and the seat of a bishopric, is pleasantly situated in a valley watered by an affluent of the Trent, 15 miles S.E. of Stafford and 118 NW. of London. Population (1801) 4712; (1921) 8394. Its cathedral—a noble pile, measuring 411 feet by 66 (or 149 across the transepts), and surmounted by three towers with spires, the central 258 feet high—dates from the 13th century, when the Mercian see, founded in 656, and constituted an archbishopric 786-800, was after its translation to Chester in 1075, and subsequently thence to Coventry, re-established here at its original seat. Despoiled, and with its central tower beaten down during the siege of Lichfield by the parliamentarians (1643), the cathedral was effectively repaired (1661-70), and restored (1860-84). At the north-east angle of the Close, adjoining the cathedral, is the Bishop's Palace (1687), and hard by once stood the castle (of which no traces now remain) in which Richard II. held high revelry at Christmas 1397, and where two years later, after his deposition from the throne, he was confined a prisoner. The grammar-school at which Addison, Dr Johnson, and Garrick were educated was turned into rural district council offices, &c., in 1920. There are two hospitals, founded 1495 and 1504; a theological college (1857); and a concert hall occupying the site of the theatre in which Mrs Siddons played. In the history of the town the principal incidents, other than those noticed above, have been its partial destruction by fire (1291); five visitations of the plague, which in 1594 claimed 1100 victims, and 821 in 1645-46; a great storm (1593) which blew down the steeples of two of its churches. Its bishops include St Chad, De Clinton (who commenced the cathedral), De Langton (who added the Lady Chapel, now thrown into the choir, and rich in stained glass brought in 1802 from the dissolved monastery of Herkenrode in Belgium), Abbot, afterwards Archbishop of Canterbury; Hacket (who carried out the restorations of 1661-70), Hurd (the tutor of George IV.), and George Augustus Selwyn. A statue of Dr Johnson was erected in 1838 in the market-place, opposite the house in which he was born, which was bought by a Mr Johnson in 1887 'to save it from the hands of spoilers' (*Notes and Queries*, 19th November 1887). Among residents or natives have been Ashmole (founder of the Ashmolean Museum at Oxford), Bishop Newton, Dr Darwin, and his biographer Miss Seward, and Honora Sneyd, afterwards Mrs Edgeworth.

Lichtenberg, GEORG CHRISTOPH, physicist and satirist, was born on 1st July 1742 at Oberarmstadt near Darmstadt, and educated at Göttingen, where he held the chair of Mathematics from 1770 till within a few years of his death on 24th February 1799. Two visits to England (1769 and 1774) inspired him with a love for things English; he had a great admiration for Garrick, and wrote a witty commentary on Hogarth's copper-plates. See a book by Bouillier (1915).

Lichtenstein, a town of Saxony, on the Röd-litz, 45 miles SSE. of Leipzig; pop. 10,000. See also LIECHTENSTEIN.

Lick Observatory is built on the lowest (4227 feet) of the three summits of Mount Hamilton, 26 miles by a fine mountain-road E. of San Jose, California. For its erection and equipment \$700,000 were left by James Lick (1796-1876), an

American millionaire, whose remains are interred in a vault within the foundations of the pier that supports the great telescope. This instrument has an object-glass of 36 inches in aperture, the founder requiring it to be 'superior to and more powerful than any telescope ever yet made.' The observatory, made over to the University of California, has done admirable work; thus the sixth and seventh satellites of Jupiter were discovered here (1905).

Lictors. See CONSUL, FASCES.

Liddell, HENRY GEORGE, joint author of *Liddell and Scott's Greek Lexicon*, was born in 1811, and educated at Charterhouse and Christ Church, Oxford, where he took a double first in 1833. He was made tutor of his college, and in 1845 professor of Moral Philosophy in his university. After acting for nine years (1846-55) as head-master of Westminster School he returned to Christ Church as dean. From 1870 to 1874 he was vice-chancellor of the university. The *Lexicon* (1843; new ed. begun in 1925) was based on the German one of Passow. It soon became indispensable to students of Greek, and a smaller edition was issued for the use of school-boys, an intermediate one in 1890. Dr Liddell's fellow-worker was Robert Scott, D.D. (1811-87), master of Balliol (1854-70), and Dean of Rochester. Dr Liddell wrote a useful *History of Rome* (1855; abridged as *The Student's Rome*). He resigned the deanship in 1891, and died 18th January 1898. See *Life* by Thompson (1899).

Liddesdale, Roxburghshire, the valley of the Liddel, which flows 27 miles SSW. near or along the Border (q.v.) to the Esk 12 miles N. of Carlisle.

Liddon, HENRY PARRY, D.D., was born at North Stoneham, Hampshire, 20th August 1829, the son of a naval captain, and at the age of seventeen went up from King's College School, London, to Christ Church, Oxford, where in 1850 he graduated B.A. with a second-class in classics, and in 1851 obtained the coveted Johnson theological scholarship. Ordained in 1852 as senior student or fellow of Christ Church, from 1854 to 1859 he was vice-principal of Cuddesdon Theological College. He was appointed prebendary of Salisbury Cathedral in 1864. In 1866 he delivered his famous Bampton Lectures on the *Divinity of Our Lord* (1867). In 1870 Dr Liddon was created Canon Residentiary of St Paul's Cathedral, and in 1870-82 was Ireland professor of Exegesis at Oxford. His sermons exercised a profound influence upon the thought of the time, and many series of them were published. The ablest and most eloquent exponent of High Church principles (combined in his case with liberalism in politics), he had long been engaged on the life of his friend Dr Pusey, when he died suddenly at Weston-super-Mare, 9th September 1890. See his *Life and Letters* by Johnston (1904).

Lie, JONAS, the most popular novelist of Norway, was born at Eker, near Drammen, on 6th November 1833. He studied law at Christiania, and practised as an advocate for a few years at Kongsvinger, but abandoned his profession for literature. He died 5th July 1908. He gives admirable realistic pictures of life in Norway, especially of the fisher-folk of the west coast. His popularity is due to the sunshine of kindness and delicate poetry that lights up his books, to the healthy tone of his writing, his fidelity to nature, and his genial humour. His best novels include *The Visionary* (1870, trans. 1894), which rapidly ran through half-a-dozen editions; *The Three-master 'Future'* (1872); *The Pilot and his Wife* (1874; Eng. trans. 1877), of which five editions were exhausted in the first year; *Go On* (1882); *One of Life's Slaves* (1883); *The Family at Gilje* (1883), his best novel; *A Whirl-*

pool (1884); *The Commander's Daughters* (1886); the excellent *Married Life* (1887); and *Maisa Jons* (1889), the life of a Christiania seamstress. Jonas Lie, moreover, published two collections of *Short Stories*, a volume of popular *Poems* (1866), and a successful comedy, *Grabow's Cat* (1880).

Liebermann, MAX, painter and etcher, born in Berlin in 1849. From the start of his career he exhibited a freedom of style markedly at variance with the academic methods then in vogue, and it was only after his fame had become assured in several countries that Germany realised that he had done for her art what Millet and his followers had done for France. In Paris he learnt technique, but it was in Holland afterwards that he became inspired with a love for atmospheric effects, and his palette lost much of the muddiness which had characterised it. 'Net-menders' is perhaps of all his work the one most typical of his art, while the extreme simplicity and naturalness of his paintings is their greatest charm. They are in many of the leading galleries of Germany, and include 'The Flax-spinners,' 'Man on the Dunes,' 'Dutch Orphan Girls,' and 'Village Street in Holland.' His etchings have also a considerable vogue, and are of more than ordinary merit.

Liebig, JUSTUS, FREIHERR VON, chemist, was born at Darmstadt on 12th May 1803. The bent of his mind showed itself early. He studied chemistry at Bonn and Erlangen, and in 1822 went to Paris to perfect his studies. There he was introduced by A. von Humboldt to Gay-Lussac, who took him into his private laboratory, and along with him proved that the fulminates are identical in composition with the cyanates. Humboldt two years later secured for Liebig the appointment of professor of Chemistry at the university of Giessen. This chair he exchanged in 1852 for the corresponding one at Munich. He died on 18th April 1873. In 1845 he had been created Baron (*Freiherr*). Liebig was one of the most illustrious and fruitful chemists of his age, not less renowned for his investigations and discoveries in pure chemistry than for his researches in applied chemistry, and not less honoured for the reformation he effected in chemical method than for his highly important applications of chemical knowledge to the furtherance of the arts of life. As the inventor of the extract of beef and the prepared infant food, his name is known almost everywhere throughout the civilised world. He was the founder of agricultural chemistry, and thus the greatest reformer of practical agriculture in the 19th century. Closely connected with his work in this department were his researches into the nutrition of plants. He taught that each of the non-volatile saline ingredients found in the ash is essential to the life and growth of the plant, and that the plant gets them from the soil; this in course of time exhausts the soil and makes it barren, unless the elements which go to nourish the plant be resupplied to it, whether by means of manure or through the chemical action of the weather. Thus he directed attention to the cycle of transmutation between the mineral, the vegetable, and the animal kingdoms. In the department of animal physiology he made notable contributions to chemical science, demonstrating, amongst other things, that the heat of the animal body is wholly produced by the processes of internal combustion attendant upon the disintegration of nutritive matters; that different kinds of food serve different purposes in the body, and so admit of classification; that animal fat is produced within the animal organism from sugar and starch; and that spontaneous combustion in the human body is an impossibility. The phenomena of fermentation he explained as being purely chemical. He also

investigated the constituents of the juices of flesh, and (along with Wöhler, q.v.) of uric acid, with most important results. This brings us to the region of pure organic chemistry. One of the most brilliant instances of the application of the methods of organic analysis in chemistry was Liebig's and Wöhler's discovery of the compound radicle benzoyl from the study of oil of bitter almonds and its derivatives. His investigations into the constituents of alcohol and its derivatives led him to oppose the existing view, that of the French chemists Dumas and Boullay, who regarded alcohol and ether as hydrates of olefiant gas; whereas Liebig denied the existence of the olefiant gas, and believed these compounds to be derivatives of a radicle ethyl, consisting of carbon and hydrogen. In the course of this inquiry he elicited for the first time chloroform and chloral; and it was whilst investigating the conversion of alcohol into acetic acid that he discovered the compound aldehyde. Then, by the clever use of the idea of the polybasic properties of certain acids, he succeeded in determining the constitution of organic acids. Among the practical discoveries and applications of Liebig may be mentioned the invention of silver-coated mirrors, an easy method for the preparation of potassic cyanide, now so largely used in electroplating, his plan for making unfermented bread, and his methods for analysing mineral waters.

When Liebig began to teach there were no public chemical laboratories in Germany. By his initiative one was established at Giessen; and from that have grown the admirably-equipped physical laboratories of the German and other universities. Besides stimulating the study of chemistry in this way, he vastly extended the use of the method of organic analysis, and invented such useful chemical apparatus as the appliances for analysis by combustion, the tube for determining molecular weight, and Liebig's condenser. His most important treatises, all translated into English, were *Anleitung zur Analyse organischer Körper* (1837); *Die Chemie in ihrer Anwendung auf Agricultur und Physiologie* (1840); *Die Tierchemie* (1842); *Handbuch der organischen Chemie* (1843); *Chemische Untersuchungen über das Fleisch und seine Zubereitung zum Nahrungsmittel* (1847); *Die Grundsätze der Agriculturchemie* (1855); *Chemische Briefe* (1844); besides numerous papers in scientific journals (317 in the *Roy. Soc. Trans.*). See works by Hofmann (1876), Shenstone (1895), and Vollhard (1909).

Liebknecht, Wilhelm (1826–1900), social democrat, born at Giessen, studied at Giessen, Bonn, and Marburg. For his share in the revolutionary government in Baden in 1848 he had to take refuge in Switzerland and England. He returned to Germany in 1862, and edited the *Allgemeine Zeitung*. Expelled from Prussia in 1865, he went to Leipzig, where he built up the Social Democratic party. Strongly anti-militaristic, he was, during two years' imprisonment (1872–74), elected to the Reichstag. With Bebel he edited *Vorwärts*. His books include one on *Robert Owen* (1892). See *Life* by Eisner (1900).—His son, **Karl Liebknecht** (1871–1919), born at Leipzig, became a barrister, was imprisoned for an anti-militarist pamphlet (1907–8), elected to the Prussian Chamber (1908), and the Reichstag (1912), and was sentenced to four years' imprisonment and six years' loss of civil rights for his opposition to the Great War in 1916. Released in 1918, he headed the Spartacus group, and was arrested and murdered.

Liebrecht, Felix, a learned linguist and folklorist, was born at Namslau, in Silesia, 13th March 1812; studied at Breslau, Munich, and Berlin; and became in 1849 professor of the German Language at the Athénée Royal in Liège, from which he

retired in 1867. Liebrecht early made his name known by a series of admirable articles in various learned journals on the origin and diffusion of popular stories, and by translations enriched with ample annotations no less valuable than the original works themselves. Among these are Basile's *Pentameron, oder das Märchen aller Märchen*, with a preface by Jakob Grimm (2 vols. 1846); the *Barlaam und Josaphat* of Joannes Damascenus (1847); Dunlop's *Geschichte der Prosadichtungen*, with large additions (1851); and an edition of the non-historical mythological portions of Gervase of Tilbury's *Otia Imperialia* (1856). Professor Liebrecht collected his scattered papers in *Zur Volkskunde* (1879), a work which has a place on the shelves of all scientific students of comparative folklore. He died at St Hubert, in Belgium, in August 1890.

Liechtenstein, an independent principality of Europe, separated from Switzerland on the west by the Rhine; on the east it is bounded by Vorarlberg. Area, 65 sq. m.; pop. 11,000. It is a mountainous district made up of the lordship of Vaduz and the countship of Schellenberg. The chief town, Vaduz (pop. 1100), lies 28 miles SSW. of Bregenz on the Lake of Constance. The inhabitants carry on agriculture, rear cattle, and cultivate the vine. They are exempt from military duty. Liechtenstein, with several other small states, formed the fifteenth member of the German Confederation until its dissolution in 1866; but in the *Plenum*, or full Council of the Diet, it had a separate vote. The Prince of Liechtenstein, whose family is one of the most ancient in central Europe, possesses extensive estates in Austria, Prussia, and Saxony. The little state is a constitutional sovereignty, and is ruled by the prince and a legislative assembly of fifteen members, elected by universal suffrage. Liechtenstein belonged till 1918 to the Austrian customs, postal, legal, coinage, judicial, and taxation systems. In 1921 it joined the Swiss customs and postal system. See works by Falke (1868–83), Umlauf (1891), Heer (1906), and Krätzl (1913).

Liège, or **LIÈGE** (local pron. as if written *Liège*; Flem. *Luik*, Ger. *Lüttich*), a city of Belgium, on a picturesque site at the confluence of Ourthe with Meuse, 62 miles S. by E. of Brussels and 47 SW. of Aachen, consists of the old town built on the hills that overlook the Meuse on the left, the new town down below on the right bank, and several suburbs. Notwithstanding its great manufacturing industry, it is a beautiful city, with elegant bridges, handsome squares and gardens, and fine churches and private houses. Its defences consisted till 1914 of a ring of modern forts and the old citadel, built in 1650, on the high ground on the left bank of the Meuse. The cathedral church was originally St Lambert's, founded in 712, destroyed by the French republicans in 1794, and wholly removed in 1802. Since that date St Paul's, founded in 968 and completed about 1628, with a good carved pulpit by Geefs, has been the church of the see. Amongst the remaining churches are two (St Denis and Holy Cross) which date from the 10th century, and three (St James', 1016–1523; St Bartholomew's, 11th and 12th centuries, with a beautiful brass font of 1112; and St Martin's, 16th century) with some architectural pretensions. The most notable amongst the secular buildings are the former bishop's palace, built in the Late Gothic style in 1508–40, and now converted into law-courts and administrative offices, and the university. This last was founded in 1817, and the usual adjuncts are attached, including a museum with valuable cave remains, a library, a school of mining, and a polytechnic school. The Conservatorium is important. Situated in the centre of

the east Belgian coal-mining district, Liège is one of the first manufacturing cities in Belgium. Its great staple manufacture is the making of firearms; and iron and steel, zinc, automobile, and other works give employment to large numbers of men. At Seraing (q.v.), 3 miles distant, are the manufacturing establishments founded by the Englishman Cockerill (q.v.). Pop. (1876) 115,851; (1920) 165,117, mostly Walloons. The Bishop of Maestricht transferred the see to Liège in 720; his successors afterwards attained to the dignity of princes of the empire and bore the title of Duke of Bouillon. The history of Liège is a long struggle between the bishop-princes and the liberty-loving burghers of the city. The latter rose in open revolt in 1407 and 1464, and on subsequent occasions; and it frequently happened that a new bishop could only gain entry into the city when he came with a foreign army at his back, as in 1648 and 1684. The city was seized by Charles the Bold of Burgundy in 1467; but he had to do his work over again, and did it with ruthless severity, in the following year. Liège was again conquered in 1691 by the French, in 1702 by Marlborough, and once more by the French in 1792. The Congress of Vienna assigned the city and the episcopal territories to the Netherlands; but in 1831 they were incorporated in the new kingdom of Belgium. Liège was taken by the Germans in August 1914, the forts resisting for some time before they were destroyed by great siege guns.

The province of Liège, with an area of 1117 sq. m. and a population close on 900,000, lies between the Belgian provinces of Limburg on the north and Luxembourg on the south. In industry it ranks second among the provinces of Belgium. Amongst the industries must be mentioned the woollen, iron, coal, steel, zinc, lead, silver, cotton, cloth, machinery, firearms. Cheese (Limburg) and butter are the most valuable of the agricultural products. Very large numbers of pigeons are reared every year as messenger birds.

Liegnitz, a town of Lower Silesia, on the Katzbach, 38 miles W. by N. of Breslau. The town dates from the end of the 10th century. In 1163 it was chosen by the Dukes of Lower Silesia as their place of residence, and from 1241 to 1675 it was the capital of the principality of Liegnitz. In the neighbourhood (Wahlstadt) the Mongols in 1241 defeated the Poles, and filled nine sacks with the ears of their slaughtered foes. Liegnitz came into the hands of Prussia in 1742. Here in 1760 Frederick the Great routed the Austrians under Loudon, and in 1813 Blücher defeated the French (on the Katzbach). It is now a place of great and varied industrial activity: iron-foundries, machine-shops, pianoforte-factories, and manufactures of woollens, cloth, hats, and gloves, with turnery, brick-making, and pottery, indicate the chief branches. Pop. 70,000.

Lien (the *tacita hypotheca* of the civil law), in English, Irish, and American law, means the security or hold over goods or land for a debt which is due from the owner of the goods, &c., to the person in whose possession they are for the time. Possession is in general essential to constitute a lien, for the moment the goods are voluntarily parted with the lien is gone. There is an exception, however, in the case of traders like factors, whereby a lien, though lost, may revive if the property comes again into the possession of the creditor. Liens are general or particular. The creditor's only right, however, is to retain possession of the property till his claim is satisfied. He cannot sell until the usual legal process permits of a judicial sale and authority to apply the proceeds to the payment of his debt.

There are several exceptions to this rule: a landlord's lien over a tenant's effects for unpaid rent, an innkeeper's over a guest's luggage for unpaid bill, a railway company's lien over goods for carriage, and a few others, may be satisfied by sale without judicial process. A solicitor has a general lien over his client's money, papers, and title-deeds till the amount of his bill of costs is paid. Bankers have a right of lien over securities to cover money due on general balance. General liens are also possessed by dyers, calico-printers, factors, and others, but do not cover general debts or money lent without special agreement. A particular lien is a lien over goods for a debt contracted in respect of such goods, as for the price of them, or some labour expended on them. Thus, a miller has a lien on the flour he has ground, a trainer on the horse he has trained. A general lien is favoured by law; a particular lien is construed strictly, for it acts in favour of one creditor as against the others. There are also maritime liens and equitable liens, which do not require possession to constitute the right. The Statute of Limitations does not affect a lien, since it does not take away the right, but only bars its ordinary enforcement by action. In Scotland lien is generally called Retention or Hypothec (q.v.). See CARRIERS, INN, MORTGAGE.

Liernur System. See SEWAGE.

Lierre, a town of Belgium, 11 miles SE. of Antwerp, manufactures silk, lace, beer, and beet-root sugar, and has the fine Gothic church of St Gummar (1425-1557); pop. 26,000.

Liestal, a town 10 miles SE. of Basel, capital of the half-canton of Baselland; pop. 6000.

Lieutenant (Fr., from Lat. *locum-tenens*, 'holding the place of another'), a term applied to a variety of representative officers, especially military. A *lieutenant-general* is next in rank to a general, a *lieutenant-colonel* next to a colonel. But the title lieutenant, without qualification, denotes the second officer and deputy, or *locum-tenens*, of the troop, battery, or company commander. *Second-lieutenant* is the rank given to officers on first joining, corresponding to the former *Cornet* (q.v.) and *Ensign* (q.v.).

In the British navy a lieutenant is the intermediate officer between the sub-lieutenant and lieutenant-commander. All cadets are trained alike and together until they have passed out of the Royal Naval College, Dartmouth. Those who volunteer to specialise in engineering and are accepted then proceed to the Royal Naval Engineering College; the remainder, who are the majority, are appointed to sea-going ships, becoming midshipmen after a certain period at sea. After passing through the ranks of acting sub-lieutenant and sub-lieutenant, and qualifying in various courses, these young officers are promoted to the rank of lieutenant, their seniority being regulated by the result of their examinations. Those who qualify as engineer officers are styled lieutenants (E). Sub-lieutenants and lieutenants in the navy rank with lieutenants and captains in the army, according to seniority in the respective ranks.

Lieutenant, LORD. See LORD-LIEUTENANT.

Lieutenant-colonel, in the British army, is nominally the second officer of a regiment; but virtually a lieutenant-colonel commands every battalion of infantry and regiment of cavalry, the post of colonel being merely an honourable sinecure awarded to a general officer. The lieutenant-colonel is responsible for the discipline of his battalion, the comfort of his men, and ultimately for every detail connected with their organisation. In this he is aided by one major, an adjutant, and a quartermaster. In the artillery and engineers,

where the rank of colonel is a substantive rank, with tangible regimental duties, the functions of lieutenant-colonel are more limited, one having charge of every Brigade (q.v.) of artillery, or two or more companies of engineers.

Lieutenant-commander. On attaining eight years' seniority lieutenants automatically become lieutenant-commanders, but their further promotion to commander is regulated by strict selection. Lieutenant-commanders, being officers of considerable experience, serve in important appointments, such as first-lieutenant of the larger ships, and in command of destroyers, gunboats, and smaller vessels. Lieutenant-commanders rank with majors.

Lieutenant-general. See GENERAL.

Lieutenant-governor. See INDIA, CANADA.

Lieven, DOROTHEA, PRINCESS OF (1784-1857), was the daughter of Christoph von Benkendorf, a landholder of German family in Esthonia, who became in 1800 the wife of Prince Christoph von Lieven, Russian ambassador at the court of Prussia. The Princess, a woman of remarkable natural ability and great accomplishments, displayed singular diplomatic gifts, and soon acquired a continental reputation. She accompanied her husband to London on his appointment to the court of St James's, became a foremost personage in fashionable society, and knew more state secrets than most politicians. On the death of the Prince in 1837, the Princess established herself in Paris, where her *salon* was still the centre of intrigues involving the interests of half Europe. For twenty years she was the passionately devoted friend of Guizot. See the *Letters* of her London residence (1812-34), published in 1902, her *Diary*, &c. (1925) and a long article in the *Edinburgh Review* for January 1903.

Lievensz, JAN (1607-74), a painter, born in Leyden, who spent three years in England at the court of Charles I., but ultimately settled at Antwerp. He painted portraits as well as religious and historical subjects; and his engravings are Rembrandtesque in character.

Liezen-Mayer, ALEXANDER VON (1839-98), a painter, born at Raab in Hungary, who became the pupil of Piloty, and spent most of his life at Munich, where he was a professor at the Academy.

Life, the kind of activity that is characteristic of organisms (plants, animals, and man). (1) Considered *chemically*, it consists of correlated series of chemical changes (metabolism), specific in nature and rate for each kind of creature, involving reactions in which proteids play an essential part, and so regulated that the dis-assimilation or breaking-down (katabolism) is for a time compensated for by assimilation or constructive processes (anabolism). (2) Considered *physically*, life is a kind of activity that occurs in a colloidal protoplasmic substratum with a definite organisation, which is in part the result of the specific metabolism, and in part conditions it, a relation which finds some analogy in that, between the flow of a river and its bed. Moreover, as Joly points out, while the transfer of energy into an inanimate material system is attended with effects conducive to dissipation and retardative of further transfer, the transfer of energy into an animate material system is attended with effects retardative of dissipation and conducive to further transfer. It is this capacity of accumulating energy acceleratively that is especially characteristic of organisms. The green leaf growing in the sunlight utilises the solar energy, and does so increasingly as it grows larger. (3) Biologically considered, life is marked by a persistence of individuality (displayed in specific

metabolism, specific organisation, and specific behaviour) in spite of ceaseless change; by the capacities of growth, reproduction, and development; and by a capacity for genuine agency or effective behaviour, a power of registering experiences and experiments, and a power of giving rise to qualities or characters distinctively new (variability), which may furnish materials for evolution. Moreover, the vital activities co-operate, on the whole, towards two main results, self-maintenance on the one hand, and the continuance of the race on the other. In its higher reaches, at least, the life of animals cannot be adequately described without the use of psychological terms, such as perceptual inference and perceptual purposefulness, and it is a fact of observation that if one wishes to make the most of a horse or a dog or the like, one must not ignore its mental aspect. To the question: At what stage in individual development, and at what level in the animal kingdom, does it become necessary to recognise the mental aspect of behaviour? no general answer can at present be given.

Definitions.—Although life eludes definition, some of the suggestions are instructive. Bichat described it as 'the sum of the functions which resist death,' a definition only superficially contradictory to Claude Bernard's epigram, *La vie, c'est la mort*. According to De Blainville, 'life is the twofold internal movement of composition and decomposition, at once general and continuous,' according to Spencer, it is 'the definite combination of heterogeneous changes, both simultaneous and successive, in correspondence with external co-existences and sequences.' A modern point of view may be indicated by Professor C. M. Child's definition: 'A living organism is a specific complex of dynamic changes occurring in a specific colloidal substratum which is itself a product of such changes, and which influences their course and character, and is altered by them.' It should be noted that, while one may give many useful descriptions of life—e.g. as consisting of all the actions and reactions between an organism and its environment, or as an endeavour after self-expression and race-continuance—the difficulty is in stating what is characteristic of the living creature as contrasted (a) with things in general, (b) with machines, and (c) with organisms just dead, or in a state of suspended animation.

Conditions of Life.—With a remarkable plasticity organisms are able to adjust themselves as individuals, or to become adapted as races, to environmental conditions which seem extremely inhospitable. We may instance the darkness and coldness of the great abysses, the scarce nutrition and the coldness of great heights, the high temperature of hot springs, the drought of deserts, the scarcity of oxygen in the medium in which some parasites live, and so on. Yet organisms become individually adjusted or racially adapted to these and other equally difficult circumstances, and few precise statements can be made as to indispensable conditions. Food, oxygen, water, and a temperature above that at which the fluids of the body freeze are indeed, in a general way, necessary; but some nematodes can remain desiccated (not in the strict sense living, yet not dead) for fourteen years, and seeds for several decennia; seeds may be kept for a time at temperatures far below zero; and some parasites can flourish in media in which there is no free oxygen. Remarkable experiments by Carrel, Harrison, and others on keeping alive excised pieces of tissue and isolated cells in suitable media have widened the conception of the resources of living organisms. On the other hand, it must be remembered that many creatures are so delicately poised that even slight environmental changes are rapidly fatal.

Origin of Living Organisms.—No individual organism has been known to originate except from a previously existing organism of the same kind. This is a fact of experience, which must not be made into a dogma. It may be noted that there is indirect evidence of the existence of very minute micro-organisms which the ordinary microscope cannot detect, and it is possible that if these arose apart from others like themselves the fact might remain undetected. As to the origin of living creatures upon the earth, the following positions have been maintained: (1) Alfred Russel Wallace postulated a 'spiritual influx' at the origin of life, thus removing the problem beyond the scope of natural science. (2) Richter, Helmholtz, Lord Kelvin, and others have suggested that living germs might reach the earth in meteorites or along with meteoric dust. It is doubtful, however, whether protoplasm could survive a long journey through space, and the theory at the best simply shifts the locality of origin. (3) Some, such as Preyer, have found satisfaction in insisting that the question as to the origin of life is a pseudo-problem, like that as to the origin of matter and energy. To Preyer it seemed that the origin of life is unthinkable, and that it is as legitimate to suppose that the inorganic originated from organisms as to suppose the converse. The plain fact, however, is that the earth was once at a temperature quite incompatible with the existence of any form or mode of life that we know of. (4) The view most in harmony with evolutionist thinking, but beset with great difficulties of its own, is that living organisms arose from a happy combination of proteids in a colloidal state, and that these, again, had arisen from a natural synthesis of inorganic substances. Sir Ray Lankester has suggested that the first protoplasm fed upon 'the antecedent steps in its own evolution,' 'upon the albuminoids and such other compounds that had been brought into existence by those processes that culminated in the development of the first protoplasm.' The tendency of modern research is to lessen the gap between the inorganic and the organic, but there are serious difficulties in the way of all the concrete suggestions that have been made as to steps by which protoplasm may have arisen in Nature's laboratory.

Vitalism.—There is no doubt that an organism may be profitably studied by chemical and physical methods, and that many processes occur in the organism that can be described in chemical and physical (i.e. theoretically mechanical) terms. It is the opinion of biologists of the mechanistic school that the chemico-physical formulation of processes that occur in the living body will gradually extend its scope until it includes all vital activity. What the future has in store in the way of scientific interpretation no one knows, but it appears that no satisfactory chemico-physical description has yet been given of any total vital operation, such as the contraction of a muscle, still less of co-ordinated behaviour, or of individual development, or of organic evolution. To many biologists, holding or inclining towards a vitalistic position, it seems clear that chemical and physical description, though of profound scientific value, is inadequate to answer the distinctively biological questions. It may be said that there are three grades of vitalism: (1) The first finds the differentia of organisms in the greater complexity of their collocations or configurations of elementary particles, but holds that no distinctive concepts are required. (2) The second holds that organisms have a monopoly of some peculiar physical energy or energies in a line with, say, electricity. (3) Thoroughgoing vitalism postulates a non-perceptual vital agency, often called *Entelechy*, associated with organisms, operating directly in certain cases, controlling the chemico-

physical processes, so that their results are different from what they would have been apart from intervention.

Perhaps, however, it is safer to be content with a descriptive or methodological vitalism: that we do, as a matter of fact, require ultra-mechanical concepts in describing or dealing with organisms. For the organism is a historical being, a psychophysical individuality, which has enregistered within itself the gains of experience and experiment, and has ever its conative bow bent towards the future. Instead of trying to interpolate a new agency, it may be enough to recognise that organisms reveal certain aspects of reality which are not apparent in the domain of the inorganic.

Lifeboat, a boat for saving life. There are two distinct kinds of lifeboats—those kept ashore at stations on the coast, for saving life when vessels happen to be wrecked or in distress; those carried on board ships for saving life should disaster overtake a vessel at sea. The latter are, of course, more numerous, each sea-going vessel being compelled by law to carry a sufficient number of lifeboats. See LIFE-SAVING APPLIANCES.

A lifeboat must possess the following qualities: great strength to withstand the violence of a stormy sea, collision with a wreck, or landing on a beach; ample buoyancy, to avoid foundering when a sea is shipped; sufficient stability, to prevent upsetting; good form, to be easy in motion and get through a heavy sea safely and quickly; room to carry a large number of passengers. A coast lifeboat must also be able to quickly discharge any water that may break into her; and many of them must have the power to self-right if upset.

In 1785 Lionel Lukin, a coach-builder, took out a patent for a boat which he described as 'unimergible.' He fitted out a boat to his design, which appears to be the first recorded attempt in this country to produce a lifeboat. No further development seems to have taken place until 1789, after a terrible wreck at the mouth of the Tyne. A committee was then formed at South Shields, and premiums were offered for the best model of a lifeboat. Two designs were selected, one by William Wouldhave, the other by Henry Greathead. The latter, being a boat-builder, was employed to construct a boat into which some of Wouldhave's ideas were introduced, though his particular idea—self-righting power—was omitted. This boat was 30 feet in length, 10 feet in breadth, had a curved keel, and the stem and stern were alike. There were ten oars, double banked. No means were provided for freeing the boat of water, and she could not self-right if upset. Lifeboats built on this plan were placed at several parts of the coast, and saved many lives.

In 1823 Sir William Hillary published an appeal to the nation, calling attention to the great loss of life from shipwrecks on our coasts. That appeal resulted in the establishment, the following year, of The National Institution for the Preservation of Life from Shipwreck (now the Royal National Lifeboat Institution). This society did good work on the coast, providing and maintaining lifeboats, and rewarding their crews.

In December 1849 a deplorable accident occurred. The South Shields lifeboat, built on the Greathead plan, went out to the assistance of a shipwrecked crew. She was upset, and drifted ashore bottom up, twenty of her crew being drowned. This disaster again called public attention to lifeboat work, and in 1851 the Duke of Northumberland offered a hundred guineas for the best model of a lifeboat.

James Beeching of Great Yarmouth was the successful candidate, and he constructed a twelve-oared boat, 36 feet long. This was the first self-righting lifeboat, and she could also free herself of water. But many modifications and alterations were afterwards made, and this type of lifeboat has been greatly improved in later years; so the self-righting lifeboat of to-day cannot be looked upon as any one man's design.

The self-righting type of lifeboat is most suitable for shallow waters. There are, therefore, other types in use where the water is deep, and these do not self-right; but they are more powerful boats, with heavy iron keels.

The smaller lifeboats of all types are intended for pulling and sailing; the larger ones are sailing boats, though provided also with oars. A few of the large lifeboats lie afloat in harbours, but the majority are kept ashore in houses, and launched down slipways into deep water. Lifeboats are usually built of wood, the planking being of double skin mahogany.

The lifeboat transporting carriage is a very important auxiliary to the smaller boats. Nearly every lifeboat which is launched from the beach is provided with a carriage, on which she is kept, in a boat-house, ready for immediate transportation to the most favourable position for launching to a particular wreck. A lifeboat is thus made available for a greater extent of coast than she would be otherwise. Even when launched abreast of the boat-house she can be conveyed much quicker to the water's edge than without a carriage. In addition, a boat can be readily launched from a carriage in a high surf, when it would often be very difficult to do so without one. The carriage consists of a fore and a main body. The latter has a keelway and bilge-ways attached to it, and the boat's weight is borne by the rollers of the keelway. The keelway forms an inclined plane, down which the boat is launched, bow first, off the rear end of the

carriage with considerable impetus. It is also used for replacing the boat, the inclined plane being reversed by removing the fore part of the carriage. All Institution lifeboats are practically unsinkable, having buoyancy air-cases filling the hold, and others placed above the water-tight deck.

Fig. 1.—Steam Lifeboat, with Single Screw in Tunnel. Length, 56 feet.

Fig. 2.—Carriage Motor Lifeboat, 'Self-righting' Type. Length, 35 feet.

A very full equipment is supplied to each lifeboat of the Institution; life-belts, anchors, cables, drogue, grapnels, life-buoys, lanterns, rockets,

and many other articles, besides the sails and oars.

mechanically. Steam lifeboats were therefore introduced about 1890, and they have done excellent work. The earlier ones had hydraulic or jet propulsion. Though not so economical, that system was adopted because it was considered less liable to damage than a screw propeller. But in the later boats a screw propeller was fitted, working in a tunnel for protection, and that method was found from experience to be the most practical. The steam lifeboats were built of steel.

The petrol motor has now displaced steam, being more suitable for lifeboats. The first motor lifeboat built for the Institution was commenced in 1905, and since that time many have been placed on the coast. These motor-lifeboats are mostly built of double-skin mahogany planking, and with a tunnel for the protection of the propeller. They are of various sizes and types, from 35 feet up to 60 feet, the latter having twin screws and 150 B.H.P.

In many countries lifeboats similar to these British coast-lifeboats are now used.

Lifeboats carried on board ships are different in many respects from the coast-lifeboats, and they are also smaller. All ships' lifeboats have to comply with the conditions fixed by the Merchant Shipping Act, and are built under the inspection of the Board of Trade. The proportions, form, materials used, and the method of construction, are controlled by rules and requirements.

There are different classes of boats provided for in the rules. Class I. has 'entirely rigid sides,' and Class II. has 'partially collapsible sides.' Each class has standard types—namely, 'open' and 'pontoon' boats.

The maximum number of persons to be accommodated in a boat is determined by the cubic capacity of the boat, and there must be seating accommodation for all persons carried.

An open type lifeboat of the first class, with internal buoyancy in the form of air-cases, is termed Class I.A., and is reckoned the principal type. The

Fig. 3.—Motor Lifeboat, with Cabin and Single Screw, 'Watson' Type. Length, 45 feet.

Fig. 4.—Motor Lifeboat, with Two Cabins, and Twin Screws in Twin Tunnels, 'Barnett' Type. Length, 60 feet.

The Institution had for many years been endeavouring to find means for propelling lifeboats

internal buoyancy in the form of air-cases, is termed Class I.A., and is reckoned the principal type. The

air-cases in such a boat have a total volume of not less than one-tenth of the cubic capacity of the boat. These air-cases are fitted along each side of the boat under the seats, also at the ends of the boat.

A full equipment is provided for each boat, including oars, sails, life-lines, sea-anchor, compass, fresh water, water-tight provision box, oil for distributing on the sea, self-igniting signal-lights, and other necessary articles.

In sea-going vessels carrying more than ten lifeboats, one has a wireless telegraphy installation. Where there are more than fifteen lifeboats, one is a motor-boat, and has wireless telegraphy and a searchlight. If more than twenty lifeboats are carried, two are motor-boats, and each has wireless telegraphy and a searchlight. These motor-boats comply with the requirements laid down for lifeboats of the first class. See **BOAT, LIFE-SAVING APPLIANCES, &c.**

Life Guards. See **GUARDS.**

Liferent, in Scots law, means a right to use a heritable estate for life, the person enjoying it being called a liferenter. For life-estate, in English law, see **ESTATE.**

Life-saving Appliances. Lifeboats, life-jackets, life-buoys, and other life-saving appliances are inventions for the preservation of life in cases of shipwreck. Every British ship must be provided with life-saving appliances in accordance with the Merchant Shipping Act.

At no moment of her voyage may a sea-going passenger ship have on board more persons than accommodation is provided for in the lifeboats that are carried. On these vessels, in addition to lifeboats, buoyant apparatus of approved material and construction is carried, sufficient to support 25 per cent. of the persons on board. The minimum boat capacity required, the minimum number of open lifeboats of the first class to be attached to davits, and the minimum number of sets of davits to be provided, are all fixed according to the length of the ship. Certain vessels, such as cross-channel boats and those carrying passengers on estuaries and rivers, cannot carry boats for all. These vessels, therefore, require to be provided with sufficient buoyant apparatus in the form of deck-seats or other approved fittings. Boats must be of lifeboat construction, with approved appliances for lowering them. The davits have to be of such strength that the boats can be lowered with their full complement of persons and equipment, and have to be fitted with gear of sufficient power to turn the boat out. All boats must be stowed in such a way that they can be launched in the shortest possible time under unfavourable conditions.

A life-buoy must be built of solid cork or other equivalent material, and fitted with life-lines and loops, and capable of floating in fresh water for at least twenty-four hours with 32 lb. of iron suspended from it. The minimum number of life-buoys to be provided is fixed according to the length of the ship.

A life-jacket has to be provided for every person on board, and, in addition, a sufficient number suitable for children. Each must be of approved materials and construction, but must not depend on air for its buoyancy, and must be capable of floating in fresh water for twenty-four hours with 15 lb. of iron suspended from it. All life-jackets and life-buoys must be readily accessible to passengers. There are various kinds of life-jackets. The one designed by Admiral Ward in 1854 for the Royal National Lifeboat Institution was made of cork covered with canvas, but an improved jacket is now made of kapok, having sufficient buoyancy

to support a man heavily clothed. It is flexible, fitting closely to the wearer, but not impeding his breathing or muscular action.

When a lifeboat is not at hand, or a raging sea and rugged coast render its use impractic-

able, a distressed ship may often receive help from shore by means of the rocket-apparatus. In 1807 a life-mortar was invented to discharge a shot with curved barbs that would lay hold of the rigging or bulwarks of a ship. In the same year a rocket, and a hand lead-line, were proposed as means of communication with stranded ships. These resulted in the modern rocket and the heaving-cane, used at every station in the kingdom. The rocket-apparatus stations are now under the control of the Board of Trade.

The method of procedure is to fire a rocket, carrying a line, over the wrecked ship. When close inshore a heaving-cane, with a lead weight on one end and a line attached to the other end, is used. By this line the crew haul on board an endless rope, or whip, rove through a tail-block, which is made fast to the mast or other part of the wreck. Those on shore, by means of the whip, haul to the ship a hawser, which is made fast, and on it the breeches buoy is worked, also by the whip. The shipwrecked persons are then brought ashore one by one. The coastguard inspector has control over all the rockets, buoys, belts, and lines kept at the various stations in his district. At each station a cart, made to contain all the requisites for the rocket apparatus, is kept ready packed for immediate use.

Liffey, a river of Ireland, winding 50 miles westward and east-north-eastward through Wicklow, Kildare, and Dublin counties, to Dublin Bay.

Lifts. Under this term are included numerous contrivances for raising weights. Such machines have various names: hoists—usually hand-worked and for lifting light goods in warehouses; elevators—chiefly used for taking passengers or their luggage, &c. to the upper floors of large hotels, business premises, &c.—and so on. There are also special Elevators (q.v.) for grain. Lifts are often on a large scale, such, for example, as occur on certain canals in place of locks at changes of level—where practically a section of the canal is alternately raised and lowered; and again on underground railways to bring passengers to the surface level (there are notable examples at the Mersey Tunnel).

Lifts consist primarily of a cage for the people or goods raised, a shaft in which this cage works, and the necessary machinery for raising or lowering the cage. There are two chief methods in use for this latter purpose; in the one the cage has

attached to its top ropes or chains which are wound up on a barrel or drum; in the other the cage is lifted by hydraulic pressure applied directly, or through the intervention of chains and ropes.

The ropes in use are, for light work, hempen; for heavy work, steel-wire ropes or chains. It is usual to counterbalance the dead-weight—i.e. the weight of the cage; in this case the rope attached to the top of the cage is generally not the lifting rope. The cage-rope is simply carried up to the top of the shaft, over a pulley there, and has suspended at its other end the counterbalance; the working rope operates the shaft of this pulley, and so lifts the cage. This saves a good deal of waste work, since the load lifted each time is only the net load, passengers and goods.

Hoists all require to be provided with some automatic clutch arrangements in case the chains or ropes break, water leaks off, the rams or pistons fracture, &c., otherwise the cages would run down with destructive velocity. These clutches are usually some form of catch kept clear of the side guides in ordinary working, but set in action by compressed springs when an accident happens. They should always be regularly tested to see if they are in working order.

Ligaments are cords, bands, or membranous expansions of white fibrous tissue, which play an extremely important part in the mechanism of joints, seeing that they pass in fixed directions from one bone to another, and serve to limit some movement of a joint, while they freely allow others. Ligaments have been arranged in three classes: (1) *Funicular*, rounded cords, such as the external lateral ligament of the knee-joint, the perpendicular ligament of the ankle-joint, &c.; (2) *Fascicular*, flattened bands, more or less expanded, such as the lateral ligaments of the elbow-joint, and the great majority of ligaments in the body; (3) *Capsular*, which are barrel-shaped expansions attached by their two ends to the two bones entering into the formation of the joint, which they completely but loosely invest: they constitute one of the chief characters of the ball-and-socket joint, and occur in the shoulder and hip joints. See JOINTS.

Ligan. See FLOTSAM.

Ligature, in Surgery. See BLEEDING.

Light. The general doctrine of Light is now only a part of the general theory of Radiation, which comprises Radiant Heat and Actinic and Electric Radiation as well as Light; but, since the battle as to the nature of radiation in general was first waged round light itself, it is convenient to consider light as representing all the forms of radiation.

Phenomena to be Explained.—Among these are the following, numbered for reference: (1) The transmission of light in straight lines (in a uniform medium); (2) its determinate velocity; (3) its spread from a point-source according to the law of inverse squares (including the production of shadows); (4) reflection; (5) refraction; (6) double refraction; (7) polarisation; (8) interference; (9) colour in the spectrum; (10) diffraction; (11) dispersion; (12) an observed distribution of energy in the spectrum; (13) an observed distribution of series of dark lines in the spectrum; (14) an observed bending of rays of light from distant stars on passing near the sun; (15) certain observed relations between a beam of light and a magnetic field.

All this points to a quick *propagation* of something—say matter, energy, motion, or condition—from luminous bodies outwards.

Explanations—none completely satisfactory.—1. *Sir Isaac Newton's*.—The simplest explanation,

at first sight, was that luminous bodies emitted something material whose impact affected the sensitive eye; that the reflection of light at surfaces was due to elastic rebound of this quick-travelling material. These phenomena might be equally well explained by waves travelling and being reflected; but Sir Isaac Newton could not reconcile himself to the notion of waves travelling in straight lines and not spreading. This difficulty, which we now know not to be a real one, inasmuch as it is only a question of proportion between the breadth of the wave-front and the distance between successive waves whether a wave-motion shall or shall not travel without spreading, led him to adopt and develop the corpuscular or emission theory of light. According to this all luminous bodies emit with equal velocities (a troublesome postulate, since the retarding attraction of the sun is so much greater than that of a candle-flame) a number of elastic corpuscles (whose mass must be extremely small, otherwise, with the velocity of more than 186,000 miles per second, their momentum would be destructive), which travel in straight lines, are reflected, and are refracted (provided that they travel *more* rapidly in the denser medium than in air or *in vacuo*, in a direction at right angles to the bounding surface between the rarer and the denser medium, which we now know to be contrary to the fact). But here began the difficulties: refraction is always accompanied by reflection, whence some corpuscles enter the denser medium, some rebound; hence a theory of easy fits of reflection and transmission had to be developed, and this involved as its explanation a theory of vibration of a general medium some way in advance of the travelling corpuscles, so as to aid or check their entrance into the denser medium. Newton discovered that the different colours of the spectrum were unequally refracted in glass; from this he had to infer that there were as many different kinds of corpuscles emitted as there were colours in the spectrum. Then, again, shadows are not absolute; the shadow of a hair produced by sunlight passing through a minute pinhole in which stands a droplet of water is bright in the centre; hence explanations had to be provided to account for the bending of rays round an object: then these explanations failed to account for similar phenomena observed when light was reflected from two mirrors. The theory became loaded with a mass of hypotheses devised to explain each particular phenomenon; but the great authority of Newton maintained its vitality down to the time and person of Sir David Brewster.

2. *Undulatory Theory, or Wave-Theory.*—The suggestion that Light might consist of travelling waves was made by Grimaldi, Hooke, and others, and was followed by Huyghens (1678), who explained double refraction; but the suggestion went into abeyance.

(a) *The Elastic Solid Wave-Theory.*—At the beginning of the 19th century Young revived the idea, and Fresnel (1813 onwards) developed it as a part of the doctrine of Elasticity. According to this view, the waves of Light are waves of *displacement* in a continuous elastic Solid, the Ether, assumed to fill all space. The displacements are at right angles to the direction of propagation.

(b) *The Electromagnetic Wave-Theory.*—At a point in a magnetic field (see MAGNETISM) the medium is (Clerk-Maxwell) in a condition of electric stress in one direction and an associated magnetic stress in a direction at right angles to the former; and if the condition be rhythmically disturbed, the disturbance will spread with a certain velocity in waves, in such wise that at any point traversed by a train of waves the medium is exposed to rhythmically alternating electric and magnetic

stresses at right angles to one another and to the direction of propagation. The analogy between this and light led Clerk-Maxwell to consider whether light itself could not be regarded as a wave-propagation of this kind, the waves not being waves of displacement but waves of propagation of *electromagnetic stresses*. It was found that the velocity of propagation coincided with the velocity of light, and that, generally, the scheme worked true to the facts known at the time (1862). Clerk-Maxwell, therefore, promulgated his Electromagnetic Wave-Theory of Light, which was afterwards extended to Radiation of all wave-lengths, from the shortest (ultra-violet radiation) to the longest (e.g. wireless transmission, then unknown).

The wave-theory, in either of its forms, explains (1), (2), (3), (4), (5) (provided that a beam of light travels *less* rapidly in a denser medium, which we now know to be the case), (6), (7), (8), (9), (10), (11); but in both forms it is hopelessly irreconcilable with (12). As to (13) it is dumb; as to (14) it offers a suggestion, provided that we admit on general grounds that a beam of light, having energy E , has mass or Inertia (q.v.) E/c^2 (where c is the velocity of light), and is therefore attracted by the sun; and as to (15) the electromagnetic theory, but not the elastic solid theory, offers valuable assistance.

As to the origination of light, the electromagnetic wave-theory shows that visible light is to be traced to rotations or oscillations of Electrons (q.v.) in a molecule, while Radiant Heat may be due to atoms or molecules as wholes.

3. *The Quantum Theory*.—Planck, scrutinising the hopeless irreconcilability of the wave-theory with (12), found that there was an underlying assumption, viz. that the flow of energy from each luminous particle was continuous. This continuous flow he showed to be a physical impossibility. He devised a scheme, according to which any given particle only occasionally emitted a definite parcel or Quantum (q.v.) of energy. The result of this would be that while the form of the wave-front would be unaffected, the wave-front itself would not be continuous, but would be represented by scattered rapid scintillations, quite undistinguishable by the eye from a continuously illuminated wave-front; but under such conditions the distribution of energy in the spectrum would be in harmony with (12). Incidentally, the ether must provide paths for the quanta, and could not be regarded as a continuous medium; a conclusion to which Sir J. J. Thomson had already come on electrical grounds. Planck's scheme has proved of extraordinary service in elucidating (13); but, then, it is wholly at variance with cases of (8), where there is a great difference between the paths of the two interfering rays.

Note, as to (14), that the amount of bending which might be expected, in a Euclidean universe, would on the wave-theory or the quantum theory be $0''\cdot88$, whereas in an Einstein universe it would be $1''\cdot76$. The observed bending of a ray of light passing the sun is $1''\cdot76$.

Since each minute parcel or quantum of energy has mass or inertia, it may be said that modern work is bringing us back to a modified corpuscular theory; but, so far, no one of the explanations offered is completely satisfactory.

The velocity of light is found by timing the eclipses of Jupiter's satellites when they are at the greatest and the least distance from the earth; by astronomical aberration-observations; by finding (Fizeau) what speed must be given to a cog-wheel to make it rotate one tooth's-breadth while light is going to a given distant mirror and returning; by finding (Foucault) what position is ultimately assumed by a ray which travels from a source to

a rotating mirror, thence to a distant mirror, and thence back to the original mirror, which by this time has been rotated somewhat. In the last method it is found that the interposition of optically denser or more refractive media *retards* the light. The mean of all observations is that light of all wave-lengths travels, *in vacuo*, with a velocity of 30,057,400,000 centimetres or 186,772 miles per second; in air, with a velocity less than this in the ratio of 10,000 to 10,003.

It is a moot question whether the velocity of light from an object moving with a velocity v is c , the same as the velocity of light from an object at rest, or whether it is $(c+v)$, the latter being the ballistic hypothesis. The former is an essential postulate for Einstein's deductions; the latter explains certain phenomena of variable stars which are intractable under the former.

The length of waves can be ascertained from measurement, at a sufficient distance, of the fringes produced by Interference (q.v.), or by the use of diffraction-gratings ruled with n lines to the centimetre. In the latter case the wave-length for any particular colour is in centimetres the n th part of the sine of the angle of deflection of that colour in the first 'diffraction-spectrum,' a result easily reached through the general theory of waves. The wave-lengths of radiant heat; light, and actinic radiations range from $\frac{1}{100}$ cm. or $\frac{1}{100}$ inch (the longest invisible heat-rays, Rubens) to $\frac{1}{1000000}$ cm. or $\frac{1}{1000000}$ inch (invisible actinic rays); the visible limits are $\frac{1}{10000}$ and $\frac{1}{100000}$ cm. The frequencies or numbers of waves per second in radiations from a hot body accordingly range from 5 millions of millions to 40,000 millions of millions per second, the extreme visible limits being 392 and 757 millions of millions per second. In electro-magnetic waves the range of wave-length is from 6 mm. (0.24 inch) to, say, thousands of miles.

The value of light as a curative agent—of phototherapy by means of sunlight, electric light, Röntgen rays, radium—is a comparatively recent branch of study; Finsen of Copenhagen was the first to attain to great success in the treatment of lupus at the beginning of the 20th century.

Various aspects or departments of the subject of light will be found dealt with in the articles on Aberration, Diffraction, Dispersion, Ether, Heat (for radiation), Interference, Optics, Photography, Photometry, Polarisation, Radium, Reflection, Refraction, Relativity, Röntgen Rays, Shadows, Vacuum-tubes, Wave, as also in ELECTRIC LIGHT, GAS (HEATING AND LIGHTING BY), PHOSPHORESCENCE, &c. See also books on light and optics by Tait, Glazebrook, Stokes, Preston, Schuster (1904), R. W. Wood (1911), Houstoun, Drude.

In law, an owner of land has a right to the light and air which pass over it; he has also the right to obstruct the light and air by erecting walls and buildings. If my neighbour builds a house on the edge of my land, he does not thereby acquire any right against me; I may build on my land so as to darken his windows. But I may, by express or implied grant, vest in him the right which is called a Servitude or an Easement—the right to forbid the erection, on my land, of any building which obstructs his lights. English law allows an easement of light to be acquired against a neighbour by twenty years' enjoyment, without any grant; and the right as acquired by old prescription is called the 'easement of ancient lights.' In Scotland such rights are not acquired by lapse of time; unless a servitude has been created, an owner may at any time build so as to darken his neighbour's windows, provided he does not act wantonly or so as to cause a nuisance. Rights to air generally go along with rights to light. Roman and Scots law recognise a servitude protecting a fine view:

English law knows no such right; but in the United States 'servitude of prospect' may be acquired; in some states by uninterrupted enjoyment for twenty or fifteen years.

Lightfoot, JOHN, one of the earlier Hebrew scholars of England, was born in 1602 at Stoke-upon-Trent, in Staffordshire, son of the vicar of Uttoxeter. He had his education at Christ's College, Cambridge, and, after taking orders, became chaplain to Sir Rowland Cotton, himself a fair Hebraist. In 1629 appeared his *Erubhin, or Miscellaneous Christian and Judaical*, dedicated to Sir R. Cotton, who in 1630 presented him to the rectory of Ashley in Staffordshire, where he laboured with incessant zeal for twelve years. He next removed to London, and was chosen minister of St Bartholomew's, to the parishioners of which he dedicated his *Handful of Gleanings out of the Book of Exodus* (1643). Lightfoot was one of the most influential members of the Westminster Assembly in 1643, but often stood alone, as in the Erastian controversy. In 1644 he was chosen rector of Much Munden in Hertfordshire, in 1650 Master of Catharine Hall, Cambridge, and in 1655 vice-chancellor of the university. At the Restoration he complied with the terms of the Act of Uniformity. He died at Ely, 6th December 1675.

The chief works of this great Rabbinical scholar were the unfinished *Harmony of the Four Evangelists among themselves* (1644-50); *Commentary upon the Acts of the Apostles* (1645); *The Harmony, Chronicle, and Order of the Old Testament* (1647); of the New (1655); and the *Horæ Hebraicæ et Talmudicæ* (1658-74; last part posthumously), the great labour of his life. The best edition of his whole works is that edited by the Rev. J. R. Pitman, with a Life (13 vols. 1822-25).

Lightfoot, JOSEPH BARBER, D.D., Bishop of Durham, was born at Liverpool in 1828, and was educated at Trinity College, Cambridge, where he graduated B.A. in 1851 as a wrangler, senior classic, and Chancellor's medallist. He was elected a Fellow of his college in 1852, and gained the Norris University prize in 1853. Ordained in 1854, he became tutor of Trinity College in 1857, Hulsean professor of Divinity at Cambridge in 1861, canon of St Paul's Cathedral in 1871, and Lady Margaret professor of Divinity at Cambridge in 1875. He received his doctor's degree in 1864, was Whitehall preacher in 1866, was appointed examining chaplain to the Archbishop of Canterbury in 1868, honorary Fellow of Trinity College, Cambridge, in 1872, select preacher at Oxford, 1874-75, and one of the Deputy-clerks of the Closet, 1875. In 1879 Dr Lightfoot accepted with great reluctance the bishopric of Durham. Although confessedly the most learned New Testament scholar in the church, his powers of administration had not been tested; but, besides making Bishop-Auckland a centre of learning for his clergy, he devoted himself with untiring energy to the practical work of his see. He produced admirable commentaries on *Galatians* (1865), *Philippians* (1868), *Colossians* and *Philemon* (1875), with dissertations. His exhaustive work on the Apostolic Fathers remains a splendid fragment, embracing only the two epistles ascribed to *Clement of Rome* (1869; Appendix, 1877; new ed. 1890), and *Ignatius and Polycarp* (1885; 2d ed. 3 vols. 1889). He died 21st December 1889.

Lighthouse.—A building erected on some conspicuous part of the coast from which a light is shown at night to guide mariners or to assist aerial navigation, and which may serve as a sea-mark by day. Aids to navigation comprise lighthouses, lightships, beacons, buoys, and fog-signals, also wireless stations giving a navigator his position, and leader cables. Lighthouses are generally placed

on salient points of the coast-line, islands, isolated or sunken rocks, and sandbanks, each requiring structures of special design. When placed on headlands or large islands lighthouses are very much alike in general features, the differences being mainly in the height of the towers, depending on the distance at which the light requires to be seen and the lighting apparatus. Towers erected on isolated wave-swept rocks in the open sea, such as Smeaton's Eddystone (now superseded by Douglass's tower), Robert Stevenson's Bell Rock, Walker's Bishop and Wolf Rocks, Alan Stevenson's Skerryvore, David Stevenson's North Unst and Dhuheartach, Alexander's Minot's Ledge and Spectacle Reef in America, Bréhat in France, D. and C. Stevenson's Chickens Rock and Platte Fougère, Guernsey, and Scott's Fastnet, are triumphs of engineering.

The history of lighthouse construction and illumination may be said to extend over a period of more than two thousand years; but the regularly organised life-preserving system of modern lighthouse engineering goes back very little farther than the end of the 18th century. None of the early lighthouse buildings now exist. The Pharos of Alexandria (331 B.C.) gave its name to its successors, though Sigeum on the Hellespont was undoubtedly older. The Romans built lighthouses at Ostia, Ravenna, Puteoli, and other parts. The Phœnician Pharos at Corufia was repaired during the reign of the Emperor Trajan, was re-established as a lighthouse about 1634, and in 1847 had a dioptric apparatus installed. There are remains of a Roman lighthouse at Dover, and of another ascribed to Caligula (40 A.D.) on the cliff at Boulogne. Corduan, at the mouth of the Garonne, has seen all the improvements, from the open chauffer to the modern dioptric apparatus. Until 1800 lighthouses were few in number and deficient in the great essential of a lighthouse—sending the greatest number of rays of light towards the horizon. At that time there were under 40 lighthouse stations and floating lights in Great Britain—many being private property. British coast and harbour lights now number upwards of 1300, while in American waters there are now upwards of 3500 lights besides 300 fog-signals.

The coasts of all countries have three lines of defence—over-sea lights, which indicate important landfalls and require the most powerful optical apparatus; secondary lights, which are of importance as direct turning-points in coastal navigation; and, lastly, harbour lights to guide ships into havens of safety. It has been laid down as an axiom by lighthouse engineers that over-sea lights of similar characteristics should not be placed nearer each other than 100 miles, and that lights on coast-lines much frequented by shipping should, if possible, be designed to overlap each other, even in dirty weather.

The selection of the type of lighthouse to be adopted for a particular site depends chiefly on the duty required, the exposure of the site, and the relative cost at the site of suitable materials for construction. Solid or skeleton structures are employed, and the materials may be stone, concrete, brick, iron, or timber. In the case of exposed rocks, and of sites below low water, construction is sometimes of the utmost difficulty.

Examples of structures on rock foundations subject to great exposure are the Wolf Rock and Dhuheartach, which are solid stone towers, and Platte Fougère, a concrete tower which is an unattended lighthouse. Skerryvore tower (fig. 1) contains a mass of 58,580 cubic feet of granite, is 139 feet in height, 42 feet in diameter at the base, and tapers upwards in a hyperbolic curve. The foundations are quarried out of the solid rock, and all

the courses are dovetailed or joggled together, and are made solid for 20 feet upwards, when they become divided off into rooms, one above the other, and 9 in number. Five seasons passed before the tower was completed; the great difficulty being

Fig. 1.—Skerryvore Lighthouse.

to effect a landing of men and materials. Smeaton's Eddystone took three years to erect, the Bell Rock four years, and Dhuheartach three and a half. At Minot's Ledge General Alexander got only 30 hours of work in the first year of construction, and 157 in the second, and the histories of the Bell Rock, Skerryvore, Dhuheartach, Chickens, Eddystone, and some others tell the same tale.

A different type of construction is the Fowey Rocks lighthouse off Florida, which is a pyramidal iron framework erected on a coral reef. The tower is 120 feet high, and is founded on iron piles sunk 10 feet into the rock. The openwork structure encloses a vertical cylinder and quarters for the keepers on a lower deck. Erection was completed in two years.

The Rothersand lighthouse, in the estuary of the Weser, was constructed with great difficulty on a shifting sandbank 20 feet below low water. A caisson, sunk 40 feet into the sand, was filled with concrete, and carried the lighthouse. The first attempt was unsuccessful, but on the second attempt the work was completed in two and a half years. For structures founded on sand, open pile-work is also successfully employed.

The cost of lighthouse towers is very variable, depending not only on the details of the structure to be erected, but on the exposure and accessibility of the site and on the nature and level of the foundation.

Lighthouse Apparatus.—The optical apparatus ordinarily consists of a flame with reflectors or refractors or a combination of both to concentrate the light and direct it towards the horizon. The system of reflectors is named catoptric, of refractors dioptric, and the combination of both, catadioptric. The first revolving light was erected at Marstrad, in Sweden, in 1783.

In 1763 reflectors, formed of pieces of silvered glass set on a parabolic mould of plaster of Paris, were used in the Mersey lights. In France, spherical metallic reflectors took their place in 1781, and parabolic mirrors in 1790. A parabolic mirror having a flame at the focus will reflect parallel to the axis all the rays of light falling on its surface, and these will

be concentrated in a beam of light many times more powerful than the unassisted beam (fig. 2). To Augustin Fresnel belongs the honour of inventing and first employing in 1822 the dioptric system for lighthouse purposes. At Corduan he placed round the lamp 8 plano-convex lenses 30 inches square, composed of a central disc surrounded by annular rings gradually decreasing in breadth as they receded from the centre. The separate pieces were cemented together and mounted in metal frames. An arrangement of inclined lenses and mirrors was placed above and subsequently below the main lenses, and to some extent utilised the light which would otherwise have escaped. Fresnel also devised an apparatus for fixed lights of the first order, showing vertical strips of light all round the horizon of varying strength depending on the divergence of the flame. For the refracting loop he adopted a polygonal form of 32 narrow lenses, but Alan Stevenson, when introducing the dioptric light into Britain, designed a truly cylindrical belt divided into sections with helical joints. He also executed the horizontal totally reflecting prismatic rings instead of the Fresnel mirrors, and secured the equal distribution of light all round (fig. 3). The only change since his day in the first order fixed light is that the prisms are smaller, but their number has increased. Fixed lights, though not so powerful as revolving, are useful as a distinction, as they lend themselves to cut-offs, the intensification of light over particular

Fig. 2.—Catoptric System.

also devised an apparatus for fixed lights of the first order, showing vertical strips of light all round the horizon of varying strength depending on the divergence of the flame. For the refracting loop he adopted a polygonal form of 32 narrow lenses, but Alan Stevenson, when introducing the dioptric light into Britain, designed a truly cylindrical belt divided into sections with helical joints. He also executed the horizontal totally reflecting prismatic rings instead of the Fresnel mirrors, and secured the equal distribution of light all round (fig. 3). The only change since his day in the first order fixed light is that the prisms are smaller, but their number has increased. Fixed lights, though not so powerful as revolving, are useful as a distinction, as they lend themselves to cut-offs, the intensification of light over particular

Fig. 4.—Catadioptric System.

sectors by vertical prisms or to positions where arcs of different colours are required. The dioptric system was introduced into Britain in 1835 at

Inchkeith. In the revolving-apparatus for Skerryvore, in 1840 Alan Stevenson substituted prisms for the mirrors below the lens, and introduced also totally reflecting prisms for first-order lights.

The ordinary parabolic reflector allows about one-third of the rays to escape past the lips by

Fig. 5.—Stevenson's Holophotal Revolving Light of the first order.

natural divergence; and to prevent this waste, Thomas Stevenson in 1849 devised the holophotal reflector (fig. 4), which consists of a lens, L, with parabolic mirror, *a*, and a spherical mirror, *bb*, which returns all the rays falling upon it back to the flame. As a development, he dispensed with the double agents above and below the lens, and substituted holophotal prisms, which parallelise

Fig. 6.—Dioptric Mirror.

the rays in revolving lights (fig. 5). In 1855 he also designed a bivalve apparatus 10 feet in diameter. Fig. 6 shows the dioptric mirror, which is largely used in lighthouses.

Fresnel devised the fixed light varied by flashes by placing straight refracting prisms on a revolving frame outside a fixed apparatus. An extension of this is the azimuthal condensing light, introduced in 1857 for narrow sounds on the west coast of Scotland, where

Fig. 7.—Azimuthal Condensing Light.

the light does not require to be of equal power in all directions. Straight refracting or reflecting prisms revolve and intercept the rays from a central fixed apparatus so as to produce darkness over the sections they subtend, while they strengthen the intermediate sections (fig. 7). The power is increased in proportion to the duration of the intervening periods of darkness.

In 1874 Hopkinson introduced group-flashing lights by splitting up the lens into several portions, so as to give a group of two or more flashes, followed by a long eclipse (fig. 8). The most notable improvement in revolving apparatus was suggested by Messrs Stevenson in 1869, and the first apparatus was constructed to their design in 1885 by Barbier

Fig. 8.—Holophotal Triple-flashing Light of the first order.

and Fenestre, Paris. This is the hyper-radiant apparatus (fig. 9), which is optically the most efficient apparatus yet made. Much of the light from burners of greatly increased diameter, when used with revolving apparatus, was not condensed by the lenses and not properly utilised; but with

Fig. 9.—Stevenson Hyper-radiant Lens.

the enlarged prisms above and below the lenses of the hyper-radiant apparatus, all the rays of light are acted on, excessive heat is avoided, and bifurcated and trifurcated arrangements are rendered unnecessary, as one central flame is alone required. Dioptric apparatus were divided into six orders till the hyper-radiant apparatus was designed. The following table gives the internal

diameter and height of the optical glass of each :

	Internal Diameter.		Height of Glass-work.	
	8 feet	8-72 inches.	11 feet	10-28 inches.
Hyper-radiant.....	6	" 0-44 "	8	" 8-5 "
1st Order.....	4	" 7-12 "	7	" 0 "
2d ".....	3	" 3-37 "	5	" 1-5 "
3d ".....	1	" 7-68 "	2	" 8-06 "
4th ".....	1	" 2-77 "	1	" 10 "
5th ".....	0	" 11-81 "	1	" 5-5 "

In 1888 C. A. Stevenson designed a form of lens spherical in the horizontal and vertical sections, which admits of the construction of lenses of increased focal distance and power without requiring enlarged lanterns. He pointed out that the spherical form loses efficiency when subtending at the focus an angle greater than 20° , and designed his equiangular prisms with an inclination outwards, which obviates all objection, the arrangement causing less divergence and loss of light than with either the spherical or the Fresnel form.

Characteristics.—Various distinctions are made in the characters of lights: (1) fixed lights; (2) revolving lights, when at regular intervals the light appears gradually, attains full brilliancy, and then gradually disappears; (3) flashing or occulting, showing at equal periods either a flash or a sudden eclipse of a steady light; (4) group-flashing, showing a group of flashes followed by a long period of eclipse. Various combinations of these characters are made and the intervals varied. The flashes are generally not less than a half-second duration, though in France they have been made one-tenth of a second in the *feu-éclair* type of apparatus, but this duration has been found too short. Colour distinction is employed for danger arcs and when other characteristics are not available. When resorted to, the coloured beams are raised to the intensity of the white light by mirrors, condensing prisms, or other means. Experiments show that a white beam is about four times stronger than a similar red beam—a difference slightly redeemed in fog. Coloured lights are used as seldom as possible on account of their reduced power, the colours used being red, green, and occasionally violet. When used for floating lights, such as buoys and lightships, the colour green in British waters is employed exclusively to mark wrecks.

Machines.—If the apparatus revolves, motion is produced generally by clockwork and by the fall of a weight. In the case of small apparatus, Messrs Stevenson produced motion by means of the heat from the burner revolving a fan. With heavy and high-speed apparatus it is usual to carry the rotating parts in a trough of mercury; but in third order and smaller apparatus, roller or ball-bearings are more suitable, as being more economical and giving increased space in the lantern.

Lanterns.—The lantern or framework of glass and metal enclosing the lighting apparatus is an important part of lighthouse economy. The early lanterns had vertical and horizontal sash-bars; but in 1835 Alan Stevenson introduced diagonal framework which does not intercept light in any azimuth, and secures a structure of great strength and rigidity. The astragals are of gun-metal, 1 inch section, glazed with plate-glass $\frac{1}{4}$ inch thick. The first order lantern is 12 feet in diameter and 10 feet in height of daylight, with an outer and inner dome of copper. In Scottish lighthouses storm-panes are always in readiness in case of breakage of a pane, but there is no instance of a lantern-pane being broken by the force of the wind, though they are occasionally broken by birds or by stones being driven against them.

Lightkeepers.—At lighthouse stations on shore there are two keepers, while at rock stations there are generally four, one being always on shore by rotation. At electric light stations there are five

keepers, one being a mechanical engineer; and where there is a fog-signal at any station, three keepers are usually stationed.

Illuminants.—Early lighthouses had on their summits chauffers in which billets of wood or coal were burned. These were uncertain, if not misleading, guides, as their appearance varied with the condition of the atmosphere. In some cases they burned 400 tons of coal yearly. Such coal fires survived in Scotland till 1816, in England till 1822, and on the Baltic till 1846. Candles, though seldom employed, were in use till 1834, and oil-lamps were known in connection with lighthouses about 1600. Smeaton's famous Eddystone had no better light than 24 tallow candles, their combined power being equal to 67 standard candles. The early lamps had torch-like wicks, and the fuel was whale oil. The flat wick was an improvement; but the lamps were still unsatisfactory till Argand, about 1780, devised the cylindrical wick burner which Teulère also is said to have discovered. To Carcel is due the arrangement for a regular flow of oil over the burner, to Rumford the idea of concentric wicks, and to Arago and Fresnel the four-wick lamp. Alan Stevenson added a fifth wick and other lighthouse engineers increased the number, though with doubtful advantage. Sir James Douglass devised powerful mineral oil burners. Almost every kind of oil, animal and vegetable, has been used in lighthouses. Spermin oil was displaced by colza in 1845 as the illuminant generally used. In 1868 Captain Doty devised multiple wick burners capable of consuming paraffin properly, and in 1872, when Dhuheartach came to be lighted, paraffin was employed and thereafter was generally adopted elsewhere with advantage on financial and photogenic grounds. Coal gas was used in 1827 for a pier light at Troon, and a system of multiple gas jets was subsequently developed. The use of gas as an illuminant is, however, seldom advisable. The luminous intensity of the beam of light from a dioptric apparatus is dependent chiefly on the intrinsic brightness of the flame and not on its total luminous intensity. Multiple wick burners and gas jets give flames of small intrinsic brightness notwithstanding their large total intensity; but the principal systems of illumination now employed in lighthouses—petroleum vapour, electricity, and acetylene—give flames of high efficiency and of great intrinsic brightness.

Oil Vapour.—The mineral oil vapour system first employed in France in 1898 is much used in modern lighthouses as giving a powerful and highly efficient light. A spray of paraffin mixed with air is injected into a heated vaporising tube, and the resulting gas vapour is supplied to an incandescent mantle. On first ignition the vaporiser is heated by a subsidiary spirit flame, but afterwards is kept heated by the mantle burner. A small reservoir of compressed air charged by hand-pump provides the pressure for injection.

Electricity.—This illuminant has been adopted in many lighthouses in all parts of the world, but its use is reserved generally for important landfalls. Trial shows that during fog electric light suffers to a greater extent than oil or gas, but the greater intensity obtainable and other advantages more than outweigh the loss in fog. Its first installation at Dungeness lighthouse in 1862 proved unsatisfactory. It was successfully adopted at La Hève in France in 1863, and the first permanent installation in England was at Souter Point in 1871. Electrical engineering practically springs from Wilde's magneto-electric machine, and his first machine was used for experimental purposes by the Commissioners of Northern Lighthouses in 1865. More powerful machines have since been devised. Meritens's alternators were used with

good results at the Isle of May lighthouse in 1887, and were subsequently adopted at other lighthouse installations. Two machines were used at the Isle of May, it being arranged that the current transmitted to the lantern could be varied at will, and that during fog the machines could be coupled and the full current from both employed. The carbons were 1.6 inches in diameter, with a core of pure graphite which burned with great steadiness at the rate of 2 inches in an hour. With closed circuit each machine developed a current of 220 amperes 40 volts. The actual candle-power being about 26,000,000, the light was seen 30 per cent. more often than a first-class revolving light. This was one of the most powerful lights in the world. Heligoland lighthouse also is very powerful.

Incandescent electric lighting from a local supply has been employed at some harbour lights and occasionally for buoys. On Girvan pier, in Scotland, a number of Leclanché cells supply sufficient electricity to light a small filament lamp made to flash by clockwork. The quantity of zinc consumed is small, and as the battery is recuperative there is no fading away of the light through time.

Acetylene.—Acetylene gives a flame of great intrinsic brightness, and is much employed as an illuminant for lighthouses. The gas is supplied in cylinders under pressure or dissolved in acetone, or is generated automatically as required on the carbide to water system. It can be used with and without mantle burners, and in unattended lighthouses is employed with much success, both for the light and as an automatic fog-signal.

Unattended Lights.—One of the most important developments in lighthouse engineering in recent times has been the unattended light (see BEACON).

Platte Fougère lighthouse, Guernsey, is the most complete unattended lighthouse in existence, and opens up new possibilities in lighthouse engineering. It is built on a dangerous reef of sunken rocks one mile from shore, particularly liable to fogs. The type of rock tower ordinarily erected at such situations would have cost not less than £65,000; but the complete installation proposed and carried out in 1910 by D. & C. Stevenson, Edinburgh, cost £3500. The tower, 46 feet high, is constructed of reinforced concrete in the form of an irregular octagon, and contains an acetylene light automatically extinguished during daylight, and a powerful siren. Electric motors and air-compressors for the fog-signal are installed in the tower, and are connected with shore by a specially designed heavily-armoured submarine cable. Electric power is received from the machinery on shore, which includes two oil-engines driving three-phase alternators. The siren gives a blast every 90 seconds, and is controlled from the shore.

Aerial Lighthouses.—When lighthouses are designed to assist aerial navigation the same principles are used as in the design of marine lighthouses, the characteristic being given to the sky and not entirely to the horizon as in sea-lights. A lighthouse optical apparatus is sometimes designed to assist both marine and aerial navigation.

Unattended Fog-signals.—Beacons have now been equipped with automatic fog-guns which are independent of power supplied from shore. These guns are operated by the explosion of acetylene gas, and run for several months without attention, giving as many as six explosions every minute. They add very greatly to the utility of beacons. An important development in lighthouse engineering was made by Messrs Stevenson, who had been the first to suggest that lights and these fog-guns might be operated by wireless control from a distance, and had already carried their suggestion into actual operation—in the installation on the Clyde of two fog-guns switched on and off by wireless control

from shore, the apparatus being erected by the Marconi Company, who added an arrangement to prevent interference from neighbouring installations.

Lightships.—Light-vessels are moored in situations where it would be impossible to erect a lighthouse. They are generally steel ships, 103 feet in length between perpendiculars, and 23½ feet beam, and very strongly built. Early light-vessels had small lanterns suspended from the yard-arms. R. Stevenson in 1807 introduced a lantern surrounding the mast, and lightship lanterns, until recently, have been made on his plan. They are now, however, usually placed on the top of the mast. Until Messrs Stevenson designed the Hugh lightship with dioptric apparatus, all floating lights had catoptric apparatus.

The North Carr Lightship, at the mouth of the Forth, is moored by a 1½-inch studded chain cable and 3-ton anchor, as it is in a very exposed position, and the engines for the fog-siren are driven by steam. The illuminant is acetylene.

When light-vessels are provided with fog-signals, these signals can be sirens, reeds, trumpets, bells, gongs, and explosive-guns. Submarine signalling-apparatus is sometimes supplied in addition. Most lightships have a crew on board, but small, unattended lightships, designed by D. & C. Stevenson, are used with advantage in very exposed situations in Scottish and foreign waters, and will cost about £3200 if equipped with unattended flashing-light and automatic fog-gun.

Fog-signals.—The average duration of fog on the whole British coast is only slightly over 400 hours yearly, though in some parts it reaches 1080 hours, while at some places in the United States the average is 2226 hours. There are few coast lighthouse stations where a phonic signal would not be of great service, as it is during dense fog, when the most powerful lights are obscured, that a vessel is in most danger; the only information it can then obtain as to its position is from such signals apart from soundings. Various instruments are used, such as bells, gongs, whistles, guns, tonite charges, sound-rockets, reed trumpets, sirens sounded by compressed air, and submarine signals. Though bells are not effective signals, many are now in use. Gongs, struck by hand, are still employed on board some lightships, but the sound, though distinctive, is not heard at any great distance. Steam-whistles are largely used in the United States, and guns and sound-rockets are still employed at a few stations. In the reed trumpet a metallic reed or tongue, 18 inches long, 2½ inches broad, and varying from ⅝ to ¾ inch in thickness at the free end, is made to vibrate by compressed air or steam blown through it. This signal is effective, though not so powerful as the siren.

Tonite charges are used at many stations in Britain. The charge consists of a small disc of dry cotton-powder surrounding a detonator of fulminate composition. The charge is hoisted above the lantern on a jib, and is connected to a small electro-magnetic machine in the light-room which fires the charge. An arrangement is made so that the circuit cannot be closed until the jib and charge are raised to the full height above the lantern. Recently, automatic acetylene guns have been introduced in the Scottish lighthouse service, which possess considerable advantage over the tonite signals. Tonite charges cannot be fired oftener than every five minutes, are expensive to maintain, and require constant attention, whereas the acetylene guns can give several reports every minute, cost little to maintain, and run for months at a time without attention.

The siren consists of two cylinders having angular slots, one being fixed and the other free to rotate

within the fixed cylinder, the compressed air impinging against the enclosed sides of the slots causes the inner cylinder to revolve, the rapid passage of one row of slots over the other produces a series of vibrations which give the note desired, and notes of different pitch can also be produced. The rotation is from 1500 to 2000 times a minute, with air pressure at 20 lb. per square inch. A trumpet covering the mouth of the siren directs the sound in any required direction, usually against the wind. The trumpet is sometimes conical, 16 feet long, and can be rotated horizontally and dipped below the horizon. By means of a small motor, driven off the air supply, the siren is set in rotation before the compressed air is admitted, and thus the pitch of the note can be kept constant from the commencement of the blast. At Ailsa Craig Messrs Stevenson adopted a central station, the compressed air at 75 lb. per square inch being conveyed to distances of $\frac{3}{4}$ and $\frac{1}{2}$ mile respectively. These signals are so arranged as not to sound together. As regards the distance to which the compressed air is carried, this was a new departure in fog-signalling. The diaphone is the signal used principally in Canada, and is on similar lines to the siren.

Submarine fog-signals are employed chiefly on lightships. A bell with a heavy lip is lowered from the ship in time of fog, and is struck by a clapper actuated by a small air motor. Ordinary vessels are equipped with microphone receivers, fixed on each side of their hulls below the water-line, the communicative-telephones being usually fitted up on the bridge. The position of the lightship can so far be located by the intensity of sound heard on the telephones. Bells have also been placed on the sea-bottom, operated by electricity by submarine cable, but a system of striking the top end of a long, submerged rod seems to offer greater possibilities of success. Though the advantage possessed by the water carriage of sound over air carriage is considerable in that the wind is no longer an adverse factor, there are disadvantages of the submarine system which make the air carriage system still the main fog-signal system.

Wireless Signalling and Leader Cables.—Several systems of wireless signalling afford great benefit to the mariner during fog and thick weather by giving him his position. One is the Marconi system, which was established experimentally in 1922 at Inchkeith in Scotland. Energy is transmitted from the island by two parabolic frames composed of vertical wires, which focus the energy into single beams. The frames are revolved and a different Morse-code letter is given out towards each point of the compass. Simple receiving apparatus is required on the ship, by which the mariner picks up the letters transmitted in his direction. An entirely different system is in use in the United States. These systems, however successful they may be, can scarcely be expected to eliminate the use of sound fog-signals transmitting direct to the ear of the seaman. The leader cable, invented by C. A. Stevenson in 1892, is established in the approaches to the harbours of New York, U.S.A., and Portsmouth in England. The cable is laid under water, and a ship having induction receiving apparatus can steer herself along the line of the cable, which leads her securely into port.

Administration.—British lighthouses are managed by the Trinity House for England, and the Commissioners of Northern Lighthouses for Scotland and the Isle of Man, the Board of Trade, by the Mercantile Marine Act of 1854, having control in finance and other matters. Some colonial lights are also under the control of the Board of Trade. The Northern Lighthouse Board was constituted by Act of Parliament in 1786. The Trinity House is an older corporation, being started as a benevolent

institution for seamen. It is also the chief pilotage authority. In the United States of America the first act of Congress relating to lighthouses was passed in 1789, and the Lighthouse Board was reconstituted in 1852. In France the lighthouse administration is under a commissioner controlled by the Minister of Public Works. In Canada, Sweden, and other countries the lighthouse service is under the Admiralty, a Minister of Marine, or a Public Works Department, and in Spain the system of administration is similar to that in France.

Lighting. See CANDLE, ELECTRIC LIGHT, GAS (HEATING AND LIGHTING BY), LAMPS, LIME-LIGHT, &c.

Lightning (Fr. *éclair*, Ger. *Blitz*), the name given to the visible discharge of electricity between one group of clouds and another, or between the clouds and the ground. Thunder-clouds, well known by their dark and heavy look, belong usually to the cumulus type (see CLOUDS), and are found at all heights from close to or almost touching the ground up to about 6000 feet. But most of the summer thunder-clouds in Great Britain float at an altitude of from 1000 to 3000 feet. On elevated mountain-tops, 12,000 feet high or more, lightning and hail showers accompany the passage of cirrus clouds over them. Lightning occurs in three distinct forms, commonly called forked-lightning, sheet-lightning, and ball-lightning, the last class serving also as a convenient term for unexplained phenomena.

Forked-lightning appears as long flashes passing from cloud to cloud or between clouds and the ground. It gets its name from the apparently sharp bends it makes, but most photographs of lightning show it in a wavy or ribbon-like form. Occasionally it splits into several branches at one or both ends.

Photograph of Lightning (from *Knowledge*, June 1889).

These flashes frequently pass between clouds several miles apart, lengths of 6, 8, and even 10 miles having been observed. The thunder which accompanies this form of lightning is due to the intense and sudden heat developed in the path of the discharge

expanding the air with explosive rapidity. As sound travels slowly compared with electricity and light, the noise from different parts of the flash reaches the ear in succession, and aided by echoes from the clouds, produces the prolonged rolling of the thunder-peal. The distance away of the flash can be estimated by the time between the flash and the beginning of the thunder, every 5 seconds being equivalent to 1 mile; 50 seconds or 10 miles is the greatest observed interval at which thunder has been heard.

Sheet-lightning, sometimes called summer-lightning, is a frequent accompaniment of warm weather in temperate climates and an almost daily phenomenon in most tropical regions. It appears as a diffuse glare lighting up a whole cloud, is often of a reddish colour, and is believed to be due to discharges of feeble intensity than those causing forked-lightning. It may occasionally be merely the reflection on the cloud of a distant thunderstorm invisible to the spectator.

Ball-lightning is an as yet unexplained phenomenon; forked and sheet lightning are the gigantic analogues of the spark and glow from an electric machine, but nothing resembling the slow-moving, luminous globe described by those who have seen ball-lightning has ever been produced artificially. The ball has been estimated at from a few inches to over a yard in diameter; and, while not affecting anything that it does not directly touch, acts like an explosive shell on any solid body in its track, throwing down walls, making holes several feet deep in the ground, or ploughing long trenches; sometimes disappearing with a loud report, at others gradually getting smaller till it vanishes. This destructive and dangerous form of lightning is happily very rare. Allied to lightning is St Elmo's Fire (q.v.). See Arthur Parnell, *The Action of Lightning* (1882).

Death by Lightning is generally instantaneous, and is probably always caused by the shock to the brain and nervous system. The post-mortem appearances are extremely variable. Sometimes no marks of injury are found; but more often lacerations, bruises, burns, and occasionally even fractures of bones are present. The clothes may be burnt or torn, even when the surface of the body is not injured; metallic substances on the person may be fused, and steel magnetised. When the accident is not immediately fatal, the consequences are still more variable: insensibility, paralysis, burns, wounds, loss of hair, eruptions on the skin, hæmorrhages, loss of speech or of one or more of the special senses, may all occur. The treatment must be directed to the special symptoms, which are liable to great variations. The general treatment is that for shock. Moderate warmth should be afforded in order to prevent loss of heat from the body. Thus the body should be well covered, and as soon as possible placed in a bed in which hot water-bottles have been put. Also if the breathing is suspended or feeble recourse should be had to one of the methods of artificial respiration. These means should be fully tried, as respiratory action has been restored after more than an hour's suspension.

LIGHTNING-CONDUCTOR (Fr. *paratonnerre*, Ger. *Blitzableiter*). The object of a lightning-conductor is twofold: first, and most important, to drain away the electricity from passing clouds and thus prevent the occurrence of lightning in its neighbourhood; and secondly, when unable to do this, to receive and convey to earth the lightning-flash without damage to the building to which it is attached. The first object is best secured by the lightning-conductor being a sharp-pointed metallic rod standing clear above all surrounding buildings, trees, &c.; while the second necessitates its having considerable diameter to carry the short-

lived but intense current produced by the flash: both require that it should be in thorough metallic connection with the earth. The action of the lightning-conductor may be illustrated by an electric machine. When the machine is in action the prime conductor, which corresponds to the thunder-cloud, discharges a rapid succession of flashes or sparks; but if a pointed metallic rod is held near it all sparking ceases, the electricity is drawn off silently as fast as it is generated by the machine, while if a ball or blunt rod is placed near the conductor in thorough connection with the ground the sparks will pass to it as the easiest passage to earth. Good copper is almost six times better a conductor of electricity than iron, and therefore lightning-conductors are usually made of copper; but they may be equally well constructed of iron if made $2\frac{1}{2}$ times the diameter, so as to equalise their conducting power. For ordinary buildings the diameter of the rod should be at least $\frac{1}{2}$ inch for copper or $1\frac{1}{4}$ inch for iron; lighthouses and similar exposed buildings are usually fitted with copper conductors 1 inch in diameter. Instead of a solid rod, wire-rope of equivalent size is frequently used for convenience of adjustment to the buildings. The top of the conductor, always a solid rod, ends in a blunt point surrounded a few inches down by three or four sharp points projecting obliquely upwards, but not rising as high as the top; these points ought to be platinised or gilded to prevent oxidation. The rod must project higher than any other part of the building. It has been found that, roughly speaking, a lightning-conductor protects from direct flashes a conical space equal to its height with a radius at the base of double its height. Thus, a rod standing 6 feet above the gable end of an ordinary house will protect the roof ridge for 12 feet along, but if the house is more than 12 feet broad will not protect the other gable. All large masses of metal in a building, more especially the roof-gutters, should be connected with the lightning-conductor, as they may otherwise form a broken connection to earth and conduct the lightning with dangerous sparking at the breaks. Sharp bends must be avoided in the conductor, and any joins in it should be braced, or embedded in a large mass of solder, so as to avoid any risk of heating at the junction by imperfect contact. Perhaps the most important part of the lightning-conductor, and certainly the part in which it is most difficult to ensure satisfactory arrangement and workmanship, is the connection to earth. Dry earth is practically a non-conductor of electricity; damp earth is a moderately good conductor, and, being of infinite area compared with any lightning-conductor, can safely receive any discharge. The problem therefore is to make a satisfactory junction with a sufficiently large area of damp soil. This is usually done by attaching to the lower end of the lightning-conductor a brass plate about a yard square, and burying it in a damp spot surrounded by gas-coke. Sometimes the lightning-conductor is connected to an iron water or drain pipe, but not a gas-pipe, as the risk of setting fire to the gas from a spark at a break must not be incurred. A faulty earth connection makes a lightning-conductor worse than useless. Every large building requires more than one conductor, and perfect safety can only be ensured by a town or district having a sufficient number of conductors to drain passing thunder-clouds of their electricity and prevent flashes from ever occurring. The first lightning-conductor was erected by Benjamin Franklin on his own house in Philadelphia in 1752. See books by Sir Oliver Lodge and Killingworth Hedges.

LIGHTNING-PRINTS are appearances sometimes found on the skin or clothing of men or animals that either have been struck by lightning or have

been in the vicinity of the stroke, and are currently believed to be pictorial representations of surrounding objects or scenery. The existence of such prints appears, from a theoretical point of view, highly improbable, as the essential conditions of forming a photographic image are wanting; still, several apparently well-authenticated instances have been recorded, one or two of which may serve to give a general idea of what is meant by lightning-prints. On the 14th of November 1830 lightning struck the Château of Benattonnière, in La Vendée; at the time a lady happened to be seated on a chair in the salon, and on the back of her dress were printed minutely the ornaments on the back of the chair. In September 1857 a peasant-girl, while herding a cow in the department of Seine-et-Marne, was overtaken by a thunderstorm. She took refuge under a tree; and the tree, the cow, and herself were struck with lightning. The cow was killed, but she recovered, and, on loosening her dress for the sake of respiring freely, she saw a picture of the cow upon her breast. These anecdotes are typical of a great mass of others. They tell of metallic objects printed on the skin, of clothes while being worn receiving impressions of neighbouring objects, or of the skin being pictured with surrounding scenery or objects during thunderstorms. One object very generally spoken of as being printed is a neighbouring tree. This may be accounted for by supposing that the lightning-discharge has taken place on the skin in the form of the electric brush (see **ELECTRICITY**), which has the strongest possible resemblance to a tree, and that this being imprinted on the skin by a slight charring of the tissues in its track has led observers to confound it with a neighbouring tree. Of other prints it would be difficult to give a satisfactory account, though observers have done something in imitation of them. When a coin is placed on glass and a stream of sparks poured on it from a powerful electrical machine, on the glass being breathed upon after its removal a distinct image of the coin is traced out by the dew of the breath. The parts of the glass surface in contact with the metal having received a different charge from the rest, a selective action by the glass on the dew of the breath takes place; but this is very different from the permanent image of the anecdote. With all due allowance for the possible printing-power of lightning, the accounts given of it in most cases bear the stamp of exaggeration.

Lights, USE OF, IN PUBLIC WORSHIP, a practice which prevailed in the Jewish (Exod. xxv. 31-39) and in most of the ancient religions, and which is retained both in the Roman and in the Oriental churches. The use of lights in the night-services, and in subterranean churches, such as those of the early Christians in the catacombs, is of course easily intelligible; but the practice, as bearing also a symbolical allusion to the 'Light of the World' and to the 'Light of Faith,' was not confined to occasions of necessity, but appears to have been from an early time an accompaniment of Christian worship, especially in connection with the sacraments of baptism and the eucharist. The time of the service in which lights are used has varied very much in different ages; but eventually it was extended to the entire time of the mass. In other services, also, lights have been used from an early period; e.g. lighted tapers were placed in the hand of the newly baptised, a usage still retained in the Roman Catholic Church. Two candles are *de rigueur* at mass, and four at high mass; but the most profuse use of lights is reserved for Benediction, and other services connected with the Exposition of the Host. The usage of blessing the Paschal Light is described at **HOLY WEEK**. The material used for lights in churches is either oil or wax; the latter in penitential seasons,

and in services for the dead, being of a yellow colour. An oil lamp always burns in a Roman Catholic church to indicate the presence of the Host in the tabernacle on the altar. In the Anglican Church candlesticks, and in some instances candles themselves, are retained in many churches, on the communion table, but in the majority of instances they are not lighted. The use of lights, except where required for giving light, has been declared illegal more than once since 1855. In the Presbyterian and Independent churches the symbolical use of lights is rejected as superstitious.

Ligne, CHARLES JOSEPH, PRINCE DE, son of an imperial field-marshal whose seat was at Ligne, near Tournai, was born at Brussels, 23d May 1735, and as an Austrian soldier served at Kolin, Leuthen, Hochkirch, &c., in the war of the Bavarian Succession, and under Loudon at the siege of Belgrade (1789). Meanwhile he had undertaken various diplomatic missions and received numerous distinctions. A Belgian by birth, an Austrian subject, the favourite of Maria Theresa and Catharine of Russia, the friend of Frederick the Great, Voltaire, Rousseau, he was always a most welcome guest at the court of Versailles and in the Paris salons. He died 13th December 1814. Of his literary works, posthumous and other, a centenary edition was published in 1914 *et seq.*

Lignin. See **CELLULOSE**.

Lignite, or **BROWN COAL**, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned with the microscope, whilst its external form is also not infrequently preserved. In this state it is often called *Wood Coal*; and it sometimes occurs so little mineralised that it may be used for the purposes of wood, as at Vitry on the banks of the Seine, where the woodwork of a house has been made of it. From this to the most perfectly mineralised state it occurs in all different stages. It is often brown or brownish black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Wherever it occurs in sufficient abundance it is used for fuel, although as a rule very inferior to common coal. Lignite occurs sparingly in Britain—the chief locality being Bovey Tracey in Devonshire, where it has long been worked. The principal repository of lignite in Europe is the Oligocene System (q.v.) of Germany, in which some of the beds attain a great thickness. Over the eastern slopes of the Rocky Mountains lignite is widely distributed, but the beds are rarely thick enough to be of economic importance. Thin beds of lignite are associated with the oligocene basalt rocks of Iceland (where it is known as 'Surtur-brand') and the Faeroe Islands, just as is the case with the similar formations in Antrim and Mull.

Unlike wood, it is soluble in nitric acid and in alkaline hypochlorites, and refractory to caustic potash solution; in the latter respect it resembles coal, which is, however, not soluble in hypochlorates.

Lignum Rhodii. See **CONVOLVULUS**.

Lignum Vitæ. See **GUAIACUM**.

Ligny, a Belgian village, 13 miles by rail NE. of Charleroi, famous for the defeat of the Prussians under Blücher by the French under Napoleon, 16th June 1815, the same day on which Ney's command was engaged with the British under Wellington at Quatre-Bras. The Prussians lost 12,000 men and 21 cannon; the French, 7000 men.

Ligonyi. See **ELGON**.

Ligula, a genus of Tape-worms (q.v.) externally unsegmented, parasitic in birds.

Ligule, a scale at the top of the leaf base, as in grasses. The corona in the daffodil and other Amaryllidaceæ may be the combined ligules of the petals.

Ligulifloræ. See COMPOSITÆ.

Liguori, ST ALFONSO MARIA DE, founder of the order of Liguorians or Redemptorists, was born of a noble family at Naples, 27th September 1696, and embraced the profession of the law, which, however, he suddenly relinquished to devote himself entirely to a religious life. He received priest's orders in 1725, and in 1732, with twelve companions, founded the association now called by his name. In 1762 he was appointed Bishop of Sant' Agata dei Goti, in the kingdom of Naples, and his life as a bishop was a model of the pastoral character; but shrinking from the responsibilities of such an office he resigned his see in 1775, after which date he returned to his order and continued to live in the same simple austerity as had characterised his early life. He died at Nocera dei Pagani, August 1, 1787, and was canonised in 1839. Liguori is one of the most voluminous and most popular of Catholic theological writers. His works embrace almost every department of theological learning—divinity, casuistry, exegesis, history, canon law, hagiography, asceticism, and even poetry. His correspondence also is voluminous, but is almost entirely on spiritual subjects. The principles of casuistry explained by Liguori have been received with much favour in the modern Roman schools; and in that church his moral theology, which is a modification of the so-called 'probabilistic system' of the age immediately before his own, is largely used in the direction of consciences (see CASUISTRY). Liguori's *Theologia Moralis* (8 vols.) has been reprinted numberless times, as also most of his ascetic works. The most complete edition of his works (in Italian and Latin) is that of Monza (70 vols.). They have been translated entire into French and German, and in great part into English, Spanish, Polish, &c.

The LIGUORIANS, called also REDEMPTORISTS, are a congregation of missionary priests founded by Liguori in 1732, and approved by Pope Benedict XIV. in 1769. Their object is the religious instruction of the people and the reform of public morality by periodically visiting, preaching, and hearing confessions, with the consent and under the direction of the parish clergy. Their instructions are ordered to be of the plainest and most simple character, and their ministrations are entirely without pomp or ceremonial. The congregation was founded originally in Naples, but it afterwards extended to Germany, Switzerland, Austria, Belgium, England, Ireland, North and South America, and Australia.

See the Life by his follower Tannoia (1779; Eng. trans. 1848); and those by Gisler (1887), Dilgskron (1887), Villecourt (1893), Berthe (1900; trans. by Castle, 1906), and Angot des Rotours (1916).

Liguria. See GENOA, ROME, ITALY.

Li Hung Chang, Chinese statesman, was born 26th January 1823, rose to be governor of Kiangsu (1861), and with 'Chinese' Gordon (q.v.) drove out the Taipings. He founded the Chinese navy, promoted the mercantile marine, and at the disastrous war with Japan (1894) was chief minister. He was dismissed and restored, negotiated peace, and visited Europe in 1896. He intrigued with Russia, and in 1900 left his post at Canton to take part in the negotiations with the powers. He died 7th November 1901. See Lives by Sir R. K. Douglas (1895), Michie (1903), Mrs Little (1903),

and J. O. P. Bland (1917), as well as his own *Memoirs*, edited by Foster (1913).

Lilac (*Syringa*), a genus of Oleaceæ (q.v.). The common Lilac (*S. vulgaris*) is a native of Hungary and the Balkan Peninsula. The flowers grow in large conical panicles; are of a bluish 'lilac' colour, purple or white, and have a very delicious odour. The leaves are a favourite food of cantharides. The bitter extract of the unripe capsules has very marked tonic and febrifugal properties. The wood is fine-grained and is used for inlaying, turning, and the making of small articles. A fragrant oil can be obtained from it by distillation. The Chinese Lilac (*S. chinensis*) has larger flowers, but with less powerful odour, and the Persian Lilac (*S. persica*) has narrower leaves. Both are often planted in gardens and pleasure-grounds. There are many other species, especially in SW. China.

Lilburne, John. See LEVELLERS.

Liliaceæ, a natural order of monocotyledons, containing about 2500 known species. They are most numerous in the warmer parts of the temperate zones. They are mostly herbaceous plants, with bulbous or tuberous, sometimes fibrous roots; rarely shrubs or trees. The shrubby and arborescent species are mostly tropical. The stem is simple, or branching towards the top, leafless or leafy. The leaves are simple, generally narrow, sometimes cylindrical, sometimes fistular. The flowers are generally large, with six-cleft or six-toothed perianth, and grow singly or in spikes, racemes, umbels, heads, or panicles. The stamens are six, opposite to the segments of the perianth; the pistil has a superior three-celled, many-seeded ovary, and a single style. The fruit is succulent or capsular; the seeds packed one upon another in two rows. This order contains many of our finest garden, greenhouse, and hothouse flowers, as lilies, tulips, dog's-tooth violet, lily of the valley, tuberose, crown imperial and other fritillaries, hyacinths, *Gloriosa superba*; many species useful for food, as garlic, onion, leek, and other species of Allium, asparagus, the Quamash or Biscuit Root (*Camassia esculenta*) of North America, the Ti (*Cordylone terminalis*) of the South Seas, &c.; many species valuable in medicine, as squill, aloes, &c.; and some valuable for the fibre which the leaves yield, as New Zealand Flax (*Phormium tenax*) and species of *Sansevieria*.

Liliencron, DETLEV VON, German poet and novelist, was born at Kiel, 3d June 1844. He fought as a Prussian officer in the wars of 1866 and 1870-71; retired, as a captain, 'because of wounds and debt.' After some time in America, where he hoped in vain for military employment, he returned to Germany and lived, at first in the civil service and afterwards in retirement, mostly in the neighbourhood of Hamburg. He died, a poor man, 22d July 1909. His best work is probably not, as he himself thought, *Poggyfred* (1896), an epos of the Don Juan class, nor his prose tales, but his lyrics and ballads—tragic, humorous, and melancholy; of war, the chase, and love. These have a directness, a freshness, courage, strength, colour, and melody that place him at his best first among the German poets of his time. See Life by H. Spiro (Berlin, 1913).

Lilith. See ADAM.

Lille (Flemish *Ryssel*), a manufacturing town and fortress of France, chief town of the department of Nord, is situated on a sub-tributary of the Scheldt, in a fertile district, 66 miles by rail SE. of Calais. Lille derives its name from the castle around which it originally arose, which from its position in the midst of marshes was called L'Isle. It was founded early in the 11th century

by the counts of Flanders. From 1305 it was mortgaged to France, but passed to Burgundy in 1365. Louis XIV. conquered the town in 1667, and, though it was recaptured by Marlborough and Prince Eugene in 1708, the Austrians restored it in 1713. In 1792 it successfully resisted the determined attacks of the Austrians. It was in German hands in 1914-18. The old fortifications have been for the most part levelled. The town is modern built, and possesses few notable buildings except the church of Notre Dame (1855), and the town-hall (burned in 1916) with the museum, the famous Wicar collection of drawings by the Old Masters, and a library. The principal institutions are a Catholic 'free university,' independent faculties of medicine, science, &c., technical schools, a music school, and an academy of art. Lille is a great textile centre: the spinning of linen and cotton, the manufacture of damask, cloth, tulle, tickings, &c., of tobacco, beer, paper, sugar, machinery, and oil, dyeing, bleaching are the chief industries. Pop. (1872) 152,775; (1886) 151,397; (1911) 217,807; (1921) 200,952.

Lillebonne, a town of Normandy, on the Bolbec, 28 miles WNW. of Rouen by rail. The *Julia Bona* of the Romans, it has very interesting remains of a Roman theatre, laid open in 1812; a 15th-century church, and a ruined castle of William the Conqueror. Pop. 6000.

Lillibullero, or LILLIBURLERO, the famous political ballad that sung James II. 'out of three kingdoms.' A scurrilous attack on the Irish recruits, it is said to have been written by Lord Wharton in 1686. The tune, ascribed to Henry Purcell, seems to be Irish.

Lillo, GEORGE, English dramatist, was born in London on 4th February 1693, and died on 3d September 1739. Whilst carrying on the business of a jeweller in London he wrote seven plays, two of which are frequently printed in collections of acting plays. These are *Fatal Curiosity* (1736) and *George Barnwell* (1731); both admirably constructed and with truly tragic conclusions, though the language is inflated and conventional. His *Arden of Feversham* (written in 1736, not published till 1762) is a weak version of the old anonymous play bearing the same title (1592). Apart from the tragic quality of his plays, Lillo deserves mention for his taking his characters from middle-class life, and for his influence in European drama. For long it was an old custom to act *George Barnwell* in certain London theatres on the night after Christmas and on Easter Monday.

Lilly, WILLIAM, astrologer, was born at Diseworth, Leicestershire, 1st May 1602. He was educated at Ashby-de-la-Zouche, and in 1620 found his way to London, where for seven years he served an ancient citizen, married his widow, and on her death in 1633 obtained a fortune of £1000. He now turned to astrology, soon acquiring a considerable fame and large profits as a caster of nativities and a predictor of future events. In 1634 he obtained permission from the Dean of Westminster to search for hidden treasure in the cloister of Westminster Abbey, but was driven from his midnight work by a storm, which he ascribes to demons. From 1644 till his death he annually issued his *Merlinus Anglicus, Junior*, containing vaticinations, to which no small importance was attached by many. In the Civil War he attached himself to the parliamentary party as soon as it promised to be successful, and was rewarded with a pension, but it is highly unlikely that his own accounts of his intimacy with Lenthall, Whitelocke, Ashmore, and others are true. After the Restoration he was for some time imprisoned, on the supposition that he was

acquainted with the secrets of the Republicans; but being set free, he retired to the country. He was again apprehended on suspicion of knowing something of the causes of the great fire of London in 1666. He died, 9th June 1681, at his estate at Hersham in Surrey. Lilly wrote nearly a score of works on his favourite subject, which are of no value whatever, except to illustrate the knavery of their author and the credulity of his countrymen. Dr Nash's judgment of him as 'a time-serving rascal' may be allowed to stand—he was gibbeted by Butler under the name of Sidrophel. See his own *History of his Life and Times* (1715).

Lily (*Lilium*), a genus of plants of the natural order Liliaceæ, containing a number of species much prized for the size and beauty of their flowers. The perianth is bell-shaped, and its segments are often bent back at the extremity. The root is a scaly bulb, the stem herbaceous and simple, often several feet high, bearing the flowers near its summit. The White Lily (*L. candidum*), a native of the Levant, has been long cultivated in gardens, and much sung by poets. It has large, pure white flowers, as much prized for their fragrance as for their beauty. The Orange Lily (*L. bulbiferum*), a native of the south of Europe, with large, erect, orange-coloured flowers, is a well-known and very showy ornament of the flower-garden. The Martagon or Turk's Cap Lily (*L. Martagon*), a

a, *Lilium testaceum*; b, *Lilium chalcedonicum*, Scarlet Turk's Cap.

native of the south of Europe, and allied species with verticillate leaves and drooping flowers, are also common in gardens. *L. chalcedonicum*, a native of the Levant, is a very brilliant species, and has been in cultivation about 300 years. The Tiger Lily (*L. tigrinum*) is a native of China, remarkable for the axillary buds on the stem; and some very fine species are natives of North America, as *L. superbum*, which grows in marshes in the United States, has a stem 6 to 8 feet high, and reflexed orange flowers, spotted with black; *L. canadense*, &c. Several very fine species have been introduced from Japan, as *L. japonicum*, *L. speciosum*, and *L. lancifolium*. The bulbs of *L. pomponium* and *L. Martagon* are roasted and eaten in Siberia. That of *L. candidum* loses its acidity by drying, roasting, or boiling; when cooked it is viscid, pulpy, and sugary, and is eaten in some parts of the East. Lilies are

generally propagated by offset bulbs. A single scale of the bulb will, however, suffice to produce a new plant, or even part of a scale, of which skilful gardeners avail themselves.—The name lily is often popularly extended to flowers of other genera of the same order, and even of allied orders. For Lily of the Nile, see ARUM. See also FLEUR-DE-LIS.

Lily, GIGANTIC (*Doryanthes excelsa*), of Australia, a plant of the natural order Amaryllidaceæ, with flowering stem 10 or 14, sometimes 20 feet high, bearing at top a cluster of large crimson blossoms. The stem is leafy, the largest leaves near the root. This plant is found on both the mountains and the sea-coast of New South Wales, and is of splendid beauty. It is remarkable for its very abundant secretion of nectar. The fibre of its leaves has been found excellent for ropes and for textile fabrics.

Lily of the Valley (*Convallaria*), a genus of plants of the natural order Liliaceæ, having terminal racemes of flowers; a white, bell-shaped, or tubular 6-cleft or 6-toothed perianth; a 3-celled ovary, with two ovules in each cell, and a succulent fruit. The species commonly known as the Lily of the Valley (*C. majalis*), the *Maiblume* or

Lily of the Valley (*Convallaria majalis*).

they appear. It is therefore very often cultivated in gardens, and forced to earlier flowering in hot-houses. Varieties are in cultivation with red, variegated, and double flowers. The berries, the root, and the flowers have a nauseous, bitter, and somewhat-acrid taste and purgative and diuretic effects. The smell of the flowers when in large quantity, and in a close apartment, is narcotic. Dried and powdered, they become a sternutatory. The esteemed *Eau d'or* of the French is a water distilled from the flowers.—Allied to Lily of the Valley is Solomon's Seal (q.v.).

Lily, John, euphuist. See LILY.

Lilybæum. See MARSALA.

Lilje, or LILY, WILLIAM, classical grammarian, was born at Odiham, in Hampshire, about 1466, and educated at Oxford, being elected demy of Magdalen in 1486. Having taken his B.A. degree he travelled to the East; and at Rhodes, then the home of the Knights Hospitallers, he learned Greek from refugees from Constantinople. He afterwards spent some time studying Greek and Latin in Rome and Venice, and returned home about 1509. After teaching for a while privately in London he was appointed (1512) by Dean Colet the first head-master of the new St Paul's school; this post he held till he was carried off by the plague towards the end of 1522. Lilje, who has good claims to be considered the first who taught Greek in London,

had a hand in Colet's *Brevissima Institutio*, which, as corrected by Lilje's friend Erasmus, and redacted by Lilje himself, was known as the *Eton Latin Grammar*. Lilje's share embraced the lines on the genders of nouns, beginning 'Propria que maribus,' and those on the conjugation of verbs, 'As in præsentî,' if no more. Besides this he wrote Latin poems, printed along with those of another great friend, Sir Thomas More, at Basel in 1518, and a volume of Latin verse against a rival schoolmaster, entitled *Antibossicon ad Gulielmum Hormannum* (1521). John Lyly (q.v.) was a descendant.

Lima, the capital of Peru, lies in a broad valley 6 miles E. of Callao, its port, with which it is connected by two railways and by tramway. A small stream, the Rimac, flows through the city, which is laid out in regular lines, with wide, straight streets, scores of *plazas*, and houses mostly of one story. The seat of an archbishop, it abounds in churches, and the cathedral (rebuilt 1746) is, after that of Mexico, the most noteworthy in Spanish America. Among other buildings that call for mention are the Franciscan and Dominican monasteries, the latter possessing the loftiest tower in the city; and the houses of congress, formerly the headquarters of the Inquisition and of the university. The university (1551) is now housed in the old Jesuits' college; and there are also a theological seminary and several special schools, besides a botanical garden and a national library. The last institution was looted during the Chilean occupation (1881-83), and numerous statues and works of art found their way at the same time to Santiago. This disaster, added to earthquakes and revolutions, has wrought sad havoc in Lima, which remains still picturesque and beautiful, but somewhat shabby and very dirty. The trade is left almost entirely in the hands of foreigners. The manufactures are not of importance, but include the casting of iron, copper-smelting, and the preparation of furniture, silver-ware, gold-lace, and stamped leather. There is a railway to Oroya, &c. Lima was founded as *Ciudad de los Reyes* (the monarchs of Spain and the Three Magi), on 18th January 1535, by Pizarro, who was murdered there in 1541, and sleeps in the crypt below the cathedral. The name was afterwards changed back to that of the Indian village that had occupied the site. Earthquakes have been numerous, the most disastrous, that of 1746, destroying 5000 out of the 60,000 inhabitants. The climate of Lima is agreeable and on the whole healthy. Pop. 220,000.

Lima, capital of Allen county, Ohio, 71 miles N. of Dayton, on the Ottawa River, where several railways cross. It is the centre of an important oil-field. Pop. (1880) 7567; (1920) 41,326.

Limaçon, a curve of which the Cardioid (q.v.) is a particular case.

Liman von Sanders, OTTO CARL, German general, born in 1885 on his father's estate of Stolp, in Pomerania; added his wife's name (von Sanders) to his own on ennoblement in 1913. After five years in an infantry regiment he exchanged to dragoons. He commanded the 6th Hussars from 1900 to 1906, when he became inspector of cavalry. He was head of the 22nd division at Cassel. During the Great War he held Turkish commands.

Limasol, or LIMASSOL (Gr. *Lemissou*), a seaport of Cyprus. It has no harbour, but there is a large trade, chiefly with France, in wine and carobs. Pop. 12,000.

Lima-wood, a dye-wood, also called Pernambuco-wood and Nicaragua-wood. See BRAZIL-WOOD.

Limbach, a Saxon town, 10 miles WNW. of Chemnitz, with hosiery manufactures; pop. 15,000.

Limborch, PHILIP VAN, Remonstrant theologian, was born at Amsterdam in 1633, studied there and at Utrecht, and afterwards served as a preacher at Gouda and Amsterdam, and became in 1668 professor in the Remonstrant college at Amsterdam, where he died in 1712. Of his numerous and learned works, most valuable for the fullness and clearness of its exposition is his *Institutiones Theologiae Christianae* (1686; 5th ed. 1735). An English translation of this, by W. Jones, was printed in 1702; and of his *History of the Inquisition*, by S. Chandler, in 1731.

Limburg, a territory on the Meuse, lying between the provinces of Liège and Brabant, was created a countship soon after its annexation by the German king (870). Shortly after 1151 it was made a duchy. The battle of Woeringen (1288) gave it to the Dukes of Brabant, after which it shared the fortunes of that state. At the peace of Münster (1648) it was divided between the United Provinces and Spain, but was again united under French rule from 1794 to 1830, and from 1830 to 1839 under the Belgian king. In 1839 it was once more divided, the lands to the west of the Meuse remaining with Belgium, whilst a long narrow strip on the east side of the river was constituted the Dutch province of Limburg. Both provinces are in parts fertile, though large portions are covered with moors. The marshy district of the Peel intrudes into the north of Dutch Limburg. Coal is mined. The Belgian province has an area of 931 sq. m.; population, 300,000. Capital, Hasselt. The area of the Dutch province is 850 sq. m.; population, 440,000. Capital, Maastricht. —The well-known *Limburg cheese* is made at the little town of Limburg, the former capital of the duchy, which is now in the province of Liège, 19 miles E. of the city of Liège. The old castle was destroyed by the French in 1675. —**LIMBURG-AN-DER-LAHN**, a town of Hesse-Nassau, 32 miles E. of Coblenz by rail, has a fine Catholic cathedral (1243); pop. 11,000.

Limbus, the name assigned by Roman Catholic theologians to that place on the fringe of hell (*Limbus patrum*) in which the just who died before Christ were detained till His resurrection, and also where infants are kept who die in original sin without baptism (*Limbus infantium*). Limbus is not a place of torture, but of a joy imperfect, and therein unlike the joy of heaven. Infants suffer only the 'pain of loss, and in no respect the 'pain of sense,' the most aggravated of the tortures of Hell (q.v.).

Lime is the monoxide of the metal Calcium (q.v.), and is known in chemistry as one of the alkaline earths. Its symbol is CaO, its equivalent is 56, and its specific gravity is 3.08. In a state of purity it is a white caustic powder, with an alkaline reaction, and so non-fusible as to resist even the heat of the oxyhydrogen flame (see LIME-LIGHT). It is obtained by heating pure carbonate of lime (as, for instance, white Carrara marble or Iceland spar) to full redness, when the carbonic acid is expelled and lime is left. This compound, CaO, is known as *quicklime*, or, from the ordinary method of obtaining it, as *burned lime*, to distinguish it from the *hydrate of lime*, or *slaked lime*, which is represented by the formula Ca(OH). On pouring water on quicklime there is an augmentation of bulk, and the two enter energetically into combination; and, if the proportion of water be not too great, a light, white, dry powder is formed, and a great heat is evolved. On exposing the hydrate to a red heat the water is expelled and quicklime is left.

If quicklime, instead of being treated with water, is simply exposed to the air, it slowly attracts both aqueous vapour and carbonic acid, and becomes what is termed *air-slaked*, the resulting compound in this case being a powder which is a mixture of carbonate and hydrate of lime. Owing to this property quicklime is employed to prevent instruments and other objects from being rusted or otherwise injured by damp. A jar is partly filled with lime and placed beside the articles in a glass case or box.

Lime is about twice as soluble in cold as in boiling water, but even cold water only takes up about $\frac{7}{100}$ of its weight of lime. This solution is known as *lime-water*, and is much employed both as a medicine and as a test for carbon dioxide, which instantly renders it turbid, in consequence of the carbonate of lime that is formed being insoluble. It must, of course, be kept carefully guarded from the atmosphere, the carbon dioxide of which would rapidly affect it. If in the preparation of slaked lime considerably more water is used than is necessary to form the hydrate, a white semi-fluid is produced, which is termed *milk of lime*. On allowing it to stand there is a deposition of hydrate of lime, above which is lime-water. Milk of lime is much used as a whitewash.

Lime prepared for building and other purposes by burning limestones in kilns often contains a considerable amount of impurity. But certain kinds of slightly impure are better than pure lime for making mortar. On the other hand, the lime which enters into the composition of plate and sheet glass, and which is used in some chemical industries, requires to be obtained from a nearly pure limestone. Chalk and white marble consist of almost pure carbonate of lime, but many of even the dark coloured limestones from different geological formations do not contain more than from 2 to 5 per cent. of foreign bodies, and these when burned generally yield a lime sufficiently pure for most purposes. Some limestones, again, contain from 20 to 30 per cent. of impurities, which commonly consist of silica, clay, magnesia, oxide of iron, and other bodies. These impure kinds often yield excellent hydraulic lime, which is very generally made by burning a limestone containing from 12 to 20 per cent. of silica, or of clay in which silica predominates. A less valuable hydraulic lime is prepared from a limestone containing a considerable amount of magnesia as well as clay. According to the absence or presence of foreign bodies, their nature and extent, limes are classed as (1) rich, fat, or pure lime; (2) impure or poor lime; and (3) hydraulic lime (see CEMENTS). When the percentage of magnesium carbonate in a limestone is high it is called a magnesian limestone, and this requires less fuel to burn it than a pure or nearly pure limestone. See DOLOMITE.

Besides the uses of lime noticed above, it is employed in the purification of coal-gas, in the unhairing of hides for tanning, in the preparation of stearic acid for candlemaking, for causticising alkalies, in the smelting of some metals, &c. Lime precipitates organic impurities from vegetable solutions containing sugar.

The following are the most important of the salts of lime. *Sulphate of lime* (calcium sulphate) is found native free from water, CaSO₄, as the mineral *Anhydrite* (q.v.), but more abundantly in the hydrated form, CaSO₄.2H₂O, as *Gypsum*. Sulphate of lime is a constituent of sea-water, and is also frequently present in drinking-water. For laboratory use a solution of sulphate of lime is made by shaking up the powder of burnt gypsum in water. See CALCIUM, and GYPSUM.

Carbonate of lime (calcium carbonate, CaCO₃) is abundantly present in both the inorganic and

organic kingdoms. In the inorganic kingdom it occurs in a crystalline form in Iceland spar, aragonite, and marble; while in the amorphous condition it forms the different varieties of common limestone, chalk, &c. It is always present in the ashes of plants, and it is the main constituent of the shells of crustaceans and molluscs, and occurs in considerable quantity in the bones of man and other vertebrates. See LIMESTONE; BUILDING STONE, MARBLE.

Chloride of Calcium, CaCl_2 , is a remarkably deliquescent substance and one of the most soluble of salts on account of its great attraction for moisture. In the solid state it is much used for drying gases, and the pipes of freezing machines are filled with a solution of it to convey the low temperature produced to the cooling vessels.

There is a combination of lime with an organic acid—viz. oxalate of lime—which is of great importance in pathology as a frequent constituent of urinary calculi and sediments; for a description of it, see OXALIC ACID.

There are several compounds of phosphoric acid and lime, of which the most important is the *tribasic phosphate of lime* (tricalcium orthophosphate), sometimes termed *bone phosphate*, from its being the chief ingredient of bones. This phosphate is represented by the formula $\text{Ca}_3\text{P}_2\text{O}_8$, and occurs not only in bones, but also in the minerals apatite and phosphorite, and in the rounded nodules termed *Coprolites* (q.v.). It forms four-fifths of the ash of well-burned bone, the remaining fifth being chiefly carbonate of lime. This ash is known as *bone-earth*, and is employed as a manure and in the preparation of phosphorus, &c.

The soluble salts of lime give no precipitate with caustic alkalies, but yield a white precipitate with their carbonates. These reactions are also common to the salts of barium and strontium. Solution of sulphate of lime gives a white precipitate with the salts of barium and strontium. The most delicate test for salts of lime is oxalate of ammonia, which, even in very dilute solutions, throws down a white precipitate of oxalate of lime. This precipitate is insoluble, except in mineral acids.

For the substance commonly designated as *chloride of lime*, see BLEACHING POWDER. For *lime as manure*, see MANURES.

Lime Compounds in Materia Medica.—*Lime-water*, mixed with an equal quantity or an excess of milk, is one of our best remedies for the vomiting dependent on irritability of the stomach. From half an ounce to two or three ounces may be thus taken three or four times a day. Its use as a constituent of Carron oil in burns is noticed in the article LINIMENTS. *Chalk*, or *carbonate of lime*, when freed from the impurities with which it is often associated, is used as a dusting-powder in moist excoriations, ulcers, &c.; and, in the form of *chalk mixture* and *compound powder of chalk*, is a popular remedy in various forms of diarrhoea. A mixture of an ounce of precipitated carbonate of lime and a quarter of an ounce of finely-powdered camphor is sold as *Camphorated Cretaceous Tooth-powder*.

Lime, or **LINDEN** (*Tilia*), a genus of trees of the natural order Tiliaceæ, natives of Europe, the north of Asia, and North America. The species are very similar; graceful umbrageous trees, with deciduous, heart-shaped serrated leaves, and cymes of rather small yellowish-green flowers: each cyme accompanied with a large, oblong, yellowish membranous leaf or wing, with netted veins, the lower part of which adheres to the axis of the inflorescence. The wood is light and soft, but tough, durable, and particularly suitable for carved work. It is much used by turners, and for making pill-boxes. The charcoal made of it is often used

for tooth-powder. It is regarded by the makers of gunpowder as being superior to every other for their purpose; it is used also for medicinal purposes and for crayons. The use of the fibrous inner bark for making ropes, mats, and other plaited work is noticed in the article BAST. It is also used as a healing application to wounds and sores, being very mucilaginous, and abounding in a bland sap. The leaves are in some countries used as food for cattle, but cows fed on them produce bad butter. The flowers have an agreeable odour, and abound in honey, much sought after by bees. The celebrated *Kovno Honey*, much valued for medicinal use and for making liqueurs, is the produce of great lime forests near Kovno, in Lithuania. The infusion and distilled water of the dried flowers are gently sudorific and antispasmodic. The former is in France a popular

Lime-tree:
a, a flower.

remedy for catarrhs. The seeds abound in a fixed sweet oil. The European Lime, or Linden (*T. europæa*), often attains a large size, particularly in rich alluvial soils. Linnaeus's *T. europæa* is now recognised by botanists to consist of two sound species, a small-leaved *T. cordata* and a large-leaved *T. platyphyllos*. The Hooded or Capuchin Lime is an interesting monstrous variety. The lime-tree is often planted for shade in towns; and the principal street of Berlin is called *Unter den Linden*, from the rows of lime-trees (by no means unmixed) which line it. The lime is a very doubtful native of Britain, although indigenous on the Continent from Scandinavia to the Mediterranean. In Britain the lime-tree is generally propagated by layers. The American Lime (*T. americana*), commonly called Basswood in America, has larger leaves than the European species. It abounds on the shores of Lakes Erie and Ontario. Other species take its place in more western and more southern regions.

Lime, the fruit of *Citrus medica*, variety *Limon*, sub-variety *Limetta*, similar to the Lemon (q.v.), but usually globular, with a nipple-like protuberance at the apex. Its origin is wrapped in mystery. There are many varieties, varying more or less in shape and size, and in the more essential characteristics of relative thickness, flavour, acidity, and juiciness of the rind and pulp. The tree varies as much in dimensions as the fruit, according to kind. It is much cultivated in the West Indies. As an anti-scorbutic lime-juice is inferior to lemon-juice, which has been much used under the name of lime-juice (see SCURVY).

Lime-light, light produced by a blowpipe-flame directed against a block of pure, compressed

quicklime. The lime, which ought to be warmed beforehand, becomes brilliantly incandescent. The blowpipe-flame may be produced in various ways: (1) blowing oxygen through a spirit flame—light obtained, about 150 candles; (2) oxygen under pressure, and coal-gas from the mains, brought in concentric tubes to a nozzle, where the mixture is burned in a fine jet—light, about 200 candles; (3) oxygen and coal-gas, both under pressure—light, about 400 candles; (4) the same, the coal-gas or the oxygen saturated with benzoline or ether or both benzoline and ether—light, up to 800 candles when both are employed; (5) warm oxygen, saturated with benzoline, gives light up to 1350 candles; (6) oxygen and hydrogen, up to about 800 candles. The mixed gases at the nozzle are explosive, and the greatest care must be taken to see that the flame is not allowed to run back or the mixture to take place elsewhere than at the nozzle. In the case where oxygen is saturated with combustible material the apparatus is so stuffed as not to allow an explosion to travel backwards in it. Lime-light was used on the stage as far back as 1837-38, but was improved in 1851-52. Thomas Drummond (q.v.) gave his name to an improved type.

Limerick, a county of the province of Munster, in Ireland, separated by the Shannon on the N. from Clare, and bounded E. by Tipperary, S. by Cork, and W. by Kerry. Its extreme length is 35 miles, its extreme breadth 54 miles; area, 680,842 acres, or 1063 sq. m. Pop. (1841) 330,029; (1861) 217,223; (1881) 180,632; (1911) 143,069, seven-eighths Catholics. It is an undulating plain, except in its extremities, north and south. The soil in general is fertile, especially the district called the Golden Vale, and a portion beside the Shannon below Limerick. About three-fifths is grass-land, whilst barren soil and bogs cover only 6 per cent. Potatoes and oats are the principal crops, wheat and clover occupying the second place. Dairy-farming flourishes; woollens, flour, and paper are manufactured. Limerick is the only town of any size. The county formed part of the territory of Thomond, the principality of the O'Briens. After the English invasion it fell, after many vicissitudes, in great part to the Desmond Fitzgeralds—the confiscated estates of the last earl (1586) in Limerick containing 96,165 acres. Limerick is more than usually rich in antiquities, both ecclesiastical and civil, of the Celtic as well as the Anglo-Norman period. There are a great number of monastic ruins at Adare, Askeaton, &c. See the county history by Fitzgerald and M'Gregor (2 vols. Dublin, 1826-27).

Limerick, capital of Limerick county, Ireland, stands at the head of the estuary of the Shannon, 120 miles by rail WSW. of Dublin. It constitutes a county of a city. The town consists of English Town, the original English settlement made in the reign of King John, on King's Island; Irish Town, which lies immediately to the south, on the left bank of the river; and Newtown-Pery, to the south of Irish Town, the newest and handsomest part of the city, dating from 1769. There are few objects of interest except the Protestant cathedral of St Mary, founded in 1180, and rebuilt in 1490; the Roman Catholic cathedral, a Gothic structure erected in 1860; the Treaty Stone; and the fine bridges across the Shannon. Limerick manufactures a little lace, grinds flour, and cures bacon. Fourth among Irish seaports, it has a graving and a floating dock, and extensive quays; imports grain, petroleum, wine and spirits, and timber. Pop. (1851) 53,448; (1881) 38,555; (1911) 38,518.

In the 9th century Limerick was an important Danish settlement, and remained so for two centuries longer; but the Danes were then ex-

pelled by the Irish. In 1174 the town fell into English hands. Ireton made himself master of it in 1651. At the Revolution Limerick was the last stronghold of James II. in Ireland. William III. himself unsuccessfully assaulted it in 1690; but in the following year his general Ginckel had better fortune: the place was compelled to capitulate on 3d October. By the terms of the treaty of Limerick the bulk of the Irish army was permitted to enter the military service of France, and the Roman Catholics were guaranteed full religious and political liberty. The violation of the civil part of this treaty by the dominant Protestant party during the reigns of William III. and Anne, down to the 19th century, has given to Limerick the title of the 'City of the Violated Treaty.'

Limestone, the popular as well as technical name for all rocks which are composed in whole, or to a large extent, of carbonate of lime. Few minerals are so extensively distributed in nature as this, and, in some form or other, limestone rocks occur in every geological system. Carbonate of lime is nearly insoluble in pure water, but it is rendered easily soluble by the presence of carbonic acid gas, which occurs in a variable quantity in all natural waters, for it is absorbed by water in its passage through the air as well as through the earth. Carbonate of lime in solution is consequently found in all rivers, lakes, and seas. In evaporation water and carbonic acid gas are given off, but the carbonate of lime remains uninfluenced, becoming gradually concentrated, until it has supersaturated the water, when a precipitation takes place. In this way are formed the stalactites which hang icicle-like from the roofs of limestone caverns, and the stalagmites which rise as columns from their floors. Travertine (Tiber-stone), or Calcareous Tufa (q.v.), is similarly formed in running streams, lakes, and springs, by the deposition of the carbonate of lime on the beds or sides, where it encrusts and binds together shells, fragments of wood, leaves, stones, &c. So also birds' nests, twigs, and other objects become coated with lime in the so-called petrifying wells, as that at Knaresborough. From the same cause pipes conveying water from boilers and mines often become choked up, and the tea-kettle gets lined with 'fur.'

While water is thus the great storehouse of carbonate of lime, very little of it, however, is fixed by precipitation, for in the ocean evaporation does not take place to such an extent as to permit it to deposit; besides, there is five times the quantity of free carbonic acid gas in the water of the sea that is required to keep the carbonate of lime in it in solution. Immense quantities of lime are nevertheless being abstracted from the sea, to form the hard portions of the numerous animals which inhabit it. Crustacea, mollusca, zoophytes, and foraminifera are ever busy separating the stores of dissolved carbonate of lime from the water, and solidifying them, and so supply the materials for forming solid rock. It has been found that a large portion of the bed of the Atlantic between Europe and North America is covered with a light-coloured ooze, composed chiefly of the perfect or broken skeletons of foraminifera, forming a substance, when dried, which in appearance and structure closely resembles chalk. In tropical regions corals are building reefs of enormous magnitude, corresponding in structure to many of the limestones met with in various geological systems.

The chief varieties of limestone are *Chalk* (q.v.); *Oolite* (q.v.); *Compact Limestone*, a hard, smooth, fine-grained rock, generally of a bluish-gray colour; *Crystalline Limestone*, a rock which, from metamorphic action, has become granular; fine-grained white varieties, resembling loaf-sugar in texture,

called *Saccharine* or *Statuary Marble*. Particular names are given to some limestones from the kind of fossils that abound in them, as Nummulite, Hippurite, and Crinoidal limestones; or the presence of impurities or admixtures of other mineral matter may give rise to varieties, as argillaceous, ferruginous, siliceous, carbonaceous, and magnesian limestones. Hydraulic limestones contain a certain proportion of silica and alumina which forms a mortar that sets in water. Many limestones, again, derive their name from the system to which they belong, as Silurian, Devonian, Carboniferous, Jurassic, &c.

Limestone, MAGNESIAN. See DOLOMITE.

Lime-tree. See LIME.

Limfjord. See DENMARK.

Limitation is a term used, in English law, in two senses: (1) A *limitation of property* is a form of words used in a deed or will to mark out the extent of the interests given. Thus, if land be granted to A and his heirs, the words 'and his heirs' are words of limitation; they indicate that an estate of inheritance is given to A.

(2) *Limitation of Actions*.—To protect persons in possession of property, and to prevent the raking up of old disputes, a time is fixed within which actions must be brought. An action to recover land must be brought within twelve years; if the owner allows that time to elapse without asserting his right his title is taken away. Actions to recover debt or damages must be brought within six years; for assault, within four years; for slander, within two years. In Scotland actions to recover land must be brought within forty years; for tradesmen's accounts, within three years; and for bills of exchange, within six years. In many of the States of America the time for bringing equitable action is limited to ten years. See DEBT, PRESCRIPTION.—For Limited Liability, see COMPANY.

Limits, METHOD OF. See CALCULUS.

Limma, an interval which, on account of its exceeding smallness, does not appear in the practice of modern music, but which, in the mathematical calculations of the proportions of different intervals, is of the greatest importance. The Limma makes its appearance in three different magnitudes—viz. the great limma, which is the difference between the large whole tone and the small semitone, being in the proportion of 27 to 25; the small limma, which is the difference between the great whole tone and the great semitone, being in the proportion of 135 to 138; and the Pythagorean limma, which is the difference between the great third of the ancients (which consisted of two whole tones) and the perfect fourth, the proportion of which is as 256 to 243. See INTERVALS.

Limnæa (Gr. *limnê*, 'a swamp'), a genus of Pulmonate Gasteropods with world-wide representation. They live in fresh water and feed mainly on vegetable matter, though not averse to newt or stickleback. The delicate shell is a somewhat elongated spiral, thus differing from that of the related Planorbis (a flat spiral) and Ancyclus (limpet-like). The animals browse on stones or water plants, or glide along under the surface film with their foot upwards, probably using their pulmonary sac as a float as well as for respiration. They can also breathe through their skin, and lacustrine forms brought up from a great depth have the pulmonary sac full of water. This is also the case in all young stages. When the water begins to dry up in a pool the snails bury themselves in the mud. Limnæids are hermaphrodite; one individual may play the part of male to one neighbour, and of female at the same time to

another; self-fertilisation or autogamy has been proved in *L. auricularia*, and may occur in other species. The eggs are laid in gelatinous masses on the under side of the leaves of water plants, or on sticks and the like. The development may be readily observed. It has been shown by Semper and others that the size attained by a particular kind of Limnæa is greatly influenced by the volume of water at its disposal for exercise, as well as by conditions of temperature and nutrition. In some other respects these snails show themselves very modifiable animals. Many of them form part of the food-supply of trout; many are eagerly eaten by such birds as water-wagtail and lapwing. The parasitic larval stages of the Liver-fluke (see FLUKE) are usually passed through within the body of *L. truncatula*, and in Britain this small species is the only intermediate host. It seems that in some other countries other species may serve in this capacity.

Limnanthemum, a genus of plants of the natural order Gentianaceæ, the species of which are widely distributed over the world, and are either aquatic or marsh plants, with entire leaves and yellow flowers. *Limnanthemum peltatum* is a native of England, but rare; it is more common in many parts of Europe, from Denmark to the Mediterranean, and is very abundant in Holland, often covering large tracts of the canals with its beautiful flowers and leaves. *L. indicum* is regarded as a valuable medicine in India, being given internally for cobra-bites. Several species from South Africa and Australia are cultivated in British aquaria for the beauty of their flowers.

Limnoria. See BORING-ANIMALS.

Limoges, capital of the French department of Haute-Vienne, and of the former province of Limousin, is picturesquely situated on the Vienne, by rail 248 miles S. by W. of Paris and 218 N. of Toulouse. Its most imposing building is the Gothic cathedral, begun in the 13th century and completed in 1851. The staple industry is the manufacture of porcelain. One-half of the product is exported to America. The enamel-work, for which Limoges was formerly celebrated (see ENAMEL), is now no longer carried on. There is a fine ceramic museum (1867). The manufactures of cotton, lace, boots, leather, and arms are the chief secondary industries. Pop. 90,000. Limoges was an important town under the Romans, and in spite of plagues, fires, and sieges (the worst that by the Black Prince in 1370), is still a place of note. It had its own mint from the 4th century down to 1837.

Limón, the chief Atlantic port of Costa Rica on the Caribbean Sea. Pop. 11,000.—On the Bay of Limón in Panamá, close to Colón (see ASPINWALL), and 240 miles ESE. of the other Limón, the Panamá Railway and the Panamá Canal have their Atlantic termini.

Limonite, or BROWN IRON ORE, hydrous ferric oxide. This mineral occurs most frequently in the form of fibrous aggregates, or earthy and amorphous masses, and never in that of definite crystals. It has a hardness of 5.5, a specific gravity of 3.3–3.9, and a yellowish-brown streak. It is the yellow colouring matter of chalybeate springs. Rocks are often stained brown or yellow from the development of secondary limonite.

Limosella. See MUDWORT.

Limousin, or LIMOSIN, LÉONARD, painter in enamel, was born circa 1505, and flourished from 1532 to 1574 at the French court. He was one of the Limousin school of enamellers. See ENAMEL.

Limpet, a name applied to species of Patella and related genera, included among the Proso-

branch Gasteropods. The dorsally convex body is covered by a more or less conical shell, with the apex nearer the anterior end; the disc-like foot takes a firm grip of the rock, apparently a case of adhesion of two very closely apposed surfaces; the ordinary gills of aquatic Gasteropods are vestigial (in Patellidæ), but their place is taken by a circle of respiratory lamellæ in a groove between the foot and the mantle. All the limpets are marine, vegetarian, and sluggish. The Common Limpet (*Patella vulgata*) inhabits the intertidal zone, keeping, when the tide is out, to a particular spot, marked by a scar, to which it returns after every nutritive excursion. The food consists of Algae, especially of minute encrusting forms. There is a peculiarly long rasping ribbon or radula in the mouth, about 2½ inches in length. The limpet's enemies are the star-fish and certain shore-birds which jerk the shell off its scar. Limpets are used as bait, and occasionally as food. The sexes are separate, and the breeding time is in autumn. Closely allied is the Pellucid Limpet (*Helcion pellucidum*), which browses on the big Laminarians, and has a delicate yellowish-brown or dusky shell with interrupted rays of a beautiful blue. The Tortoise-shell Limpet (*Acmæa*) is more distantly related; it has a true left gill. Still more remote are the Key-hole Limpets, e.g. *Fissurella* with a hole at the top of the cone, *Emarginula* with a narrow slit on the anterior aspect. Not nearly related are the Slipper-limpets, e.g. *Crepidula*. The American *C. fornicata*, introduced into England, about 1880, along with oysters, has rapidly spread; it is remarkable in forming chains of a dozen or so, one individual on the back of another; in being a protandrous hermaphrodite, first a male and then a female; and in disposing its eggs in numerous little balloon-like bags stuck on to the surface on which the mollusc happens to be sitting. See Ainsworth Davis and Fleure, 'Patella,' *Liverpool Marine Biology Memoirs*, No. X., 1903.

Limpopo, OORI, or CROCODILE RIVER, a river of south-eastern Africa, has its sources in the heart of the Transvaal, between Pretoria and Potchefstroom, describes a huge curve to the north, bounding the Transvaal, and joins the Indian Ocean a little north of Delagoa Bay. Its course exceeds 800 miles, and it has numerous tributaries, the most important being the Olifant from the right. The Limpopo can be ascended 100 miles by steamboat; but its upper reaches are obstructed by rapids and falls. A great dam at Hartbeespoort, west of Pretoria, has been made for irrigation.

Limulus. See KING-CRAB.

Linacre, or LYNACER, THOMAS, physician and scholar, was born at Canterbury about 1460, studied at Oxford, and was elected Fellow of All-Souls' College in 1484. Shortly afterwards he went to Italy, where he learned Greek from Chalcondylas and studied under Politian; he graduated in medicine at Padua. About 1501 Henry VII. made him tutor to Prince Arthur and king's physician. This latter office he continued to fill during the reign of Henry VIII. At the same time he practised in London; he also founded the Royal College of Physicians. Late in life he entered the church and held several benefices. He died 20th

October 1524. Linacre was one of the earliest champions in England of the New Learning. He translated several of the works of Galen into Latin that was praised for its elegance and purity, and wrote some grammatical treatises—the most important, *De Emendata Structura Latini Sermonis* (1524). See Life by Dr Noble Johnson (1835).

Linares, a town of southern Spain, 90 miles by rail ENE. of Córdoba, is celebrated for its mines of argentiferous lead and copper. There are in the town lead and iron foundries, and gunpowder and dynamite factories. Pop. 40,000.

Linaria. See TOADFLAX.

Lincluden, a ruined abbey, 1½ mile NNW. of Dumfries, at the Cluden's influx to the Nith. It was founded about 1164 for Benedictine nuns. See M'Dowall's *Chronicles of Lincluden* (1886).

Lincoln, a city of England, the capital of Lincolnshire, and a parliamentary, county, and municipal borough, is situated on the Witham, 42 miles S. of Hull, 33 NE. of Nottingham, and 130 N. by W. of London. Built on the slope of a hill, which rises 210 feet above the river, and is crowned by the cathedral, the city is imposing in effect, and can be seen from afar in the flat fen-country. It is

Lincoln Cathedral.

very ancient, is irregularly laid out, and contains many interesting specimens of early architecture—notably the castle, commenced in 1086 by William I.; the Newport Gate, or Roman arch, on the north side of the city; the Exchequer and Stonebow gateways, the latter supporting a guildhall of mediæval architecture; the Jew's House (Norman), associated with the legend of Hugh of Lincoln (q.v.); St Mary's Guild (Norman); and the middle grammar-school (to which additions have been made), founded in 1567 in the Grey Friars. But the chief glory of Lincoln is its cathedral, admittedly one of the finest in England. Erected between 1075 and 1501, it measures 524 feet by 82 (or 250 across the transepts), and in style is mainly Early English. Its matchless central tower (1235–1311, and 265 feet high) was previous to 1547 surmounted by a spire, as till 1808 were the two western towers (completed in 1450). Other noticeable features are the west front (partly Norman), with its three doorways (1123); the Galilee or

south porch (*circa* 1240); the Decorated choir (1254), with its rich sculpturing; the decagonal chapter-house (restored since 1888); Norman font (1075-93); and Great Tom of Lincoln (see article *BELL*), hung in the central tower, which also contains a mellow-chiming clock (1880). Besides the cathedral, there are fourteen churches of various dates, a county hall (1823-26), theological college, school of science, and bishop's palace (1886-87) embodied with a former palace of 1149. Several iron-foundries and important manufactories of agricultural machinery are in operation here, and an active trade is done in flour. The horse-fair, held annually in the spring, is one of the largest in the world, and the race-meetings, which take place on the Carholme, date back to at least the reign of James I. One member is returned to parliament for the city. Lincoln was a British and afterwards a Roman town (*Lindum*), and has abundant Roman remains. In the history of Lincoln the most noteworthy incidents have been frequent invasions by the Danes (786-875); great fires (1110 and 1124); a battle (1141) between the adherents of Stephen and the Empress Matilda; the second coronation of Henry II. (1155-58); an earthquake (1185), which did much damage, especially to the cathedral; the battle of Lincoln, or Lewis Fair, fought 4th June 1218; five parliaments held between 1301 and 1386; and lastly, the siege of the town, and desecration of the cathedral, by the parliamentarians under the Earl of Manchester (1644). Among bishops of Lincoln were Remigius, who in 1073 transferred the see hither from Dorchester in Oxfordshire; St Hugh of Avalon; Robert Grosseteste; Cardinal Beaufort; Fleming and Smith, the respective founders of Lincoln and Brasenose colleges at Oxford; Cardinal Wolsey; Tenison and Wake, afterwards archbishops of Canterbury; Thurlow, a brother of the Lord Chancellor; and Christopher Wordsworth, the founder of the theological college. Pop. (1801) 7398; (1831) 11,873; (1881) 37,313; (1921) 66,020.

Lincoln, (1) capital of Nebraska, stands in a fertile prairie country, on Salt Creek, 55 miles SW. of Omaha. Laid out in 1867, it is a handsome and thriving city. The public buildings include the state capitol, university and other colleges, prison, and insane asylum, and the United States court-house. There are numerous manufactories. Pop. (1880) 13,003; (1920) 54,948. —(2) Capital of Logan county, Illinois, 28 miles NNE. of Springfield, manufactures machinery, and is the seat of Lincoln University (Cumberland Presbyterian) and of an imbecile asylum. Pop. 12,000.

Lincoln, MOUNT, a peak of the Rocky Mountains, in Colorado, about 8 miles NE. of Leadville, reaching a height of 14,297 feet. A railway has been constructed to the silver-mining works at the summit, and here is a meteorological station conducted by Harvard College, another station being placed at a lower level (13,500 feet).

Lincoln, ABRAHAM, sixteenth president of the United States, statesman, wit, orator, and national hero, was born in Hardin county in Kentucky on the 12th February 1809. He was descended in the sixth generation from Samuel Lincoln, who emigrated from Norwich in England to Massachusetts about 1638. Samuel's grandson removed to Berks county, Pennsylvania, and died there in 1735. The family history henceforward marks the advancing wave of settlements, first south-westward, skirting the eastern slope of the Alleghanies, then surmounting these mountains and spreading over the Ohio valley. Samuel's great-grandson rested in Virginia; his son, Abraham, followed the pioneer Daniel Boone to Kentucky, and while

clearing a farm in the forest was killed by Indians in 1784. Abraham's son, Thomas, then but six years old, grew up without education, and in 1806 married Nancy Hanks of the same pioneer stock. Abraham, the future president, was their second child, but lost his mother before he was ten years old. His restless father had crossed the Ohio in 1816, and made a new home in the forests of Indiana, just before its admission as a state. In 1819 he brought from Kentucky a second wife, Sarah (Bush) Johnston, a worthy woman, who trained her step-children as faithfully as her own. Abraham learned the little that was taught in the backwoods schools, and was employed in rough farm-work until at the age of nineteen he took on a flat-boat a cargo to New Orleans. His first close view of slavery made a lasting impression on his mind.

When Lincoln was twenty-one his father removed to central Illinois, where the son assisted in felling trees, building another log-cabin, and splitting rails for fences. After a second trading voyage to New Orleans he returned to be a clerk in a country store at New Salem, Illinois. When the Indian chief Black Hawk disturbed the northern part of that state in 1832 Lincoln served a few weeks as captain in an uneventful campaign. Being defeated as a candidate for the legislature, he purchased a small store, but its failure left him burdened with debt. However, he was made village postmaster, and also deputy to the county surveyor, and the light duties allowed him time to study law and grammar. Elected to the legislature in 1834, he served until 1842, when he declined further nomination. He had become leader of the Whigs, and was influential in having the state capital removed in 1839 from Vandalia to Springfield, where he had fixed his residence. Thither, too, came Mary Todd (1818-82), the daughter of Robert Todd of Lexington, Kentucky, and in November 1842 she was married to the rising lawyer. In 1846 Lincoln was elected to congress, but his service was limited to a single term. Professional work was steadily drawing him from interest in politics when in 1854 Stephen A. Douglas, by his Kansas-Nebraska bill, repealed the Missouri Compromise of 1820, and reopened the question of slavery in the territories. The bill roused intense feeling throughout the North, and Douglas resolved to defend his position in a speech at the state fair at Springfield in October. Lincoln, invited by his Whig friends to reply, delivered on the same day a speech which first fully revealed his power as a political debater. Against his wish 'Honest Abe' was then elected to the legislature, and the Whigs of that body endeavoured to send him to the United States senate, but finally at his request joined in electing Lyman Trumbull, an anti-Douglas Democrat. When the Republican party was organised in 1856 to oppose the extension of slavery Lincoln was its most prominent leader in Illinois. At its first national convention in the same year the delegates of his state presented him as a nominee for the vice-presidency. But he did not attain a national reputation until 1858. Then Douglas, seeking re-election to the United States senate, began a canvass of Illinois in advocacy of his views of 'popular sovereignty.' Lincoln, as candidate for the same position, arranged with Douglas for a series of debates. The contest attracted the attention of the whole country; but though the general verdict was in favour of Lincoln and his cause, the peculiar arrangement of the legislative districts gave Douglas the immediate advantage, and secured his election.

In another memorable oration in the Cooper Union, New York, in February 1860, Lincoln proved that the founders of the republic had

desired the restriction of slavery. In May of that year the Republican convention was held in Chicago, and on the third ballot nominated him for the presidency. The Democratic party held its convention in Charleston, but was unable to agree on a candidate. Douglas was nominated by one wing, Breckinridge by the other. After an intensely exciting campaign Lincoln received a popular vote of 1,866,462; Douglas, 1,375,157; Breckinridge, 847,953; and Bell, 590,631. Of the electors Lincoln had 180; Breckinridge, 72; Bell, 39; and Douglas, 12.

The pro-slavery leaders forthwith put in execution their plans for the secession of their states. South Carolina moved first, and with the six Gulf states formed, in February 1861, the Confederate States of America. Lincoln, leaving Springfield on 1st February, passed through the principal northern cities, making brief addresses at various points, and reaching Washington on the 24th. His inaugural address on 4th March declared the Union perpetual, argued the futility of secession, expressed his determination that the laws should be faithfully executed in all the states, deprecated the impending evils, and made a touching appeal to all friends of the Union. Of the seven members of Lincoln's cabinet four had been Democrats, three Whigs; two were from border slave-states. The chief places were given to W. H. Seward of New York (secretary of state), and Salmon P. Chase of Ohio (secretary of the treasury). Edwin M. Stanton was made secretary of war in 1862.

On April 12, 1861, the Confederate general Beauregard attacked Fort Sumter in Charleston harbour. The civil war being thus commenced, Lincoln called a special session of congress, summoned 75,000 militia for three months, and ordered the enlistment of 65,000 regulars for three years. He proclaimed a blockade of the southern ports, and endeavoured to make it effective. The Southern Confederacy soon had control of eleven states, and put in the field 100,000 men. The first important battle was fought at Bull Run, Virginia, July 21, 1861, and resulted in a disgraceful rout of the Union army. Further account of the military and naval events of the war belongs to general history. The struggle which sanguine statesmen predicted could be ended in a few months was prolonged over four years, with dreadful sacrifices of men and means. Foreign intervention, which seemed imminent at the outset, was with difficulty averted. After sixteen months, in which the disasters to the Union army had outnumbered the victories, Lincoln declared to Horace Greeley the line of his conduct: 'My paramount object is to save the Union, and not either to save or destroy slavery. If I could save the Union without freeing any slave, I would do it; if I could save it by freeing all the slaves, I would do it; and if I could do it by freeing some and leaving others alone, I would also do that.' One month later the time had come for decision, and on September 22, 1862, just after McClellan's victory at Antietam, Lincoln proclaimed that on and after January 1, 1863, all slaves in states or parts of states then in rebellion should be free. On the following New-year's Day the final proclamation of emancipation was made. This greatest achievement of his administration, wrung from him by the exigencies of civil war, was completed and made immutable by the passage of the Thirteenth Amendment of the Constitution, which he planned and urged, though it was not fully ratified until December 1865.

In July 1863 Grant's capture of Vicksburg restored to the Union full control of the Mississippi River, while Meade's defeat of Lee at Gettysburg destroyed the last hope of the Confederates to transfer the seat of war north of the Potomac.

In November of that year, at the dedication of the National Cemetery at Gettysburg, Lincoln delivered a brief address, closing with these words: 'We here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.'

General Grant was called to the chief command of the Union army in March 1864, and entered upon that policy of persistent attrition of the Confederate forces which finally brought peace. In the Republican Convention at Baltimore in June Lincoln was unanimously nominated for a second term. The Democrats at Chicago in August declared the war a failure, yet nominated General McClellan. In November Lincoln received of the popular vote 2,216,000, and McClellan 1,800,000; of the electoral votes Lincoln had 212, McClellan 21. In his second inaugural address, in March 1865, Lincoln rose above the ordinary range of such occasions, and like an inspired prophet set forth the profound moral significance of the tremendous war which he saw drawing to a close. A month later he had entered Richmond, from which Grant had driven Davis and Lee. Lincoln returned to Washington to consider the new problems presented by the overthrow of the Confederacy. But his work was already finished. While seeking relaxation with his family at Ford's Theatre he was assassinated by J. Wilkes Booth, an actor, and died on the next morning, April 15, 1865. The national rejoicing over the return of peace was turned into grief for the martyred president. The whole civilised world joined in expression of sorrow for his fate.

Lincoln was 6 feet 4 inches in height, with long limbs and large hands and feet, dark complexion, broad, high forehead, deep-set gray eyes, and coarse black hair. He was slender, wiry and strong, mild and patient, fair and direct in speech and action, scorning all tricks and subtleties, steadfast in principle, sympathetic and charitable. He was a man of strict morality, abstemious, and familiar with the Bible, though not a professed member of any church. His public life was devoted to the good of his fellow-men, and his fame is established as the saviour of his country and the liberator of a race.

See *Lives* by Arnold (1885), Herndon and Weik (3 vols. 1889), Nicolay and Hay (10 vols. 1890; abridgement by Nicolay, 1906), Morse (2 vols. 1893), Hapgood (1899), Tarbell (1900), Binns (1907), Rose Strunsky (1914), Lord Charnwood (1916), W. E. Barton (1925).

Lincoln, BENJAMIN, an American general, was born at Hingham, Massachusetts, 24th January 1733; in 1776 reinforced Washington after the defeat on Long Island, and served with him that year; in 1777 was appointed major-general, was wounded in October, and disabled until the following August; then received command of the southern department, and in 1780 was besieged by Clinton in Charleston, and compelled to capitulate. He was exchanged a year later, took part in the siege of Yorktown, and was deputed to receive Cornwallis's sword. He was secretary of war from 1781 to 1784, and died 9th May 1810.

Lincolnshire, a maritime county of England, and, after Yorkshire, the largest in the country, is bounded on the N. by the estuary of the Humber; E. by the North Sea, the Wash, and Norfolk; S. by Cambridge, Northampton, and Rutland shires; and W. by Leicester, Nottingham, and York shires. Measuring 75 miles from north to south and 48 miles from east to west, it has a seaboard of about 90 miles, and contains 2665 sq. m. Pop. (1801) 208,557; (1881) 469,919; (1901) 498,781; (1921)

602,105. The surface is comparatively flat; along the coast stretches a line of low-lying marshes, varying in breadth, from which in places the sea is only kept out by means of earthen embankments. To the west of these marshes lie the Wolds, a range of chalk downs, which, commencing near Barton-on-Humber in the north, extend thence in a south-easterly direction for about 40 miles to the neighbourhood of Spilsby and Horncastle. The western side of the county, from the Humber in the north through Lincoln to Grantham in the south, consists principally of light uplands, whilst in the south-east are fens forming part of the Bedford Level (q.v.). The efforts to drain the Fens and the Isle of Axholme encountered great opposition from the 'stilt-walkers,' from the reign of Charles I. down to the first quarter of the 18th century. The chief rivers of Lincolnshire, besides that which forms its northern boundary, are the Trent, Witham, and Welland; and a noticeable feature of the county is the numerous canals which intersect it—Car-dyke and Foss-dyke, the two largest, being probably the work of the Romans. Clay, sand, loam, chalk, or peat, varying with the locality, are the prevailing soils. Near Ancaster limestone is extensively quarried, and in the western districts ironstone abounds. The chief crops are corn and turnips, and in places flax is cultivated; but from an agricultural point of view the county is best known for its rich 'warp-lands' along the banks of the Trent, and for the immense flocks of sheep grazed on its pastures. Horse-breeding, too, is extensively prosecuted, the horse-fairs at Horncastle and Lincoln attracting many foreign and London dealers; and amongst other industries may be noted the manufacture of agricultural implements and machinery, and the great shipping trade and fisheries connected with the port of Grimsby.

Lincolnshire is divided into three districts or 'Parts,' as they are called—viz. the Parts of Holland in the south-east, comprising the greater part of the Fens, the Parts of Kesteven in the south-west, and the Parts of Lindsey, which is by far the largest, occupying the remainder of the county. These Parts, each of which has its own county council, are subdivided into thirty-one wapentakes or hundreds, the city and county borough of Lincoln, the county borough of Great Grimsby, and the municipal boroughs of Boston, Grantham, Louth, and Stamford. Holland, Lindsey, and Kesteven (with Rutland), are parliamentary counties, with one, four, and two members, and the boroughs of Grantham, Grimsby (including Cleethorpes), and Lincoln each return one member. Other towns are Gainsborough, Sleaford, Spalding, and Sutton.

The history of the county apart from Lincoln is soon told. It was here that in 1536 first broke out the insurrection known as the 'Pilgrimage of Grace,' which had for its object the restoration of the old religion and re-establishment of dissolved monasteries; and in 1643, during the Civil War, Ancaster, Gainsborough, Grantham, and Winceby were the scene of contests between the rival forces. To the antiquary Lincolnshire is of special interest on account of the beauty of its many churches—Boston, Crowle, Grantham, Heckington, Louth, Long Sutton and Tattershall amongst them; whilst of other places of interest it will suffice to mention here the ruined abbey of Crowland, and Bolingbroke Castle (of which but little remains), the home of John of Gaunt and of his son Henry IV., who was born there. Other eminent persons associated with the county are Gilbert of Sempringham; John Foxe, the martyrologist; William Cecil, Lord Burghley; Captain John Smith; Archbishop Whitgift; Thomas Heywood, the dramatist;

Sir Isaac Newton; Thomas Sutton, founder of the Charter-house; Dr Busby; John Wesley; Scott, the commentator; Sir John Franklin; Dr Dodd; Lingard; Latham; Tennyson; Connington; and Jean Ingelow.

See the 'Victoria History,' works by Allen (1884) and Sir C. Anderson (1880), Murray's *Handbook*, and the 'Diocesan History,' by Venables and Perry (1897).

Lincoln's Inn. See INNS OF COURT.

Lind, JENNY. See GOLDSCHMIDT, MADAME.

Lindau, PAUL, man of letters, was born on 3d June 1839 at Magdeburg. He trained himself for journalistic work in Paris, returned to Germany in 1863, and edited various journals, including *Die Gegenwart* and *Nord und Süd*, both of which he founded. He laboured in three or four other fields of literary activity. Amongst pleasantly-written books of travel are *Aus Venetien* (1864), *Aus Paris* (1865), and *Aus der Neuen Welt* (1884). His skill as a writer of critical sketches in a satirical and humorous manner is shown in *Harmlose Briefe eines deutschen Kleinstädters* (1870) and *Literarische Rücksichtslosigkeiten* (1871), and his calibre as a literary critic in studies on *Molière* (1871) and *Alfred de Musset* (1877), and in *Dramaturgische Blätter* (1875-78), *Nüchterne Briefe aus Baireuth* (1st and 7th ed. 1876), *Baireuther Briefe* (5th ed. 1883), and *Aufsätze* (1875). But he is perhaps better known as a writer of plays and novels, the subjects of which are taken almost exclusively from modern life. The former possess the merits of lively dialogue and a fair degree of dramatic power; the most successful was perhaps *Maria und Magdalena*. A collection of his theatrical pieces was published in five volumes (1873-88). The novels include *Herr und Frau Bever*, *Toggenburg*, *Mayo*, a romance cycle, *Berlin* (1886-90), *Die Brüder* (1894). He managed theatres at Meiningen and Berlin. He died 31st January 1919.

Lindera, a genus of Lauraceæ. See JOSS-STICKS.

Lindisfarne. See HOLY ISLAND.

Lindley, JOHN, botanist, was born on 5th February 1799 at Catton, near Norwich. His father, the author of *A Guide to Orchard and Kitchen Gardens*, owned a nursery garden. Botany attracted young Lindley's attention at an early date. When little more than twenty he went to London, and wrote for the *Encyclopædia of Plants*. In 1822 he was appointed assistant-secretary to the Horticultural Society, and in 1829 professor of Botany in University College, London. He retired from this chair in 1860, and died at Turnham Green on 1st November 1865. His works include the *Synopsis of British Flora* (1829); *Introduction to the Natural System of Botany* (1830); *Outline of the Structure and Physiology of Plants* (2 vols. 1832); *Flora Medica* (1838); *The Vegetable Kingdom* (1846), a standard work on the subject of classification; and *Theory and Practice of Horticulture* (2d ed. 1855). Along with W. Hutton he published *The Fossil Flora of Great Britain* (3 vols. 1831-37).

Lindsay, a Scottish historical house of Norman extraction. Sir Walter de Lindsay, settling in Scotland under David I., acquired Ercildoune in Berwickshire, and Luffness in East Lothian. His descendant, William Lindsay, Justiciary of Lothian in the 12th century, acquired Crawford in Clydesdale, married Princess Marjory, sister of King William the Lion, and had three sons. The two elder lines of these ended in heiresses, and Crawford eventually came to the descendants of William of Luffness, the third son.

Earls of Crawford and Duke of Montrose.

—Sir Alexander Lindsay, younger brother of Sir James of Crawford, the hero of Otterburn, acquired Glenesk and Edzell, and his son David married the sister of Robert III., and was created in 1398 Earl of Crawford. Their chief seat was Finhaven, in Angus. The family attained its climax of power under David, fifth earl, who was made Duke of Montrose in 1488. The grand-nephew of the duke was known as 'The Wicked Master,' and his conduct led his father to transfer the earldom to David Lindsay of Edzell, the next heir. He, however, left it at his death to the son of the 'Wicked Master.' This line ended in the sixteenth earl, and by arrangement, Lord Lindsay of the Byres succeeded to the earldom of Crawford in preference to the descendants of the uncle of the sixteenth earl, who had been created Lord Spynie, and the intermediate cadets of Edzell and Balcarres.

Lord Lindsay of the Byres, Viscount Garnock.—Sir William Lindsay, younger brother of the first Earl of Crawford, acquired extensive estates with his wife, a daughter of Sir William Mure of Abercorn. His grandson was made Lord Lindsay of the Byres, county Haddington, in 1445, but their principal residence was Struthers Castle in Fife. The tenth lord was in 1644 created Earl of Lindsay; and, as stated above, under a new patent of Charles I. he became seventeenth Earl of Crawford. He was High Treasurer of Scotland. His grandson by a younger son was created Viscount Garnock in 1703. The fourth Viscount Garnock succeeded as twenty-first Earl of Crawford; and his son, the twenty-second Earl, dying in 1808, was the last of the direct line of the Byres.

Earls of Balcarres and Crawford.—The Lindsays of Balcarres, in Fife, were a branch, and eventually the representatives, of the Lindsays of Edzell. The first was Lord Menmuir, Secretary of State to James VI. His son David was created Lord Lindsay of Balcarres in 1633, and his grandson, Alexander, Earl of Balcarres in 1651. On the death of the twenty-second Earl of Crawford, James, seventh Earl of Balcarres, became twenty-third Earl of Crawford. A further claim was preferred without success to the dukedom of Montrose, conferred by James III., by the 25th Earl of Crawford (q.v.). See his *Lives of the Lindsays* (1849), and Jervise's *Land of the Lindsays* (2d ed. 1882).

Lindsay, Sir David. See **LYNDSAY**.

Lindsay, Nicholas Vachel, American poet, born 10th November 1879 at Springfield, Ill., was educated at Springfield High School, Hiram College, and art schools in Chicago and New York, and tramped America trading his rhymes and preaching 'The Gospel of Beauty.' Inoculating his muse with the rag-time virus, in *The Congo* (1914) and other collections, he compelled attention by his missionary zeal and his irrepressible spirits. See the 'autobiographical foreword' to his *Collected Poems* (1923).

Lindsay of Pitscottie, Robert, the author of *The Chronicles of Scotland*, from the reign of James II. to 1565. There is nothing to learn of Lindsay personally, except that he was born about the beginning of the 16th century, and was proprietor of the lands of Pitscottie in Fifeshire. He is best known by his territorial appellation. His Chronicle was Sir Walter Scott's favourite Scottish history; and though Pitscottie was not contemporary with the whole of the events he describes, he must, for the latter portion of his history, have derived much of his information from eye-witnesses. His style is quaint and graphic, and his facts in general trustworthy, except where he deals in marvels, to which he is a little prone. It is he who tells, on the authority of Sir David Lindsay, Lyon King-of-arms, that striking story of the

apparition to James IV. at Linlithgow, of which Scott gives a vivid picture in *Marmion*. The best edition is that edited by Sheriff Mackay for the Scottish Text Society (3 vols. 1899-1911).

Lindsey, PARTS OF. See **LINCOLNSHIRE**.

Lindsey, THEOPHILUS (1723-1808), one of the first English Unitarians (q.v.), was a native of Middlewich, Cheshire, a Fellow of St John's College, Cambridge, an Anglican clergyman till 1773, and author of several works. See his *Memoirs* by Belsham (1812).

Line, BREAKING THE. See **CLERK, JOHN**; and **TACTICS, NAVAL**.

Linen. Flax, like wool, has been used as a material for woven fabrics from a very remote period. Not only are there frequent references to linen in the Bible and other ancient records, but, owing to the wonderful durability of the fibre, many linen mummy-cloths of great age and some of extremely fine texture have been found in Egypt. Some of the finest linens used by the ancient Greeks and Romans were woven on Egyptian looms. The cultivation of flax was extensive in Italy, and it was probably by the Romans that the growth of flax for textile purposes was introduced into Britain. Since before the Christian era the art of spinning and weaving this fibre by primitive methods has been practised in countries occupied by the Romans, and can be traced over the greater part of Europe from the 6th or 7th century, at first as a domestic industry. Figured stuffs of linen or of silk and linen, made in Italy and Spain in the 14th century, may be seen in museums. The ground of the Bayeux Tapestry (q.v.) is of linen. Flanders was famous for table-linen in the 11th century, and Flemish weavers often settled in England. In 1698 William III. invited a Huguenot called Crommelin from Holland to Ireland, where he soon established the industry at Lisburn, in a region where it still flourishes. Government boards were ultimately formed in Ireland and Scotland to assist the linen trade by bounties. In 1720 the linen exports from Scotland were valued at £200,000. Huguenot refugees promoted the linen industry wherever they settled. In England the linen manufacture was also assisted by bounties, which did not finally cease till 1832. The year 1787 marks the first introduction of a mill for spinning linen-yarn by machinery in the United Kingdom. It was built at Darlington, and the patentees of the machines were J. Kendrew and T. Porthouse. In Scotland the first flax-spinning mills were erected at Bervie in 1787, and near Glamis in 1790, and prospered with very primitive machinery. Dundee and Leeds quickly followed. Although the powerloom of Cartwright was applied to the weaving of cotton in 1785, it was not till 1812 that the first factory, that had any real success, for weaving linen by power was established by C. Turner & Co. of Limehouse, London. Speaking generally, the improvements in the machines for spinning and weaving cotton have been more rapid than in those employed for the manufacture of linen.

Heckling.—The preparation of the fibre of the flax-plant into the state in which it is sent to spinning-mills is described under the heading **FLAX**. At the mill it gets a rough sorting, and is then heckled, a process which has been in use for centuries. A hand heckle is an oblong stock of wood studded with strong steel teeth about 7 inches long in the case of the first or 'ruffer' heckle. The heckler takes a handful or strick of flax by the middle and draws the root end several times through the teeth. He then turns the strick, and in the same way heckles the opposite end. The flax is next similarly treated on a heckle with finer teeth, and if it is to be spun into fine yarn

it is further combed on still finer heckles. The object of the process is to separate the flax into two portions—viz. 'line,' which is the long and best portion, and 'tow,' which is the short and unravelled portion. What are called vertical sheet-heckling machines are now universally employed. This kind of machine consists of endless leather sheets moving over rollers placed at some distance apart with proper driving-gear. A number of heckle-stocks, placed at regular intervals, are fixed on the surface of these sheets or bands, two of which are placed opposite to, and so near each other that their respective heckle-pins intersect where the actual heckling takes place. At this part of their course the sheets move in a nearly vertical direction downwards, and heckle the flax, which is fixed in a holder and hangs down between the sheets. At a large modern machine of this kind, improved by the addition to the flax-holders of automatic changing devices, the number of operatives has been reduced from four to one, and a much better yield of heckled 'line' secured.

Preparing.—Next the flax 'line,' sorted into qualities, is 'prepared' (see JUTE, SPINNING) on three machines. (1) The *spreading-frame*, where the flax is first formed into a continuous ribbon or sliver. (2) The *drawing-frames*, on each of which this sliver is 'doubled' and drawn out by rollers through travelling gills with steel teeth, a similar arrangement forming part of the spreading-frame. There are generally three, and occasionally four, drawing-frames, each successive frame having finer gill teeth than the one before it, and from eight to fifteen slivers delivered by one of these machines are drawn out into one sliver by the next. The object of so much doubling and drawing is to produce a sliver of very uniform size throughout, and with the fibres all parallel. (3) The *roving-frame* through which the sliver is passed singly; it is so far similar to the drawing-frame in construction, but with a flyer and bobbin for the now greatly attenuated sliver, which is slightly twisted by the former and wound upon the latter. Flax-tow is carded in the same way as Jute (q.v.), and then goes through the preparing processes just described.

Spinning.—The 'rove' or 'rovings' are spun into yarn on the 'throstle' invented by Arkwright. This machine is also used in spinning cotton, and it does not differ in principle for either fibre (see SPINNING). A peculiarity in flax-spinning is that for all fine yarns the fibre is spun wet—the temperature of the water used being 120° F. By this treatment a given weight of flax can be spun into a much greater length than formerly, and a better yarn is produced. Dry spinning is, however, adopted for coarse and heavy yarns.

Weaving.—The hand-loom is still applied, to some extent, to the weaving of fine linens, but for linen fabrics generally the power-loom is in almost universal use. It was found to be a much more difficult task to adapt the power-loom to linen than to cotton owing to the want of elasticity in flax-yarn. The construction of looms is explained under WEAVING, and the bleaching and calendering of linen and other fabrics are described under these several heads.

Linen is manufactured in most European countries, but on the Continent the industry attains much importance only in France, Belgium, and Germany. The neighbourhood of Courtrai in Belgium, and Westphalia in Germany, have long had a reputation for producing yarns of extreme fineness for costly lace. France is celebrated for her cambrics and beautiful damasks. In the United Kingdom the finest linens are made at Belfast and other places in Ulster, the classes of goods made being lawn and cambric handkerchiefs,

surplice linens, printed linens for dresses, damask table-linen, shirtings, sheetings, and towellings. At Dunfermline and several other places in Fife, linen damasks, diaper towelling, and plainer fabrics of medium weight are largely manufactured, upholstery linen being chiefly made at Kirkcaldy. Linen goods of similar character are extensively woven at Barnsley, in Yorkshire. Heavy fabrics, such as sailcloth, canvas, and sacking, are made at Dundee, Arbroath, and a few more Forfarshire towns.

Of our great textile manufactures the making of linen fabrics is the only one that shows signs of becoming a contracting industry. For several kinds of heavy goods it has to compete with jute, and for certain medium and fine fabrics with cotton. Compared with these, linen is a costly textile, and its advantages of strength, glossiness, and, in the fine qualities, of not being easily soiled hardly suffice to keep up the former demand for it. The great fault of flax is that the steeping process does not remove all the natural gum in the fibre. If the gum could be completely taken out by some inexpensive process, there seems to be no reason why flax should not be spun as easily as cotton. For some fabrics, such as sheetings, cotton, owing to its greater warmth and cheapness, is now preferred; and for others, such as damasks, the two materials are often used together.

Line Spectrum. See SPECTRUM.

Lines of Force. See MAGNETISM.

Ling (*Molva vulgaris*), a fish of the family Gadidae, abundant on most parts of the British coasts, and elsewhere throughout the northern seas, and in value almost rivalling the cod. In form it is much more elongated than the cod, and even more than the hake, with which it agrees in having two dorsal fins and one anal fin, the anal and second dorsal long; but it differs from the hake in having a barbel below the chin, and teeth of unequal size on the jaws and vomer. The ling is generally three or four feet long, sometimes more, and has been known to weigh seventy pounds. The colour is gray, inclining to olive, the belly silvery, the fins edged with white. The tail-fin is rounded. The gape is large, and the mouth well furnished with teeth. The ling is a very voracious fish, feeding chiefly on smaller fishes. It is also very prolific, and deposits its spawn in June; the ova, as usual in the Gadidae, are pelagic. It is found chiefly where the bottom of the sea is rocky. Great numbers are caught in the same manner as cod, by hand-lines and long lines, on the coasts of England, Scotland, the Orkney and Shetland Islands, &c.; considerable numbers are also taken by the trawl. Most of them are split from head to tail, cleaned, salted in brine, washed, dried in the sun, and sent to the market in the form of *Stock-fish*. They are largely exported to Spain and other countries. The air-bladders or *sounds* are pickled like those of cod. The liver also yields an oil similar to cod-liver oil, which is used for the supply of lamps in Shetland and elsewhere. Two other species of *Molva* from the coasts of Europe have been described.

Ling, PEHR HENRIK. See GYMNASTICS.

Linga (a Sanskrit word which literally means a sign or symbol) denotes, in the sectarian worship of the Hindus, the Phallus (q.v.), as emblem of the male or generative power of nature. The Linga-worship prevails with the Sivaites (see INDIA). Originally of an ideal and mystical nature, it has degenerated into practices of the grossest description; thus taking the same course as the similar worship of the Chaldeans, Greeks, and other nations of the east and west.

The manner in which the Linga is represented is generally inoffensive—a pillar of stone or other cylindrical object being held as an appropriate symbol of the generative power of Siva. Its counterpart is *Yoni*, or the symbol of female nature as productive. See Muir's *Sanskrit Texts* (vol. iv.), and Kittel's monograph (Basel, 1876).

Lingard, JOHN, historian, was born at Winchester, 5th February 1771. Both his parents were Lincolnshire Catholics, his father a carpenter, his mother the daughter of a respectable farmer who had been ruined by the penal laws. A promising boy, he was sent in 1782 by Bishop Talbot to the English College of Douai (q.v.), where he remained till in 1793 it was broken up by the Revolution. The Catholic Relief Act enabling Catholics to open schools in England, the Douai community was transferred first to Crook Hall, near Durham, and in 1808 to Ushaw. Lingard, who had accepted the office of tutor in Lord Stourton's family, in 1794 resumed his theological studies, and, next year receiving priest's orders, became vice-president of the college, prefect of the studies, and professor of Philosophy. In 1811 he accepted the secluded mission of Hornby, near Lancaster, declining the offer of a chair at Maynooth, as fourteen years later of a cardinal's hat; and here he 'grew old in illustrious obscurity.' He twice visited Rome, in 1817 and 1825; in 1821 obtained his doctorate from Pius VII.; and in 1839 received a crown pension of £300. He died at Hornby, 17th July 1851. His first important work, the *Antiquity of the Anglo-Saxon Church* (2 vols. 1806; 3d and much enlarged ed. 1845) was but the pioneer of what became the labour of his life—a *History of England to 1688* (8 vols. 1819–30; new ed. 10 vols., with an 11th by Belloc, 1915). This from the outset attracted much attention. It was fiercely assailed in the *Edinburgh Review*; but Dr Lingard in his reply displayed so much erudition, and so careful a regard for original authorities, that he added materially to his reputation as a scholar and a critic. The chief mark of its Catholic origin is not seldom the absence of Protestant bias and prejudice; still, it is as declaring the views of a candid and judicious Catholic that the later volumes retain a permanent value. The earlier volumes have been largely superseded. For his numerous minor writings, see the authoritative *Life and Letters* by Halle and Bonney (1911).

Lingoa Geral, a trade jargon used in intercourse with the Indians of Brazil, based on Tupi-Guarani.

Lingua Franca, the corrupt Italian which has been employed, since the period of the Genoese and Venetian supremacy, as the language of commercial intercourse in the Mediterranean, especially the Levant. Any similar language, as, for instance, the Chinook jargon in the north-west of the United States, is called generically a *lingua franca*. Compare 'pidgin English,' under CHINA.

Linguistics. 1. The name linguistics would naturally be applied to the study of language in the widest sense. It is usual, however, to use it of departments other than those that have already been made the subjects of special treatment—for example, Philology, Grammar, Phonetics (q.v.).

2. Some of the subjects with which linguistics deals are: the nature of language as such; the meaning of meaning; the definition of a sentence and of a word; what is essential in a language, and what desirable; comparative merits and comparative difficulty of languages; whether thought and language are inseparable; effect of language on personal and national character, and *vice versa*; nature of a perfect language (philosophically speaking); whether the language that is best for

communication is necessarily best for thinking; requirements of a world language (speaking practically); nature and possibility of translation; what constitutes clear speech, beautiful speech, correct speech, good speech; nature of metre; character of a successful linguist, and effect of linguistically good and of linguistically bad language-study on mind and character; language-learning and language-teaching.

3. The last-named will be the subject of this article, and it will be treated from one special angle. Though the child learning its mother-tongue is rightly held up as the one really successful language-learner, no previous attempt has been made to explore exhaustively the grounds of that success in the child's circumstances and mentality. If these were understood in detail, the pedagogic problem, as well as that of the self-taught student, would almost solve itself.

Circumstances.—A. 4. The child inherits a craving for a means of communication (§ 54), and the mother-tongue is its *only* means. There is no reason to suppose it inherits any desire to learn languages in general; once provided with one language, it must lose the most powerful stimulus to linguistic effort, a stimulus which can be revived only by recreating the original isolation. Consequently the greatest success in making a bilingual child is achieved when it speaks different languages with different people.

5. An older learner can seldom attain to this complete isolation, and nothing less will revive the child's instinct. When the writer was attempting to learn Flemish, he found it incredibly more difficult to talk it with a native he knew to be a French or English speaker than with one who was neither.

6. The older learner can, however, cultivate a kind of mental isolation by avoiding all comparison between one language and another, and by building up an accompaniment of circumstances, place, times, persons around any one language as distinct as possible from those connected with any other. This total association is probably even more important than the various individual associations within the language. When the writer, who knew then no foreign language but German, began to learn French, he found the total association 'foreign language' so powerful that he constantly put French sentences into German word-order.

7. The strongest justification of the pure direct method is this need of isolation and total association (§ 6). Arguments in the nature of purely mathematical calculation of time spent on this or that detail have not as much weight as would at first appear.

B. 8. The child uses a new expression because it needs it. Probably it has already felt the need a considerable time before it has discovered the expression. This has several important consequences. Every language-teacher who in class has found himself at a loss for some expression knows how greedily he picks up the expression when he meets it afterwards, and how well he remembers it. Again, the new interest, which demands the new expression (a) lasts for some time, giving ample occasion for repetition; and (b) tends to recur at gradually lengthening intervals, thus fulfilling perfectly the conditions of successful memorising. Further, the very concurrence of new word with new interest has incalculable power. Thus, people who would have thought themselves incapable of acquiring any foreign vocabulary picked up with ease such words as *camouflage* and *soviet*.

9. There would appear to be some psychological principle in accordance with which conscious interest in some kinds of action may hinder the action. Darwin (*Expr. Em.*) prevented some young men from sneezing after snuff by betting them they

could not. The present writer's daughter's dog, which yaps spontaneously for tit-bits, has to make a great effort, stamping two or three times with his forefeet, to yap on the command, 'Ask for it.' Is the child perhaps a better linguist for not being consciously interested in language at all?

10. Apart from the question of interest as a stimulus, harmony between the circumstances and the language is of obvious importance in making clear the meaning of the expressions. The child half-knows beforehand what is going to be said; if it misunderstands, its mistake often takes direct effect upon it, as when it is asked to do something, or told that something is hot. So that language is at first a mere easily digested accompaniment. The child gets the full benefit of what Palmer calls ostensive teaching over a very long period.

11. Among other circumstances, the importance of facial and bodily gesture can hardly be over-estimated. The schoolmaster endeavouring to teach a kindly expression may nullify his direct method efforts through diabolical rage at the pupil's stupidity; while the good-natured teacher can hardly be expected to get into a bad temper in order to illustrate an expression of anger. Mere acting is never the same. For a real and effective natural method, the language and behaviour must proceed from the occasion, not the occasion be created for the sake of illustrating some feature of the language. It is of the very nature of language to be incidental to other activities. As soon as it becomes the main interest its motive is gone. *Conscious teaching, or learning, and natural method are definitely contradictory.* Language is best learned at one's work—as, for example, by foreign waiters in England. Teaching mathematics, history, and other subjects each in a different foreign language might yield a good result (for the language-learning).

12. The capacity of the child to draw inferences (a) from the circumstances and (b) from the behaviour, voice, and face of the speaker is remarkable. Among other things, it enables it to distinguish baby-talk from 'proper' speech, a fact which renders unnecessary any comment on the current nonsense about the supposed evils of using baby-talk.

13. The writer's children, when playing with their dolls, always changed easily and accurately from the one style to the other, according as they wished to simulate affection or parental severity. Most children hear baby-talk; yet permanent speech-defects, except those current in the normal adult speech of the child's environment,¹ are very rare indeed. What chiefly conduces to clear speech is a cheerful and unconstrained atmosphere in childhood. The affectionate baby-talking mother produces such an atmosphere, and generally encourages the children to speak loudly and boldly, with the best results.

C. 14. The child does not have to find a teacher, much less pay him. It is meaningless to speak of the 'natural method' in the case of anyone needing to search for his instruction. The moment deliberate exertion of that kind is called for, the psychological situation ceases to be that of the child.

D. 15. The child is in a small class of equal attainment, usually one pupil to one or more teachers.

E. 16. The teacher is usually, the apparatus always, at hand when the child is in the mood to learn; for with the child it is the apparatus—namely, the new object of interest—which creates the mood to talk, and the inclination is not generally very strong unless further stimulated by the presence of someone to talk to. The learner of a foreign language, on the other hand, has to take his lesson

at a fixed time, and, if he is an adult, very often at the end of a tiring day, when even the most enthusiastic linguist would often rather read about a language than talk in it; and his instructor, often as tired as himself, does not talk about his tiredness, as the mother of the child would (thus giving an effective lesson in the weariness and self-pity vocabulary, with memory aids in the shape of sighs, and groans, and signs of imminent collapse), but struggles instead with the humorous or exciting chapter they happen to have arrived at in their reading-book.

F. 17. The child is not called upon to say anything beyond its powers. No one complains if it is silent. It is not forced by emergencies, like the older learner in a foreign country, to invent wrong expressions, to say them with a wrong pronunciation, and to go on repeating them till wrong idiom and wrong pronunciation become habitual and fluent. With the child the growth of fluency keeps pace with the growth of correctness. (Such mistakes as do remain after the child has become a fluent speaker are the hardest to get rid of.) The beginner who acts on the catch-word, 'Go to the country,' will be well-advised to make a *long* stay, and to listen as much and talk as little as possible for at least a year.

18. At all stages the trick of fluency largely consists in confining one's thought within the limits of one's powers of expression.

G. 19. The ability to speak like a native is largely a negative matter—it consists in being able to invent new expressions for new occasions with the certainty that one will not invent one which the native would not have employed. To have this certainty requires a *negative memory*, since there are a great many expressions used by foreigners which are in perfect accord with the structure of the language, and are wrong only because the natives happen to have already invented another expression for that occasion. Thus the only objection to the admirable German word *Pappschachtel* is that Germans usually say *Karton*. The prior existence of another expression is capable of making the perfectly correctly formed neologism unintelligible. Thus the only Englishman who would understand *hoof-iron* would be one who did not know the word *horse-shoe*.

20. The negative memory required in order to be sure that the ground is free for invention, as distinguished from the positive memory which stores expressions, must be a matter of very long experience. Probably one understates rather than overstates the case in saying that not less than five years in the country will enable a good linguist to be quite sure that no sentence he constructs will sound comical to the native.

H. 21. The child is presented with (i.) the right material; (ii.) all the right material; (iii.) all the material together; (iv.) nothing but the right material; and (v.) the accessibility of any feature of the language is exactly proportional to its frequency of occurrence—that is, to its importance.

22. (i.) The Right Material.—It seems hardly worth while to argue the question what constitutes correct speech. If the learner has not sufficient linguistic intelligence to see that correctness depends upon usage, and that to speak a language as no native ever actually speaks it, or to write it as no native ever writes it, cannot possibly be correct (whatever this or that teacher or grammar-book may say), let him at least be consistent with himself, and not either (a) first set out with the determination to speak like an educated native, and afterwards grumble that the language his instructor gives him disagrees with the grammar-book, or (b) start with a determination to follow the grammar-book, and afterwards complain be-

¹—which are, of course, not speech-defects at all (§ 27), but differences of dialect.

cause every sentence he utters makes the natives laugh.

23. Since in writing we have time to think, it is obvious that we should begin with the conversational language. And this for the older learner is precisely the language about which full and accurate information is hardest to obtain. The mistakes which the non-native teacher unavoidably makes are a small matter in comparison with the deliberate misinformation dealt out by the native. It may be said bluntly that it is practically impossible to get any native of any country to teach his language in a form which any native ever uses in friendly unconstrained conversation.

24. Even when the teacher is willing to do so, he is practically never aware how he speaks, as is evidenced by the almost universal failure of attempts by natives to supply conversational reading books. (Sweet's books are the only English exceptions.)

25. Grammars and dictionaries are a byword. (Sweet's too short *Primer of Spoken English*, and Palmer's much fuller *Grammar of Spoken English* are the only exceptions known to the writer. Even of these the latter contains several sentences which are not genuine conversational.) As the dative of *Fritz*, all German grammars give *Fritzen*, which in the mouths of Germans is heard only by way of humorous familiarity. Most German grammars give *gutes Weines* as one form of the genitive, and their authors see nothing absurd in first giving this form and then carefully warning one, in a footnote, never on any account to use it.

26. The only way to be sure of observing the real conversational language is to overhear it used among natives; and this is the best defence of the catchword, 'Go to the country.'¹

27. (ii.) All the Material.—If the teacher is to be to his pupil what the parent is to the child, the ever-ready source of information, capable of supplying any word the child requires, he can hardly be said to know the language at all till he knows it perfectly. The mother, it is true, often has to say, 'I don't know what it is called.' But the expressions the mother does not know are not known by other people of the child's environment, or if they are, the child learns from them what it fails to learn from its mother. What is not known to the people of the child's environment is, of course, not part of the language which the child succeeds in learning: the child's teachers are therefore perfectly informed *ex hypothesi*.

28. In contrast to this state of affairs, there is probably at the present date, apart from foreigners bred in England, not one foreign teacher who can teach so essential a matter as English intonation. Intonation frequently alters semantic values entirely. It is absurd to describe as phonetic the texts in general use which print in exactly the same form three sentences so different as [ai | beg jo | padn] (I am sorry I knocked into you), [ai beg jo | padn] (What did you say?), and [ai—beg jo | padn] (You are quite mistaken). Sweet's texts, the passages from Sweet and Coleman in Palmer's *English Intonation*, Palmer's *Everyday Sentences* and his *Grammar of Spoken English*, and Jones's *Intonation Curves*, are the only considerable texts as yet available for the study of English tones.

29. Another essential which the child acquires in the earliest stages is a good supply of blank-cheque expressions: *something to (dig) with, the thing you (wipe pens) on, one of those things over there*. With the aid of these, one is never at a loss. All natives hesitate for words; much depends on how one hesitates.

30. This forms one more justification of the pure

¹ But the great difficulty is to be sure that one is overhearing the correct dialect, that is to say, the dialect one wishes to learn.

direct method. Sweet's objection; that explanations given in the foreign language are not so clear as if given in the pupil's own tongue would lose most of its force if explanatory periphrasis should prove to be almost the most important element in any language.

31. A point of detail is the spelling and pronunciation of names. Writers of books for language-learners appear to think it a matter of no importance to know, for example, how a Russian pronounces *Holland*. Even Passy's *Dictionnaire Phonétique Français* has very few names. Jones's *Pronouncing Dictionary* is a refreshing exception. To be without complete information in this matter—an annoyance unknown to the child—is, of course, an absolute bar to speaking like a native.

32. The parent will be wise not to follow Jespersen's advice always to pronounce precisely, if this means pronouncing more precisely than is usual among the speakers of that style of speech which it is desirable for the child to learn. To pronounce more precisely than the native is to pronounce differently from the native, that is wrongly (§ 22). The native does sometimes pronounce more precisely than at others—for example, in giving peremptory orders. The learner does not want to know *only* this pronunciation; he wants to know *all* the varieties of pronunciation used by the speakers of the type of language he is studying (§ 13). The parent, or the teacher, provided he is sure that his own pronunciation is that of the speakers in question, should pronounce not in a precise manner, but simply in an ordinary manner.

33. This is particularly important in class-teaching, in reference to imparting the power to *understand* a language. The pupils who have heard only a precise pronunciation (like those who have heard only a slow pronunciation) will be in no better position to understand the native speaker than those who have grown accustomed to any other non-native, that is, incorrect pronunciation.

34. Gesture in some African languages is an essential adjunct to the spoken language. In such cases gesture ought, of course, to be carefully described in the grammars. It never is. (The case of a separate and independent gesture-language is, of course, quite different.)

35. (iii.) All the Material together.—At first sight this would seem to be a disastrous handicap. But a little consideration will show that many things are learned better in connection with other things. A simple example from German is the fact that one easily remembers that *Schafe* is the plural of *Schaf* (sheep) when one knows that *Schäfer* means shepherd(s); *geniesst* (enjoys) helps one to remember that 'recovers' is *genest* (not *geniest*). Again, similar words, such as *sorry* and *sorrow*, *round* and *surround*, are mutually helpful, whether they are connected etymologically or (as in these examples) totally unrelated.

36. The disadvantages of excessive grading are obvious. To avoid all exceptions in the early stages means that the pupil has to unlearn the tendency to make irregular forms regular, *vous disez, vous faisez*; whereas such forms as *dites* and *faites* are too rare to interfere with the normal conjugation. To have a first-year Latin reader with no verbs but those of the first conjugation means setting up an invincible tendency to conjugate *rego* like *amo*. Learners require to know from the first that there are several possibilities—such as that 'it' is *ce, elle, or il*, according to the circumstances; not merely that such and such an expression takes the subjunctive, but that this other one of similar meaning takes the conditional.

37. Apart from these direct advantages of ungraded presentment, the stimulus to alertness is incalculable. The effect of being plunged into the

language-forest, without even any rules to guide one, can be experienced by anyone who will make an attempt to learn a language of some quite unknown type by means of text and translation alone. With no aids to generalisation, the keenness of one's observation, and the exactness of one's memory, of the isolated forms are a revelation. The child has the added advantage of attempting no conscious generalisations of its own. Older minds begin to look for a rule, where one is not already given to them; and having found it, hear or see all further instances hazily.

38. For readiness in using the language, the generalising mind is at a positive disadvantage. Machine-gunners are advisedly taught to cure stoppages unhesitatingly before they are allowed, by studying the mechanism of the gun, to know the reason for what they do. It is almost certainly a correct assumption that knowledge would lead to reflexion and to consequent slowness of response to the different emergencies.

39. The most stimulating feature of the text and translation method is the constant watchfulness to discover which word means which; and still further watchfulness, and better memory, would result from the absence of word-division. The child is forced to discover where, in the confusion of sounds it hears, one word ends and another begins.¹

40 (v).² Accessibility Proportional to Importance.—The absence of grading, word-division, and rules makes it impossible to do other than identify the most frequent elements first.³ Or rather, since the unstressed elements are harder to hear, the child must recognise first the commonest among the more significant elements.

41. Sweet is probably wrong in warning the learner against neglecting the less significant elements, on the ground that it is discouraging, after making some progress, to find oneself uncertain whether some small word means *because* or *although*. If one allows oneself to be discouraged, it is, no doubt, fatal. But if one attends to the main elements, the steady application to every sentence of common sense and imagination (two qualities in which the adult certainly *can* rival the child) will gradually make the meaning of the others self-evident. When a child knows a great many full words we are instinctively satisfied. We feel sure the grammatical structure will follow; and we are never disappointed.

42. It is in fact almost impossible to concentrate effectually on the emptier words till our knowledge of the fuller ones forces us to see what a difference the others make. When we see that [ju 'masn 'sɪŋ] means the very contrary of [ju 'mas 'sɪŋ], we are compelled to pay attention to the almost inaudible element [n].

43. The doubt about the ultimate advantage of word-division applies to everything else which appears at first sight to make things easier. Sweet remarks that without explanation the learner could not be expected to discover the rules for the various Welsh equivalents of *Yes*. But what if, in the

¹ It makes very few mistakes. The only case the writer has been able to observe among his four children was an uncertainty whether *belong* was two words or one, which led to the strange compromise, 'That's longs to me.' All four of these children had such a clear word-consciousness that they constantly used strong forms for weak; very often the *wrong* strong forms: [ai kʊd əv dʌn ɪt] instead of [kʊd əv]. The view that word-division is purely conventional is in any case quite untenable. The earliest word-divided Greek MSS. are the non-literary ones. Sapir says, 'Young Indians, taught merely how to render accurately [in writing] the sounds, had no difficulty whatever in determining the words.' They agreed with one another ('spontaneously'), and with Sapir and other white students.

² For (iv.) see § 47.

³ Short *detached* expressions of an expletive character are naturally learned easily by the child. They are the last things the older learner acquires in a foreign language, though one never feels at home with a language until one does acquire them.

effort to discover them, one fixes the equivalents the better in one's memory? If it then prove true that one cannot do without the explanation, it is never too late to receive it, and it will be remembered the better for the stimulus of the long inquiry.

44. Whatever conclusion we come to in this matter, the ungraded presentment does undeniably secure that accessibility shall be proportional to importance. To contrast the unhappy lot of the older learner, who either works with books, or with a compatriot teacher who has learned largely from books, one has only to reflect that a widely-used French dictionary (1920, complete with phonetic spelling of each word) gives the French for *glomerule*, *spurrier*, *omentum*, *giantry*, *gleet*, *stibial*, &c., and does not give any equivalent for *stick down*, *thank you*, *what relation are you to me?* *copy-book*, *coupon*, *it's time to go*. In fact, for the older learner, accessibility of information is *inversely* proportional to its importance.

45. We are now in a position to understand the paradox, so exasperating to the adult, that the native child, however meagre its store of expression, always seems somehow to speak like a native; the adult foreigner, with four times the number of words and of syntactical types, practically never. The child's defects are usually negative, the adult foreigner's mostly positive. The child's language is the core of the native adult's—a reduced photograph—less detail, but the same general shape. The adult foreigner's is a shapeless picture made up of some parts of the original photograph, some excrescences, and many blanks—a book-word here, stiff syntax next, and then a dead halt at one of the commonest words in the language: 'I have seen yesterday ze man of which we had conversed on ze previous day; he stood yonder, near ze...' and he forgets the word *lamp-post*, or quite probably has never met it.

46. The divergencies of children's idiom from that of the adults in their environment is found on close observation to be greater than would at first be supposed; but (a) the expressions, however divergent, are based on the native model, so that they sound comical rather than foreign: 'Look at my good-idea place' (i.e. the place I have so cleverly chosen), 'We played a fun on him' (for 'a trick on him'); (b) the mistakes are similar in character to those one is accustomed to hear from other native children. In a word, the native children speak 'perfectly,' because it is they who fix the standard of permissible divergence!

47 (iv).¹ Nothing but the Right Material.—The child speaks like a native in the negative sense that while it has little English (for example), it has on the other hand practically nothing definitely *un-English* in its speech (see, however, § 46). Even those who see the importance of presenting the commonest elements first often fail to realise that the rarer is not only less useful in itself, but it forms an actual bar to learning the commoner elements; to have the word *enter* in his mind makes it almost impossible for the foreigner ever to get used to saying *go into*.

48. Elements not actually of frequent occurrence take their place in the front rank of frequency when they are the only possible elements to express their meaning; and they do not in that case act as barriers against something more ordinary. Such a noun as *kangaroo* is a common word in this sense, though a child may not hear it once in six months.

49. In preparing linguistic reading-books this should be borne in mind. Careful statistics of frequency in books are useless, of frequency in talk impossible. The only practical guide to a word in

¹ For (v.) see § 40.

the first line of frequency is the instinctive knowledge possessed by everyone, which enables him to say, with extraordinary confidence and almost invariable correctness, 'A child of such and such an age would,' or 'would not understand it.')

50. When we have learned to present the right material, method, important as it is, will be seen to be secondary. To say that no one can learn a language from books is premature. In the present state of the books, no one, except the foreigner learning from Sweet and Palmer, has ever been given a fair chance to try.¹

I. 51. The child learns by sound, not sight. As the visual imagery is probably the strongest in most human beings, this advantage might be questioned. But, apart from the fact that the child probably inherits the inclination to communicate by voice, we have to remember that even the most pictorial writings in existence are secondary to the language of speech. If the spoken words were laborious sound-symbols for original pictures, the case would be altered. As it is, writing, especially of the alphabetical type, is very unsuggestive to the imagination. There is no relationship between the resonance of the sounds and the size of the letters; so that, even in phonetic writing, two such utterly different words as the Russian ['sopstvennoi'] (own) and [søver'jennoi] (perfect) have a certain resemblance, and may be confused by the beginner's eye, which they certainly could not be by his ear.

J. 52. Corrections, if any, are simple and direct; the child is not bothered with the (generally absurd) 'reasons' offered to older learners. Repeated or striking mistakes often cause anger or amusement, and this introduces an emotional association which is much more effective than the formal correction of an instructor.

K. 53. In spite of some recent statements to the contrary, the child starts speaking with isolated words and very small groups. The absence of context and the child's difficulties with the consonants makes these short expressions quite unintelligible, even to those in closest touch with the child, unless at least the vowel-sounds are well imitated. The child starts with a powerful stimulus to pronounce as perfectly as it can. The older learner, with his continuous speech and his ability to pronounce approximately a large number of the consonants, is often understood with the aid of the context, in spite of a very bad pronunciation of all the vowels and of the difficult consonants. To counterbalance the resulting lack of incentive to perfect imitation a careful study of Phonetics (q.v.) is probably indispensable.

Mentality.—A. 54. The child inherits the gregarious instinct, with its passionate craving for communication, and for communication by voice. Though it inherits no gift for a particular language, it is born a language-learning animal.

55. To suggest, as Jespersen does, that the child first cries from pain, and finding this brings its mother, repeats the cry deliberately, is to put the cart before the horse. Many other signs bring the mother hurriedly to the child's cot, but the child does not develop gesticulation till later. As Dr Pritchard (Infants' Hospital, S.W.) expresses it, 'babies cry for the same reason that lambs cry; because they want their mother.' The babies' cry of pain can generally be distinguished from their normal bleating.

B. 56. The child is free from prepossessions. Even with other languages than the first this is true for the youngest children. Having no interest in language *for itself*, they make no comparisons between one language and another.

57. Probably the best way to clear one's head of prepossessions is to read about the nature of

language, and about the structure of the remotest types of languages, and argue oneself into believing, of each language in turn, that it is more rational than any other, particularly than one's own. If Sweet or Jespersen has convinced one that inflexion is a nuisance, take the other view for a change. Make oneself an *advocatus diaboli*; prove that parts-of-speech are a myth, that 'be' is a transitive verb, that the division of sentences into subject and predicate is absurd. After this drill one is prepared, like a child, to accept without demur whatever new characteristic a new language presents. One will not then, for example, like the Edinburgh translators of the Bible, make Gaelic nouns in apposition agree in oblique cases (because they do so in Latin!).

C. 58. The child's experiences have a vividness the adult cannot hope to recover. The adult's experiences, with the exception of falling in love for the first time, and perhaps of food-tastes, lose their keenness by being compared to experiences already passed through.

D. 59. The child is eager without being anxious; it does not distrust its memory (*Ec. and Tr. Mem.*, § 42); is not irritated by failure to remember; does not worry to *improve* its memory (*Ec. and Tr. Mem.*, § 1); does not fatigue its interest. (The older learner, especially the fussy adult, does all these things—except the idle, and they are not eager.)

E. 60. Never having been pressed to say what it cannot say, the child has no reason to fear that the expression which comes to its mind will be incorrect. It speaks boldly; and the boldly and deliberately made mistake clashes more sharply with the resulting laugh or correction. No one is so hard to correct as the hazy pupil.

61. As the child speaks boldly, but not continuously, its behaviour is the happy mean between the diffident and hazy pupil who gives his teacher nothing tangible to deal with, and the talkative one who never gives a pause for correction.

F. 62. The child is naïve; accepts everything as of importance; has not sufficient intellectual power to be selective. (The unintelligent plodder among adults has at least this one quality in common with the child; probably more stupid people succeed in language-learning than in any other activity. Bright minds start with little patience for petty details and irregularities, though they may be brought to see the necessity of attending to them.)

G. 63. The child has an absolutely uncritical reliance on its models. This is not always possible for the intelligent older learner. But at the moment of receiving instruction at any rate, the critical faculty should be in abeyance; childlike eager absorptiveness should be the learner's mood.

H. 64. The child is very sensitive to ridicule; but it is not troubled with the self-consciousness that would make it *anticipate* ridicule—or anger. It is not afraid to talk, and to pester others with questions.

I. 65. The child is drawn to talkative people, and shuns the taciturn.

J. 66. Possibly, as Professor Gilbert Murray suggests, the very young child has considerable telepathic power.

67. When we see the child's case before us, and realise in what qualities and circumstances we can hardly hope to resemble it, there are presented three alternatives: (a) to attempt the revival of its qualities to the utmost of our power (at what risk to our mental condition we do not know); (b) to use such of its gifts as we retain, and supplement them with our adult powers; or (c) boldly to throw over the child-approach, and attempt the study from an entirely adult angle, by the systematic application of rules.

¹ For (v.) see § 40.

68. The choice has been the subject of endless discussion. It is time it were made the object of carefully recorded experiment.

Lingula, a genus of Brachiopoda (q.v.).

Lingula Flags. See CAMBRIAN SYSTEM.

Liniments (from the Latin word *linire*, 'to besmear') may be regarded, in so far as their physical properties are concerned, as ointments having the consistence of oil, while, chemically, most of them are *soaps*—that is to say, compounds of oils and alkalies. In consequence of their slighter consistence, they are rubbed into the skin more readily than ointments. Among the most important of them are: *Liniment of Ammonia*, popularly known as *Hartshorn and Oil*, which is prepared by mixing and shaking together solution of ammonia and olive-oil, and is employed as an external stimulant and rubefacient to relieve neuralgic and rheumatic pains, sore throat, &c.: *Soap Liniment*, or *Opodeldoc*, the constituents of which are soap, camphor, and spirits of rosemary, and which is used in sprains, bruises, rheumatism, &c.: *Liniment of Lime*, or *Carron Oil*, which is prepared by mixing and shaking together equal measures of olive or linseed oil and lime-water; it is an excellent application to burns and scalds, and from its general employment for this purpose at the Carron iron-works has derived its popular name: *Camphor Liniment*, consisting of camphor dissolved in olive-oil, which is used in sprains, bruises, and glandular enlargements, and which must not be confounded with *Compound Camphor Liniment*, which contains a considerable quantity of ammonia, and is a powerful stimulant and rubefacient; and the *Opium Liniment*, which consists of soap liniment and tincture of opium, and is much employed as an anodyne in neuralgia, rheumatism, &c. These are the chief liniments according to the old definition, but the term has gradually come to be applied to tinctures intended for external use. Such are the liniments of aconite, belladonna, cantharides, iodine, &c., which are made by treating the drugs with alcohol, and thus obtaining a concentrated tincture.

Linköping, one of the oldest towns in Sweden, capital of East Gothland and the seat of its bishop, stands $3\frac{1}{2}$ miles S. of Lake Roxen and 142 miles by rail SW. of Stockholm. The Romanesque cathedral, which dates from the 12th century, is one of the finest churches in Sweden. Since 1887 Linköping has had direct communication for vessels with the Baltic, and now exports timber and gilded mouldings. Pop. 28,000

Links. See GOLF.

Linley, THOMAS, English musical composer, was born at Wells in 1732. He first gained a reputation at Bath as teacher of singing and conductor of the concerts in the Assembly Rooms. But in 1775 his son-in-law Sheridan induced him to compose great part of the music for his opera *The Duenna*, and persuaded him to go to London to superintend its performance. In the following year the two, in conjunction with R. Ford, bought Garrick's share of Drury Lane Theatre. During the next fifteen years Linley was musical director

of this theatre, composing numerous occasional pieces and the music of the operas *Gentle Shepherd* (1781), *Carnival of Venice* (1781), *Selima and Azor* (1784), *Strangers at Home* (1786), *Love in the East* (1788), &c. Linley's name stands highest, however, as a composer of music for songs and elegies—it is simple, sweet, melodious, and yet lively. He died in London on 19th November 1795. —Two of his sons inherited his musical talent, THOMAS (1756–78), who possessed real genius and was a friend of Mozart in Italy, and WILLIAM (1767–1835), who composed glees, songs, &c. See Miss C. Black, *The Linleys of Bath* (1911).

Linlithgow, an ancient royal burgh, the county town of Linlithgowshire, lies 16 miles W. of Edinburgh, near the southern shore of Linlithgow Loch, which, 150 feet above sea-level, covers 102 acres, and deepens westward from 10 to 50 feet. On a promontory, 66 feet high, stands the stately ruin of Linlithgow Palace, mostly rebuilt between 1424 and 1633, accidentally burned by Cumberland's troopers. It was the birthplace of James V. and Mary Stuart. The neighbouring parish church of St Michael is a very fine Decorated structure of mainly the 15th and 16th centuries; within its south transept James IV. received the Flodden warning. Another event in Linlithgow's history was the murder of the Regent Moray. The Cross Well (rebuilt in 1807), the town-hall (1668), and the new town-hall (1889) are also noteworthy. Pop. 4000.

Linlithgowshire, or WEST LOTHIAN, a Scottish county, washed on the north for 17 miles by the Firth of Forth, and elsewhere bounded by Edinburgh, Lanark, and Stirling shires. Its length south-westward is 22 miles, its average breadth 7 miles, and its area 127 sq. m. The only large streams are the Almond on the south-eastern, and the Avon on the western boundary; and the principal eminences are Cairnnaple (1016 feet), Cockle-rue (912), Dechmont Law (686), and Glower-o'-er-em (559), the last with a monument to General Adrian Hope, who fell in the Indian Mutiny. The rocks are Carboniferous, with igneous intrusions; and coal has been largely mined since the 12th century, as also are ironstone, fireclay, and shale. Excellent sandstone is quarried at Binny. The soil is generally fertile, except to the south and south-west, where it is moorish or rocky. Towns, noticed separately, are Linlithgow, South Queensferry, Bathgate, Bo'ness, and Broxburn; among the mansions are Hopetoun, Dalmeny, Dundas, and Kinneil; and the antiquities include prehistoric and Roman remains, the Romanesque church of Dalmeny, the castles of Barnbougle, Blackness, Niddry, &c., and the preceptory at Torphichen of the Knights of St John. The county returns one member to parliament. Pop. (1801) 17,844; (1841) 26,872; (1901) 65,708; (1921) 83,962. See Sibbald's *History of Linlithgowshire* (1710), and the 'Cambridge County Geography' by Muir (1912).

Linnaea. See CAPRIFOLIACEÆ.

Linnaeus, CARL, ennobled in 1757 as CARL VON LINNÉ, the founder of modern botany, was born at Råshult, in the Swedish province of Småland, on 23d May 1707. His father, the rector of the parish, destined him for the church. But whilst still a child he showed a passion for flowers. He was sent to school at Wexiö, then passed on to Lund (1727) and Uppsala universities to study medicine; but his real study was botany. In 1730 he was appointed assistant to the professor of botany in Uppsala. The greater part of 1732 was occupied in executing a commission from the Uppsala Academy of Sciences—an exploring trip through Swedish Lapland, the botanical results of which were pub-

lished as *Flora Lapponica* in 1737. His diary of this journey was translated into English and published by Sir J. E. Smith in 1811 as *Lachesis Lapponica*. Then followed a journey of scientific exploration and survey through the province of Dalecarlia. In 1735 he went abroad to take his doctor's degree at Harderwijk in Holland. Passing on to Leyden and Amsterdam, he found encouragement in Gronovius, to whom he showed the MS. of the *Systema Naturæ*, and helpful patronage in Boerhaave, who introduced him to the wealthy Dutch banker, Clifford. Clifford, who had a magnificent garden and greenhouses and botanical collections, employed the young Swede to arrange them for him. It was the autumn of 1737 before he was done with the work. But in the meantime he had paid a visit to England, and published some of his most famous books, such as the *Systema Naturæ*, *Fundamenta Botanica*, *Genera Plantarum*, *Critica Botanica*, in which he expounded his celebrated system of classification, based on differences in sexual characteristics. This system of Linnæus, although intentionally an artificial one, was predominant for a long time in the botanical schools of Europe (see BOTANY). On his way home he was tempted to stay nearly a year at Leyden to help to arrange the botanical garden belonging to the university. Then he paid a flying visit to Paris, where he became acquainted with Bernard and Joseph de Jussieu. On reaching home he practised as a physician in Stockholm for three years with brilliant success. In 1741 he was appointed professor of Medicine and Anatomy at Uppsala, but exchanged this chair for that of Botany in the following year. With this post was combined the directorship of the botanical gardens. During the many years that Linnæus taught botany his fame and his lectures increased the number of pupils attending the university from five to fifteen hundred. The years 1745-46 were marked by the publication of the *Flora Suecica* and *Fauna Suecica*, the latter embodying the results of fifteen years' labour; 1751 by the *Philosophia Botanica*; and 1753 by the appearance of *Species Plantarum*, in which he first fully established the custom of using a second or trivial name in addition to the generic name. Just previous to his appointment as professor he conducted a scientific journey through the islands of Öland and Gothland, in 1746 a similar journey through the province of West Gothland, and in 1749 another in the province of Skåne, of all of which he wrote descriptive accounts in Swedish. Linnæus died on 10th January 1778. See the Swedish Life by T. M. Fries (1903) or its English adaptation by B. D. Jackson (1923).

The LINNEAN SOCIETY was formed in London in 1788, and obtained a royal charter in 1802. Its founder and first president was Sir J. E. Smith, who purchased the books and MSS. and botanical collections of Linnæus after the death in 1783 of the great botanist's son, and from whom they passed into the hands of the society in 1828.

Linnell, JOHN, artist, was born in London in 1792, in 1805 entered as a student at the Royal Academy, and distinguished himself greatly during his course, not only in painting, but in sculpture and engraving. He was a pupil of Benjamin West and Varley, and himself taught drawing to Mary Wollstonecraft Shelley. He painted many portraits of eminent men, as his friend Blake, Malthus, Whately, Peel, and Carlyle. His landscapes were mostly painted from the sweet scenery of Surrey. Of these need only be named 'Harvest Showers,' 'A Coming Storm,' 'Autumn,' and 'The Heath.' Linnell died at Redhill, 20th January 1882. See his Life by A. T. Story (1892).

Linnet (*Linota cannabina*), a common finch, also known as Brown, Grey, Rose Linnet, for there is considerable seasonal change of colour. It is widely distributed throughout Europe, a resident in most parts of the British Isles, a summer visitor to others. It breeds in waste places, building in bushes, especially gorse, not far from the ground.

Linnet (*Linota cannabina*).

The food consists of seeds, berries, insects, buds, and fruit. It sings all the year and is too often caged. Among its British congeners are the Twite, Mountain Linnet or Hill Lintie (*L. flavirostris*), the Lesser Redpoll (*L. rufescens*), the Mealy Redpoll (*L. linaria*). The Green Linnet is *Ligurinus chloris*. See GREENFINCH.

Linoleum. See FLOORCLOTH.

Linotype. See PRINTING.

Linschoten, JAN HUYGEN VAN, Dutch traveller, born at Haarlem in 1563, died at Enkhuyzen in 1611. From 1585 to 1588 he visited India, Africa, China, and the Eastern Archipelago. In a subsequent voyage he witnessed, from a distance, the famous fight between Sir Richard Grenville (q.v.) and the Spanish fleet at Flores, August 1591. Of all these scenes he gives graphic accounts in his 'Diary' containing *Discours of Voyages into the East and West Indies* (Dutch 1596, English 1598; reprinted in 1871).

Linseed, the seed of Flax (q.v.), whence are procured linseed-oil (see OILS) and Oil-cake (q.v.); the seeds being first bruised or crushed, then ground, and afterwards subjected to pressure, sometimes without heat, and sometimes with the aid of a steam heat of about 200° (93.4° C.). *Linseed-oil* has a peculiar and rather disagreeable odour and taste, and, when pure, is colourless. It is chiefly used for making varnishes, paints, &c. Cold-drawn linseed-oil is purer than that in making which heat is applied. By cold expression the seed yields from 18 to 20 per cent., and with heat from 22 to 27 per cent., of oil. Linseed-oil boiled, either alone or with litharge, white-lead, or sulphate of zinc, dries much more rapidly on exposure to the air than the unboiled oil; and *boiled or drying oil* is particularly adapted for many uses.—*Linseed-meal*, much used for poultices, is generally made by grinding fresh oil-cake, but it is better if made by grinding the seed itself.

Lint was the name given to linen cloth or rags when shredded or scraped down so as to form a soft material, suitable for dressing wounds and soaking up discharges. This is now superseded by a cotton cloth specially woven for the purpose, with one side soft and fluffy. See also FLAX.

Linton, SIR JAMES DROMGOLE, water-colour and oil painter, was born in London, 26th December 1840. He laboured with success to elevate the status of his favourite branch of art, painting in water-colours; and in 1883 the Institute of Water-

colour Painters, of which he had been elected a member in 1867, was reorganised, its title being henceforth the Royal Institute of Painters in Water-colours, and its exhibitions being thrown open to everybody, not confined, as hitherto, to members. Linton himself was president in 1884-99, and again from 1909. In 1885 he was knighted. His most successful pictures are those of single figures. He died 3d October 1916.

Linton, WILLIAM JAMES, wood-engraver and author, was born in London in 1812. As a wood-engraver he may be said to be the most artistic who ever lived. Some of his finest work may be found in the pages of the *Illustrated London News*, to which he frequently contributed, from its commencement till he finally went to the United States in 1867. As an author, the zealous chartism of his youth tinged much of his work. Among his various works may be mentioned the *Plaint of Freedom* (1852), *Claribel and other Poems* (1865), several volumes of *The English Republic*, *Some Practical Hints on Wood-engraving* (1879), *Life of Thomas Paine* (1879), *A Manual of Wood-engraving* (1884), *Poems and Translations* (1889), and *The Masters of Wood-engraving* (1890). He died 1st January 1898. See his *Memories* (1895).—His wife, ELIZA LYNN, born at Keswick, 10th February 1822, had published her first novel a dozen years before their marriage in 1858. Together they prepared a volume on *The Lake Country* (1864), he furnishing the illustrations and she the letterpress; in 1867 they separated. Mrs Lynn Linton was an indefatigable worker, and her novels were many; *The True History of Joshua Davidson* (1872) and *The Autobiography of Christopher Kirkland* (1885) are of heavier calibre than the rest. She did a great deal of magazine work, and her 'Girl of the Period' articles in the *Saturday Review* appeared in a collected form in 1883. She died 14th July 1898, and her *Life* by Layard appeared in 1901.

Lintot, BARNABY BERNARD (1675-1736), a famous London publisher, born at Southwater, Sussex, published for Pope, Gay, Farquhar, William King, Fenton, Parnell, Steele, Rowe, and others. In 1715-20 he published Pope's *Iliad*, and in 1725-26 the *Odyssey*.

Linz, capital of Upper Austria, is on the right bank of the Danube, here crossed by an iron bridge 780 feet long, 117 miles W. of Vienna. Population 100,000. A busy commercial place, it has a splendid new Gothic cathedral (1862-1924), the old cathedral church (1670), the bishop's palace, the national museum, &c. It was besieged by the peasants in 1626, and during the war of the Austrian Succession in 1741 and again in 1742. Here peace was signed between the Emperor Ferdinand III. and George Rakoczy of Transylvania in 1645, and in the vicinity Bernadotte defeated the Austrians in 1809.

Liola, the largest instrument of the mandoline family, answering in mandoline bands to the double bass among bowed instruments, is made in Naples.

Lion (*Felis leo*), the largest and most majestic of the Felidae. It is, when mature, of a nearly uniform tawny or yellowish colour, paler on the under-parts; the young alone exhibiting spots like those common in the Felidae. The male has usually a great shaggy and flowing mane; and the tail, which is pretty long, terminates in a tuft of hair. The whole frame is extremely muscular, giving, with the large head, bright-flashing eye, and copious mane, a noble appearance to the animal, which, with its strength, has led to its being called the 'king of beasts,' and given rise to fancies of its noble and generous disposition, having no foundation in reality. A lion of the largest size measures about 8 feet from the nose to the tail, and the tail about 4 feet. The lioness is smaller, has no mane,

and is of a lighter colour on the under-parts. The strength of the lion is such that he can carry off a heifer as a cat carries a rat.

The lion is an inhabitant of the tropical and subtropical regions of Africa and Asia. It was anciently much more common in Asia, and was found in some parts of Europe, particularly in Macedonia and Thrace, according to Herodotus and other authors. The Cave Lion (*Felis spelaea*), whose bones are met with in cave-deposits of England and the Continent, hardly differs from *Felis leo*. The lion is not in general an inhabitant of deep forests, but rather of open plains, in which the shelter of occasional bushes or thickets may be found. The breeding-place is always in some much secluded retreat, in which the young—two, three, or four in a litter—are watched over with great assiduity by

Lion (*Felis leo*).

both parents, and, if necessary, are defended with great courage—although, in other circumstances, the lion is more disposed to retire from man than to assail him or contend with him. When met in an open country the lion retires at first slowly, as if ready for battle, but not desirous of it; then more swiftly; and finally by rapid bounds. If compelled to defend himself he manifests great courage. The lion often springs upon his prey by a sudden bound, accompanied with a roar; and it is said that if he fails in seizing it he does not usually pursue, but retires as if ashamed; it is certain, however, that the lion also often takes his prey by pursuing it, and with great perseverance. The animal singled out for pursuit, as a zebra, may be swifter of foot than the lion, but greater power of endurance enables him to make it his victim. Deer and antelopes are perhaps the most common food of lions. The lion, like the rest of the Felidae, is pretty much a nocturnal animal; its eyes are adapted for the night or twilight rather than for the day. It has a horror of fires and torch-lights; of which travellers in Africa avail themselves, when surrounded by prowling lions in the wilderness by night, and sleep in safety. Lions rapidly disappear before the advance of civilisation. In India they are now confined to a few wild districts; and in South Africa their nearest haunts are far from Capetown and from all the long and fully settled regions.

The mane of the lion, and the tuft at the end of the tail, are not fully developed till he is six or seven years old. The tail terminates in a small prickly, the existence of which was known to the ancients, having been discovered by Didymus Alexandrinus, one of the earliest commentators on the *Iliad*; it was supposed by them to be a kind of goad to the animal when lashing himself with his tail in rage. The prickly has no connection with the caudal vertebrae, but is merely a little nail or

horny cone, about two lines in length, adhering to the skin at the tip of the tail. It has been stated to occur also in the leopard.

There are several varieties of the lion, slightly differing from each other in form and colour, but particularly in the development of the mane. The largest lions of the south of Africa are remarkable for the large size of the head and the great and black mane. The Persian and other Asiatic lions are generally of a lighter colour, and inferior in size, strength, and ferocity to the African lion. Guzerat and the south of Persia produce a somewhat smaller variety, remarkable as being almost destitute of mane.

The lion is easily tamed, at least when taken young, and when abundantly supplied with food is very docile, learning to perform feats which excite the admiration of the crowds that visit menageries. The greatest of lion-tamers, Van Amburgh, died in his bed at Philadelphia, 29th November 1865; still, exhibitions of this kind are not unattended with danger, as too many instances have proved. Lions were made to contribute to the barbarous sports of the ancient Romans; a combat of lions was an attractive spectacle, and vast numbers were imported into Rome, chiefly from Africa, for the supply of the amphitheatre. Pompey exhibited 600 at once.—Lions were kept in the Tower of London from the 13th century till 1834; and one died here in 1770 after seventy years' confinement. They have not unfrequently bred in the menageries of Europe (with particularly good results in the Dublin Zoological Gardens), and a hybrid between the lion and the tiger has occasionally been produced. For the lion in heraldry, see HERALDRY.

Lionardo da Vinci. See LEONARDO.

Lions, GULF OF (*Golfe du Lion*), the large gulf of the Mediterranean on the south of France, extending from the frontier with Spain eastwards to the Hyères Islands.

Lipari Islands, known also as the *ÆOLIAN ISLANDS*, a volcanic group in the Mediterranean, consisting of half-a-dozen larger and numerous smaller islands, with an aggregate area of 116 sq. m., and situated off the north coast of Sicily, north-west of Messina. They rise to 3170 feet above the level of the sea; many of the smaller islands form part of the rim of a gigantic crater. The ancient classical poets localised in these islands the abode of the fiery god Vulcan—hence their ancient name, *Vulcanice Insulæ*. Stromboli (3022 feet) is almost constantly active; Vulcano (1017 feet) is so intermittently; the rest are extinct. Lipari (area, 32 sq. m.) is the most important of the group. The next in size are Vulcano, Stromboli, Salina, Filicudi, Alicudi, and Panaria. The principal products of the islands are grapes, figs, olives, wine (Malmsey), borax, pumice-stone, and sulphur. The warm springs are much resorted to, and the climate is delightful. Lipari, the chief town, is a bishop's see and a seaport. Pop. of commune of Lipari 13,000.

Liparite, an igneous rock, so called from its occurrence in the island of Lipari. It has a wide geographical distribution, and is also known as Rhyolite and Quartz-trachyte. It is a highly acidic rock, and has a glassy base, often more or less devitrified. Throughout this base are scattered quartz, sanidine, plagioclase, and biotite; and other minerals may also be present. The more compact varieties often exhibit spherulitic and fluxion structures, which occasionally impart a kind of laminated or banded aspect to the rock. Liparites are the lava-form or effusive equivalents of plutonic granites.

Lipetzsk, a town in the Russian government

of Tamboff, on the right bank of the Veronezh, a tributary of the Don, and 300 miles by rail SSE. from Moscow, was founded in 1700 by Peter the Great, but only began to flourish at the beginning of the 19th century, when the admirable qualities of its chalybeate springs became known; pop. 20,000.

Lipogram (Gr. *leipō*, 'I leave out,' and *gramma*, 'a letter') is a species of verse characterised by the exclusion of a certain letter, either vowel or consonant. The earliest known author of lipogrammatic verse was the Greek poet Lasus (born 538 B.C.); and it is recorded of one Tryphiodorus, a Græco-Egyptian writer of the same period, that he composed an *Odyssey* in 24 books, from each of which, in succession, one of the letters of the Greek alphabet was excluded. Fabius Clandius Gordianus Fulgentius, a Christian monk of the 6th century, performed a similar feat in Latin. In modern times the Spaniards have been most addicted to this laborious frivolity. Lope de Vega wrote five novels, from each of which one of the vowels is excluded; and several French poets have also practised the trick. See Wheatley's *Anagrams* (1862).

Lipoids. See PHYSIOLOGY.

Lippe, or, as it is generally called, but incorrectly, **LIPPE-DETMOLD**, a small state of northern Germany, lying between Westphalia on the W. and Hanover on the E. The Weser touches it on the N. and the Teutoburger Wald crosses it in the S. Area, 469 sq. m.; pop. 154,000, nearly all Protestants. The capital is Detmold (q.v.); other towns, Lemgo and Horn. The surface is hilly; woods cover about a fourth, and are well cared for. The principal occupation is agriculture, with the rearing of cattle and swine. The products of these callings, with timber, salt, meerschaum pipes, tobacco, and starch, are the chief results of the industrial activity exported. The little country is governed by a Landtag of twenty-one members. The principality of Lippe became a republic in November 1918. The former reigning family was one of the oldest in Germany, and can be traced back to the 10th century. The first who took the name of count of Lippe was Bernhard in 1129. The family split into three branches in 1613—Lippe, Brake, and Schaumburg. The second of these became extinct in 1709. For the third, see **SCHAUMBURG-LIPPE**. See historical works (1847-92) by Falkmann.

Lippi, **FRA FILIPPO**, commonly known as **LIPPO LIPPI**, a Florentine painter, was born in 1412; but, losing his parents whilst still an infant, he was entrusted to the Carmelite friars of Florence when only eight years of age. In the story of his life as told by Vasari there are several romantic incidents; but most of them are now discredited, except that he seduced Lucrezia Buti, apparently a nun of the convent of St Margaret at Prato, and possibly married her. Lippo Lippi, who studied principally Masaccio, painted religious subjects, which he conceived and designed from a human standpoint. His greatest work was done on the choir walls of the cathedral of Prato—illustrations of the lives of John the Baptist and St Stephen. He was busy executing a series of incidents from the life of the Virgin in the cathedral apse at Spoleto when death arrested his hand, about 8th October 1469. Besides these works he painted several Madonnas and altar-pieces, amongst these last one for the nunnery chapel of San Ambrogio, Florence, the subject of Browning's poem. Lippo Lippi had a patron in Cosimo de' Medici. See books by Strutt (1901) and Konody (1911).

His son, **FILIPPINO LIPPI**, was born at Florence about 1457, and educated at Prato. His artistic style has a strong element of originality, but also

shows the influence of his father and Botticelli. His most celebrated frescoes are scenes from the lives of St Peter and St Paul in the Brancacci chapel at Florence (cf. MASACCIO), incidents illustrating the character of St Thomas Aquinas in the Minerva church at Rome, and subjects from the legends of St John and St Philip in Santa Maria Novella at Florence. His best easel-pictures include 'The Virgin and Saints' (in the Uffizi at Florence), 'The Adoration of the Magi' (Uffizi), 'The Vision of St Francis.' Filippino died in April 1504 at Florence.

Lippincott, JOSHUA BALLINGER, an American publisher, was born of Quaker parents in Burlington, New Jersey, in 1816, had charge of a book-seller's business in Philadelphia from 1834 to 1836, when he founded the house of J. B. Lippincott & Co., and by 1850 was at the head of the book-trade in Philadelphia. He died 5th January 1886, and the firm was converted into the J. B. Lippincott Company, the authorised American publishers of the present edition of this work. *Lippincott's Magazine* was established in 1868.

Lippstadt, a town of Prussia, on the river Lippe, 30 miles E. by N. from Dortmund. It has manufactures of iron, &c. Founded in 1168, it was captured by the Spaniards in 1620, and by the French in 1757. Pop. 17,000.

Lipsius, RICHARD ADELBERT, a great German theologian, was born at Gera, February 14, 1830, studied theology at Leipzig, and, after serving there as *privat-docent* and professor extra-ordinary, was called to fill a chair at Vienna in 1861, at Kiel in 1865, and at Jena in 1871. He died 19th August 1892. Lipsius made contributions of the greatest importance to theological science in the fields of dogmatics and the history of dogma, the philosophy of religion, and New Testament exegesis and criticism. In 1875 he founded the *Jahrbücher für Protest. Theologie*. Among his books are *Glaube und Lehre* (1871), *Die Quellen der Röm. Petrus-sage* (1872), *Lehrbuch der Evangelisch-Protest. Dogmatik* (1876), *Die apokryphen Apostelgeschichten und Apostellegenden* (1883-87), and *Philosophie und Religion* (1885).—Of his brothers, JUSTUS HERMANN (born at Leipzig, 9th May 1834) is eminent as a philologist. After teaching at Leipzig, Meissen, Grimma, he became in 1869 extra-ordinary professor of Classical Philology at the university of Leipzig, and in 1877 ordinary professor of the same, and director of the Russian philological seminary. His books are an edition of the *De Corona* of Demosthenes (1876), and of Meier and Schömann's work, *Der Attische Prozess* (1883-85). He also collaborated with Curtius, Lange, and Ribbeck in the well-known *Leipziger Studien*, established in 1878. Their sister MARIE (born at Leipzig, 30th December 1837) made valuable contributions to music and its history, under the pseudonym of La Mara, such as *Musikal. Studienköpfe* (5 vols. 1868-82), *Gedanken berühmter Musiker über ihre Kunst* (1873), *Klassisches und Romantisches* (1892); and translated Liszt's *Chopin* (1880).

Liquefaction of Gases. See GAS AND GASES.

Liqueurs, the very numerous alcoholic preparations flavoured and sweetened with various herbs. *Benedictine*, first made by the monks of that order at Fécamp (and now by a trading concern there), is said to contain lemon-peel, nutmeg, cloves, cardamoms, cinnamon, angelica, hyssop, thyme, arnica, peppermint, besides alcohol. *Aniseed Cordial* contains also coriander and fennel seed. *Kümmel* is made (largely at Riga) with sweetened spirit, flavoured with cumin (Ger. *Kümmel*) and caraway seeds, the latter usually so strong as to conceal any

other flavour. *Maraschino* is distilled from cherries bruised, but, instead of the wild kind, a fine delicately-flavoured variety called *Marazques* is used in Dalmatia. *Noyau*, or *Crème de Noyau*, is a sweet cordial flavoured with bruised bitter-almonds. *Peppermint* is usually sweetened gin, flavoured with essential oil of peppermint. *Chartreuse*, *Curacao*, and *Kirschwasser* have separate articles. *Vermouth* is alcoholised white wine, aromatised with worm-wood, gentian, angelica, germander, and oranges. *Cherry Brandy* and *Sloe Gin* are sweetened spirits flavoured with cherries and sloes.

Liquidambar, a genus of the order Hamamelidaceæ. They are tall trees, remarkable for their fragrant balsamic products. *L. styraciflua*, the American Liquidambar, or Sweet Gum tree, is a beautiful tree with palmate leaves, a native of Mexico and the United States. It grows well in the milder parts of Britain. Its wood is of a hard texture and fine grain, and makes good furniture. From cracks or incisions in the bark a transparent, yellowish balsamic fluid exudes, called *Liquid Liquidambar*, *Oil of Liquidambar*, *American Storax*, *Copalm Balsam*, and sometimes, but erroneously, *White Balsam of Peru*. It gradually becomes concrete and darker coloured. Its properties are similar to those of storax. That of commerce is mostly brought from Mexico and New Orleans. *L. orientale*, a smaller tree with palmate leaves, is a native of the Levant and of more eastern regions, and yields abundantly a balsamic fluid, which has been supposed to be the *Liquid Storax* imported from the Levant; but on this point there is a diversity of opinion. See *STORAX*. *L. Altingia*, the *Rassamala* of Java and other Malay islands, is a mighty tree, towering over most others. The leaves of *L. formosana* nourish a silk-worm producing a strong, coarse silk.

Liquidation, the winding-up of any business, but applied more particularly to joint-stock companies. The liquidation of insolvent firms is treated under *BANKRUPTCY*; that of registered companies is regulated by the Companies Acts, which provide three modes of liquidation: (1) by the court, (2) voluntary, and (3) subject to the court's supervision. Compulsory liquidation may be ordered on petition by a creditor or contributory; voluntary liquidation may be resolved upon by an extraordinary or a special resolution of the shareholders; and a supervision order may on petition and cause shown be pronounced in a voluntary liquidation.

In any case the liquidation is conducted by a *liquidator*, who in court liquidations is appointed by the court and called 'official liquidator', but in voluntary liquidation is chosen by the shareholders. The liquidator's duty is to wind up as speedily as possible, but he may carry on the business temporarily should that appear necessary for a favourable realisation. He must also prepare a list of contributories, if the capital is not fully paid up or the company is unlimited. This list, which is made up from the register of shareholders, consists of members in their own right and those liable as representatives of others. In addition to these, there is a list (B) of those who have been members within a year of the winding-up and who are liable, if the existing members are unable to satisfy the necessary contribution. They can only, however, be called upon to contribute in respect of unpaid debts incurred before they ceased to be members. A contributory cannot set off a debt due to him by the company against calls by the liquidator so long as any creditors remain unpaid. The claims are ranked and adjudicated upon very much as in bankruptcy, and the surplus, if any, is divided among the shareholders. Unregistered companies, except railway companies incorporated by act of parliament, may

be wound up under the provisions of the Companies Acts.

Liquids. See articles on Boiling, Capillarity, Cohesion, Diffusion, Evaporation, Fluid, Heat, Hydrodynamics, Hydrostatics, Matter, Melting-point, Osmosis, Solution, Spheroidal Condition, Surface-tension, and Viscosity.

Liquorice (*Glycyrrhiza*), a genus of perennial herbaceous plants of the natural order Leguminosæ, sub-order Papilionaceæ, having long, pinnate, sweet roots, and generally creeping root-stocks; pinnate leaves of many leaflets, and terminating in an odd one; flowers in spikes, racemes, or heads; a 5-cleft, 2-lipped calyx, and a 2-leaved keel. The ancient Greek name, now the botanical name, signifies *sweet root*, and from it, by corruption, liquorice and other modern names are derived. The roots of liquorice depend for their valuable properties on a substance called *Glycyrrhizine*, allied to sugar, yellow, transparent, uncrystallisable, soluble in both water and alcohol, and forming compounds both with acids and with bases.

They are a well-known article of materia medica, and were used by the ancients as in modern times, being emollient, demulcent, very useful in catarrh and irritations of the mucous membrane. — The roots of the Common Liquorice (*G. glabra*) are chiefly in use in Europe. The plant has stems 3 to 4 feet high, and racemes of whitish violet-coloured flowers. It is a native of the south of Europe and of many parts of Asia, as far as

Liquorice (*Glycyrrhiza glabra*):
a, root.

China. It is cultivated in many countries of Europe, chiefly in Spain, and to some extent at Mitcham in Surrey and at Pontefract in Yorkshire. The roots are extensively employed by porter-brewers. They are not imported into Britain in considerable quantity, but the black inspissated extract of them (*Black Sugar* or *Stick Liquorice*) is largely imported from the south of Europe, in rolls or *sticks*, packed in bay-leaves, or in boxes of about 2 cwt., into which it has been run. Liquorice is sometimes used in the manufacture of sweet tobacco. Liquorice is propagated by slips; and after a plantation has been made almost three years must elapse before the roots can be dug up for use. The whole of the roots are then taken up. The plant is propagated by cuttings of the root-stocks. — The roots of the Prickly Liquorice (*G. echinata*) are used in the same way, chiefly in Italy and Sicily, Russia, and the East. — The only American species is *G. lepidota*, which grows in the plains of the Missouri.

Liquor Laws. — Civilised communities have for centuries recognised that the unfettered common sale of alcoholic liquors could not, in view of the social consequences of such sale, be permitted. Liquor legislation has, therefore, provided for total prohibition of such sale as the general rule with exceptions — in the form of licences — to meet the supposed needs of the community. Formerly such

exceptions have usually been granted by the local authority, but during the last hundred years in English-speaking and Scandinavian countries the people have in not a few countries claimed and secured the right of deciding by their direct votes on this important matter, and the United States has gone so far as to refuse to permit any such exceptions.

Newfoundland (population, 259,000). — Total prohibition of the manufacture and importation of alcoholic liquors came into operation in 1916; but owing to the difficulty of enforcing the law on her long coast-line, the proximity of the French Island of Miquelon, and of the United States and Canada, the law has been badly enforced, and has been repealed in favour of Government sale.

Canada (population, 8,788,000 in 1921). — The manufacture, export, import, and inter-province transport of liquor is under Dominion jurisdiction; only the regulation or prohibition of sale is left to the provinces; but a province where Prohibition of Sale is in force may require the Dominion Government to take a provincial referendum for or against importation into the province, and if such importation is not desired the Dominion Government prohibits it. A prohibition province cannot, however, in any way stop brewing and distilling in its midst under Dominion Licence.

Quebec (population, 2,361,000). — In Quebec many areas have, under the Canada Temperance Act, voted out the common sale of liquor. In other areas, which include the large towns, liquor is sold by, or by licence from, the Quebec Liquor Commission under the Alcoholic Liquor Act 1921. Spirits are sold — but in bottle only — by the Commission; one bottle being purchasable at a time, but the number of purchases being unlimited. Beer is sold under licence, the brewers paying 5 per cent. of the price to the Commission; there is no limitation on quantity. In Montreal, with a population of 650,000, there are over 950 drink-shops. Liquor is freely advertised by the Commission and the brewers, and production and consumption of liquor are on the increase. The Commission shows a large profit. There is much dissatisfaction with the social results.

Ontario (population, 2,934,000), after a long experience of Local Option, is now under Provincial Prohibition under the Ontario Temperance Act, 1916, and, by referendum, secured the Prohibition of Importation in 1921 by a majority of 166,835. In 1919 it rejected a proposal to repeal the O.T.A. by 423,508 or 68 per cent. of the votes cast. On 23d October 1924, however, a referendum was taken on the alternatives, (1) Maintenance of the Act, or (2) Government sale in sealed packets. The province voted for the Act by about 38,000 majority, but majorities in favour of Government sale were given in the larger cities.

Manitoba (population, 610,000). — In 1916 Manitoba voted Prohibition by a majority of 24,000 or 65 per cent., and in 1920 voted Prohibition of Importation. In 1923 it reversed these decisions, and by a majority of 40,000 voted for Government sale, while rejecting by 38,000 a proposal for the sale of beer in hotels. Government sale is not set up in areas where there is a strong local objection.

Alberta (population, 588,000). — Provincial Prohibition was in operation from 1915, and Prohibition of Importation from 1920, but in November 1923 Government sale of all liquors was voted by a majority of 60 per cent.

Saskatchewan (population, 758,000), after being under the Dispensary system, voted Provincial Prohibition in 1916 by 95,249 to 23,666, and in 1920 voted Prohibition of Imports by 31,690. In July 1924, however, it voted for Government sale by a majority of about 20,000.

British Columbia (population, 525,000).—War-time Prohibition was carried during the war, but soon rejected in favour of Government sale of liquor in sealed packages. There is widespread dissatisfaction with the system, and the Government admits that the illicit sales equal those by the Government.

New Brunswick, Prince Edward Island, Nova Scotia (population, 1,009,000).—Provincial Prohibition and Prohibition of Importation are in operation in these provinces, though they are finding difficulties in enforcement owing to their maritime position.

Speaking generally Prohibition has not had a fair trial in Canada owing to the refusal of the Dominion Parliament to grant provincial self-government in the matter of the manufacture and export of liquor.

Australia (population, 5,715,000).—The Commonwealth Parliament fixes the rates of duty on liquor, and controls the traffic in the Federal territories. The States have full control over the manufacture and sale of liquor within their borders. The capital (Canberra) is under Prohibition, and there is 6 o'clock closing in every State.

New South Wales (population, 2,198,000).—From 1906 to 1919 Local Option was in force, but the majority required was 60 per cent., and was not secured, and no vote was taken after 1913. A State Referendum will be taken in 1923, and every five years thereafter, but the vote will not be operative until 1930, and compensation is payable by the State.

Victoria (population, 1,615,000).—The State has been under licence with Local Option. In 1922 Local Option was abolished, and a State-wide Referendum by 60 per cent. majority is to be taken in 1930, and every 8 years afterwards.

Queensland (population, 811,000).—In 1912 a Local Option law was passed, the options being for Progressive Reduction, for Prohibition (taken in 1925), and Increase. Prohibition requires a 60 per cent. vote.

South Australia (population, 519,000).—Local Option was introduced in 1891, but postponed until 1906. Each electorate is a Local Option district. The law is practically inoperative.

Western Australia (population, 351,000).—Local Option was introduced in 1911, but the first general poll was taken in 1921 when four issues—Continuance, Increase, Reduction, and No-licence—were submitted in 42 districts. No-licence required a 60 per cent. majority, which must be 30 per cent. of the electorate. Reduction was carried in 10 areas: the 'Trade' vote being 39,875; and anti-Trade, 38,242. State-management of hotels was carried at this poll by 28,910 to 24,938. The Licensing Amendment Act, 1922, provided for a State poll in 1925, 1930, 1935, &c. for or against Prohibition. A 60 per cent. majority with 30 per cent. of electorate is required.

Tasmania (population, 213,000).—A Local Option law on the issues Continuance or Reduction is in force, but is practically inoperative.

New Zealand (population, 1,219,000).—The policy of Local Option, under which 12 areas voted No-licence, and are still under No-licence, was changed in 1911 in favour of a National Prohibition Referendum. In that year the poll showed: For Prohibition, 259,943 (55.8 per cent.) Against, 205,661 (44.2 per cent.), but as a 60 per cent. majority was required Prohibition was not secured. In April 1919 a special poll showed:

Prohibition, with Compensation . . .	253,827
Continuance . . .	264,189

In December 1919 and 1922 further polls were taken, and again in 1925:

	1919.	1922.	1925.
Prohibition, without } Compensation	270,250	300,792	291,388
Continuance . . .	241,251	282,669	268,425
State Control . . .	32,261	35,727	50,949

The Union of South Africa (population: white, 1,520,000; coloured, 5,410,000).—The Liquor Laws are based on English law and custom. A local Licensing Authority grants and renews licences, but generally speaking the localities can theoretically express themselves by petition against grants and renewals, though in practice the difficulties are so great as to prevent any real control. The South African Parliament, which now controls liquor legislation, has discussed a Local Option measure on three occasions, with the following results:

In 1917, 26 for, 57 against...majority 31.

In 1923, 41 for, 50 against...majority 9.

In 1924, 51 for, 53 against...majority 2.

INDIA. — 1. *British*. — Liquor is sold under licences which are auctioned by the Government. In 1874-75 the liquor revenue was £1,561,000; in 1901-2, £4,015,000; in 1922-23, £12,282,000; the average liquor revenue being 23.5 per cent. of the total revenue of India. At the present time the questions of Prohibition and Local Option are under consideration in the various presidencies and provinces, and is in operation in the Punjab in a somewhat imperfect form. Government Committees in Bombay and Burma recommend Local Option.

2. *Bhopal and Kathiawar* are under Prohibition. Prohibition legislation is under consideration in most parts of India.

Ceylon is under Local Option with 60 per cent. majority, but on 10th November 1921 a resolution was passed by the Legislative Council in favour of 'total prohibition within a reasonable time.'

The United States, after experimental State legislation of many kinds, on the 16th January 1920 put into operation National Prohibition of the manufacture, sale or transport of intoxicating liquors within, the importation thereof into or the exportation thereof from the United States and all territory subject to the jurisdiction thereof, for beverage purposes. This was carried out by the Eighteenth Amendment of the Federal Constitution.

Such amendment required a two-thirds vote in both Houses of Congress and was adopted by the House of Representatives by 282 to 128; and by the Senate by 65 to 20. It required ratification by the legislatures of three-fourths (36) of the States within seven years, but in fact was ratified by 36 States by 16th January 1919 within thirteen months, and by 46 out of the 48 within eighteen months, and came into force on 16th January 1920. The total votes in the lower houses of the State Legislatures which ratified were 3782 for, and 1035 against, or 78.5 per cent. majority; in the Senates, 1310 for and 237 against, or 84.6 per cent. majority. The Constitution of the United States does not provide for a Referendum, but the Congress which submitted the Amendment, and the Legislatures which ratified it, were chosen by the electors of the various States. The Nineteenth Amendment, granting the franchise to women, was not passed until after the Prohibition Amendment.

The National Prohibition Act, commonly known as the Volstead Act, was passed on 27th October 1919 over the veto of President Wilson as 'appropriate legislation' for the enforcement of Prohibition. Intoxicating liquor was declared to include all alcoholic liquors intended for beverage purposes which contain one-half of 1 per cent. or more of alcohol by volume. This percentage was many years ago adopted at the instance of the Trade as

a means of preventing the bootlegger from competing with the licensed dealer. Both the Federal Government and the individual States have concurrent power to enforce the Act, and nearly all the States have passed special measures for this purpose.

The validity of Prohibition was challenged in 1920 in a number of test cases, but the Supreme Court of the U.S.A. declared for the validity of the Amendment, and also of the Volstead Act.

No compensation has been payable under Prohibition. As long ago as 1887 the Supreme Court decided that prohibitory legislation merely prevented a man from using his property to the detriment of his neighbours, and therefore simply put him on the same footing as the rest of the community.

The Prohibition Law, strictly construed, prevented Atlantic liners from bringing their ships' liquor stores within three miles of the United States, but under a series of treaties with England and other countries in 1924, the right of searching vessels suspected of smuggling has been extended beyond the three-mile limit to such distance as the suspected vessel can traverse in one hour, while the privilege has been given to foreign ships to bring their liquor stores within the three-mile limit provided they are sealed up. American ships cannot, of course, carry liquor at all.

In *Austria, Hungary, Yugoslavia, Rumania, Czechoslovakia, and Germany* legislation in reference to alcoholic liquors is under revision. The tendency is in the direction of increased restriction, and Local Option is receiving special consideration.

In the *Baltic States, Esthonia, Latvia, Lithuania, and Poland*, various schemes of liquor legislation are under consideration, but there has been no definite legislation. The rival claims of Local Option and State Control are under official consideration.

Belgium in 1919 prohibited the sale of spirits for on-consumption, but the consumption of wine and beer was not included, and is still very heavy, and under the system of licence prevailing there is practically free sale of these liquors.

In *France* the production of liquor is subject to certain restrictions, but a wide liberty of production is given to householders for domestic consumption. In 1922 the persons who enjoyed this privilege, called *bouilleurs de cru*, numbered no fewer than 1,846,000 persons. During the war the manufacture of absinthe was prohibited, and this is still maintained, but with some laxity. Licences for the sale of liquor are issued primarily for the purpose of excise, but the 'préfets' and mayors in towns and counties have certain rights of supervision as to the number of licences to be issued. The credit sale of spirits for consumption on or off is prohibited. No female servants under 18, other than members of the family, are allowed to serve upon on-licence premises, and the sale of liquor to young persons under 16 is prohibited.

Denmark.—Consultative Local Option has been in force in Denmark since 1909, but in 1924 Parliament adopted a new Licensing Law giving the right of direct Local Option.

Holland.—A Bill for the prohibition of spirits has passed the Second Chamber by a substantial majority, but is not likely to be carried through the First Chamber.

Finland is under Prohibition, but considerable difficulties have been found in enforcement owing to the smuggling of liquor by its neighbours. The Finnish Parliament is, however, determined to maintain the law.

Iceland.—Prohibition, which came into force on 1st January 1915, is still in operation, with the exception that the Spanish Government has com-

pelled Iceland to take a certain quantity of Spanish wine on pain of closing her ports to the sale of fish, which is Iceland's staple industry.

Norway declared by popular vote for the prohibition of distilled liquors and of wine containing more than 12 per cent. alcohol. Owing to the economic pressure brought by France, Spain, and Portugal upon the Norwegian Government, it was compelled to lift the prohibition of wines containing up to 21 per cent. alcohol. Local veto prevails through almost the whole of rural Norway, but the sale of beer and wines is permitted in the towns under the 'Samslag' or Company Management.

Sweden.—A referendum on National Prohibition took place on 27th August 1922, and the result was: 889,028 for Prohibition; 924,874 against Prohibition. Of the men voting, 40 per cent. were for Prohibition; but of the women, 58 per cent. for Prohibition; and taking the country as a whole, the women's vote gave a majority for Prohibition of approximately 135,000. Local Option prevails through the greater part of the rural districts, and in the towns the trade is carried on by the Gothenburg system regulating the on-sale of alcoholic liquors, and the Bratt ration card system regulating the off-sale.

Russia.—The complete prohibition in force during the War has been reduced to prohibition of spirits only, and is now said to be even entirely abolished and a system on the lines of the old monopoly has taken its place.

Switzerland.—In 1921, 160,000 Swiss citizens requested the Government to submit a referendum in favour of Local Option, but no step has as yet been taken. Free distillation of fruits is allowed. Absinthe is prohibited. The general sale is under licence.

Italy.—The Liquor Traffic is carried on under excise licence. M. Mussolini's Government is contemplating legislation to raise to 1000 the proportion of inhabitants to one public house from the proportion of 500 under the law of 1913.

Spain and Portugal have practically free trade in liquor under excise licence.

Lira (Lat. *libra*). See FRANC, PIASTRE.

Liriodendron, or TULIP-TREE, a genus of Magnoliaceæ. *L. tulipifera*, a beautiful tree with a stem sometimes 100 to 140 feet high and 3 feet thick, with a grayish-brown cracked bark, and many gnarled and easily broken branches, is a native of North America from Ontario to Massachusetts, and from Wisconsin to the Gulf of Mexico, but wanting in the Pacific states. The leaves are roundish, ovate, and three-lobed, the middle lobe obliquely truncated. The flowers (greenish-yellow marked with orange) are solitary at the extremities of the branchlets; they resemble tulips in size and appearance. The bark has a bitter, aromatic taste, and, like that of all the Magnoliaceæ, contains a bitter principle, called *Liriodendrin*, which has been used as a substitute for quinine in fevers. The tulip-tree is one of the most beautiful ornaments of pleasure-grounds wherever it grows, and flowers well—in

Tulip-tree
(*Liriodendron tulipifera*).

Britain, however, only in the southern parts. It does not flower freely till the tree is from twenty to thirty years of age. It is now plentiful in many parts of the south of Europe. In some parts of the basin of the Mississippi it forms considerable tracts of the forest. The heart-wood is yellow, the sap-wood white. The timber is easily wrought, takes a good polish, and is much used for many purposes. The American Tulip-tree was the only species known till the discovery lately of the Chinese *T. chinense*. It is a somewhat smaller tree, known in Kiang-si by a name signifying 'goose-foot,' from the shape of its leaves.

Lisbon (Port. *Lisboa*), capital of Portugal, stands on the northern shore of the Tagus (*Tago*), at the shoulder of its bottle-shaped bay—an expansion of the river—and 9 miles from the river's mouth; it is 412 miles by rail WSW. of Madrid. The city extends for some 7 miles along the shore, and climbs up the slopes of a low range of hills, occupying a site which for imposing beauty is surpassed by only two cities in Europe—Constantinople and Naples. The oldest part is that which escaped the earthquake of 1755; it lies on the east, round the citadel, and consists of narrow, intricate streets, not over clean. It is still known by its Moorish name of Alfama. The western portions were built after the earthquake, with wide and regular streets, fine squares, and good houses. The summits are mostly crowned with what were formerly large monasteries, now dissolved. The cathedral of the 'patriarch,' built in 1147, restored after 1755, has a Gothic façade and choir; its interior is gloomy. The large church of St Vincent contains the tombs of the former royal (Braganza) family. The church of Estrela has a dome of white marble, and is a reduced copy of St Peter's at Rome. In San Roque is a chapel thickly encrusted with mosaics and costly marbles; it was first erected in Rome, and consecrated by the pope saying mass in it, before it was set up in Lisbon. But the finest structure in the city is the monastery and church of Belem, a monument to the great seamen of Portugal; it was begun in 1500 on the spot from which Vasco da Gama embarked (1497) on his momentous voyage. It is constructed for the most part in the Gothic style, with an abundance—a superabundance—of decorative ornament, and has magnificent cloisters. Inside the church are new tombs (1880) to Camoens and Vasco da Gama, and the grave of Catharine, wife of Charles II. of England. The monastery is now used as an orphanage and foundling hospital. Neither of the royal palaces, that of the Necessities, or that of Ajuda at Belem, possesses features of great interest. A fine square facing the bay is surrounded with government offices, the handsome custom-house, and the marine arsenal. The arts and sciences are not in a flourishing condition, notwithstanding the existence of a university, an academy of sciences (1779), with a library, an academy of arts, a polytechnic school, a medical school, a conservatory of music, a public library of half a million vols. and 16,000 MSS., natural history and other museums, two observatories, &c. There are also a military arsenal, a mint, a large lazaretto, a military and a naval school, &c. A magnificent aqueduct, completed in 1738, brings water to the city from springs 14 miles to the north-west. It withstood the shock of the great earthquake, although it crosses a valley 263 feet above its lowest point, and on thirty-five arches, the longest 110 feet. In the cemetery of the English church Fielding was buried in 1754. The population of the city was 246,343 in 1878; but the municipal boundaries were enlarged in 1885 so as to include Belem and other suburbs, and in 1923 the population was 486,372. A series of

forts protect the seaward approaches to the city. The harbour is one of the finest in the world, deep, well sheltered, and large enough to hold all the ravies of Europe. Much of the trade is with the Portuguese colonies—such imports as cocoa, coffee, and india-rubber coming thence. But the trade of Lisbon is small compared with what it was in Portugal's palmy days. The most important industries are in gold and silver wares and in jewellery; next come cotton-spinning and weaving, the manufacture of silk, hemp, chemicals, hats, boots, tobacco, soap, cutlery, and stoneware, and iron-founding.

Lisbon is a contraction of Olisipo, the name by which the place was known when it was the capital of the Lusitanians; it was also sometimes called Ulyssippo, to connect it with a myth about Ulysses. From the Romans it passed to the Goths, and from them was wrested by the Moors in 716. They called it El-Oshbuna, and kept their hold of it down to 1147, when Alphonso I. of Portugal seized it with the help of English, German, and Flemish crusaders. In 1373 the city was captured and in great part burned by the Castilians, who again laid siege to it eleven years later, but without success. It was made the capital of the kingdom by John I. in 1422. In 1580 it was seized by Alva for Philip II. of Spain; and it was from this port that the 'invincible' Armada set sail. When the Duke of Braganza roused his countrymen to shake off the Spanish yoke (1640), he recaptured Lisbon, and once more it was made the capital. But the city was doomed to misfortune: it had been three times taken from the Moors by the Christians previous to 1147, it had suffered from a severe earthquake in 1344, and had been visited by the plague in 1348; but the greatest disaster overtook it on 1st November 1755, when, in less than ten minutes, the greater part of the city was made a heap of ruins, from 30,000 to 40,000 persons were killed, and damage done to the extent of nearly 20 millions sterling—one of the greatest earthquake convulsions on record, the shock being perceptible in one direction as far as Scotland, in another at Mitylene in Asia Minor, and in a third at Fez in Morocco. The French were in possession of the city for ten months during 1807-8. The tale of Lisbon's misfortunes was completed by a series of military revolts during the second quarter of the 19th century, especially in 1831, and by a bad attack of yellow fever in 1859. St Antony of Padua, Camoens, and Pope John XXI. were natives of Lisbon.

Lisburn, a market-town of Antrim (till 1898 partly in Down), on the Lagan, 93 miles by rail N. by E. of Dublin and 8 SW. of Belfast. The importance of the place is due to the Conway family, who built a castle here in the time of Charles I. and introduced the existing industries. It is a clean and well-ordered town, and manufactures linens, damasks, muslins, &c., and has flax-spinning and bleaching. Its parish church is the cathedral of Down, Connor, and Dromore, and contains a monument to Bishop Jeremy Taylor, who died here in 1667. There is a well-equipped technical school. Pop. 12,000.

Lisieux (ancient *Noviomagus Lexoviorum*), a town in the French department of Calvados, 30 miles by rail E. by S. of Caen. In the church of St Pierre (1045-1233; a cathedral down to 1801), Henry II. of England married (1152) Eleanor of Guienne. Lisieux is the centre of an extensive manufacture of coarse linens (*cretonnes*, from the original maker), woollens, flannels, and cottons, and has a trade in agricultural products. The population is 15,000. Four miles distant is Val Richer, where stood the abbey of which Thomas

Becket was first abbot, the ruins of which were made into a summer residence for Guizot.

Liskeard, a municipal borough in Cornwall, stands on steep hills overlooking the Looe, 18 miles WNW. of Plymouth. It is chiefly an agricultural town. St Martin's church, Perpendicular in style, restored in 1879, is one of the largest in Cornwall, and has a tower (1902) incorporating parts of its 14th-century predecessor. The town-hall (1859) is a good Italian building. A stannary or coinage town, Liskeard was made a free borough in 1250 by Richard, king of the Romans, who built a castle there. Till 1832 it returned two members (Coke and Gibbon the most illustrious), and then till 1885 one. Pop. 4000. Two miles south is the spring of St Keyne (q.v.).

Lisle, ALICIA, the aged widow of one of Cromwell's lords, was beheaded at Winchester on 2d September 1685 for having sheltered one Nelthrop, a rebel fugitive from Sedgemoor. Thirty-six years before, at Charles I.'s execution, she had said that her 'blood leaped within her to see the tyrant fall.'

Lisle. See ROUGET DE LISLE.

Lismore, a town on the Blackwater, in Ireland, in the county of Waterford, 43 miles SW. of Waterford city. The cathedral, the parish church since the see was united to Cashel, was rebuilt in 1663, on the site of a monastery founded before 540, a celebrated school of learning from 635 till its destruction by the Danes in 833. The castle, originally founded by John Lackland in 1185, was the residence of the bishops till the 16th century. In 1857 it was given to Sir Walter Raleigh, who sold it to the 'great' Earl of Cork, and in it his son, Robert Boyle (q.v.), was born. It was twice besieged during the Great Rebellion, and on the second occasion (1645) it yielded to the Parliamentary forces. In 1753 it passed to the Duke of Devonshire. Lismore returned two members from Charles I.'s reign to the Union. Pop. 1500.

Lismore (Gael. 'great garden'), an island of Lorn, Argyllshire, in Loch Linnhe, about a mile from the mainland, and 8 miles N. of Oban. It rises to 417 feet, and is 10½ miles long, 1½ miles broad, and contains several interesting remains—the choir of the cathedral (1236) of the pre-Reformation diocese of Lismore or Argyll (since 1749 used as the parish church); Achanduin Castle, the residence of the bishops; and Castle-Rachal, a Scandinavian fort. See also GAELIC LANGUAGE.

Lissa (Pol. *Leszno*), a town of Poland, 40 miles S. by W. of Posen, was during the 16th and 17th centuries the headquarters of the Bohemian Brethren in Poland. It is now a place of 16,000 inhabitants.

Lissa (Serb. *Vis*), an island of Dalmatia, 32 miles SW. of Spalato. It was held by Britain in 1810-15. Off it the Italian fleet was defeated by the Austrians in 1866.

Lissajous' Figures. See SOUND.

List, FRIEDRICH (1789-1846), was born at Reutlingen in Württemberg, the son of a tanner, was for a time in the public service and a professor of Economics at Tübingen, but was too outspoken for the government, and withdrawing to America, acquired wealth through a coal-mine. He was for a time (1833) U.S. consul at Leipzig, and zealously promoted railways and manufacturers' associations in Germany. His 'National System' of political economy took form in 1841; in a paper he established he advocated a national German commercial system and a national fleet, and failed to carry through a scheme for a commercial union between Germany and Austria. Depression led to insanity and suicide. He taught that every nation should aim to develop all its resources, so as to be as far

as possible independent of the rest of the world. Protection (q.v.) is necessary for a country till it has developed its industry and commerce. Free trade is good only if all nations practise it reciprocally, but is the goal to which all nations should tend. His teaching justified protection in the British colonies, and has often been cited in tariff reform controversies. His *National System of Political Economy* was translated, and appeared in a new edition in 1904. There are Lives by Goldschmidt (1878), Jentsch (1901), and Miss M. E. Hirst (1909).

Lister, JOSEPH, LORD, was born of Quaker stock at Upton, Essex, 5th April 1827, the son of the London wine merchant and microscopist Joseph J. Lister, F.R.S. (1786-1869), and studied at London and at Edinburgh under Syme. He was professor of Surgery successively at Glasgow (1860-69), Edinburgh (1869-77), and at King's College, London (1877-93). His observations on the coagulation of the blood, on inflammation, and on suppuration (basing on Pasteur's researches) led to his great achievement, the introduction of the Antiseptic (q.v.) system, which revolutionised modern surgery. He made his first successful experiments with carbolic acid at Glasgow in 1865, published these in 1867, and carried them out more fully in Edinburgh and London; and the transition from antiseptis to asepsis was but the development of the doctrine and method he had established—'the greatest triumph of modern surgery,' as it has been justly called. He was said to have saved more lives than the 19th century wars had cut off. He held many doctorates and honours, native and foreign; was P.R.S. from 1895 to 1900; became a baronet in 1883; and, the first surgeon to be thus honoured, a baron in 1897. He died 10th February 1912. See Life by Godlee (revised 1924).

Liston, JOHN (1776-1846), low comedian, played from 1805 to 1837 at the Haymarket, Drury Lane, and the Olympic. 'Paul Pry' (1825) was his most popular creation.

Liston, ROBERT (1794-1847), born at Ecclesmachan manse, near Linlithgow, studied at Edinburgh and London. At Edinburgh, as surgeon and lecturer, he acquired a European reputation; and in 1835 he was called to the council of University College, London. His most important works are *Elements of Surgery* (1831) and *Practical Surgery* (1837). His uncontrollable temper involved him in quarrels with his professional brethren.

Liszt, FRANZ, pianist and composer, was born at Raiding, in a German-speaking district of Hungary, on October 22, 1811. His father, Adam Liszt, steward of Prince Eszterházy's estates, had himself musical gifts, and guided the precocious talents of his son with great judgment. At the age of nine Franz played in public at Oedenburg, and afterwards at Presburg, when several Hungarian noblemen offered the means for his education, and he was taken to Vienna, where he studied under Czerny and Salieri. On December 1, 1822, he appeared at a concert there, and the audience were in raptures with his playing; April 13, 1823, was the date of a memorable concert, after which Beethoven ascended the platform and kissed the boy—a reminiscence to which he always alluded with veneration. He proceeded to Paris, and, though admittance to the Conservatoire was denied by the inflexible Cherubini, he continued his studies under Paer and Reicha. He soon became a favourite in Paris salons, and made a tour to Vienna, Munich, Stuttgart, and Strasburg, with unmistakable success. He visited England thrice in 1824-27, but met with scarcely so much appreciation. In 1827 his father died, and he entered on a great mental struggle. He was repelled by the

then low estate of musical art and artists, and his strong religious feelings drew him towards the church. He was also fascinated by Saint Simonianism, and at intervals the attractions of the world influenced him strongly. In 1831 he heard Paganini, and was fired by the resolve, which he carried to triumphant issue, to become the Paganini of the pianoforte. He became intimate with most of the great *littérateurs* then in Paris, more especially with Lamennais, Lamartine, Victor Hugo, and George Sand, who exercised a marked influence upon him, as did also Chopin. From 1835 to 1845 dates his relationship with the Countess d'Agoult (q.v.), known in literature as Daniel Stern, who bore him three children, one of whom, Cosima, became the wife of Von Bülow, and subsequently of Richard Wagner. The enthusiasm which his playing excited in Paris, as elsewhere, has been graphically depicted by Heine. In 1849, at the height of popularity, he retired to Weimar to direct the opera and concerts, and to devote his time largely to composition and teaching. Here he brought out remarkable works denied a hearing elsewhere—e.g. Wagner's *Lohengrin* and Berlioz's *Benvenuto Cellini*; and the little town became the centre of musical life in Germany. Here, too, commenced the close relationship with, and incalculable services rendered to, Wagner. In 1861 he resigned his appointment, and his life was subsequently divided mainly between Weimar, Rome, and Budapest, in which latter city he was in 1870 appointed president of the Academy of Music. In 1865 he received minor orders in the Church of Rome, and was afterwards known as Abbé. The record of his visit to London in 1886 is that of a triumphal progress. His influence was irresistible. Passing through Paris, he travelled to Baireuth, where, after attending several of the festival performances, he was attacked by hopeless illness, and breathed his last on July 31, 1886.

All things considered, he may be regarded as at the time the foremost figure in the musical world. As a pianist he was simply unapproachable; he exercised a charm bordering on the fabulous. His supreme command of technique was forgotten by hearers in admiration of the poetic qualities of his playing. That he was equally unique as a teacher is amply evident from the enthusiastic veneration of his pupils, among whom are many of the greatest living masters of the pianoforte. His literary works on music, though rather rhapsodical, are of real value; they include monographs on Chopin and Franz, and a volume on the music of the Gypsies. His influence in bringing to a hearing some of the greatest works of other musicians was invaluable. As a composer there is some difficulty as yet in properly estimating his work. His transcriptions for the piano, at least the later ones, are universally considered the finest ever made; his Hungarian rhapsodies may be deemed the highest reach of this form of composition. His pianoforte works are of enormous number, and not yet completely known. All his original works have a very distinct, sometimes a very strange individuality. He has the merit of creating, in his twelve symphonic poems, a new form of orchestral music. Their most distinctive features are the carrying out of a definite 'programme,' and the Wagnerian use of the *Leitmotiv*, by which unity is given to the whole piece. One or two masses, the 'Legend of St Elizabeth,' and a few other works, embody his religious aspirations, with reverence for old forms. His songs have a peculiar charm. As a man he possessed a most striking personality, and exercised a powerful fascination on all who came in contact with him. To call his generosity princely is to do honour to the title. The whole proceeds

of every one of his concerts subsequent to 1847, which must have amounted to an enormous sum, were devoted to the benefit of others.

See his *Letters* (trans. 1894); the *Lives* by Nohl (trans. Chicago, 1884), Martin (1886), De Beaufort (1886), and A. Göllerich (Leip. 1888); the *Recollections* (1888) of Janka Wohl; Ramann, *Liszt als Künstler und Mensch* (1894); A. Hervey, *Liszt and his Work* (1911); *Franz Liszt*, by his daughter Frau Cosima Wagner (1911); and *Ferencz Liszt*, by Frederick Corder (1925).

Litany (Gr. *litaneia*, 'supplication'), a form of prayer in which the same thing is repeated several times at no long intervals. Hence in Latin the word is always used in the plural, *litanie*. The common formula, *Kyrie eleison*, *Christe eleison*, *Kyrie eleison*—'Lord, have mercy upon us—Christ, have mercy upon us—Lord, have mercy upon us'—is the simplest ('lesser') litany. The word may be properly applied to the forms common among the Eastern Christians at different points during the celebration of the eucharist (see *LITURGY*) and other services, in which the deacon recites a number of short supplications, and the people reply after each '*Kyrie eleison*.' This practice formerly existed in the West at the commencement of the liturgy: it is still preserved in the Ambrosian rite during Lent; and the ninefold *Kyrie* of the Roman rite is merely a surviving remnant of the same thing, the responses having been preserved, although the prayers have been dropped. Owing to the litany being a form of public prayer specially adapted for and used in public processions, the word *litaneia* has now obtained among the Greeks the secondary and technical meaning of a *procession*, and the word regularly applied by them to the forms of united prayer conducted by the deacon is *ektené*.

In the Latin churches the word litany is now used to indicate a special service or form of supplication of medieval origin, in which, after the simple *Kyrie* and the invocation of Christ and of the Holy Trinity, follows a very long string of saints' names, each followed by the response 'Pray for us;' then a series of clauses naming different evils, and a series of adjurations based on events in the life of Christ, both followed in every instance by the response 'Deliver us, O Lord;' and next a series of supplications, beginning 'That it may please Thee, to all of which the response is 'We beseech Thee, hear us.' After this comes the triple invocation of Christ as the Lamb of God, the simple *Kyrie* again, the Lord's Prayer, Psalm lxx., a series of pieces of an intercessory character, and a very large number of prayers or collects. It may be observed that in the medieval editions the names of local saints are generally found mingled with the others. According to the present Roman rule the use of the litany is only absolutely commanded upon the Monday, Tuesday, and Wednesday before Ascension Day, when a procession is made to implore a blessing upon the fruits of the earth, and which are thence called Rogation (or 'asking') Days, and upon St Mark's Day (April 25), when a procession is made to pray for public health during what is in the south an unhealthy part of the year. The litany is, however, ordered upon nearly every occasion of public supplication, such as war, famine, pestilence, &c., and is subject to great alterations, especially after the Lord's Prayer, to meet the special occasions. It is also used on all special occasions, such as ordinations, consecrations, &c., with special alterations, and, in an abridged form, before the Mass on the eves of Easter and Pentecost.

The form of the litany used by Anglicans is a translation of the pre-Reformation one, but extremely free. The invocations of saints and the psalm are entirely omitted. Its use is prescribed

upon all Sundays, Wednesdays, and Fridays, when it is used either as a special service or appended to morning prayer. It is also used at ordinations. It does not possess the same elasticity as the Roman for adaptation to different occasions.

It may be worth adding that in the Latin churches there are also two other litanies, the use of which is permitted in public worship, but which do not form any part of the church service. Both begin like the litany proper. The first is called that of the Holy Name (or sometimes 'of Jesus'). In this the invocation of the Trinity is immediately succeeded by a long series of invocations of Christ under different titles (such as 'Jesus, Good Shepherd,' 'Jesus, King of all the Saints'), with the constant response 'Have mercy upon us.' The other litany is called that of the Blessed Virgin (or sometimes 'of Loretto'). In it the invocation of the Trinity is succeeded by a series of titles addressed to the Blessed Virgin.

There are also a vast variety of other so-called litanies, mostly of French origin, and generally designed to invoke some particular saint under a string of complimentary epithets, on the model of the litany of the Blessed Virgin. Their public use is prohibited, and there is no more guarantee of their doctrinal soundness than may attach to the approval of any bishop given to the book of prayers for personal use in which they may happen to be found.

Litchi (*Litchi chinensis*, or *Nephelium Li-tchi*), one of the most delicious fruits of China, Cochinchina, and the Malay Archipelago. The tree which produces it belongs to the natural order Sapindaceæ, and has pinnate leaves. The fruit is of the size of a small walnut, and grows in racemes. It is a red or green berry, with a thin, tough, leathery, scaly rind, and a colourless, semi-transparent pulp, in the centre of which is one large dark-brown seed. The pulp is slightly sweet, subacid, and very grateful. The Chinese preserve the fruit by drying, and in the dried state it is imported into Britain.

Literary Fund, ROYAL, founded in 1790 by David Williams, who had been a dissenting minister, the friend of Franklin, Mackintosh, &c., incorporated in 1818, relieves distressed literary men of all nations, and their widows and children.

Litharge. See LEAD.

Lithgow, WILLIAM, Scottish traveller, was born at Lanark in 1582. He had already visited the Shetlands, Bohemia, Switzerland, &c., when, in 1610, he set out from Paris, by way of Italy and Greece, to Palestine and Egypt, performing most of this and his subsequent journeys on foot. His second tramp led him through North Africa from Tunis to Fez and back, and home by way of Hungary and Poland. In his third and last journey (1619-21) to Spain *via* Ireland he was seized as a spy at Málaga, tortured by his jailers and by inquisitors, and only released through the agency of the English consul. After he returned to London he became an object of commiseration to the king and his court. Gondomar, the Spanish ambassador, promised him reparation, but contented himself with promising. So Lithgow assaulted, or by another account was assaulted by, him in the king's anteroom, for which he was clapt into the Marshalsea. He died at Lanark, perhaps in 1645. His enthusiastic but most interesting *Rare Adventures and Paineiful Peregrinations* was published in

a complete form in 1632 (new ed. 1906), though an incomplete version came out in 1614. Besides this he wrote accounts of *The Siege of Breda* (1637) and the *Siege of Newcastle* (1645; new ed. 1820), *Poems* (ed. by James Maidment, 1863), and other works.

Lithic Acid. See URIC ACID.—*Lithic Acid Diathesis* is the term employed in medicine to designate the condition in which there is an excess of lithic (or uric) acid, either free or in combination, or both, in the Urine (q.v.).

Lithium (sym. Li; at. no. 3; at. wt. 7.0; sp. gr. 0.5336) is the metallic base of the alkali *lithia*, and derives its name from Greek *lithos*, 'a stone.' It was discovered by Arfvedson in 1817 in some Swedish minerals; but since the introduction of spectroscopic research it has been found to be widely present in many mineral waters, in the ash of plants, &c. The metal is of a white, silvery appearance, and is much harder than sodium or potassium, but softer than lead. It admits of being welded at ordinary temperatures, and of being drawn out into wire, which, however, is inferior in tenacity to leaden wire. It fuses at 356° (180° C.). It is the lightest of all known solids, its specific gravity being little more than half that of water; it decomposes water at ordinary temperatures. It burns with a brilliant light in oxygen, chlorine, and the vapours of iodine and bromine. It is easily reduced from its chloride by means of a galvanic battery. When lithium is burned in air it forms an oxide, lithia, Li₂O, along with a trace of a higher oxide. This oxide, when treated with water, yields a hydrate, LiOH, having alkaline properties and resembling soda and potash. Lithia forms a series of salts (carbonate, chloride, citrate, &c.) analogous to the potash and soda salts, and all of these, when placed in the flame of a Bunsen burner and examined with the spectroscope, show characteristic red bands by which their presence can always be ascertained.

In medicine the salts of lithia hold a high place as solvents of uric acid. The carbonate and citrate are used for this purpose, and are said to be much more efficient in cases of gout and gravel than the potash salts.

Lithography (Gr. *lithos*, 'a stone,' and *graphein*, 'to write'), the art of printing from stone, and one of the most important of the reproductive arts, was invented in 1796 by Aloys Senefelder (1771-1834). In that year a piece of music—Senefelder's first work—was printed from the stone, and in 1800 he patented his invention in Bavaria, most of the German states, and Austria. Afterwards he opened establishments in London and Paris, but did not succeed very well. The great secrecy and jealousy with which the new art was guarded by its patentees prevented progress being made, and it was not till many years afterwards that their complicated manipulation became sufficiently simplified for the rapid advance which then became possible. Senefelder, on whom the king of Bavaria settled a pension, lived to see his invention brought to complete perfection.

The principles on which lithography is founded are (1) the strong adhesion of greasy substances to calcareous stone; (2) the affinity of one greasy body for another, and their antipathy to water; (3) the facility with which calcareous stone imbibes water. It follows that, if a greasy line be drawn on a prepared stone, its adhesion is such that it can only be erased by entirely removing the surface of the stone so far as the grease has penetrated. If water be put on the surface of the stone it remains on those parts not covered with grease; a roller charged with greasy ink may then be passed over the stone, the ink adhering to the greased portions, while the parts wet with water will repel

the ink and remain clean. A piece of paper put on the stone, if pressure be applied, will receive an impression in ink of the greasy line. The covering of the stone with a solution of gum-arabic (to be afterwards described) is an almost indispensable aid to the water in resisting the ink.

There are various methods employed in lithography—drawing on stone with pen or brush with liquid ink; drawing on paper, and transferring to stone; engraving on stone; drawing on stone with crayons or solid ink, transferring from engraved plates or woodcuts, &c. These differ only in the manner of applying the greased drawings to the surface of the stone. The printing from them is in nearly all cases identical.

The Stones.—The immense quarries of Solenhofen in Bavaria furnish the best stones; others of inferior quality are obtained in France and Italy. The stones are composed of lime, clay, and siliceous earth, and are of various hues, from a pale yellowish-white to a light buff, reddish, pearl-gray, blue, and greenish colour. Those of a uniform gray colour are the best. They are found in beds, commencing with layers of the thickness of paper; the thickness required for printing-stones being from about 2 to 4 or 5 inches. When in the quarry they are soft and easily cut to any required size. They are afterwards ground face to face with sand and water, and when quite level polished with pumice-stone, and finally with smooth polishing stone. Thin plates of zinc or aluminium are largely used in place of stones for many purposes, and have the advantages of being much cheaper, less bulky, and very much lighter. Their flexibility also has rendered possible the fast-running 'rotary' and 'off-set' presses described below. The plates are prepared with a finely grained, porous surface, and are treated on the same principles as the stones, though the greasy image has not such holding power as on stone.

The writing and drawing inks and crayons are composed of lard, hard soap, white wax, shell-lac, Venetian turpentine, carbonate of soda, and Paris black. The proportions used and the methods of manufacture vary considerably. All descriptions can be purchased ready prepared. The greasy ingredients are the important parts; the black is only added to enable the artist to see the effect he is producing as he goes on.

Writing or drawing on stone is performed with a fine pen or brush, or a ruling pen for straight lines. The ink is rubbed down with a little water and under gentle heat, in the same manner as China ink, and the subject may be traced as for a drawing on paper. Great care is necessary in handling the stone, as its affinity for grease is so keen that a finger-mark would develop into a black blot in printing. When the drawing is finished it is covered over with a solution of gum-arabic in water. This gumming fills up the pores of the stone on the undrawn parts, and prevents the greasy lines of the drawing from spreading. The stone is then removed to the printing press and prepared for printing. The gum is first washed off with clean water, enough remaining in the pores of the stone, however, to assist the water to resist the ink in the subsequent printing. The stone is then damped with a canvas cloth, and a roller (made of wood or iron, covered with one or two thicknesses of flannel and an outer covering of fine leather), charged with printing-ink is passed over the stone till every part of the drawing is thoroughly inked. Any accidental grease or finger-marks will now become visible, and must be removed with acid, scraping with a knife, or polishing with polishing stone. When the drawing is made satisfactory the stone is washed over with a weak solution of nitric acid in gum-water. This *etching*,

as it is called, is a very important operation. If applied too strong the acid would remove the drawing completely from the stone; but when diluted to the proper strength it gently eats away the surface of the bare parts of the stone, opening up the pores for the better reception of the gum to be afterwards applied, thoroughly cleans it from grease-soils, and sharpens the lines of the drawing. When the stone is sufficiently etched the acid is washed off and another coating of gum applied; when this is dry it is again washed off, and, usually, to clean the stone from the drawing-ink, the surface is washed with turpentine. For all that can be now seen on the stone the work is quite lost; but it is only the black ink that is washed off; the *grease* lines are *in* the stone, which is all that is necessary. The stone is now damped with a cloth and inked with a roller till all the drawing is black again; a piece of paper is placed on the top, passed through the press, and when taken off has received an impression of the drawing. The damping and inking is repeated for every impression, and when the stone is put away or left for a time it is, for preservation, covered with the indispensable gum, which is again washed off when printing is resumed. The ink for black printing is composed of Paris black, ground up with varnish made from boiled linseed-oil.

Writings and drawings made on prepared paper and transferred to stone for printing are, perhaps, the most important items in general lithographic work. The transfer paper is prepared on one side with a coating of isinglass, flake-white, and gamboge, and afterwards smoothed by passing several times through a press over a heated stone. The writing or drawing is made on this preparation with a pen or fine brush with the lithographic transfer ink, and when finished is transferred to the stone in the following manner. The paper is put for a few minutes between damped blotting-paper. A *warmed* polished stone is put in the press, the paper is placed with the coated side upon it, and passed several times through the press, after which the paper is damped with water and gently rubbed with the fingers till it comes easily off, leaving the drawing adhering to the stone. The stone is gummed over and proceeded with as already described. After the first inking-up, and before etching, any defects in the transfer can be touched up with a pen or brush. In France and some other countries this class of work, however, is generally either directly drawn or engraved on the stone.

Fresh impressions of lithographs, of engravings on wood, steel, or copper, and of letterpress may be transferred to and printed from the stone by the above process, the paper used being prepared with a special composition, and the ink a mixture of the writing and printing inks. Many subjects, such as music titles, &c., are engraved cheaply on zinc, expressly to be transferred to stone. When the design is small and required in large numbers, it may be transferred many times on one stone, and many printed on one sheet of paper at every impression.

Engraving on stone, so called, is another method of putting a drawing on stone, and is as follows. A polished stone is covered with a coating of gum slightly coloured; this is afterwards roughly washed off, leaving only a very thin film of the gum, which can be easily cut through. On this ground the drawing is executed with etching-points of diamond and steel of various breadths, exactly as in etching, the surface of the stone being cut through the gum in making the lines. When the drawing is finished any greasy matter is rubbed into the lines and allowed to remain an hour or two till the stone has imbibed enough at the lines. The gum is then washed off, and the stone damped and

inked and proceeded with as above, except that engraved stones are generally inked with a dauber—i.e. a piece of wood covered with one or two pieces of flannel, with which the ink is rubbed into the lines.

'Chalk-drawings' are drawn, with lithographic chalk, either directly on to stones grained by grinding with sand, or on paper with a grain impressed on the surface, and transferred to stone or metal plates. A fine-grained chalk-drawing is one of the most difficult subjects to print satisfactorily.

'Shading-mediums' have become almost indispensable to the lithographer, as they afford the readiest means of laying a tint or ruling. The medium consists of a film of gelatine composition supported by the edges in a wooden frame, and impressed on one surface with a raised stipple or ruling. The film is inked with a roller and transfer ink, only the tops of the raised dots receiving the ink; the film is then placed face down on the stone and transferred by rubbing the back. The film is transparent, and allows the operator to see the effect before rubbing down. Parts on which the stipple is not required are protected by painting over with coloured gum, which is allowed to dry before the stipple is applied. On washing with water the gum and the ink come away together, leaving the stipple on the ungummed parts. These shading-mediums are made in immense variety of stipples and rulings of varying fineness, as well as many fancy patterns, and many patterns may be combined to produce new effects.

'Photo-lithography' is the application of photographic methods to lithography. The negatives are made in the same way as for line and half-tone blocks (see ILLUSTRATION OF BOOKS), but the metal plates of zinc or aluminium are very thin, and there is no 'etching' in the sense of creating an appreciable relief. The image may be printed on to the plate direct, exactly as for line blocks, or on to a special gelatine-coated transfer paper sensitised with bichromate. This paper is exposed under the negative, inked over with transfer ink, and placed in water, when the gelatine which has not been affected by light becomes soft and slimy, and the ink wipes off these parts readily with a piece of cotton-wool, remaining only on the parts corresponding to the lines and dots of the original. This is transferred to stone in the usual way.

Chromo-lithography is the most beautiful of all the methods of printing from stone. The object being to produce, as nearly as possible, fac-similes of pictures in colour, it is necessary to employ a number of stones, in some cases as many as twenty or thirty, each printing a separate tint, to produce the infinite variety of colour in a finished colour-drawing. The usual method of procedure is as follows. A careful outline of the entire design is drawn on, or transferred to, a stone; from this, called the *key*, as many copies are printed as there are colour-stones required. These impressions are dusted with dry black or raddle, and, being set off on the colour-stones, form guides to the artist in drawing in the various colours; after which the key lines can be washed away with water. On one of these stones the general effect of the picture is sometimes drawn, and this, printed in a neutral gray, forms the basis of the finished print. The other stones are drawn separately to correspond with the different colours required to produce the necessary effect. It will be easily understood that in arranging the various colours with their varying degrees of depth on the different stones, the proper amount of force to be given to each, and the effect likely to be produced by printing one tint over another, have to be considered, and give scope for a great deal of professional skill. There are many different methods of drawing the tints on the

stone which are too technical for our limits. The finest work is done by stipple, drawn by hand with a fine brush, a method in which French and German artists on stone are very skilful. The colour stones are printed in the manner already described, except that coloured inks are used instead of black. The different colours, varying in number from four or five to twenty or thirty, being printed by separate impressions on the same paper, it is obvious that great care is necessary to see that every impression is exactly fitted to the others, or exactly *registered*, as it is called. Several mechanical appliances are used to secure this exactness. When the necessary number of impressions have been printed and the stone has to be cleaned for another subject, the surface must be laboriously polished down till every vestige of grease is removed.

Such is a brief outline of the different methods employed in lithography, but each method is capable of infinite number of variations in the hands of different operators.

Lithographic presses vary as much in construction as those for the letterpress. The hand-press is very simple. The stone is placed on a movable table, and a *tympan*, an iron frame covered with leather, folds down over the paper when placed on the stone. It is then rolled under the *scraper*, generally a piece of boxwood fixed in an upright, which applies the pressure. The damping and inking are done by hand.

The first self-acting lithographic machine, introduced into Britain by Siehel of Berlin and Vienna, failed from the fact that it was constructed, like the hand-press, with a scraper arrangement for the impression. This produced too much friction, rendering speed dangerous, and work difficult to keep on the stone; and it was not till about 1860 that the machine as at present in use, with a cylinder for the pressure, was introduced from France. It is somewhat an adaptation of the letterpress single-cylinder machine (see PRINTING), and a very brief description will suffice. The stone is placed on a movable bed, which can be raised or lowered according to the thickness of the stone. The sheet is fed in at the top of the cylinder, whence a gripper arrangement leads it over the stone. At one end are the damping-rollers, which are covered with some soft absorbent fabric; and at the other the inking-rollers, covered with the finest French leather, with inking-table, duct, and distributors. The stone passes first under the dampers, then to the inking-rollers, thence back to the cylinder to print the impression, and so on *ad infinitum*. The weak point in this type of press is the reciprocating motion of the heavy table and stone, which travels the length of the machine, stops, and runs back again for each impression. In the 'rotary' machine the zinc or aluminium plates used in place of stones are fixed round a cylinder which revolves continuously, and a much higher speed is possible.

The difficulty of bringing the printing surface of either stone or zinc plate into sufficiently close contact with the paper to obtain a good impression made it imperative to use only very smooth papers for lithographic printing until the introduction of the type of press known as the 'off-set' press, as the image is not printed direct on to the paper but on to rubber, and from the rubber on to the paper. It is an adaptation of a press which had been used for some time in printing designs on tinplate to be made into fancy boxes, &c. The greasy image is transferred to a zinc plate in the usual way, except that it is correct with the finished print as regards right and left, whereas for direct printing the design is, of course, reversed. The plate is fixed on a cylinder fitted with the usual damping and

inking rollers. This cylinder revolves in contact with a second cylinder of identical size, covered with a 'blanket' of fine rubber, to which the ink image is transferred at each revolution. Pressing against this cylinder is a second rubber-covered cylinder, and the paper is fed between these two, receiving the image from the rubber surface. The resilient pressure of the two rubber surfaces transfers the image, even when composed of fine ruling or stipple, to rough surfaced papers which could be printed in no other way. 'Off-set' machines can run at such high speeds that it is difficult to feed the paper in with sufficient rapidity and accuracy. With automatic feeding speeds over 10,000 per hour have been reached, and it has been found that fine work, such as bank cheques, prints cleaner and sharper when the machine runs fast. The capacity for printing on rough uncoated paper, and the saving of time both in the printing and in the 'making-ready,' render it probable that this machine will revolutionise certain classes of printing. In America much beautiful work in seven or eight colours has been produced on off-set machines, using a combination of hand-work and photography, on the 'half-tone' principle. (See ILLUSTRATION OF BOOKS.)

See G. A. Audsley, *Chromo-lithography*, a popular treatise (44 plates), and W. D. Richmond, *The Grammar of Lithography and Colour and Colour Printing as applied to Lithography* (6th ed. 1887), both in Wyman's Techn. Series; David Cumming, *Handbook of Lithography*; A. Seymour, *Practical Lithography*; Charles Harrap, *Transferring and Metallography*; H. J. Rhodes, *The Art of Lithography*; F. T. Corkett, *Photo-Litho and Off-set Printing*.

Lithology (*lithos*, 'a stone') is a name sometimes used for that division of geology which considers the constitution and structure of rocks, apart from their relations in time or position to each other. See GEOLOGY, PETROGRAPHY.

Lithomarge, an earthy or clay-like mineral substance, sometimes called *Mountain Marrow* (Ger. *Steinmark*), consisting chiefly of silica and alumina, with oxide of iron and various colouring substances, derived from the decomposition of various minerals. It is soft, greasy to the touch, and adheres strongly to the tongue. It is generally white, yellow, or red, often exhibiting very beautiful colours. It is found in Germany, Russia, &c., also in the tin-mines of Redruth in Cornwall.

Lithophagidæ (Gr., 'stone-eaters'), a term sometimes applied to the molluscs which bore holes for their own residence in rocks. See BORING-ANIMALS.

Lithopone, a white pigment made from barium sulphide and zinc sulphate.

Lithotomy (Gr. *lithos*, 'a stone'; *tomē*, 'the act of cutting'), the technical name for the surgical operation popularly called *cutting for the stone*. As most of the symptoms of stone in the bladder (which are noticed in the article CALCULUS) may be simulated by other diseases of the bladder and adjacent parts, it is necessary to have additional evidence regarding the true nature of the case before resorting to so serious an operation as lithotomy. This evidence is afforded by passing a metal instrument (sound) along the urethra, by which the stone can be felt, by using the cystoscope, through which it can be seen, or, most simply, by X-ray examination.

Lithotomy has been performed in various ways at different times, both in the perineum and above the pubes. The earliest form of lithotomy is known as *cutting on the gripe*, or *Celsus's method*. It received the former name from the stone, after being fixed by the pressure of the fingers in the anus, being directly cut upon and extracted. The *Marian method*, founded on the erroneous idea that membranous parts would not heal after incision,

while their dilatation was comparatively harmless, was the operation mainly in vogue for nearly 200 years, till Frère Jacques introduced what was essentially the lateral method. Cheselden (1727) and Liston in the first half of the 19th century perhaps most deserve mention among the many surgeons who subsequently improved upon the original operation.

The *lateral operation*, so called from the lateral direction in which the incision is made into the skin of the perineum and the neck of the bladder, in order to avoid wounding the rectum, was, with various minor modifications, generally employed almost to the present day. Frère Jacques seems to have devised the method and to have practised it with much success; and in 1702 he published a description of it. The advantage of this operation, by which a free opening, sufficiently large for the extraction of all but very large stones, can be made into the bladder without laceration of the parts or injury to the rectum, was immediately recognised by the leading surgeons of the time, and the Marian process was at once universally given up. Other varieties of the perineal operation are termed median, bilateral, &c.

The *suprapubic* or *high* operation was first performed by Pierre Franco in 1561. It has recently come almost entirely to displace perineal lithotomy, and is specially applicable for stones of large size which cannot be crushed or are difficult to remove through the outlet of the pelvis.

From the shortness of the female urethra and the extent to which it can be dilated, and, additionally, from the comparative rarity of calculous affections in women, the operation of lithotomy is seldom required in the female sex.

The more general adoption of lithotripsy has greatly diminished the number of cases in which lithotomy has to be resorted to.

Lithotripsy (Gr., 'stone-crushing'), the surgical operation of breaking up a stone in the bladder into such small fragments that they may readily be expelled by the urethra. Although the importance of such an operation has been recognised from the earliest time, a French surgeon, Civiale, who commenced his researches in 1817, but did not perform his first operation till 1824, may be regarded as the discoverer of lithotripsy. The instrument by which the disintegration of the stone is effected is introduced in the same manner as a catheter or sound into the bladder, and, after catching the stone, either bores, hammers, or crushes it to pieces. The stone is grasped by the blades of such an instrument as that shown in the figure, and the blades are then forcibly approximated to each other by means of a screw. The various fragments are gradually broken down in the same way till they are small enough to be discharged through a catheter introduced for the purpose.

Since the operation was first introduced, the instruments employed both for crushing the stone and for evacuating its fragments have gradually been improved; and experience has shown that this method is capable of superseding lithotomy in the adult in the vast majority of cases where an operation for stone is necessary.

It used to be considered advisable in the case of all but very small stones to crush and remove only a portion of the calculus at one time. To Bigelow of New York belongs the credit of recommending (in 1878) the method now adopted by almost all surgeons. He gave it the name of *litholapaxy* ('stone-evacuation'), but it only differs

from lithotripsy in that the procedure is completed at one sitting. This improvement was an outcome of the teaching of Otis of New York, who found it possible to introduce instruments of larger size, and therefore more effective than had been previously considered safe.

In adults, conditions which make lithotripsy undesirable are 'extreme size, with hardness of structure in the calculus itself, and confirmed narrowness or other obstruction in the urinary passages, rendering the employment of adequate instruments impossible' (Sir H. Thomson). In children the risk attending lithotomy is much less than in adults; but the difficulties of lithotripsy, in consequence of the small size of the urethra, are much greater: in boys, therefore, the former operation is still generally preferred, except in the case of very small stones.

Lithuania (Lithuanian name *Lietuva*; Germ. *Litauen*), a country of Europe long united with Poland, till 1918 incorporated with Russia, and thenceforward with lessened area an independent republic. The territory in actual possession of the republic consists of the former Russian government of Kovno, with small parts of the surrounding districts, including (as an autonomous area) that part of Prussia lying to the north of the river Niemen. Lithuania claims also the greater part of the old Russian governments of Vilna and Suwalki, and the north of Grodno, now held by Poland. With her northern neighbour, Lettland (Latvia), Lithuania in 1921 exchanged a small corner of Kovno for a short piece of the Courland coast, including Polangen (Polanga). Her outlet to the Baltic was enlarged by the seizure in 1923 of the Memel district. The Council of Ambassadors sanctioning this, sanctioned at the same time the seizure (1920) by Poles of the great south-eastern region, including the capital, Vilna (Lith. *Vilnius*).

Lithuania is almost entirely within the basin of the Niemen, which traverses and then bounds the south-west. Small parts of the north drain to the Aa and the Windau. The country is a plain with great forests (about one-fifth) and marshes. Nearly half is arable land, producing potatoes, rye, oats, barley, and flax. Attempts are being made to introduce improvements in dairy-farming. Exports are live-stock, grain, butter, eggs, and farm produce generally, timber, and flax. Trade is chiefly with Germany, the United Kingdom, and Lettland.

As a race the Lithuanians are fair and well-built, with fine features and blue eyes. They have a strong religious temperament. The Memel district is Protestant. Elsewhere the people are mostly Roman Catholics, with considerable Jewish and Orthodox minorities. But they cling tenaciously to heathen reminiscences and customs which are of great interest to the anthropologist. The vast primeval forests and numerous marshes and lakes have impressed traits of peacefulness, melancholy, and loneliness, but at the same time of sweetness, upon both the national character and the national songs. For many centuries worship was performed in the forests, and great oaks are still objects of religious veneration. They were never town-dwellers, and have always relied for protection upon the dense forests and the extensive marshes. They were kept in a state little inferior to serfdom by the landowners, German and Polish; and the Russians sought to Russianise them, forbade the printing and reading of books in the Lithuanian language (1864-1904), oppressed the Roman Catholic Church, and settled Russian peasants in the country. A university was opened at Kovno in 1922.

The constitution of 1922 declares all citizens equal without distinction of sex, nationality, or religion. The Seim (diet) is elected for three years by universal, direct, secret suffrage. The Seim

elects the president of the republic. Memel has its own diet.

HISTORY.—The first prince to gather the scattered tribal chiefs around him was Ringold (1230-35); his policy of centralisation was continued by his son Mindovg (died 1263), who even consented to be baptised, but afterwards apostatised. During these reigns the Lithuanians waged almost incessant war against the Livonian order and the Teutonic Knights (see LIVONIA). Olgerd (1345-77), after reviving (along with his brother Keistut, the legendary national hero of the Lithuanians) the principality of Lithuania, extended his conquests into southern Russia. His son Jagiello (1377-1434) married the heiress of Poland (q.v.), thus forming the first link between these two states; the last was welded in 1569 by their complete political unity. Meanwhile Lithuania had been governed by grand-dukes appointed by Poland. The grand-duchy was composed of (1) Lithuania proper, corresponding to the former Russian government of Vilna with Troki; (2) the duchy of Samoghitia; (3) 'Russian Lithuania,' comprising Polesia, Black Russia or Novogrodok, White Russia or Minsk, Meislav, Vitebsk, Smolensk, Plotsk and Polish Livonia. But in the 15th century Lithuania extended as far south as Odessa and the Sea of Azov, and as far east as the river Moskva. As part of Poland, Lithuania became Russian (see POLAND). During Russian repression Lithuanian nationalism—literary, political, religious, and cultural—arose; and Lithuanian books and papers were smuggled from Tilsit. In 1905 a national assembly at Vilna in vain demanded autonomy. In 1917-18, however, Lithuania (the old governments of Grodno, Kovno, Vilna, Minsk, and parts of Mohilev and Vitebsk) asserted its nationality. It was in German occupation during the Great War. After the Germans came the Russian Bolsheviks. Peace was made with Russia in 1920; but a Polish filibustering expedition seized, and Poland kept, Vilna and a great slice of 'ethnographical Lithuania.'

The territory claimed by Lithuania has an area of about 60,000 sq. m. and a population of about 4,800,000. The territory in actual possession measures about 21,715 sq. m., and has about 2,300,000 inhabitants. Vilna (Vilnius) being in Polish hands—as are Grodno (Gardinas) and Suwalki (Suwalkai)—the actual capital is Kovno (Kaunas; pop. 90,000). Other towns are Memel (Klaipėda) and Shavli (Siauliai).

See E. J. Harrison, *Lithuania, Past and Present*.

LANGUAGE AND LITERATURE.—The Letto-Lithuanians, to whom belong the Letts, the Cours of Courland, and the Borussians or ancient inhabitants of East Prussia, as well as the Lithuanians, constitute one of the main divisions of the Indo-European stock; to them are sometimes added the Yatvyags or Yadvings, who dwelt on the upper tributaries of the Bug and Niemen. The Jmuds are a branch of the Lithuanians proper. The Lithuanian tongue is more primitive in some respects than any other Indo-Germanic language, though it contains a strong admixture of Slavonic words. Owing to its many archaic forms and the early stage of its development it possesses great value for students of comparative philology. The literature is exceptionally rich in poetry, popular tales, &c. The poetry is frequently full of the very breath of nature. See works by Schleicher (1854 to 1876) and Bezenberger (1877 and 1882), and collections of songs by Rhesa and Kurschat (1843), Nesselmann (1853), Brugmann and Leskien (1882); Veckenstedt's *Mythen, Sagen*, &c. (1883); Ch. Bartsch, *Litauische Melodien* (2 parts, 1887-90); Bender, *Lithuanian Etymological Index* (1922). A Lithuanian literary society was formed in Tilsit in 1879.

Litmus is a well-known colouring matter, which is obtained from several lichens, but chiefly from *Lecanora tartarea*. The lichens are powdered and digested with ammoniacal fluids (urine, for example) till they undergo decomposition. Alum, potash, and lime are then added, and the mixture is allowed to stand till the maximum degree of colour is observed. Sand and chalk are added to give a due degree of solidity, and the mass is then dried in cubes, and is ready for the market. The exact nature of the changes which ensue is not altogether known; it is, however, certain that the pigment is originally red, and that it only becomes blue on the addition of alkalies or of lime. This blue colour is again changed into a red on the addition of a free acid. See TEST-PAPERS.

Litre, the unit of the metric measures of capacity, both dry and liquid. It is the volume of a cubic decimetre (see METRE), and contains a kilogramme of water at 39°·2' (4° C.) in a vacuum; it is equal to 0·2200967 British imperial gallon, and is therefore less than a quart—4½ litres being roughly equal to a gallon. The litre is subdivided decimally into the *decilitre*, *centilitre*, and *millilitre* (respectively $\frac{1}{10}$ th, $\frac{1}{100}$ th, and $\frac{1}{1000}$ th of a litre). Ten litres make a *decalitre*; 100, a *hectolitre*; 1000, a *kilolitre*. The hectolitre is the common measure for grain, and is equal to 0·3439009 British imperial quarter, or nearly 2½ imperial bushels.

Little, THOMAS. See MOORE.

Littleborough, a town of Lancashire, 3½ miles NE. of Rochdale, is virtually its suburb, and shares in its manufactures; pop. 11,500.

Little Falls, a city of New York State, on the Mohawk River, 73 miles WNW. of Albany, on the line of the Erie Canal and of two railways. The Mohawk here passes through a narrow rocky gorge, with falls of 44 feet, giving water-power to several mills and factories. Pop. 13,000.

Littlehampton, a seaport and watering-place on the coast of Sussex, 18 miles W. of Brighton, and 63 SW. of London, is the port for Arundel. It has a good golf-links. Pop. 11,300.

Littlemore, a hamlet 2½ miles SSE. of Oxford, famous for its associations (1828–43) with Newman.

Little Rock, the capital of Arkansas, is situated on the south bank of the Arkansas River, 280 miles from its mouth, and 345 miles by rail SSW. of St Louis. It contains the state capitol, prison, and asylums for the blind and deaf-mutes, a United States arsenal, a Roman Catholic cathedral, court-houses, colleges, &c. Pop. (1880) 13,138; (1920) 65,142.—NORTH LITTLE ROCK (formerly Argentea), on the other side of the river, has railway shops; pop. 14,000.

Littleton, or LYTTLETON, SIR THOMAS, English jurist, was born in 1402 at Frankley House, near Bromsgrove, Worcestershire, his mother being the heiress of Thomas de Littleton, lord of the manor of Frankley. He was recorder of Coventry in 1450, king's sergeant in 1455, in 1466 judge of common pleas, and in 1475 a knight of the Bath. He died on 23d August 1481. Littleton's 'authentic reputation' (Fuller's phrase) rests on his work on *Tenures*, which was originally written in law French. It treats of the English law relating to rights over land, and was the first scientific attempt to classify the subject. It seems to have been first printed in the year of its author's death, if not before, and passed through numerous editions. The first translation into English was made probably as early as 1500. It was the original text that Coke commented upon in his famous *Coke upon Littleton* (see COKE).

The changes in the laws relative to property have greatly diminished its value, and it is now little studied by lawyers; yet it is considered a model from the clear and logical manner in which the subject is handled.

Littoral Deposits, accumulations formed in shallow water along a shore line. They are generally gravelly and arenaceous in character, and exhibit rapid alternations of finer and coarser grained materials.

Littre, MAXIMILIEN PAUL ÉMILE, an eminent French philologist and philosopher, was born in Paris, 1st February 1801. He first studied medicine, but ere long gave himself to philology, mastering Sanskrit, Arabic, Greek, and the chief modern languages. One of his first tasks was a translation of the works of Hippocrates (10 vols. 1839–61), which at once opened for him the door of the Academy of Inscriptions. Littre held democratic opinions, distinguished himself on the barricades in 1830, and was one of the principal editors of the *National* down to 1851. He embraced Comte's Positivism with great ardour, and defended it ably in pamphlets and in journal articles, but he did not share the disciples' indiscriminating enthusiasm for the Master's later works. Disappointed at the results of 1848, he retired from active politics, resigning even his office of municipal councillor of the city of Paris. Returning to a life of study, Littre continued his researches in the history of medicine, at the same time working ardently at the history of the French language. His article, *La Poésie Homérique et l'Ancienne Poésie Française* (1847), attracted great attention. It was an attempt at the translation of the first book of the *Iliad* in the style of the Trouvères. The Academy of Inscriptions chose Littre, in place of Fauriel, in 1844, to be one of the commission charged with continuing *L'Histoire Littéraire de France*, and he is one of the authors of vols. xxi.–xxiii. In 1854 he was appointed editor of the *Journal des Savants*. Littre's principal work is his *Dictionnaire de la Langue Française* (4 vols. 1863–72; supplement, 1878), a monument of patience and erudition. This splendid work—the real *thesaurus* of the French language—did not prevent the French Academy in 1863 from rejecting its author, whom Bishop Dupanloup denounced publicly as holding immoral and impious doctrines. In January 1871 Gambetta appointed him professor of History and Geography at the École Polytechnique. Next month he was chosen representative of the Seine department in the National Assembly, where he sat with the party of the Left. On the 30th December 1871 the French Academy at last admitted him to membership; whereupon Bishop Dupanloup resigned his seat. Littre published *Médecine et Médecins* in 1872. He died at Paris, 2d June 1881.

Other works of Littre's were: French translations of Strauss's *Life of Jesus* (1839–40) and of Pliny's *Natural History*; *Histoire de la Langue Française* (2 vols. 1862), *Littérature et Histoire* (1875); books on positivism and philosophy; and *Œuvres Complètes d'Armand Carrel* (1857). In his *Études et Glanures* (1880) is an account of the origin of his great Dictionary. See also Sainte-Beuve's *Notice sur M. Littre* (1863) and *Nouveaux Lundis*, vol. v.; Caro's *Littre et le Positivisme* (1883); and Pasteur's discourse on succeeding Littre at the Academy.

Liturgy, a word derived from the Greek *leitourgia*, signifying originally a 'service,' such as those rendered by citizens to the state. By the translators of the Septuagint it was applied to public worship, and among the Greeks the sense is now limited to the celebration of the eucharist. The word at one time enjoyed a wider signification, and in English the term liturgy is still sometimes loosely used to indicate a general body of forms

for public worship prevailing in a particular community; but by the more correct writers it is used in the same exclusive sense as is the original by the Greeks. The present article is designed briefly to sketch the history and development of the forms used in the celebration of the eucharist or Lord's Supper, exclusive of those employed only by Protestants.

With regard to the form used by Christ Himself (Matt. xxvi. 26-28; Mark, xiv. 22-24; Luke, xxii. 19, 20; 1 Cor. xi. 23-25) only three features are recorded, besides the taking hold of the bread and the cup. These are that He (1) gave thanks (*eucharistēsas*) and blessed, that (2) He brake, and that (3) He administered. To these we must necessarily prefix, on any subsequent occasion, the laying of the table and the placing upon it of bread and wine. It appears from Acts, xx. 7-12, that the ceremony was preceded by a sermon or discourse, and from 1 Cor. xiv. 16 that the blessing was regarded as identical with or part of the thanksgiving (*eucharistia*), which was the name given to the whole of the principal formula; while we learn from Tim. ii. 1, 2, that the thanksgiving contained a prayer for all men, and from 1 Cor. xiv. 16 that at the conclusion of the thanksgiving the word 'Amen' was answered. The New Testament also contains no less than five directions (Rom. xvi. 16, 1 Cor. xvi. 20, 2 Cor. xiii. 12, 1 Thess. v. 26, 1 Pet. v. 14) with regard to the giving of a religious kiss, and it is hard to escape the conclusion that this ceremony must have been associated with the principal act of worship, the eucharistic celebration.

Whether any such thing as a liturgy had yet been committed to writing in the time of the apostles is unknown. At anyrate it is evident from 1 Cor. xiv. 16 that the use of a fixed form was not obligatory. Moreover, there are certain passages that occur both in the writings of St Paul and in the so-called Clementine liturgy, which, in the judgment of some of the most eminent critics (notably Dr Neale), appear from the context in each case to be quoted in the epistles from the liturgy, and not in the liturgy from the epistles. It is a plausible conjecture that a form or forms may have been drawn up as models, without the celebrant being tied to their strict use.

The martyr Justin in his first defence of Christianity gives a scanty and confused account of the liturgy, from which, however, it is possible to gather the six points above mentioned, with three additional facts—viz. that portions of the Old and New Testaments were read before the sermon, that after the sermon there were prayers of an intercessory character, and that the kiss was given after these prayers and before the bread and wine were placed upon the table. Justin also mentions that the thanksgiving was very long.

Some words used by Justin may mean that in his day a custom already prevailed which in any case was certainly in force very soon after. This was the rule of secrecy (*Disciplina Arcani*, q.v.) by which all unbaptised persons, including those who were actually under preparation for baptism (*katechoumenoi*), were dismissed from the assembly as soon as the sermon was over, and which was later extended so as to conceal from them as far as possible the knowledge of what afterwards took place. This rule has caused Western writers to divide the liturgy into two parts, the first, up to the sermon inclusive, being termed the Mass of the Catechumens (*Missa Catechumenorum*), and the rest the Mass of the Faithful (*Missa Fidelium*). Other persons unfit to be present at the celebration were dismissed at the same point. This twofold division made by western writers must not be confused with a twofold division made by the Easterns, who call all the portion which follows the commencement of the

thanksgiving by the distinctive name of the *Anaphora* ('offering'), whence the terms Pro-Anaphora and Anaphora to distinguish the two portions.

The Clementine liturgy is found embedded in the compilation called the Apostolic Constitutions (q.v.). It is not known where it was used, but as it is in striking harmony with the account given by Justin, who was writing at Rome, it seems probable that it is the form once used at anyrate in that city.

The rule of secrecy is probably the main reason for the extraordinary scantiness of allusions to the eucharist among early Christian writers. Into these it is needless to enter here. It suffices to say that all known liturgies later than the so-called Clementine are divisible into five distinct schools, called respectively the Roman and the Ephesian, which are Western, and the Hierosolymitan, the Babylonian, and the Alexandrian, which are Eastern. All these, however, show their common origin by consisting of certain main parts, although all do not contain all these parts, and the parts themselves are not always arranged in the same order. These parts are of course called by different names in different countries; those used by English scholars, which are mostly derived from those of the Roman liturgy, will be here given in brackets, and generally employed. The ceremony ordinarily begins with some opening hymn (introit), and there is often a short litany, always with the Greek response of *Kyrie eleison*. There is often also some confession or acknowledgment of sin and prayer for pardon. There is then a prayer or prayers, and some portions of the Scriptures are read, interspersed with psalms or hymns, and ending with a reading from the Gospels, after which is usually preached the sermon, if there be one. The next stage (offertory) is the spreading upon the altar of a piece of linen or silk (corporal), and the placing of the bread (host) and wine upon it, except in the case of the pure Alexandrian form, where this is done first of all. Except among the Armenians, a few drops of water are added to the wine. There are in any case some prayers. After this, except in the Roman school, the kiss (*Pax*, 'kiss of peace') is given. The thanksgiving is then introduced with some form of the words, 'Lift up your hearts' (*Sursum corda*)—Answer, 'We lift them up unto the Lord.' 'Let us give thanks unto our Lord God'—Answer, 'It is meet and right.' The first part (preface) of the thanksgiving always closes with some reference to the angels who never cease to cry aloud—and here the people join in singing some short hymn, beginning 'Holy, holy, holy, Lord God of Sabaoth' (*Sanctus* or *Triumphal Hymn*). The continuation (canon) of the thanksgiving then comes to a rehearsal of the circumstances of the institution of the eucharist, reciting the words of Christ (consecration), and this again is followed by a brief remembrance of His life, and by a particular prayer, which will be spoken of hereafter. The thanksgiving closes with a short doxology, and 'Amen' is answered. The Lord's Prayer is then said, either before or after which the Sacrament is broken, and a portion put into the chalice. About this point the sacrament in both kinds is often lifted up (a ceremony properly termed the Elevation, but now often the Little Elevation), as though to invite the communicants to approach, and the words 'the holy to the holy' are usually uttered. In the Roman school the kiss is given now. Next comes the administration of the communion, preceded by some prayers of preparation, and accompanied or followed by a psalm or hymn. The whole service ends with prayers of thanksgiving for the communion received (post-communion), and a benediction. It will be remarked that in the above sketch

one important feature is not mentioned—viz. the prayer for all men (the Great Intercession). It occurs in all the liturgies, but it is placed at different points, and it is in the particular point at which this prayer occurs that the difference between them mainly consists. All the liturgies also have adopted the use of the Nicene Creed, though they differ as to the point at which they interpolate it; but, as the creed itself dates only from the 4th century, and forms no integral part of the ceremony, this is a matter of little moment. It is to be remarked that in all the rites some portions of the service (even such as are not personal to himself) are said by the priest inaudibly (*secreto*), a singular custom which may perhaps have arisen after the introduction of congregational singing, and owe its origin to the desire, on the one hand, not unduly to protract the service, and, on the other, not to omit either the singing or the prayers.

In the West the use of the word *liturgy* has been almost entirely superseded, except in the disquisitions of the learned, by some form of the word which appears in Latin as *missa* and in English as *mass*. The derivation of this word has been disputed, but it is admitted that it is connected with the proclamation, *Ite*; *missa est*, often made at the end of the Roman mass, and it may now be regarded as certain that it is a mere corruption of *missio*, and means simply a dismissal. In the Western rites the bread is always unleavened. The language is normally Latin, which was the common literary tongue when these rites were composed, and has never been changed. They have a custom, introduced about 1100 A.D., that, immediately after the utterance of Christ's words of institution, in each case the celebrant should lift the sacrament above his head, and this is now commonly called by Westerns the elevation, while the true elevation, or lifting of the sacrament, as though to intimate that the moment of communion is at hand, is by them called the Little Elevation. By a custom sanctioned in the 15th century, the celebrant only (with the exception of the kings of France at their coronation, and a few of the assistants at a papal high mass) communicates from the chalice. The manner of conducting the service is divided into High, Sung, and Low Mass. A High Mass is sung, with a deacon, sub-deacon, and other assistants, and the use of incense. A Sung Mass is sung by the priest and choir or congregation, but there is only one clerk and usually no incense. A Low Mass is read by the priest with one clerk, and without either music or incense. A Low Mass occupies about half an hour, the others (with simple music) about three-quarters of an hour. Very many priests celebrate it every day, so that it sometimes takes place scores of times in the same church on the same day.

(A) The Roman liturgical family is often called the Petrine, and is traditionally ascribed to the apostle Peter. It is certain, however, that the early Roman Church was a Greek church. When its liturgy became Latin is unknown; possibly the Latin liturgy is of African origin. There is no trace of the change before the 4th century. The distinctive features of the Roman family are the peculiar position of the Pax, and that the great intercession (except the prayer for the dead, which has perhaps, however, been misplaced) occurs between the Sanctus and the Consecration. It is represented by two main rites.

(a) The Roman. This is the common Roman mass familiar in most parts of the world. The Roman liturgy has several varying forms, such as that used by the Dominicans (who, as in the Alexandrian school, place the bread and wine on the altar at the beginning) and the Carthusians. These preserve the usages of particular times and places in the middle ages, as was also the case with

the Sarum, the Aberdeen, and other medieval rites. There are also some French variations, especially that of the church of Lyons, but their peculiarities may have to do with survivals from the Gallican (see below). It has also been translated into Slavonic, into Armenian by the Dominicans, and into Chinese by the Jesuits, but of these the Chinese has never come into use, and the Armenian is extinct.

(b) The Ambrosian liturgy is that of the ecclesiastical province of Milan. Its main interest for scholars lies in the fact that it is a development, parallel to, but independent of, the present Roman liturgy, from some earlier form of the latter, which has been the common parent of both, and that it preserves some features of this parent which have been lost or much obscured in the Roman use.

(B) The origin of the Ephesian or Ephesine family of liturgies is traditionally ascribed to St John. Its distinctive feature is that the great intercession does not form part of the thanksgiving, as directed by the apostle Paul, but is placed after the close of the offertory, and immediately followed by the Pax, before the thanksgiving begins. It is almost extinct, but was once represented by at least three branches, of which one only survives. (a) The Mozarabic liturgy is the ancient liturgy of Spain, and owes its present name to the fact that those who continued to practise it had lived mixed with the Arab population. It would have died out altogether had not the celebrated Cardinal Ximenes established a special chapter to celebrate it in the cathedral of Toledo, and sanctioned it for the holders of a few isolated benefices, so that the practice of this liturgy is now confined to a side-chapel in the cathedral of Toledo, and the use of a few individuals. It is written in a very peculiar dialect of degraded Latin, and the existing texts are corrupt, some portions having been avowedly added by Cardinal Ximenes, under whose care all the service-books of this rite were edited. (b) The Gallican or ancient liturgy of Gaul is totally extinct. No copy of it is known to exist, and the attempt to reconstruct it from fragments and incidental notices has largely exercised the industry and ingenuity of the learned. (c) The Celtic liturgy, as imported by Patrick into Ireland and by Columba into Scotland, was undoubtedly Gallican in form. Gildas the Wise introduced the Roman liturgy in the 7th century, and it gradually took the place of the other, which was finally stamped out in Scotland by St Margaret, and soon afterwards in Ireland, where it lingered a little longer. Its remains are more scanty than those of the Gallican. What liturgy was used by the early British (i.e. Cymric) Christians is unknown. It may have been either Roman, Gallican, or both. There is even a mention of a Greek liturgy in Wales. In the three Eastern families the bread (except among the Armenians) is always leavened. They are celebrated as a rule in the classical literary tongue of their respective countries. With regard to them it has to be observed that, while the majority of the Christians who use them belong to the Orthodox (vulgarly called the Greek), the Nestorian, or the Monophysite communions, there is everywhere a minority who adhere to the communion of Rome, and that, while employing, with only very slight differences, the same liturgies, there is between them a very grave doctrinal difference as to the consecration which cannot be ignored by the liturgical scholar. In each of these families the place of the prayer which follows the remembrance of the life of Christ in the Roman liturgy is occupied by a form invoking the Holy Ghost to descend upon the elements that they may be the body and blood of Christ. The Catholics maintain that the consecration is effected solely by the words of Christ, and that this prayer is therefore to be understood in

the same sense as in the corresponding one in the Roman liturgy—viz. as merely asking that the sacrament may be blessed to the receivers, and that the Holy Ghost is invoked to descend upon it in order to enable the communicants to 'discern the Lord's body' (1 Cor. xi. 29), in a manner somewhat similar to that in which He descended upon Christ's natural body at the time of His baptism, in preparation for the work of His ministry. On the contrary, the bulk at least of the Easterns outside the communion of Rome maintain that this invocation is essential (if not indeed the sole essential) to the consecration, which is not effected, or at least completed, until it has been uttered. It may be added that the Eastern Catholic clergy are in the habit of saying low masses without music and generally without incense, and that their celebrations are as frequent as those of Latins; while among the Orthodox and Monophysites there is a daily celebration in monasteries and cathedrals, but in ordinary churches only on Sundays, holy days, and special occasions; and among the Nestorians, although the celebration is nominally prescribed for all Sundays, Fridays, and holy days, it is not uncommon to find only a sort of Mass of the Catechumens performed even upon many Sundays.

(C) The origin of the Hierosolymitan or Jerusalem family of liturgies is ascribed to the apostle James. Its distinctive feature is that the great intercession occurs just before the closing doxology of the thanksgiving. (a) The earliest existing form is a liturgy in Greek, called by the name of the apostle, which is now obsolete everywhere, though it is said to have long lingered on in some of the Greek islands, for St James's Day only. However ancient may be some portions of it, especially in the thanksgiving, it contains in its present form comparatively recent features, the dates of which are known. (b) The Constantinopolitan. There is a liturgy (originating from the Church of Cæsarea) called by the name of St Basil, abridged from that of St James, and of which the inaudible parts of the anaphora have again been abridged, under the name of St John Chrysostom, although it is very uncertain how far Basil and Chrysostom are really to be credited with the work. These liturgies, or rather this liturgy (since the differences are only in the inaudible part), is the only one in use in the Orthodox communion, and is celebrated in Greek, Arabic, Slavonic, and Georgian. A stranger entering a Greek church is liable to be struck, if not confused, by the way in which the actual liturgy, mostly inaudible, is overlaid with litanies and hymns of varying length, and still more by the almost entire concealment of the altar behind the screen called the *eikonostasion* ('image-stand'). (c) The Greek rite in Italy. A good many Italians, especially in the south, belong to the Greek rite. They now use the Constantinopolitan liturgy. There was once, however, a native Sicilian Greek liturgy, of which a text has been published by Assemani, and of which certain peculiar local practices are probably survivals. The members of the Basilian order in Italy had also a peculiar form of Greek liturgy, which may now be regarded as extinct, as the present government has suppressed all their monasteries, and the surviving members have mostly if not universally adopted the pure Constantinopolitan. Their liturgy was generally regarded as the Constantinopolitan affected by Westernisms, but this point has not been sufficiently investigated. (d) The Armenian liturgy is an adapted translation of the Greek St Basil. The language is Armenian. There is no *eikonostasion*, but a veil is sometimes drawn round the altar. The celebration of this rite is far more pompous and spectacular than that of any other used among Christians. (e) The Syriac liturgy of St James appears to be a free translation from an

early form of the Greek. Devout Syrian ecclesiastics seem to have had a sort of passion for composing paraphrases of the inaudible parts of the anaphora, and there exist at least some forty such compositions, sometimes dignified by the name of liturgies. This liturgy of St James is that used by the section of the native Christians of India ('Christians of St Thomas') who have abandoned the communion of Rome and their own ancient Babylonian rite, and embraced Monophysitism. (f) The Constantinopolitan rite has had a great effect upon the forms of the Alexandrian or Egyptian liturgy, which is treated below under E.

(D) The origin of the Babylonian school of the liturgy, otherwise called the Assyrian or Chaldean, is ascribed to the apostle Thaddæus. The language is Syriac. The distinctive feature is that the great intercession occurs after the remembrance of the life of Christ and before the invocation, which immediately precedes the closing doxology of the thanksgiving. The oldest existing form is that of the liturgy called 'of the Apostles,' and is certainly of profound antiquity. There are two paraphrases of the anaphora of this liturgy, one of which is called the liturgy of Theodore of Mopsuestia; the other is named by the Nestorians in honour of the founder of their sect, but they appear to be as a whole older than the time of these persons. In the churches of this rite the sanctuary is a separate room, somewhat after the manner of the Holy of Holies of the Jewish temple, and the whole ceremony is of severe simplicity. The liturgy of Malabar, or original liturgy of the native Christians of India ('Christians of St Thomas'), is a form of the Babylonian liturgy of the Apostles, but is said to have suffered much ignorant meddling, under the influence of the Portuguese, at the synod of Diamper (1599).

(E) The Alexandrian liturgical family represents the form of the liturgy belonging to the Church of Egypt, and its origin is ascribed to the evangelist Mark. The properly distinctive feature is that the great intercession occurs between the *Sursum corda* and the *Sanctus*—viz. in that part of the thanksgiving called the preface. Its existing monuments have all been corrupted by diverse external influences, and their history is very obscure. (a) The normal or original form is called the liturgy of St Mark, and is in Greek. Like that of St James, it contains passages, especially in the thanksgiving, of which it would be rash to measure the antiquity, but, as we now have it, it has undoubtedly been modified under Constantinopolitan influences, and probably since the triumph of Monophysitism in Egypt. It continued to be used for many centuries by the Orthodox, but is now extinct, as they have adopted the full rites of Constantinople. (b) Renaudot has published what he believed to be an Alexandrian edition of the Constantinopolitan liturgy of St Basil. (c) At what period the Coptic or native language was substituted for the Greek is uncertain, and the present writer is inclined to the belief that it was a device of the Monophysites to popularise their heresy and emphasise their separation from the Orthodox. But whoever the translators may have been, they were confronted by the fact that the population were to a great extent bi-lingual; many formulæ were familiar in Greek, and the theological terminology was mostly Greek. Accordingly the liturgy was translated into a sort of jargon of Coptic mixed with Greek words, many formulæ were left in Greek, and the deacon was provided with a set of biddings in Greek so ample as nearly to amount to a translation of the prayers. The liturgy so produced was that which bears the name of St Cyril. It is a free translation and adaptation from that of St Mark, but from a recension earlier than that of which we possess any Greek text. It

is now almost extinct. (d) A fresh anaphora was composed, called by the name of St Basil, and in which the great intercession is transferred to the latter part of the thanksgiving, as in the Hierosolymitan family. It is now used only on some rare occasions. (e) A third anaphora was composed, called by the name of St Gregory, and this, joined to the pro-anaphora of St Cyril, constitutes the ordinary Coptic liturgy. A fresh linguistic difficulty has however arisen. Coptic is totally dead, and Arabic has become the language of Egypt. Hence the sermon is of course in Arabic, some parts of the liturgy are always, and the Creed and Lord's Prayer often, said in Arabic; each portion of Scripture is read in Arabic as well as Coptic, and Arabic hymns are introduced. The service is, in fact, trilingual. Coptic churches are generally very plain, the altar is surrounded by a wooden partition, and the ceremony is not showy. Incense is burned almost without ceasing from the beginning until the consecration. (f) The Abyssinian liturgy is in Ethiopic, and is called that of the Apostles. It is an adapted translation of the Coptic St Cyril. Here also there has been a considerable tendency to compose paraphrases of the anaphora, of which as many as ten are known to Western scholars.

It remains to mention a few externals which are common to all these families. All light wax tapers during the celebration, however bright may be the natural light (see LIGHTS), and incense (q.v.) is universally burned. Fans (q.v.) came into use in the southern countries where flies are troublesome, but as a rule they have now become mere ornaments carried in processions. As to vestments, the Chasuble (q.v.) is universally worn by the celebrant; nor is there any trace of a time when it was not. As, however, it is originally a mere round piece of stuff with a hole in the middle for the head, the hands can only be used while wearing it by raising it at the sides or in front. Hence in the Roman, Ephesian, and Babylonian families it is cut up at the sides and hangs down before and behind; among the Orthodox the front part below the breast is cut away; in the Alexandrian rite, and by the Armenians and some of the Syrians, it is entirely split up the front, and becomes a mere cloak. In all the families is also worn a long gown down to the feet, which is in English called an *Alb* (q.v.). This, with its accompanying girdle, of course represents the long tunic worn by orientals. The *stole* is a strip of stuff worn by the priest round his neck, and by the deacon over his left shoulder. It seems to be the *talith* or religious garment of the Jews, which must of course have been worn in prayer by Christ and His earliest disciples, and which, as usually arranged, exactly resembles a stole. The *maniples* (in Greek, *epimanikia*) are cuffs seemingly used simply to confine the sleeves of the alb; the corresponding object worn by Latins, however, is put on the left arm only, and has a long flap; and some have maintained that it was originally a pocket-handkerchief. The *amice* is really a veil or covering for the head, and by the Copts it is so worn until the thanksgiving. In the other families it is generally pushed down upon the neck, and the Armenians, by embroidering it, have made it into a sort of ornamental collar.

The liturgies used by Protestants are either, as among Anglicans, adaptations of the Roman rite, or, as among Presbyterians, forms altogether newly invented, based upon Scripture and convenience only. The latter process has resulted in some interesting coincidences, such as the general introduction among Presbyterians of the ceremonial in-bringing of the bread and wine at the offertory, called by the Greeks 'the Great Entrance;' while one school gained the popular name of 'Lifters,' from practising the Elevation. It may, however,

be remarked that Spanish Protestants have always shown a great leaning to the Mozarabic liturgy, the reason for which is plain enough, since it is not Roman, and is undoubtedly ancient and intensely national; and it is not improbably owing to the influence of Spanish refugees in London that in the second (and present) Anglican liturgy the great intercession (the 'Prayer for the Church Militant') has been placed in the offertory. The liturgy used by the body commonly known as Irvingites is remarkable for its literary merit.

Liu-kin. See RYU-KYU.

Liutprand, or LUITPRAND, an author to whom we owe much of our knowledge of the history of the 10th century, was born of a distinguished Longobard family in Italy about the year 922. He entered the service of Berengar, king of Italy; but, having fallen into disgrace, he repaired to Germany, and served the Emperor Otto I., with whom he returned to Italy in 961. Otto made him Bishop of Cremona, and afterwards sent him on an embassy to Constantinople. He died about 972. His *Antapodosis* treats of the period from 886 to 950. He wrote also *De Rebus Gestis Ottonis Magni Imperatoris*, covering the years 960 to 964, and *De Legatione Constantinopolitana*, a satire on the Greek court. The best edition of his works is printed in Pertz's *Monumenta Germanica*, vol. iii. See Köpke, *De Vita Liutprandi* (1842), and W. P. Ker, *The Dark Ages* (1904).

Liutprand. See LOMBARDS.

Livadia (anc. *Lebadeia*), a town of Greece, 60 miles NW. of Athens, destroyed by earthquake in 1894; pop. 8000. From it the central part of modern Greece used to be called Livadia.

Livadia, the name of an estate, with a couple of palaces and magnificent gardens and vineyards, which belonged to the Russian imperial family, situated on the south coast of the Crimea, 30 miles SE. from Sebastopol. The entire neighbourhood is sprinkled with castles and villas of notabilities, who came for sea-bathing in autumn.

Liver. The liver is the largest gland in the body. It weighs from 3 to 4 lb., and measures about 12 inches from side to side, and 6 or 7 inches from its anterior to its posterior border. It is situated in the right hypochondriac region, and reaches over to the left; being thick behind, convex on its upper surface, where it lies in the concavity of the diaphragm, and concave below, where it rests against the stomach, colon, and right kidney. This lower surface presents a fissure dividing the

organ into a right and a left lobe. The liver is retained in its position by five ligaments. Besides the right and left lobes, there are three smaller lobes. The great bulk of the organ is, however, made up of the right lobe, which is six times as large as the left. The vessels of the liver are the hepatic artery, which comes off from the coeliac axis, and supplies the organ with nutrient blood; the portal vein, which conveys to the liver the venous blood of the intestines, spleen, and stomach, and from which (after the vessel has ramified like an artery) the hepatic veins arise and convey the blood from the liver into the inferior vena cava.

In fact, the liver is a great glandular mass placed in the path of the veins passing from the stomach

happens that the liver may have a heavier task thrown upon it than it can undertake. Thus, a rapid dissolution of corpuscles may take place from various conditions; for instance, there may be an excess of blood after a bloodless amputation, where the blood of a limb before the operation has been driven into the rest of the body; or, again, when the blood from the after-birth has been allowed to flow into the body of a baby. In these cases the liver may be unable to excrete all the pigment and jaundice will arise. A similar condition will follow any obstruction to the outflow of bile from the liver (gall-stone, inflammation of ducts, &c.). The already secreted bile will in that case pass back into the system through the absorbent lymphatics. In the bile are certain organic salts, taurocholate and glycocholate of sodium. It is probable that these result from the destruction of albumen, perhaps that of the red blood-corpuscles. Of these salts and their rôle in the economy there is much to be learned; they are probably in part reabsorbed from the intestine into the blood.

These functions of the liver commence at an early period of intra-uterine life, the excreted bile accumulating in the intestine, and forming the greenish meconium. After birth the bile may be looked upon as performing in its passage through the intestine the part of an aid to digestion and absorption, and as preventing undue decomposition of the food by bacteria (see BILE, DIGESTION).

But the liver has other and perhaps equally important functions to perform. It is a great storehouse of food material. When the body is well nourished the liver cells store a certain quantity of fat, which they can part with during starvation. In stall-fed animals, beer-drinkers, &c. the liver is loaded with fat, while the liver (*pâté de foie gras*) of the Strasburg goose is a mass of fat, with hardly any vestige of the original tissue left.

Claude Bernard was the discoverer of one of the greatest functions of the liver. It appears that carbohydrates and proteins absorbed in a soluble form into the blood are, for the most part, seized by the liver and prevented from entering the general circulation. The liver retains them chiefly in the form of glycogen or animal starch, $C_{12}H_{20}O_{10}H_2O$; and after a good meal as much as 5 per cent. of the organ may consist of it alone. This glycogen is then discharged from the liver, probably in the form of a soluble sugar, as the economy is in need of it. We have here a wonderful provision for regulating the food-supply to the tissues, for it would be of obvious disadvantage to them were they inundated with pabulum directly after each meal, and then left without any at all. Many parts of the body, the muscles for instance, are capable of storing glycogen on their own account; but this power is limited, and the great glycogen storehouse is the liver.

We have already seen that there is evidence that protein substances are broken down in the liver. The greater part of the nitrogen of the protein is excreted by the kidneys in the form of urea, which substance, as has experimentally been shown, has its primary origin in the liver itself. If carbonate of ammonia be injected through the organ it is converted into urea, which appears in increased quantity in the blood, and is excreted by the kidneys. After a highly nitrogenous diet urea in like manner appears in the blood, the nitrogen having separated from the protein molecule. In birds and reptiles, where the nitrogen waste of the body is uric acid, not urea, the former substance is also formed by the liver, extirpation of the organ causing a marked diminution in the uric acid formation.

DISEASES OF THE LIVER.—The liver, like other organs of the body, is subject to disorder and dis-

Fig. 1.—The Liver:

and intestines towards the heart. The blood, laden with nutritious matter, has to pass through the liver before it can get into the general circulation; in its passage it comes into intimate relationship with the minute hepatic cells, which alter its constitution, abstracting or adding various constituents. The bile is one of the products of the liver cells, which, obtaining their raw material from the blood, secrete this fluid into tiny ducts (drains). These join with other vessels to form larger and larger ducts (just as veins join with other veins to form larger vessels), which finally leave the liver and pass towards the gall-bladder. Here the Bile (q. v.), which is constantly secreted, is stored up ready to be discharged into the intestine during digestion. The bile, which is of a brown, or in some animals, of a green colour, is coloured by pigments (bilirubin, biliverdin), which are undoubtedly decomposition products of hæmoglobin, the colouring matter of the blood. It appears, therefore, that the red corpuscles of the blood which contain this pigment are continually suffering dissolution, probably the old and useless cells being destroyed within the body by the agency of other cells. Whether their destruction actually takes place within the liver is not yet absolutely certain, but it is certain that the liver removes their colouring matter from the system. Occasionally it

ease. It is subject to congestion from exposure to cold, and it is certain to suffer from any prolonged violation of the laws of dietetics. The European living in India who persists in the food habits of a cold climate, although he lives in a warm one, is certain to develop a 'liver.' The beer-drinker acquires a fatty liver, and the dram-drinker an organ in which the cellular elements have greatly diminished, the mass of the organ becoming mere fibrous tissue. The most important, because the commonest, malady connected with disorder of the liver is that known as *biliousness*. The acute form, or 'bilious attack,' has been shortly noticed under Bile (q.v.); but many persons suffer habitually or for long periods from an allied condition. The symptoms are very various; but the most common are dull pain with a feeling of weight in the region of the liver, and pain in the right shoulder, usually worst after meals; a bitter taste in the mouth, with coated, yellowish tongue, dull headache, giddiness; sometimes drowsiness, sometimes sleeplessness; and generally more or less depression of spirits. The condition is most apt to occur in those who take too much or too rich food or drink, with too little exercise. It is probably caused not merely by deficient secretion of bile, but by imperfect performance of the other functions of the liver, especially the disintegration of albuminoid bodies. For the removal of the condition the most important measure is proper regulation of the patient's habits. Great care in diet must be enjoined, particularly as regards alcoholic drinks. Of these malt liquors and sweet or strong wines are the most injurious; but it is generally best to abstain from them altogether. Rich dishes must be avoided, and sugar and meat be taken in moderate amount. Exercise in the open air is very important: riding is the most, walking probably about the least, useful form. With regard to drugs, mercurials (e.g. blue pill) often give great relief; but their habitual use is dangerous. A daily draught in the morning of some saline aperient is generally desirable; and nitro-hydrochloric acid in small doses, with some bitter tonic, is often very useful. Biliousness seldom seriously shortens life, but it often grievously interferes with its enjoyment, and with the power of doing work with any vigour or satisfaction.

Congestion of the liver occurs in at least some cases of biliousness, and in inflammation of the organ; also in chronic form with disease of the heart or lungs causing interference with the return of blood through it. In long-standing cases of this disease the substance of the liver presents a peculiar mottled appearance, whence it is called *nutmeg liver*.—*Gall-stones* (see CALCULUS) and *Jaundice* (q.v.) have already been considered.

Acute inflammation (hepatitis) and abscess may occur in the course of other diseases, especially pyæmia; but in their most characteristic form they are much more common in hot countries, and in a large proportion of the cases follow on amoebic dysentery. The symptoms are extremely variable; there may be fever, pain, or weight in the liver and right shoulder, and disturbance of digestion; but in some cases all these are absent. If the abscess be in the anterior part of the liver, its presence may be indicated by bulging, or enlargement with alteration of shape of the organ; but if deeply seated no indication of its presence may be found.

Treatment.—In the early stages the disease sometimes seems to be checked by the administration of large doses of ipecacuanha and the application of poultices or hot fomentations; and even when an abscess is present it may subside spontaneously, or may discharge through lung, stomach, bowels, or skin with a favourable result. Such cases, how-

ever, are exceptional; and the introduction of the aspirator and of antiseptic methods has shown that surgical interference in such cases need not be dreaded as it once was. Evacuation and opening of liver abscesses have in fact in recent years saved many lives that would otherwise in all probability have been sacrificed.

Acute yellow atrophy of the liver is a curious and happily rare disease, chiefly affecting young women, in which rapid and intense jaundice, attended by severe nervous symptoms (headache, delirium, coma, &c.), but without fever, almost invariably leads to a fatal issue in a few days. After death the liver is found much diminished in size; and its secreting cells are reduced to a mass of granular debris. The symptoms much resemble those of phosphorus poisoning; and the condition chiefly occurs during pregnancy, though its causes are obscure.

Cirrhosis of the liver, or *interstitial hepatitis* (Gr. *kirrhos*, 'yellowish'), begins as an inflammatory affection, in which cells are deposited (see INFLAMMATION) in the areolar tissue surrounding the branches of the portal vein. The smaller branches become obliterated by the pressure, and, as the new fibrous tissue contracts, larger branches of the veins and ducts become strangulated, and the surface of the organ assumes the uneven or bossed appearance known as *hobnailed*. In this affection the liver is probably at first somewhat enlarged, and occasionally remains so, but in general as the contraction of the fibrous tissue increases it becomes considerably smaller than the natural size. The ordinary cause of this disease is spirit-drinking, and it is popularly known as the *gin-drinker's liver*. The obstruction to the portal circulation occasions the effusion of serum into the peritoneal cavity; and this effusion often goes on so rapidly as soon to force up the diaphragm and impede respiration. The lower extremities may become anasarcaous, but the arms and face are never affected. The portal obstruction often also gives rise to hemorrhage from the bowels or stomach. In a fully developed case of cirrhosis the liver is so altered in structure that palliative treatment is all that can be attempted. This must be directed to the relief of the dropsy, and, if medicines fail to remove or diminish it, temporary relief may be obtained by tapping; but the disease is a very hopeless one.

Amongst the other affections of this organ are the *fatty liver*. The liver in this case is much enlarged, of a pale colour, and rounded at the edges; the disease is most commonly found associated with phthisis and in cases of general obesity. Closely allied to this is the *lardaceous* or *waxy liver* (see WAXY DISEASE). Tubercle, syphilitic disease, and different forms of cancer, generally secondary to cancer elsewhere, are not unfrequently found in this organ. It is also much the most frequent seat of Hydatids (q.v.).

Liverpool, a seaport, city, municipal and parliamentary borough, episcopal see, and seat of a university, situated on the Lancashire or eastern bank of the estuary of the Mersey. The city is roughly semicircular in shape, the base on the river being about 7 miles long, while the principal thoroughfares radiate from the central point of the water-line, known as the Pier Head, $3\frac{1}{2}$ miles from the open sea. The population of Liverpool in 1921 was 802,940; but the adjoining borough of Bootle and the urban districts of Huyton, Crosby, Litherland, Seaforth, and Waterloo on the Lancashire side, together with the boroughs of Birkenhead and Wallasey and adjoining urban districts on the Cheshire side of the river, are essentially parts of the same urban community, economically dependent on the activities of the port; the population of this greater Liverpool amounts to considerably over a million.

History.—Liverpool was an insignificant rural hamlet and fishing-station until in 1207 King John turned it into a free borough with a view to using it as a point of embarkation for Ireland. The reason for its choice was the existence of a little harbour, a creek re-entering from the estuary and forming a harbour from its swift currents. This creek, known as the Pool, gave the place its name; it was transformed into the first dock in 1709–15, but was filled up in 1826, and all trace of it has now disappeared. In 1229 the borough obtained a gild-merchant and powers of self-government by a charter purchased from Henry III. Between 1232 and 1237 a castle with four towers was erected on a rock overlooking the entrance to the Pool by William de Ferrers, Earl of Derby, then lord of the town. In 1406 a second fortress, known as the Tower, was created by Sir John Stanley. Both of these mediæval fortresses were demolished in the 18th and 19th centuries. During the middle ages Liverpool was much used for the transport of troops to Ireland. It enjoyed a share of Irish trade, and also some trade with Spain and South France. But its isolation and defective communications by land prevented it from becoming a centre of any importance. It had a population of about 1000 in the middle of the 14th century, but declined greatly during the 15th, and did not regain its earlier population until the end of the 16th century, when it was described as a 'decayed borough.' It had returned members to the parliaments of 1295 and 1307, but did not regain this privilege till 1547. There was some revival of trade in the early 17th century, and a valuable new charter conferring extensive privileges was granted by Charles I. But growth was interrupted by the Civil War, during which Liverpool was three times besieged and captured, twice by the Parliamentarians, and once by Prince Rupert on his way to Marston Moor, 1644. The real development of Liverpool began after the Restoration, when the population was about 5000. In this period a considerable trade was opened with the West Indies and the American colonies, and the sugar-refining and tobacco industries began. In the first half of the 18th century progress was more rapid; the population rose to 25,000 by 1760, the first two docks were opened, and a handsome new town-hall was built. Liverpool began to compete successfully with Bristol for the control of the West Indian trade, and from this was led to enter on the West African slave-trade. This became for three-quarters of a century the chief source of Liverpool's wealth and the foundation of her prosperity. At the end of the century it was estimated that five-eighths of the English slave-trade and three-sevenths of the total slave-trade of the world was carried in Liverpool ships, and the net profit of the trade seems to have averaged about £300,000 per annum. In the first half of the 18th century Liverpool began to conquer the obstacles to free communication by land and sea which had hitherto hampered her development. The river-channels were buoyed. The shallow streams of Lancashire and Cheshire were made navigable. The first good roads were constructed; until this date there was no road from Liverpool practicable for carriages. But it was in the period 1760–1815 that the position of Liverpool as the main port of industrial England was really established. The industrial revolution not only vastly increased the output of all the English industries, but established all the chief of them on the coal-field areas within a hundred miles of Liverpool, and a very rapid creation of roads and canals, for which much of the capital and enterprise were found in Liverpool, brought these new industrial areas into easy communication with the port. At the same time vast new foreign

markets were opened by the rapid growth of the United States, the opening of Spanish America to trade on the revolt of the Spanish colonies, and the opening of the eastern trade by the withdrawal of the East India Company's monopoly (1813). In 1760 Liverpool chiefly traded with the West Indies and West Africa; in 1815 her ships already trafficked with every part of the world. To meet this growing trade the dock system was much enlarged, and population rose from 25,000 in 1760 to about 100,000 in 1815. Local industries also developed, notably pottery (printing on pottery was a Liverpool invention), watch-making, iron-founding, rope-making, and shipbuilding, besides the old tobacco and sugar industries. But most of these industries had already begun to decay before the end of the period, and Liverpool depended almost exclusively upon the carrying-trade. In the almost continuous wars of the period 1760–1815 Liverpool played a large part. Every merchant-ship went armed and prepared for war; there were fleets of privateers, in which men of all classes had a share, and numerous prizes and prisoners were brought into the port; in 1799 there were over 4000 French prisoners in the Liverpool jail. The rapid growth of this period produced acute social problems. The government of the town had since 1580 been in the hands of a close, self-elected town-council, and although it was often attacked, this system survived unimpaired till the Municipal Reform Act of 1835. The close council, though it administered the dock estate and the large burghal landed estate honestly and on the whole efficiently, felt no responsibility for the supervision of the town's development. Consequently the town was badly laid out, slum areas of inconceivable vileness and unhealthiness grew up, and the population was terribly overcrowded. One-ninth of the inhabitants lived in cellars, and many more in narrow and undrained courts and alleys, the houses of which were commonly built back to back, while the water-supply was totally inadequate. Even the principal thoroughfares were mean, narrow, tortuous, and very dirty. The population, trained by the violence of privateering and slave-trading, was very turbulent, and there were frequent riots, in one of which (1778) the mob besieged the town-hall with cannon brought from the ships. Drunkenness was widespread; in 1795 one house in seven was said to be a drink-shop. There was no adequate police-system. In short, the unduly rapid and unregulated growth of this period left to the next age a social problem more difficult than perhaps any other English town had to face. During the 19th century (1815–75) there was a very rapid expansion of trade and wealth, and a very slow but real amelioration of the social condition of the town. The tonnage of ships entering and clearing from the port rose from 640,000 in 1816 to 8,385,000 in 1875; the area of the dock-estate was multiplied sixfold in the same period, and the length of the dock-wall rose from $1\frac{1}{2}$ miles to $5\frac{1}{2}$ miles; the population rose from 100,000 in 1815 to 493,000 in 1871; and though this figure includes certain growing suburbs later included in the city, it does not include the towns of Bootle and Birkenhead, which became independent municipal boroughs in 1869 and 1877 respectively. The character of the port was transformed by the application of steam to sea and land transport, which alone rendered possible the marvellous growth of this period. The first railway, that between Liverpool and Manchester, was opened in 1830. The first steamboat seen in the Mersey was in 1815, and although steam-power was for some years used only for river-traffic, in the thirties it began to be applied to the coasting and Atlantic trade. In 1840 the Cunard Company began its regular services to

New York, and this may be said to be the beginning of the series of 'liners,' sailing to a fixed time-table, which have become the main feature of Liverpool trade. During this period the town had a very bad reputation; it was known as 'the black spot on the Mersey,' and in 1874 the *Times*, commenting on its social condition, could say that 'Liverpool is a town whose leading inhabitants are negligent of their duties as citizens.' This was not quite just, for the conditions were unusually difficult, and much had already been done. The unreformed council before 1835 had widened all the main thoroughfares in the centre of the town. A series of fine public buildings had been erected: a domed custom-house in 1826, St George's Hall, one of the noblest of modern buildings, in 1854, a city library and museum in 1856, an art gallery in 1873, two big public secondary schools in 1835 and 1843. A new water-supply, drawn from reservoirs at Rivington, was opened in 1857. The reformed corporation of 1835 had remodelled the police-system, drained every part of the town, and acquired, by the three Building Acts of 1842, 1846, and 1864, powers of regulating buildings and of demolishing insanitary property, which were in advance of the powers possessed by any other English town. The closing of cellars and the demolition of courts and alleys was proceeding steadily, if slowly. In 1868 three large parks were acquired; there had hitherto been scarcely any public places of recreation. Liverpool was still an ugly and unhealthy place in 1875, but it was improving. The period from 1875 to the present day has been the most creditable in the history of Liverpool. While wealth has increased even more rapidly than before, in all the arts of civilisation a remarkable advance has been made, until Liverpool now ranks among the handsomest, best governed, and most progressive of modern cities. The population of the whole urban area, of which the town-hall is the centre, has nearly doubled. The area subject to the municipal authorities has been increased by successive enlargements from 5000 acres in 1875 to 24,000 acres in 1923. The extraordinary expansion of trade is dealt with below; but it may be noticed that neither the rapid growth of the trade of other nations, nor the opening of the Manchester Ship Canal and the development of other English ports, seems to have done anything to retard the progress of Liverpool. In 1875 the total value of the imports and exports of Liverpool was £184,000,000, in 1920 it had reached the enormous figure of £1,000,000,000. At the same time the external aspect of the town has been greatly improved. Nearly all the principal streets have been rebuilt, and many of them have been widened. Attention has latterly been paid to the outskirts, the more modern suburban roads are broad and tree-planted, and a wide boulevard, known as the Queen's Drive, has been constructed round the whole of the outskirts. New parks and gardens have been created both in the outskirts and in the heart of the city; the worst slum areas have been swept away, and the erection of model dwellings under corporate control has been undertaken on a scale unknown elsewhere; there are now over 2600 dwellings under the control of the corporation. Seven large public secondary schools have been established or taken over by the corporation, apart from the elaborate provision of elementary and technical schools, and there are ten branch libraries. A cheap and efficient tramway system has rendered possible a wider distribution of the population, and contributes largely to the relief of rates. Since 1874 the licensing bench has followed a systematic policy of reducing licenses, and the number of licensed houses has fallen steadily. In 1911 a remarkable system of organisation for the dock-labour of the port was instituted, which is

expected largely to reduce the amount of surplus casual labour and of unemployment. In 1880 Liverpool became an episcopal see, and in 1903 the erection of a cathedral, destined to be the largest in England, was commenced. In 1881 a university college was founded, which in 1903 was raised to the dignity of an independent university. All the changes of the last fifty years have combined to transform the character of the town. Still a cramped, ugly, and sordid commercial town in 1875, it has become a handsome and well-built city, equipped with all the apparatus of civilisation.

Trade.—Liverpool has few important industries. In recent years the port has become one of the principal milling-centres of the world, and immense flour-mills are located immediately beside the berths of the corn-ships, especially on the Birkenhead side of the river. The manufacture of tobacco, of which Liverpool is the chief importing port, is carried on on a large scale; sugar-refining is still carried on, though it is less important than it used to be; such shipbuilding as the port conducts is housed on the Cheshire side of the Mersey; there are some chemical and engineering works; there is a considerable manufacture of matches; the huge soap-works at Port Sunlight are within the limits of the port; and there are some minor industries. But it is the transport trades, and above all shipping, which give their main occupation to the immense population of Mersey-side. The only rival of Liverpool as a ship-owning centre is London, but Liverpool is *par excellence* the port of ships of very large tonnage; the average size of a Liverpool ship is twice as large as the average size of a London ship. These ships ply to every part of the world, and it is estimated that one out of every ten ships in the world hails from Liverpool. Liverpool is beyond rivalry the chief port for the export of British products, and she has the main share in the traffic with British possessions, and generally with the trans-oceanic as distinct from the European world. By far the most important single item in this vast traffic is the cotton trade. Next in order come, among imports, dead meat, corn and cereals, india-rubber, wool, live animals, copper, timber, tobacco, and sugar—all foodstuffs and raw materials; and, among exports, iron and steel manufactures, woollen manufactures, machinery, linen manufactures, chemicals, china and earthenware, and hardware. But practically every commodity known to commerce can be seen on the wharves and in the warehouses of Liverpool.

Docks.—The dock-system, which is the greatest pride of Liverpool, has been since 1857 under the control of the Mersey Docks and Harbour Board, a body of 28 members, 4 of whom are appointed by the Mersey Conservancy Commissioners, and 24 by payers of dock dues. In 1857, when this Board was first constituted, the line of docks extended for 5 miles along the Lancashire shore; their water-area amounted to over 192 acres, and their lineal quayage to about 15 miles. The Dock Board has added a number of new docks, but its main work has been the reconstruction of the whole system to meet the needs of large steamers, which were only in their infancy in 1857. The length of the line of docks is now about 7 miles; the water-area was in 1918 600 acres, and the lineal quayage over 36 miles. The Board has also created a large number of graving-docks, suitable for vessels of all sizes and types; it has since 1890 dredged the main channels of the river so as to make them practicable for the largest vessels at all states of the tide; it has erected a series of great warehouses for special purposes, among which may be noted the grain-elevators on both sides of the river, and the colossal tobacco-warehouse,

whose 14 floors have an area of 36 acres; and it has repeatedly enlarged the landing-stage (the most characteristic feature of modern Liverpool, begun in 1847), until it is now a vast floating platform, 2478 feet long by 80 feet broad, supported on some 200 pontoons, rising and falling with the tide, and connected with the river-wall by eight hinged bridges, and a floating bridge for the heaviest cart-traffic. The landing-stage accommodates at once river-ferries, coasting-steamers, and the largest liners. Immediately behind it is the Pier Head, an open place, which may be called the portico of Liverpool; here, on the site of one of the earliest docks, filled up in 1900, stand the palatial offices of the Dock Board.

The Municipality.—The Liverpool City Council consists of a lord mayor, 37 aldermen, and 112 councillors, representing the 35 wards into which the city is divided. The immense annual expenditure of the city is provided for by the income of the corporate estates, which are among the largest, if not actually the largest, owned by any English town, by the productive services, and by the rates. There are three distinct poor-law authorities, the area of one of which extends beyond the limits of the city. They maintain three large workhouses.

The University.—University College, Liverpool, obtained a charter in 1881, and began its work in 1882 in a disused lunatic asylum, with 6 chairs, 2 lectureships, and a total capital of under £100,000. In 1884 it was admitted as an affiliated college of the Victoria University, Manchester. Its students, its resources, and the public recognition of its usefulness grew so rapidly that in 1903 it applied for and obtained a charter as an independent university, and now ranks next after Manchester among the modern English universities. Its students now number about 2300. Mainly drawn from the Liverpool district, the student-body also includes representatives of most foreign countries and British colonies. The students are elaborately organised in a self-governing guild of undergraduates, which has its headquarters in a handsome students' union or club. Some of the special schools of the university have earned a wide reputation, such as the Institute of Archaeology, with 4 chairs, and valuable collections, which sends out frequent archaeological expeditions, and the School of Tropical Medicine, with 3 chairs and a large special laboratory, which has sent out many scientific expeditions to investigate the plagues of tropical regions. The buildings are extensive and convenient, but cannot pretend to any dignity of aspect. They stand in a poor quarter, near the crown of the ridge behind the central part of the city. By accident rather than design they form the central point in a line nearly two miles long, on or near which stand almost all the principal educational institutions of the city—seven of the chief secondary schools, a training college for teachers, the school of art, a large gymnasium, a medical club, and most of the principal teaching hospitals. The university is governed by the king as visitor, by a chancellor, two pro-chancellors, a vice-chancellor, by a court, a council, an academic senate, five faculties, and a convocation of graduates.

Ecclesiastical.—Liverpool has been since 1880 the see of a bishopric, which has jurisdiction over South-west Lancashire from Southport to Warrington. In 1880 an endowment fund of £100,000 was raised. In 1903 the foundation-stone was laid of a new cathedral, of which the first section was opened in July 1924. It will, when completed, be the largest in England, 584 feet long by 198 feet broad (at the widest point); the vault of the nave will be 116 feet high, and the central tower 260 feet high. The cathedral stands in a dominating position on the hill behind the central part of the city,

and will be visible from all parts of the river. The design, by Sir Giles Gilbert Scott, is Gothic, but does not reproduce the style of any particular period. Of the many Anglican churches in Liverpool, the mediæval church of St Nicholas, at the Pier Head, dates from 1356, but was rebuilt in the 18th and early 19th centuries. Liverpool is also a see (since 1913 archiepiscopal) of the Roman Catholic Church, which has a modest pro-cathedral. The Roman Catholic population is very large, owing to the great number of Irish residents. There are about 170 Nonconformist churches and chapels, 3 synagogues, a large Greek church, a German church, and a Swedish church. Charities are very numerous, and generously supported. Perhaps owing to the needs of its population, Liverpool has been a pioneer in many charitable works—the first school for the blind, the first child-protection society, the first society for the prevention of cruelty to animals, the first police-aided clothing system for children trading in the streets, and the first district nursing-organisation started in Liverpool.

Liverpool, ROBERT BANKS JENKINSON, EARL OF, statesman, was born 7th June 1770, the son of the first Earl (1727–1808). He was educated at the Charterhouse and Christ Church, Oxford, and entered parliament in 1791 as member for Rye. Like his father he was a Tory, but with Liberal ideas on trade and finance. In 1794 he became a member of the India Board, and in 1801 foreign secretary in the Addington ministry, when he negotiated the unpopular treaty of Amiens. In 1803 he was created Lord Hawkesbury, and on Pitt's return to power he went to the Home Office, as it was thought desirable he should continue to lead the House of Lords. On the death of Pitt he was invited to form an administration, but declined in consequence of the schism in the Tory party. In 1807, however, he again took the Home Office, under the Duke of Portland, and next year succeeded his father as Earl of Liverpool. In Perceval's ministry of 1809 he was Secretary for War and the Colonies, and in this capacity was charged with pusillanimity in connection with the Peninsular war. After the assassination of Perceval in 1812 Lord Liverpool formed an administration which it was predicted would not last for six months, but which in fact existed for nearly fifteen years, and then fell only through the illness of the premier himself. The first ten years of the Liverpool ministry (1812–22) have been severely criticised. The partition of Saxony, the abandonment of Poland, the union of Holland and Belgium, the Austrian establishment in Italy, the alleged connivance of England in the suppression of the revolutionary agitation in Naples, the mismanagement of the finances, the increase in the duty on foreign corn, the coercive measures adopted for dealing with discontent in England, are all pointed to as so many proofs of the incapacity or despotic sympathies of the English government of this period. Lord Liverpool himself was a Free Trader, and regarded the Corn Law of 1815 as merely an experiment; and when he was joined by Huskisson and Canning he began to liberalise the tariff. He also desired to retain a portion of the property tax, which would have obviated the necessity for fresh taxes; and, as it only affected men with incomes of upwards of £200 per annum, its retention would

have been a distinct boon to the working-classes. But Whigs and Tories alike opposed it. Notwithstanding the blunder of the sinking fund, Lord Liverpool's financial policy generally was of a sound and enlightened character; and his administration was an economical one. As a statesman, his chief title to remembrance lies in the fact that he united the old and the new Tories at a critical period, and in a manner which neither Canning nor Wellington could accomplish. On 17th February 1827 he was stricken with apoplexy, but he remained nominally prime-minister until April, when Canning formed a new government. He died 4th December 1828. See the Life by C. D. Yonge (3 vols. 1868).

Liver-rot. See FLUKE.

Liverworts, or HEPATICÆ, are flowerless plants having affinity with mosses, but commonly of lower organisation, the two groups together forming the division Bryophyta, a name which implies that its members are typically moss-like. The vernacular appellation is due to some of the species, such as of *Marchantia* or *Conocephalum*, having in the past been used medicinally for liver complaints; the lobed thallus bearing a supposed resemblance to the lobed liver was, on the hypotheses of *similia similibus curantur*, regarded as an infallible remedy for diseases of that organ. Hepatics, however, are of no medicinal nor direct economic utility. Compared with mosses, hepatics exhibit a far greater variation of the gametophyte thallus, and the plant is always dorsiventral; whereas in mosses, the leaves being arranged spirally on the axis, the plant has no upper nor

which moss capsules never possess; in dehiscence it usually opens from apex downwards simply by four vertical slits, a method rarely seen among mosses; the product of spore germination is a small filamentous, discoid, or rudimentary protonema which is usually short-lived, a marked contrast with that commonly produced by mosses.

The product of assimilation in the Hepaticæ is not starch, but an oily compound of carbohydrate and proteid substances.

The Bryophyta are interesting not only from morphological, systematic, and æsthetic aspects, but, forming as they do a stepping-stone from the lower, more aquatic and algal-like Thallophyta to the higher, more terrestrial and fern-like Pteridophyta, they are of great importance to the student of plant-evolution. In this last respect the Hepaticæ, being the less specialised group, are of greater value than the mosses, for, while the lowest genera of liverworts are more or less aquatic and algal-like in both habit and simplicity in structure of the spore-bearing generation, the higher types distinctly forecast in each respect the nature of the lower ferns, yet without their complexity of anatomical structure. It must be understood that one of the wide gulfs in the evolution of plants has been the step of adaptation, in the case of both nutrition and sex, from the aquatic to the terrestrial habit, and it is because the Hepaticæ appear to occupy an island, so to speak, in this wide gulf that they attract the attention of the plant-evolutionist.

For our immediate purpose the Hepaticæ may be divided into the Thalloid and Foliose groups. The former includes all species lacking a differentiation into stem and leaf, while those of the latter possess these organs distinctly. Stem and leaf, however, are in this case scarcely comparable morphologically with those organs of flowering plants, because the ordinary known hepatic plant is really the gametophyte or sex-producing generation, whose fertilised female cell grows into a sporophyte, or spore-producing generation, dependent upon the gametophyte for its nutrition, and for this reason called the sporogonium. The ordinary flowering plant, on the other hand, is the sporophyte, bearing and nourishing the microscopic representatives of the gametophyte upon it. In the two classes of plants the function of nutrition is, in fact, transposed, for, while the hepatic plant is both nutritive and reproductive, bearing first its gametes and in due season its sporophyte, in the flowering plant nutrition is entirely allocated to the sporophyte, which bears and feeds the representatives of the gametophyte. Reasons for this inversion of function in the two classes of plants may be sought in the following among other causes: First, the gametophytes of the lower class, by maintaining their simplicity of structure (a phenomenon possibly due to sex being the dominating factor of their life), entirely failed to adapt themselves to terrestrial conditions of existence, their life being easy of maintenance in damp, humid places. The sporophytes, on the other hand, did ultimately succeed in making the evolutionary advances necessary for the harder life of drier habitats, a factor favouring the struggle being the advantage offered by the discharge of spores into the atmosphere for dispersal by air currents. Secondly, the abolition of a separate existence for the gametophyte generation was probably brought about by a transference of the essential process of meiosis (i.e. reduction of number in the chromosomes in nuclei of reproductive cells) from the production of the asexual spores to that of the mother-cells of the gametes themselves, a process of evolution again representing an advance from aquatic to terrestrial conditions.

Life-history of Liverwort (*Marchantia polymorpha*):

1 and 2, developing thallus; 2 shows the cup with gemmæ; 3, section across thallus, showing barrel-shaped stomata with green cells in chamber below, and mucilage cell on left; 4, antheridiophores; 5, development of antheridia; 6, antheridium nearly ripe; 7, spermatozoid; 8, archegoniophore; 9, 10, archegonia before fertilisation; 11, 12, 13, fertilised egg dividing; 14, immature sporogonium, containing spores and elaters.

lower side. None of the thalloid hepatics could be mistaken for a moss, although they might be confounded with certain lichens, and the foliose or leafy hepatics which might be confused with mosses are readily distinguished from the latter by the following features: The hepatic plant is nearly always more delicate in structure, and its rhizoids are mostly without septa; its leaves are in two opposite rows, frequently with a third row of entirely different under-leaves; the upper-leaves are often bilobed, and these as well as the under-leaves are frequently bifid or multifid, nearly always without midrib, nerves, or thickened border, and have cells which are regularly hexagonal and similar in different areas of the leaf. The fertile hepatic differs again from the moss in that its capsule has no calyptra, because it always grows through the top of the altered archegonial wall instead of carrying it up in the form of a cap; it has no columella, but frequently contains elaters,

The Thalloid or frondose hepatics are represented on the one hand by the most simple forms, and on the other hand by those of the most complex organisation. The genus *Riccia* affords examples of the former, and the latter are exemplified by *Marchantia*, which, indeed, notwithstanding its thalloid nature, is one of the most complicated of all the genera of the Hepaticæ. Transitional forms between thalloid and foliose types are exhibited by such genera as *Blasia*, *Fossombronia*, *Metzgeria*, &c., belonging to the Jungermanniaceæ subsequently discussed, and this interesting feature is exhibited by no other group of plants.

There are over 140 species of *Riccia* flourishing on damp or wet soil, or in water. The thallus is lobed, the lobes usually being arranged in a rosette an inch or less in diameter. It consists of simple cellular tissue several cells thick, the cells being sometimes formed more compactly along the middle of a lobe, thus simulating a midrib. Rhizoids (i.e. hairs serving as roots) and scales are given off from below, while the upper stratum of chlorophyllous cells is provided with air spaces which may give the plants a beautiful crystalline appearance. Assimilation is carried on by the upper stratum of cells, and although simple air pores occur in some species, true stomata are absent. The upper epidermal cells of many species are conical above, and may thus serve as lenses concentrating light with its synthetic powers on the chlorophyllous tissue below. The antheridia and archegonia are contained in chambers immersed singly in the thallus, and the fertilised egg produces a sporogonium of the simplest form. This consists merely of a stalkless, thin-walled capsule, which always remains within its chamber, and, of course, has no haustorium. There are no elaters, and the large spores when ripe are liberated from the decayed apex of the archegonial cavity.

Marchantia has over sixty species, growing mostly in extensive patches on soil and rock in damp places or even in water. One species only occurs in Britain, viz. *M. polymorpha*, which is fairly common, although absent from many localities. These are commonly much larger plants than any species of *Riccia*, and the irregularly lobed thallus has a complex structure. It is many cells thick, and, besides possessing a distinct midrib, it is provided with tissues differentiated for specific functions, such as absorption, assimilation, and even with a series of cells having broad pits, simulating those of higher plants, for the storage and translocation of water. These pitted cells during drought absorb water from the spongy tissue above, which consequently contracts, making the upper surface concave; this, by closing the stomata, checks the normally rapid transpiration and prevents the withering of the plant. The chlorophyllous assimilating tissue is contained in special chambers, above which are situated the barrel-shaped stomata; these together forming a complexity of structure peculiar to this and allied genera. Special mucilage-cells for water absorption also occur in the thallus near the chambers. Asexual reproduction takes place by means of a copious supply of highly organised gemmæ. These grow on minute stalks at the bottom of gemmæ-cups, which are conspicuous objects on the thallus; the gemmæ being blown or washed away, rapidly grow into new plants. The closely allied *Lunularia cruciata*, a garden pest overgrowing flower-pots and damp paths, is well known to horticulturists, and is distinguished from *Marchantia* by its crescent-shaped receptacles, the gemmæ from which are its chief means of propagation. The antheridia and archegonia of *Marchantia* are produced on the expanded apex of vertical umbrella-shaped organs known respectively

as antheridiophores and archegoniophores. The former are undivided flat-topped structures, having large antheridia in chambers on the upper side; the latter, however, have the expanded top deeply lobed, and bear archegonia in a groove on the lower side of each lobe. The antheridia, as in the case of all Bryophyta, produce spiral and biciliated spermatozoids, which swim to the archegonia through the film of water caused by rain or dew. The fertilised archegonia give rise to sporogonia, which when ripe are short-stalked, hang downwards, and contain besides the spores long spiral elaters. The latter, being hygroscopic, twist about in response to the varying atmospheric humidity, and thus assist in ejecting the spores from the burst four-valved capsule, or in retaining them according to external conditions. The sporogonium of *Marchantia* is thus a comparatively simple one; the gametophyte, on the other hand, has attained a complexity of structure remarkable among the Bryophyta. This is entirely in contradistinction to *Anthoceros*, described hereinafter.

The sections to which belong *Riccia* and *Marchantia* muster between them some 300 species. Another section typified by *Anthoceros* has 120 members, but more abundant are the Jungermanniaceæ, with about 3600 species. The last are naturally the most typical Hepaticæ, and are the most numerous kind in this country, having representatives in almost every suitable spot, from the maritime sandy-heaths to the highest mountain-top. This great group of Jungermanniaceæ is sometimes divided into two divisions—viz. *Anacrogynæ* and *Acrogynæ*. The former do not exceed 300 species, most of which are more or less frondose, and, as the name implies, the female organs are not apical; the elongation of a shoot, therefore, is not hindered by their production. To this division belong *Blasia*, *Fossombronia*, *Metzgeria*, *Monoclea*, *Pellia*, and others, as well as the peculiar aquatic *Riella*, whose thallus is not dorsal-ventral, but is unique in having the thinner leaf-like marginal portion wound spirally around a central midrib. The *Acrogynæ*, as the name suggests, produces archegonia at the apex of a shoot, whose elongation is thus checked. About 3300 species are included in this division, and the bulk of our native hepatics belong here, such as *Frullania*, *Lophocolea*, *Scapania*, *Plagiochila*, &c.

Frullania tamarisci grows in large reddish-brown patches on rocks and tree-trunks in almost every hilly district, and will serve to illustrate the Jungermanniaceæ *Acrogynæ*. Its prostrate stems, one to three inches long, have a row of overlapping leaves on each side; these, as in all similar hepatics, are inserted obliquely on the axis and lie with their upper surface facing one way. These leaves possess basal under-lobes, which curve into a sac-like structure containing mucilage; this substance, by absorbing water during rain or dew, acts as a reservoir to the plant in dry periods. Very few hepatics, however, form modified under-lobes of this kind. Along the under side of the stem runs another row of smaller and slightly overlapping bifid leaves, termed amphigastria or under-leaves. With very few exceptions all the leaves of the *Acrogynæ* are but one cell thick, and are naturally destitute of stomata or pores, although they exhibit great diversity of shape. From between the leaves the stem, especially near its base, gives off numerous rhizoids. The antheridia occur in groups of two or three at the base of modified leaves that grow on short lateral branches of the smaller male plant. The archegonia grow on a short branch at the apex of the main stem of the female plant, surrounded by a number of modified leaves named as follows: The archegonial wall becomes the calyptra, which is surrounded by the perianth,

and this by the upper and lower involucre bracts, while the leaves surrounding the antheridia are called perigonal bracts. Both kinds of sex organs are in this group of Hepaticæ often accompanied by hair-like or scale-like paraphyses. The sporogonium of *Frullania* is small and not very readily found, so for the explanation of this organ another species, viz. *Lophocolea cuspidata*, may be employed. This plant grows in yellow-green patches on fallen timber, stumps, rocks, banks, &c. in almost every damp, shady locality. Its young sporogonium is surrounded by a large angular perianth, and this by numerous involucre bracts much larger than the ordinary leaves. It has a short stalk bearing an egg-shaped, dark-brown capsule containing spores and spiral elaters. The base of the stalk has a well-formed haustorium, which penetrates the stem of the gametophyte. When the capsule is ripe it is pushed out from among the bracts by a longitudinal expansion of the cells of its stalk through the imbibition of water to a dozen or more times their previous length. The capsule opens by four longitudinal slits into four segments or valves, and then the liberation of the spores begins. The opening of the capsule is due to the drying and consequent contraction of the cells of its wall. This brings about a tension causing a rupture of cells along the sites of weaker resistance afforded by the four lines of dehiscence, for which purpose preparation was made at a very early stage in the development of the capsule.

Many species of the Jungermanniaceæ multiply asexually by gemmæ. These are commonly produced by cells or groups of cells breaking away from the margins of the leaves. Occasionally such gemmæ are so abundantly formed that the plants bearing them present a mealy appearance. Special gemmæ cups, as in *Marchantia*, are unknown in this group, although *Blasia* provides its copious gemmæ with a long horn-like receptacle, and a few other genera have their special methods of protection for the immature gemmæ. In some species, e.g. *Metzgeria furcata*, the gemmæ are leaf-like, while in others the leaves themselves, when broken off, grow into new plants. Another common method of increase is for a young branch to die off behind; becoming thus separated from the parent, it produces a new individual, and this in time a new colony.

The plant-evolutionist, however, turns his admiring gaze more particularly to the Anthocerotaceæ, of which the genus *Anthoceros*, with over eighty species, may be considered typical; of these species six only grow sparingly in Britain. The lobed thallus is somewhat betwixt that of *Riccia* and *Marchantia*. It is always of delicate texture and often almost semi-gelatinous; it also exhibits analogy if not affinity with certain green Algae in that its cells possess but a single chloroplast. The sporogonium, however, is more highly developed than that of any other group of Hepaticæ. This genus, therefore, presents interesting features in the possession of a degraded thallus (gametophyte) associated with a sporogonium of a very advanced type, thus forecasting a higher order of plant whose sporogonium is a sporophyte living on soil, air, and light as a being independent of its gametophyte. The *Anthoceros* sporogonium is a narrow, elongated structure, one to two inches long, possessing at its base a large haustorium, which may even push tiny rhizoids into its gametophyte. A very short stalk becomes imperceptibly differentiated into a long linear capsule. The latter has a central columella similar to that of certain mosses, from which the capsule wall splits gradually in two parts from the apex downwards as the spores slowly ripen. With the spores are a number of sterile non-spiral cells,

which serve as elaters of a degenerate kind. This sporogonium also exhibits a unique feature among hepatics, in that it is not altogether devoted to spore formation and distribution; for it possesses a system of chlorophyllous assimilating tissue provided with stonata simulating the form of those on the leaves of flowering-plants. Here, then, is a sporogonium ripening and liberating its spores slowly and successively from its apex downwards; this function being at least partially subordinate to the process of carbon assimilation, in proof of which its life continues even after the spores have been shed and its gametophyte withered. Imagine the tiny rhizoids of the haustorium growing through the tissues of the gametophyte into the soil, or, perhaps like a fern embryo, producing new ones for that purpose. Such rhizoids would draw nutrient solutions from the soil, and the cells would pass it up to the chlorophyllous tissue, where, under the stimulus of energy derived from the sun, the chemical compounds from the soil mixed with those imbibed from the air would become transformed into carbohydrates and proteids—food for the maintenance of the plant and its offspring. The stimulus of hunger is the basis of many evolutionary advances, and its satisfaction makes great demands upon the ingenuity of Nature. 'The more we have, the more we want,' is an old adage verified by daily experience not only among men, but with animals and plants too. The life of the lowest organisms is mainly concerned with reproduction, the organism being, in truth, little more than a sex cell; but as we ascend the scale of beings, so progressively do we find the reproductive phase becoming subordinate to the nutritive. This victory of the feeding phase over the reproductive, together with the concomitant and continuous reaching out for food, has been, and still is, one of the great factors in organic evolution. Hunger then is, so to speak, one of the greatest inventions the world has seen. Granting the premises of the foregoing clauses, one can readily imagine the sporogonium, feeling the stimulus of an increased food-supply, would strive for more. In this struggle the absorptive and assimilative organs would increase in size and power. The stalk, to pass the sap more readily, would elongate and partially thicken certain of its cells, which in the evolutionary progress of generations would become elementary wood vessels extending through the body wherever required, as may be found in *Marchantia*. The green assimilative tissue would, in response to the increased supply of sap, increase and grow into lobes more or less leaf-like, that form fulfilling Nature's constant aim of providing the utmost power and ability with the least space and tissue. So in this elementary and acknowledged manner the slightest increase or other alteration in the form and function of one organ would, as from common experience we know, have an immediate direct or indirect effect in modifying other organs. The reader, however, must be reminded that such ideas are partially speculations, for no botanist has ever discovered a transitional form of sporogonium of the kind imagined. But such a theory is more than mere scientific guessing, because it has a basis of fact. And who shall be bold enough to gainsay that such was at least one of Nature's ways by which the sporophyte became inducted into the old, old, barren world as dominant partner in the alternation of the generations of plants?

During the dry summer of 1911 forest fires destroyed considerable areas of timber and heath near Blairgowrie in Perthshire, after which for the first year practically nothing grew on the burnt soil. Then several kinds of mosses and the *Marchantia polymorpha* appeared and flourished in

such extraordinary profusion for two or three years, that when walking among them on a dry day in late spring one's shoes and stockings were browned by the dusty spores. Subsequently other vegetation, such as grasses, sedges, scirpus, broom, &c. began to appear, and then the Bryophytes rapidly diminished. This example serves to illustrate the part taken by certain members of the Bryophyta in the colonisation of new ground sufficiently damp for their existence.

Upon consideration of the delicate structure of the Hepaticæ, as well as of the habitats in which they commonly grow, one would scarcely expect to find good and abundant fossils of them preserved in the rocks as records, however brief, of their past history. In the first case their fragile tissues would doubtless decay before fossilisation could take place, and, secondly, the sites where they usually flourish are not such as would be likely to yield fossils. As fossils, hepatics are consequently scarce, and many impressions and casts supposed by some to represent their remains cannot be relied upon as being such. Certain thalloid Hepaticæ have, however, been distinguished from Jurassic rocks as well as from those of more recent origin. But it is in the Oligocene ambers of North Germany that the most perfect remains of hepatics have been found, the plants having been embalmed in the fluid resinous substance and thus beautifully preserved.

Pearson, *The Hepaticæ of the British Isles*, 2 vols.; S. M. Macvicar, *The Student's Handbook of British Hepaticæ, The Distribution of Hepaticæ in Scotland*; D. H. Campbell, *Mosses and Ferns*; K. Goebel, *Outlines of Classification and Special Morphology of Plants, Organography of Plants*, 2 vols.; W. Hofmeister, *On the Higher Cryptogamia*; V. Schiffner, in Engler and Prantl, *Pflanzenfamilien*; H. Leitgeb, *Untersuchungen über die Lebermoose*, 6 vols. See articles MOSSES, FERNS, GENERATIONS (ALTERNATION OF), EVOLUTION, SPORE, &c.

Livery (through the French from Lat. *liberare*, 'to deliver'), a word derived from the custom which prevailed under the Merovingian and Carolingian kings of *delivering* splendid habits to the members of their households on great festivals. In the days of chivalry the wearing of livery was not as now confined to domestic servants. The duke's son, as page to the prince, wore the prince's livery, the earl's son bore the duke's colours and badge, the son of the esquire wore the livery of the knight, and the son of the gentleman that of the esquire. Cavaliers wore the livery of their mistresses. There was also a large class of armed retainers in livery attached to many of the more powerful nobles. The livery colours of a family are taken from their armorial bearings, being generally the tincture of the field and that of the principal charge, or the two tinctures of the field are taken instead where it has two. They are taken from the first quarter in case of a quartered shield. These same colours are alternated in the 'wreath' on which the crest stands. The royal family of England have sometimes adopted colours varying from the tinctures of the arms. The Plantagenets had scarlet and white; the House of York, murrey and blue; white and blue were adopted by the House of Lancaster; white and green by the Tudors; yellow and red by the Stuarts, and by William III.; and scarlet and blue by the House of Hanover. An indispensable part of the livery in former times was the Badge (q.v.).

The freemen of the 75 city guilds or corporations which embrace the different trades of London are called liverymen, because entitled to wear the livery of their respective companies. In former times the

wardens of the companies used yearly to deliver to the Lord Mayor certain sums, twenty shillings of which was given to individuals who petitioned for the money to enable them to procure sufficient cloth for a suit, and the companies prided themselves on the splendid appearance which their liveries made in the civic train. Till the Reform Bill in 1832, the liverymen had the exclusive privilege of voting for members of parliament for the City. The twelve chief corporations are the Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Tailors, Haberdashers, Salters, Ironmongers, Vintners, and Clothworkers.

Livingston. See GUATEMALA.

Livingston, an eminent American family, descended lineally from the fifth Lord Livingston, the guardian of Mary Queen of Scots, and from his grandson, the Rev. John Livingston (1603-72), minister of Ancrum in Teviotdale, who was banished for refusal to take the oath of allegiance to Charles II., and from 1663 was pastor of the Scots kirk at Rotterdam. His son Robert was born at Ancrum in 1654, went to America in 1673, settled at Albany, and received a grant of a vast tract of land, which he had erected into the manor and lordship of Livingston. He died in 1725. One of his grandsons was Philip Livingston (1716-78), who sat in the first Continental congress, and was one of the signers of the Declaration of Independence. Another was William Livingston (1723-90), the 'Don Quixote of the Jerseys', who was the first governor of New Jersey (1776-90), and conspicuous for the energy and ability of his administration. The most distinguished of the family, however, were the brothers Robert R. and Edward Livingston, great-grandsons of the first Robert.

ROBERT R. LIVINGSTON was born in New York city, 27th November 1746, graduated at King's (now Columbia) College in 1765, and was admitted to the bar in 1773. Sent to congress in 1775, he was one of the five members of the committee charged with drawing up the Declaration of Independence. When the constitution of the state of New York was settled he was appointed chancellor, a dignity he retained till 1801. He was then sent to Paris as minister plenipotentiary, and (with Monroe) negotiated the cession of Louisiana to the United States. He enabled Fulton to construct his first steamer, and introduced in America the use of sulphate of lime as a manure, and the merino sheep, and in many other ways distinguished himself as a national benefactor. He died on 26th February 1813. There is a biography by F. De Peyster (New York, 1876).

EDWARD LIVINGSTON, jurist and statesman, was born at Clermont, New York, 26th May 1764, and graduated at Princeton in 1781. He was called to the bar in 1785, and soon obtained an extensive practice. He had spent his youth among the founders of American independence, all of whom he had known as visitors of his father—a justice of the New York Supreme Court—and he at once attained a prominent position. He sat in congress from 1795 to 1801, when he became U.S. district attorney for New York, and mayor of New York city; but in 1803, owing to the misappropriations of a subordinate, he found himself considerably in debt to the federal government. He at once handed over his whole property to his creditors, threw up both his appointments, and resolved to quit New York. Louisiana had just been annexed to the United States through his brother's negotiations; and in 1804 he settled in New Orleans, where he at once obtained lucrative practice at the bar. During the second war with England he was aide-de-camp and secretary to General Jackson: and from 1822 to

1829 he represented New Orleans in congress. In 1823-24 Livingston was employed in reducing to system the civil code of Louisiana—for which task his wide acquaintance with jurisprudence rendered him peculiarly fitted. He was also commissioned to prepare a new criminal code, and in a preliminary treatise he laid down the principles on which he was to proceed. He proposed the abolition of the punishment of death, and a penitentiary system, which at once drew general attention to his labours. His book was reprinted in London, translated into French, and was very favourably received in England, France, and Germany. His code of crimes and punishments was completed, but not directly adopted. Livingston was elected in 1829 to the United States senate, and in 1831 appointed secretary of state. Two years later he went to France as minister plenipotentiary, and succeeded in securing payment of the indemnity on account of French spoliations. He died on 23d May 1836. See the *Life* by C. H. Hunt (New York, 1864).

Livingstone, DAVID, missionary and traveller, was born at Blantyre in Lanarkshire, 19th March 1813. His parents, who were in humble life, were of devout and exemplary character; his father in particular being a great reader, especially of travels and missionary intelligence, and much interested in the enterprise of the 19th century. At the age of ten David became a worker in a cotton-factory at Blantyre, and continued in that laborious occupation for fourteen years. His thirst for knowledge led him to read all that he could lay his hands on; he used also to attend a night-class, after the long hours of the factory, for the study of Latin. The reading of Dick's *Philosophy of a Future State* was not only the means of a profound impression on his own mind, but kindled the desire to devote his life as a missionary to the service of Christ. Deeply impressed with the advantages of medical training to a missionary, he resolved to qualify himself in medicine, as well as the other attainments looked for in a missionary. The London Missionary Society having accepted the offer of his services, he went to London to complete his studies. His first desire was to labour in China, but, war having broken out between that country and Great Britain, this wish could not be fulfilled. The Rev. Robert Moffat's visit at this time to England turned many hearts to Africa—Livingstone's among the rest; ultimately he was appointed to that field, and, having been ordained on 20th November 1840, he set sail for Africa, reaching Lattakoo or Kuruman, Moffat's settlement, on 31st July 1841.

For several years Livingstone laboured as a missionary in the Bechuana country, at Mabolse, Chonuana, and Kolobeng, places that were chosen by him just because they were in the heart of heathenism. The conversion of Sechéle, chief of the Bakwains, and several of his tribe was a great encouragement. Repulsed by the Boers in an effort to plant native missionaries in the Transvaal, he directed his steps northward, discovered Lake Ngami, and found the country there traversed by fine rivers and inhabited by a dense population. His anxiety to benefit this region led finally to his undertaking to explore the whole country westwards to the Atlantic at St Paul de Loanda and eastward to the Indian Ocean at Quilimane. Livingstone had married at Mabolse Mary, eldest daughter of the Rev. R. Moffat, and now he found it necessary to send her, with their children, to England, that he might be free for this vast and perilous undertaking. To accomplish it occupied from 8th June 1852, when he left Capetown, to 26th May 1856, when he arrived at Quilimane. This journey was accomplished with a mere handful

of followers, and a mere pittance of stores, amid sicknesses and other bodily troubles, perils, and difficulties without number. But a vast amount of valuable information was gathered respecting the country and its products, its geography and natural history, the native tribes, the regions that were favourable to health, and some great natural wonders, such as the Zambesi Falls. Livingstone, however, found that the London Missionary Society were not willing that he should be to so large an extent an explorer, and some time after returning to Britain he resigned his office as one of their missionaries.

At home Livingstone was welcomed with extraordinary enthusiasm, receiving the acknowledgments and honours of scientific societies, universities, town-councils, and other public bodies in every quarter of the country. In addition to these tokens of honour the fifteen months spent at home were signalised by three things: the writing of his book, *Missionary Travels* (1857), which was received with the liveliest interest; his visit to Cambridge, awakening the enthusiasm of many of the students, and leading to the formation afterwards of the 'Universities Mission;' and his appointment by Her Majesty's government as chief of an expedition for exploring the Zambesi and its tributaries and the regions adjacent.

On this expedition Livingstone set out on 10th March 1858. While successful in many ways, it led to not a little disappointment. Livingstone explored the Zambesi, the Shiré, and the Rovuma; discovered lakes Shirwa and Nyasa, and came to a decided conclusion that Lake Nyasa and its neighbourhood was the best field for both commercial and missionary operations. His disappointments arose from the grievous defects of a steamer sent out to him by government; from the death of comrades and helpers, including his wife and Bishop Mackenzie; from the abandonment of the Universities Mission; from the opposition of the Portuguese authorities; but mainly from the distressing discovery that, encouraged by Portuguese traders, the slave-trade was extending in the district, and the slave-traders using his very discoveries to facilitate their infamous traffic. At length a despatch recalling the expedition was received, 2d July 1863. Livingstone at his own cost had brought out a new steamer, but she could not be put on the lake. Depressed though he was, he explored the northern banks of Lake Nyasa on foot; then in his own vessel and under his own seamanship crossed the Indian Ocean to Bombay; and after a brief stay there, returned to Britain, reaching London on 23d July 1864.

At home Livingstone had two objects—to expose the atrocious deeds of the Portuguese slave-traders, and to find means of establishing a settlement for missions and commerce somewhere near the head of the Rovuma, or wherever a suitable locality could be found. His second book, *The Zambesi and its Tributaries* (1865), was designed to further these objects. He was again received with every demonstration of honour and regard. A proposal was made to him on the part of the Royal Geographical Society to return to Africa and settle a disputed question regarding the watershed of central Africa and the sources of the Nile. He said he would go only as a missionary, but was willing to help to solve the geographical problem. He set out in August 1865, *via* Bombay and Zanzibar. On 19th March 1866 he started from the latter place, first of all trying to find a suitable settlement, then striking westward in order to solve the geographical problem. Through the ill-behaviour of some of his attendants a report of his death was circulated, but an expedition headed by Mr E. D. Young, R.N., ascertained that the

report was false. Livingstone pressed westward amid innumerable hardships, and in 1867-68 discovered Lakes Moero and Bangweolo. All the while he was doing what he could for the religious enlightenment of the natives. Obligated to return for rest to Ujiji, where he found his goods squandered, he struck westward again as far as the river Lualaba, thinking it might possibly be the Nile, but far from certain that it was not what it proved afterwards to be, the Congo. Returning after severe illness once more to Ujiji, Livingstone found H. M. Stanley there, who had been sent to look for him by the proprietor of the *New York Herald*. But no consideration would induce him to return home till he had made one more effort to solve the geographical problem. He returned to Lake Bangweolo, but fell into wretched health. His sufferings always increasing, when he reached Chitambo's village (Old Chitambo, now in Rhodesia) he was obliged to give in. On the morning of 1st May 1873 he was found by his attendants on his knees, dead. His faithful people embalmed his body as best they could, carried it amidst the greatest perils to the shore, where it was put on board a British cruiser, and on 18th April 1874 it was buried in Westminster Abbey. Among the remains brought home were his *Last Journals*, brought down to within a few days of his death; these were published in 1874. Stanley suggested the name of Livingstone for the main stream of the Congo (hence the Baptist Mission on the Lower Congo was called the 'Livingstone Inland Mission'), and Sir H. H. Johnston proposed that part of the East African territory acquired by Britain in 1890—the lower drainage area of the Zambesi—should be called Livingstone Land.

See Professor Blaikie's *Personal Life of David Livingstone* (1890); the short Life by Thomas Hughes (1889); Sir H. H. Johnston, *Livingstone and the Exploration of Central Africa* (1891); and addresses and publications connected with Livingstone's centenary, celebrated all over the world in 1913.

Livingstonia Mission was based on a suggestion made by Dr Livingstone that Lake Nyasa was the best position for the establishment of a mission with a view to the annihilation of the Portuguese and Arab slave-trade on the east of Africa. Its first settlement at Cape Maclear at the south end of the lake was abandoned in 1883 for a healthier site at Bandavè, half-way up the west shore. An expedition was equipped in 1875 by the Free Church of Scotland for establishing the mission here; and another station, called Blantyre, after Livingstone's birthplace, was planted in 1876 by the Established Church of Scotland in the Shiré Highlands, within easy distance of the lake. Since 1890 the country has been part of Nyasaland, or British Central Africa. Maize, cotton, coffee, tobacco, and chillies are grown; and rubber, groundnuts, and beeswax are collected and exported.

Livius. See LIVY.

Livius Andronicus, the father of Roman dramatic and epic poetry, was a Greek by birth, probably a native of Tarentum, and was carried a slave to Rome in 272 B.C., but afterwards liberated by his master. He translated the *Odyssey* into Latin Saturnian verse, and wrote tragedies, comedies, and hymns after Greek models. Mere fragments are extant. See LATIN.

Livonia (Ger. *Livland*) was one of the three Baltic provinces of Russia, lying between Esthonia and Courland. In the beginning of the 13th century the principality was given to the Knights of the Sword, who in 1237 were merged in the order of the Teutonic Knights, and maintained their sovereignty against the Archbishop of Riga, and against Sweden, Poland, Lithuania,

and Russia down to past the middle of the 16th century. From that time Livonia was a bone of contention between Poland, Sweden, and Russia, until its incorporation with the last-named in 1721. From the middle of the 19th century, and especially from 1881, the Russians made determined efforts to russify it. The people were, in about equal numbers, Letts and Esthonians, with German and Russian minorities. Accordingly, at the Russian revolution the northern half became part of Esthonia (q.v.), while the southern united with Courland to form the republic of Lettland or Latvia. The Livonians proper, a Finnic race akin to the Esthonians, have dwindled down to about 2400.

Livorno. See LEGHORN.

Livre, the name of an ancient French coin, derived from the Roman *Libra*. There were livres of different values, the most important being the *Livre Tournais* (of Tours), which was considered the standard, and the *Livre Parisis* (of Paris), which was equal to five-fourths of a livre Tournais. It was divided into 20 sous, each of 12 deniers. In 1795 the livre was superseded by the franc (80 francs = 81 livres Tournais).—LIVRE was also the ancient French unit of weight, and was equal to about 1 lb. avoirdupois; the kilogramme (see GRAMME) has taken its place.

Livy. TITUS LIVIUS (59 B.C.—17 A.D.), Rome's greatest historian, was born, according to St Jerome, at Patavium (now Padua) in the Venetian province, in Julius Caesar's first consulship. Of a noble and wealthy family, he received the usual education in rhetoric and philosophy, and on coming to Rome was admitted to the court of Augustus. Independent in character and means, he never flattered the emperor like Virgil and Horace, but, avowing his preference for the republic over the monarchy, he foresaw in the growth of luxury the fall of the empire, and in the loss of freedom the end of Rome. He praised Brutus and Cassius and sympathised with Pompey, at the same time stigmatising Cicero, an accessory to the murder of Cæsar, as having got from Antony's bravo's only his deserts. Of the great Cæsar himself he doubted whether he was more of a curse or a blessing to the commonwealth; and throughout his history he seems to have mentioned Augustus but twice, and that incidentally—though in reply to the Greek Timagenes, the detractor while the guest of Augustus, he says that by restoring peace and allaying civil strife the emperor had reinvigorated Rome to overcome a thousand armies more formidable than the Macedonian Alexanders. Such friendship as they had for each other Livy and Augustus never lost—Augustus taking a lively interest in the progress of Livy's work, while Livy seems to have been still intimate enough at court to exhort the future Emperor Claudius (born 10 B.C.) to the study of history. Livy had a son, also, it is believed, a man of letters, and a daughter married to Magius the rhetorician. He visited various parts of Italy—among them Campania and the Neapolitan seaboard, and, probably in disgust at the abasement of the senate and the cruelties of Tiberius, he returned to his native Patavium to die.

Livy's work, recording the history of Rome from her foundation to the death of Drusus, 9 B.C., was published in instalments, and comprised 142 books, of which those from the 11th to the 20th, and from the 46th to the 142d, have been lost. Of the 35 that remain the 41st and 43d are imperfect. The last writer to notice the history as still entire is Priscian the grammarian (5th century). Its voluminousness, the labour and cost of transcription, and possibly the vindictive hatred of emperors, like Caligula, to its republican spirit, combined, it is

supposed, to lessen the number of copies, till those that survived must have perished in whole or in part, with such pagan libraries as Gregory the Great is known to have burned. The hope, renewed at intervals, of recovering the lost books has never been realised, though false reports have got about from time to time; the 'perioclae,' or summaries of the contents of each book, composed in the wane of Roman literature, to catalogue names and events for rhetorical purposes, have all, however, come down to us, except those of books 136 and 137. But what has been spared is more than enough to confirm in modern days the judgment of antiquity which places Livy in the forefront of Latin writers. His impartiality, subject always to a conviction just escaping Chauvinism that Rome morally and materially was the greatest 'birth of time,' is not less a note of his work than his veneration for the good, the generous, the heroic in man. His style, save where the text still defies the commentator, is as nearly perfect as is compatible with his ideal of the historian. The narrative flows deep and full, never straying beyond its banks nor growing turbid within them, picturesque on all due occasions, interesting and animated through historic traets often dreary in themselves. Niebuhr found in his rich, at times sombre, glow of colour another proof of his Venetian origin; certainly for portraiture of character he is the Titian of historians. The fastidious, possibly jealous, Asinius Pollio detected in his Latinity a provincialism redolent of Patavium, but latter-day scholars seek for this 'Patavinitas' in vain—find, in fact, nothing more than the first faint streaks of the silver age revealed in an occasional preference for poetic diction. His defects in the 'fierce light' of modern research are more apparent to us than even to his contemporaries. For investigation of facts he did not go far afield; our own Hume is not more of an arm-chair historian. He declined even at the instance of Augustus to verify an important inscription in the temple of Jupiter Feretrius, and he omitted to consult the epigraphs inscribed in the temple of Diana on the Aventine, the treaties concluded by Rome with Gabii and Ardea, even the Icilian law which Dionysius examined with such pains. Accepting history as fine art rather than as science, he was content to take his authorities as he found them, and where they differed to act the eclectic, guided by taste or predilection. Yet his work remains monumental, in spite of all the streaks in the marble, and the modern reader never fails to appreciate that impulse of the Spaniard from Gades who made a pilgrimage to Rome just to see Livy, and having done so returned satisfied.

The bibliography accumulated round Livy is a library in itself. Gronovius, Drakenborch, Ruddiman, Madvig, Alschefski, Ussing, Luchs, Weissenborn, Müller, Cocchia, and Walters and Conway have contributed much to purify his text and illustrate his meaning. A good English translation has been begun by B. O. Foster (1919); meritorious versions of parts of his history (that of Church and Brodribb, for example, Books xxi.-xxv.) have been published, and there is a translation of the whole, in fine Elizabethan English, by Philemon Holland (1600). See Taine's *Essai sur Titus Live* (1860); the book by Capes on Livy in 'Classical Writers' (1879); Seeley's introduction to his edition of Book i.; and the introduction in Weissenborn's edition re-edited by Müller (1902).

Lixiviation (Lat. *lix*, 'ashes'), a term employed in chemistry to denote the process of washing or steeping certain substances in a fluid, for the purpose of dissolving a portion of their ingredients, and so separating them from the insoluble residue. Thus, wood-ash is lixiviated with water to dissolve out the carbonates of soda and potash from the

insoluble parts. The solution thus obtained is called a *lixivium*, or *ley*.

Lixouri, a thriving town in Cephalonia, on the west side of the Gulf of Argostoli. It lies opposite the capital, Argostoli (q.v.), at a distance of less than 3 miles, though the road round the gulf is nearly 20 miles long. Pop. 6000.

Lizard Point. See CORNWALL.

Lizards (*Lacertilia*), an order of reptiles occupying a somewhat central position in that class. The body is usually well covered with scales, reaching a climax in the tubercles and spines covering the Australian moloch, but very much reduced in the geckos and amphisbænas. There are generally fore and hind limbs, but either pair may be lost, or both in such serpent-like forms as the slow-worm (*Anguis fragilis*) and the amphisbænas. Shoulder and hip girdles are always present, in rudiment at least. Unlike snakes, lizards have non-expandible mouths, and almost always movable eyelids and external ear-openings. The teeth are fused to the jaws, not planted in sockets; the protrusible tongue, broad and short in geckos, agamas, and iguanas, long and terminally clubbed in chamæleons, is in most lizards a narrow, worm-like, bifid organ of touch. There is a transverse cloacal aperture, a urinary bladder, and a double copulatory organ. Most are oviparous, but a few—e.g. the slow-worm and our British *Lacerta* (*Zootoca*) *vivipara*—bring forth their young living. Lizards, though most abundant in the tropics, and absent from very cold countries, are virtually world-wide in distribution. There is one marine form, *Oreocephalus* (*Amblyrhynchus*) *cristatus*, from the Galápagos; most of the rest are terrestrial. Yet the geckos climb on rocks and trees, the giant Varanidae are semi-aquatic, the amphisbænas are subterranean, and the arboreal dragons (*Draco*) take long swoops through the air from branch to branch. The food generally consists of insects, worms, and similar small animals, but some prey upon larger animals, and others are vegetarian. Lizards are usually active, agile animals, beautifully and often protectively coloured. They are noteworthy for brittleness in the caudal region, and for their power of reproducing lost tails or even legs. Among the most remarkable forms may be noted the Geckos (q.v.); the large monitors (*Varanus*), which attain a length of six feet, and

Common Lizard (*Lacerta vivipara*).

prey upon small mammals, birds, frogs, fishes, and eggs; the poisonous Mexican lizard, *Heloderma horridum*, with large poison-gland and fang-like teeth; the worm-like Amphisbænas; the Slow-worm, which illustrates so well the tendency lizards have to break in the spasms of capture; the large Iguanas, which frequent tropical American forests, and feed on leaves and fruit; the sluggish spiny 'Horned

Toads' (Phrynosoma); the Agamas, taking the place of the Iguanas in the Old World; the Flying Dragon (q.v.); the Australian frilled lizards (Chlamydosaurus), with a peculiar collar of skin; the grotesque Moloch; and the divergent Chamæleons (q.v.). The unique New Zealand reptile, *Sphenodon* or *Hatteria*, with its remarkable persistent pineal eye, is to be regarded as the sole survivor of a distinct order—*Rhynchocephalia* (see SPHENODON). There are five British lizards, the commonest being *Lacerta vivipara* and the Slow-worm. Two other species of *Lacerta*—*L. agilis* and the green *L. viridis*—have a local distribution in the south of England and the Channel Islands. The modern forms are classified in twenty-one families, including over 1600 species. Though *Lacertilia* probably began about the Permian times, their remains are not numerous before Tertiary strata.

See Boulenger's *Catalogue* of the British Museum Collection (1885-87) and Leighton's *British Lizards* (1904).

Ljubljana, the Slovenian name of Laibach (q.v.).

Llama, or LAMA, a domesticated race of the Huanaco (*Lama* or *Auchenia huanaco*) of the plateaux of the Andes and the plains of Patagonia. The alpaca is another domesticated race of the same origin. The vicuña is another wild species (*L. vicugna*), smaller in size, frequenting the mountains of Peru and Bolivia. The two species form the genus *Lama*, differing from the Old World Camelus in the smaller size, absence of hump, longer woolly hair, and shorter tail. The feet are narrower, the toes more independent, and the dentition is slightly different; in several ways *Lama* is nearer than *Camelus* to the ancestral Miocene stock. The domesticated llama is about three feet high at the shoulders; the males are very valuable beasts of burden, hardy, tractable, and inexpensive. The females are not so strong, and are kept for breeding. The flesh of the young is used. Good-tempered on the whole, the llama is wont, when teased, to squirt out not merely spittle, but the contents of its stomach. It can also kick and bite. Bezoar stones are sometimes found in the intestines.

Llanberis, the 'Chamonix of Wales,' 9 miles ESE. of Carnarvon, lies at the north-west base of Snowdon, and near the foot of the wild Pass of Llanberis. The two lakes of Llanberis, 2 and 1½ miles long, are sadly disfigured by slate-quarries.

Llandaff, a small town of Glamorganshire, on the right bank of the Taff, 2 miles NW. of Cardiff (q.v.). It is the seat of a very ancient bishopric, said to have been founded by St Dubricius, who died in 612, and among whose successors have been St Teilo and Bishops Godwin, Shute Barrington, Richard Watson, Sumner, and Copleston. The cathedral church, in virtue of which Llandaff is a 'city'—one of the smallest in Britain—was built between 1120 and the first half of the 15th century, and is mainly Early English in style. It had fallen into utter ruin in 1575, but in 1735-52 was barbarously patched up into an 'Italian temple.' In 1843-69 it was thoroughly restored. There is an Anglican theological college.

Llandilo, or LLANDEILO FAWR, a town of South Wales, on the Towy, 14 miles ENE. of Carmarthen. It gives name to a group of Silurian (q.v.) or Ordovician strata. Pop. 2000.

Llandovery, a municipal borough (1484) of South Wales, on the Bran, 25 miles ENE. of Carmarthen. It gives name to a group of Silurian (q.v.) strata. Pop. 2000.

Llandudno, a fashionable watering-place in Carnarvonshire, North Wales, is situated on the level neck of a promontory between the Great and

Little Orme's Heads, 48 miles by rail WNW. of Chester. Its bracing and delightful climate, its good sea-bathing, and its picturesque surroundings—the Great Orme's Head (700 feet) commanding views of Snowdon and Anglesey, and even of Man and the Cumberland mountains—have combined to raise Llandudno since 1841 from a small fishing-village to a famous health and holiday resort, with many hotels and boarding-houses, a fine promenade, a pier (2400 feet), and a pavilion (seating 4000), a 'marine drive' (5½ miles), pleasure-grounds (the 'Happy Valley'), &c. Resident pop. (1851) 1131; (1881) 4839; (1911), 10,469. The census of 1921, in the holiday season, gave a pop. of 19,290.

Llanelly, a manufacturing town and seaport of Carmarthenshire, South Wales, 11 miles WNW. of Swansea. The mineral wealth of the vicinity, and the easy access to the sea, have raised it from a mere village in 1813 to a town of considerable commercial importance. It has a number of large steel and tin-plate works. There are also foundries, patent fuel, copper, engineering, tin-stamping, and de-tinning works, potteries, chemical works, &c. Large docks have been constructed, and coal is largely exported. Llanelly is a municipal borough (1913), but no longer parliamentary (since 1918). Pop. 37,000.

Llanfairfechan, a pleasant little watering-place of Carnarvonshire, North Wales, at the base of Penmaenmawr, 7 miles WSW. of Conway; pop. of urban district, 3700.

Llangollen, a town of Denbighshire, picturesquely situated on the Dee, 22 miles SW. of Chester. It has a town-hall (1866) and flannel manufactures, and is visited by tourists on account of the beauty of the famous Vale of Llangollen, and for its antiquities, among which are Dinas Bran or Crow Castle, Valle Crucis Abbey (1200), and Eliseg's Pillar (8th or 9th century). Plas Newydd, ½ mile S. of the bridge, was for half a century the residence of the two Irish recluses, the 'Ladies of the Vale,' or 'Maids of Llangollen,' Lady Eleanor Butler (1745-1829) and Miss Sarah Ponsonby (1755-1831), who were visited here by Madame de Genlis, Miss Seward, De Quincey, and many other celebrities. Pop. 3700.

Llanidloes, a municipal and, till 1918, parliamentary borough of Montgomeryshire, North Wales, on the Severn, 56½ miles NW. of Hereford by rail and 56 SW. of Shrewsbury. Its interesting church, built partly with materials from Cwmhir Abbey, was restored in 1882. Considerable manufactures of flannel and other woollen fabrics and iron-founding are carried on; and in the neighbourhood are extensive lead-mines. Pop. 2600.

Llanos (Span., 'plains,' from Lat. *planus*, 'level,' pron. *lya'nos*, or American-Spanish *zha'nos*) are vast plains in the northern portion of South America, in some parts barren and sandy, in others covered with luxuriant grass and stocked with innumerable herds of cattle. Over great portions, however, there is a heavy growth of timber. The llaneros resemble the Gauchos (q.v.) farther south.

Llanthony, on the Honddu, in Monmouthshire, 10 miles N. of Abergavenny, a Cistercian abbey, founded in 1108. Its church and chapter-house form a fine ruin in the Transition Norman style. In the Prior's Lodge Walter Savage Landor lived for three years after his marriage, until driven away by worries that harassed all his life. He had spent much toil and money on attempts to improve the natural sterility of the soil. Four miles up the valley is Llanthony 'Monastery,' founded by 'Father Ignatius.'

Llerena, a town of Spain, 83 miles by rail N. of Seville. Near here the British cavalry routed the French cavalry on 11th April 1812. Pop. 7000.

Llewelyn (better *Llywelyn*). See WALES, BRECKNOCKSHIRE, GELLERT.

Llorente, JUAN ANTONIO, born at Rincón del Soto, near Calahorra, in 1756, was trained for the priesthood and took orders early, but his studies were chiefly secular—history, archæology, and jurisprudence—and in his memoirs he confesses an inclination to the French philosophy of the day. His advancement, however, was rapid. He became vicar-general of the diocese in 1782, agent of the Inquisition at Logroño in 1785, and canon of Calahorra and secretary to the Inquisition in 1789. The projected reforms in the procedure of the Holy Office brought him into close connection with Jovellanos, and the imprisonment of the minister drove him into retirement for a time; but in 1805 he found favour with Godoy, whom he served by justifying on historical grounds his attack on the fueros of the Basque Provinces. In 1806 he was made canon of Toledo, and was on the high road to a bishopric when Napoleon put a stop to his promotion. He was, however, included among the Notables assembled at Bayonne to ratify the French usurpation. King Joseph, who stood in need of adaptable Spaniards, gave him a seat in his council of state, and appointed him to sundry posts more or less connected with confiscation; and in 1809, when the Inquisition was suppressed, placed all its archives in his hands that he might write its history. After the battle of Vitoria he withdrew to Paris, and there, in a French translation, the work came out in 1817–18; the Spanish edition did not appear till 1822. The work provoked bitter feeling, to which he added by his *Portrait Politique des Papes*, and at the instance of the clerical party he was ordered to quit France forthwith. He died on 5th February 1823, a few days after his arrival at Madrid. He was charged with animus against the Inquisition, the Church, and the Pope; but his opponents substantiated only minor inaccuracies against him. He wrote also on the fueros of the Basque Provinces, and on *Gil Blas*, and an autobiography.

Lloyd George. See GEORGE (DAVID LLOYD).

Lloyd's is in the first place an association of underwriters, each of whom conducts his business according to his own views. For those views, or for the business transacted by individual underwriters, Lloyd's as a corporation is in no way responsible, except that the committee of Lloyd's before the election of any underwriting member requires that the candidate shall place in the hands of the committee security to meet his underwriting liabilities. Lloyd's as a corporation, and the committee as its executive, have little to do with marine insurance. Their business is to conduct the affairs of Lloyd's in its corporate capacity, to carry out the supply and distribution of shipping intelligence, and to guard as trustees the corporate funds and corporate property.

The name of Lloyd's is derived from a coffee-house kept by Edward Lloyd in the 17th century. In 1692 Lloyd's coffee-house moved from Tower Street to Lombard Street, where it became the centre of shipping and underwriting business; and in 1774 Lloyd's moved from the coffee-house in Lombard Street to the north-eastern premises of the Royal Exchange, where it occupied, on the first floor, the rooms hitherto held by the East India Company. In 1924 a new building by Sir Edwin Cooper was begun in Leadenhall Street on a site also associated with the East India Company. The wars, which lasted from 1775 with but short pauses

till 1815, raised Lloyd's to the high position which it now holds, bringing home to merchants the necessity of covering their risks as effectually as possible. High premiums adequate to high risks were offered. Merchants of wealth became insurers of property afloat, and tens of thousands were written in the names of single underwriters at Lloyd's. The wars had the effect of bringing foreign marine insurance from all parts of the world to Great Britain, since the security of Lloyd's then, as now, was unequalled in the world.

In the second place, Lloyd's is an enormous organisation for the collection and distribution of marine intelligence. The intelligence department of Lloyd's was originally established at Lloyd's coffee-house to meet the public desire for information with regard to vessels at sea. *Lloyd's News* was established in 1696, and resuscitated in 1726 under the name of *Lloyd's List*, which is thus the oldest newspaper in Europe except the *London Gazette*. See NEWSPAPERS. The intelligence department at Lloyd's has continually developed. During the Napoleonic wars the government was often indebted to the committee of Lloyd's for the earliest information of transactions all over the world. The corporation has its agents in every port, and there is no line of sea-coast in the whole world which is not watched by some representative of Lloyd's. The general introduction of telegraphy caused an enormous development of the information received at and distributed from Lloyd's.

The great wealth of Lloyd's, and the fortunes made there, attracted general attention, and in 1810 parliament appointed a committee to inquire into the affairs of the institution. From this inquiry Lloyd's emerged victoriously, and since that time has continued to assist in the promotion of every measure which might aid in the preservation of life at sea, the prevention of fraud in connection with marine insurance, and the rapid collection and distribution of maritime intelligence to all interested. In 1871 Lloyd's was incorporated by act of parliament. Various works are published by the corporation for the benefit of the mercantile community. The Austrian Lloyd was organised at Trieste as a marine insurance society in 1833, but in 1836 founded a share company for steam-navigation. The North-German Lloyd is primarily a shipping company, founded at Bremen in 1857. See F. Martin's *History of Lloyd's* (1875), and Grey's *Lloyd's Yesterday and To-day* (1893).

Lloyd's Bonds are obligations by railway companies under their seal, purporting to be for work done, or for materials supplied for the purposes of an undertaking, and covenanting to pay the debt and interest thereon. Devised in 1860–64 by the English counsel, John Horatio Lloyd (1798–1884), to enable railway companies to exceed the powers of borrowing money granted to them by parliament, they are valid only when granted in *bond fide* to contractors and others for work actually done or materials supplied. They cannot be given for a mere loan of money to the company; and a company issuing them otherwise than authorised forfeits to the crown the amount of the bond.

Lloyd's Register of British and Foreign Shipping is a society established with the primary object of classifying vessels according to their strength and efficiency for the safe carriage of cargoes. It is the recognised authority on such matters not only in the United Kingdom but also abroad, and is the nearest approach to a perfect merchant shipping council any country possesses. It was established in 1834, superseding two rival institutions, founded in 1760 and 1799. At its head offices in London, its affairs are controlled by a

committee of merchants, shipowners, and underwriters, elected to represent the important shipping centres of the country. There are also branch committees at Liverpool and Glasgow. In technical matters affecting the society's rules, which are published annually, the general committee is assisted by the technical committee, on which there are representatives of shipbuilders, engineers, steel-makers, and forge-masters, elected by leading technical institutions. The co-operation of these experts ensures that the rules embody the highest scientific knowledge and the widest practical experience in ship-construction and marine engineering. Both new and old vessels can be classed under the rules. The plans for a new vessel are, first of all, submitted to the committee and examined by the professional staff; when finally approved, the building of the vessel proceeds under the supervision of the society's local surveyors, and on completion a detailed report is forwarded by them to the committee, who assign the character.

Steel and iron vessels are classed for an indefinite period under a system of periodical surveys, the symbol 100A1 denoting a vessel of the highest class as regards hull, machinery, and equipment. Very few vessels are now built to any but that grade, although the rules provide for a lower one. There is also the A1 class, which is given to vessels intended for special services, and a large number of vessels have been built to this class. Wooden and composite vessels are assigned the character A1 for a term of years varying according to their materials. Lower grades are expressed by the symbol A1 in red and *Æ*.

The society is entrusted by parliament with the assigning of freeboards under the Merchant Shipping Act, and among its other functions are inspection of machinery and boilers of steamers; control of public proving-houses for anchors and chains; testing of steel for ships and boilers; the inspection of forgings and castings.

The Register Book which is issued annually to the subscribers gives detailed information, such as character, tonnage, dimensions, date of build, ownership, &c., of vessels holding the society's class, and, so far as possible, of all other sea-going vessels, together with other useful matter. Two yacht registers are published—one in London relating to British and foreign yachts, the other in New York about American and Canadian yachts.

Llywarch Hen. See WALES (LITERATURE).

Loach, a name applied to the members of a family of small freshwater fishes (*Cobitidae*) related to the carps. They have an elongated body, minute scales or none, at least six barbels at the mouth, and the air-bladder more or less enclosed in bone. When the water is stagnant they gulp air at the surface and expel it at the vent. They are very sensitive to changes of atmospheric pressure, and the German *Misgurnus fossilis* is called the 'weather fish.' The headquarters of loaches are in central and southern Asia; there are three European species, two in Britain. The Loach or Stone Loach (*Nemachilus barbatula*), the 'Beardie' in Scotland, usually 3-4 inches long, is a palatable little fish, often used as bait. The smaller and valueless Spined Loach (*Cobitis taenia*) occurs from England to Japan. It uses as a weapon an erectile bifid spine beneath the eye. See C. Tate Regan's *Freshwater Fishes of the British Isles* (1911).

Load-line. See PLIMSOLL.

Loadstone, or MAGNETIC IRON ORE, a mineral consisting of a mixture of the ferric and ferrous oxides, FeOFe_2O_3 or Fe_3O_4 , remarkable for its highly magnetic quality. The name loadstone or lodestone ('leading-stone') is derived from its power of drawing or leading bits of iron; the

earliest magnets were pieces of loadstone, and the value of the ore for making a mariner's compass (see COMPASS) was early known: 'the lodestare [polestar] draweth the lodestone as the lodestone the steel.' Loadstone is black, and has a metallic lustre; its hardness=5.5 to 6.5, and its specific gravity=5.16 to 5.18. It is one of the most common constituents of eruptive works, occurring in these generally in the form of small octahedra or irregular grains. Some rocks, such as certain basalts, contain so much magnetite as strongly to affect the compass. Larger and well-defined crystals are met with in the crystalline schists, more especially in chlorite-schist. Magnetite also occurs massive, associated with other iron ores, forming in some places irregular bedded sheets amongst the crystalline schists, and in other places entering largely into the composition of mountains, as in Sweden—one of the richest iron-bearing regions in the world. The iron-sands which occur here and there in river-beds and along certain sea-coasts consist of magnetite which has been derived from the degradation of eruptive rocks.

Many strange beliefs have been held about the properties of the loadstone, and an interesting account of the true and untrue among these is given by Sir Thomas Browne in his *Vulgar Errors* (book ii. chaps. 2, 3). Thus, one species was said to attract flesh; again, its operation was hindered by garlic, by the diamond, by quicksilver. Heavy bodies such as chariots of iron could be suspended in the air by systems of magnets arranged. Again, it possessed valuable medicinal properties in cases of dropsy, ruptures, and gout; and had, moreover, magical efficacy to detect incontinence and theft, to divine, and to afford means of communication with absent friends.

Loam. See SOILS.

Loan, an express or implied contract whereby the property of one person is transferred into the possession of another, the borrower undertaking to return the thing or money lent to the owner. The delivery of chattels (moveable property) by way of loan or deposit is in English law called a bailment. When goods are thus delivered merely for the convenience of the owner, as in the case of goods kept by a friend without charge, the depositary is liable only for gross negligence. If they are delivered merely for the advantage of the bailee, as in the case of a gratuitous loan, the depositary is bound to use the strictest diligence. Where the arrangement is for the advantage of both parties, as in the case of furniture hired from a shop, ordinary diligence will suffice.

A loan of money is usually made on an undertaking by the borrower to repay the money lent, and to pay interest thereon. The rate of interest was formerly restricted by the laws against Usury (q.v.), but there is now no law in the United Kingdom to prevent a lender from stipulating for any interest, however exorbitant. By the Money-lenders Acts of 1900 and 1911, however, in any transaction which is substantially one of money-lending by a 'money-lender,' if the interest or charges are excessive, the borrower, or any surety for the borrower, may obtain relief under these acts. A lender has, of course, a right of action against the borrower; but he generally endeavours to secure himself by obtaining some special and easily-enforced right against the debtor and his property. He may, for example, take a bill of exchange or promissory note for the amount, so as to acquire the special rights which the law confers on the holder of a negotiable instrument. Or he may secure himself by obtaining specific rights over some part of the debtor's property. Thus, the debtor may give him possession of some part

of his property by way of pawn (see PAWN-BROKING); or, if he retains possession of his property, he may make a formal conveyance of it to the creditor by way of Mortgage (q.v.).

Loans are contracted not only by individuals, but by governments and public bodies. The aggregate debts of municipal corporations in the United Kingdom is very large (see also NATIONAL DEBT). Loans of this class consist of capital sums advanced for the most part by private persons, in consideration of payment of principal and interest or in consideration of annuities paid to the lender. When the subjects of one state lend money to the government of another, as, for example, when English investors buy Turkish bonds, international questions may arise in regard to payment. But it is now an accepted maxim that investors as such have no claim to the assistance of their government. When people lend money to Turkey they do so to obtain a high rate of interest; and they know, or ought to know, that 'high interest means bad security.'

Loanda, SÃO PAULO DE, capital of Portuguese West Africa, lies on a small bay some 210 miles S. of the mouth of the Congo. It has broad, tree-shaded, but dirty streets, several churches, forts (1578), and the residences of the governor and bishop. The harbour is gradually sanding up, so that vessels lie $1\frac{1}{2}$ mile from shore. A railway runs to Ambaca and Malanje. Pop. about 20,000.

Loango, a coast district of West Africa, stretching northwards from the mouth of the Congo to about 4° S. lat. By the Berlin Conference of 1885 it was divided between the Congo Free State, Portugal, and France. See CONGO, GABUN.

Loasaceæ, the American natural order of herbaceous dicotyledons, with stinging hairs, which contains the genus *Loasa* or *Chile Nettle*.

Lobatcheffsky, NIKOLAI IVANOVICH (1793-1856), by Clifford called the Copernicus of mathematicians, was the son of a peasant of Nijni-Novgorod, and died professor at Kazan. He was the founder of the non-Euclidean geometry.

Löbau, a town of east Saxony, 12 miles SE. of Bautzen, has mineral springs and manufactures of linens, cottons, woollens, &c.; pop. 12,000.

Lobelia, a genus of dicotyledonous plants of the natural order Lobeliaceæ, named after the French botanist Matthias de Lobel (1538-1616). This order is nearly allied to Campanulacæ, one of the most conspicuous differences being the irregular corolla. Its species, natives of tropical and temperate climates, abound chiefly in damp woods in America and the north of India. They are generally herbaceous or half-shrubby, and have a milky juice which often contains much caoutchouc. A poisonous character belongs to the order, and some are excessively acrid, as *Lobelia Tupa*, a Chilean and Peruvian plant, whose very smell excites vomiting; yet the succulent fruit of one species, *Centropogon surinamensis*, is eatable.—The genus *Lobelia* is the only one of this order of which any species are British. The Water Lobelia (*L. Dortmanna*) is frequent in lakes with gravelly bottom, often forming a green carpet underneath the water with its leaves, which have the form of a double tube. The flowers are lilac, the flowering stems rising above the water. To this genus belong many favourite garden-flowers, as the beautiful Cardinal Flowers (*L. cardinalis* and *L. fulgens*), and the Blue Cardinal (*L. syphilitica*), natives of the warmer parts of North America, perennials, which it is usual to protect during winter in Britain, and the South African *L. Erinus*. To this genus belongs also the Indian Tobacco of North America (*L. inflata*), an annual, with an erect stem, a foot high

or more, with blue flowers, which has been used as a medicine from time immemorial by the aborigines of North America. A liquid alkaloid, *Lobelina*, and a peculiar acid, *Lobelic acid*, have been obtained from it. In small doses it acts as diaphoretic and expectorant; in full doses, as a powerful nauseating emetic; while in excessive doses, or in full doses too often repeated, it is a powerful acro-narcotic poison. It is the favourite remedy of a class of empirics, and deaths from its administration occur.

Lobelia Erinus (garden variety).

Lobelias of huge size (up to 22 feet), and combining the most peculiar forms with splendid colours, have been found on Ruwenzori, Kilima-Njaro, and other high mountains of East Africa. They are *Lobelia gibberosa*, *L. Volkensii*, *L. Holstii*, and *L. Deckenii*. *L. gibbosa* is a very drought-enduring species of the Australian forests, being still alive when all other herbs are withered.

Lobito Bay, just north of Benguela, in Portuguese West Africa, bids fair to be the gateway of Central Africa.

Lob Nor, or LOP NOR, a freshwater lake, or group of lakes, of East Turkestan, in the desert of Gobi. The lakes are very shallow and shifting. The ancient Lob Nor was salt.

Lobo, JERONIMO, a Jesuit missionary, born at Lisbon in 1593, went out to India in 1621, but travelled back to Abyssinia in 1625, and was for nearly ten years superintendent of missions in Tigre. He died at Lisbon in 1678. From Lobo's Portuguese MS. account of his travels in Abyssinia the Abbé Legrand published a French translation in 1728, and of this again Dr Johnson produced an abridged English version in 1735—his first work. Sir Peter Wyche also translated into English parts of Lobo's MS. in 1669.

Lobos Islands, two small groups of rocky islands, about 12 miles off the coast of Peru, famous for the great quantity of guano which they produced.

Lobster (*Homarus*), a genus of higher crustaceans nearly related to the Crayfish (q.v.), from which it differs in having the last segment of the thorax fixed, not free, in the inequality of the great claws, and in other by no means striking details. The most important species are *H. vulgaris* and *H. americanus*, European and American respectively. After adolescence they live off the coasts on rocky bottoms at considerable depths, active, carnivorous, pugnacious animals, often attaining a large size—even a couple of feet from beak to tail. The colour during life is a beautifully clouded and varied bluish-black, the pigment being known as zoonerythrin, which changes to a nearly uniform red on boiling. A 10-inch lobster is about four years old, and has moulted its cuticle twenty-five times, a hazardous process often fatal, leaving the skin soft and the flesh flabby. Adult

males moult twice a year, females once—soon after the young are hatched out. The eggs, up to 160,000 at a time in a 16-inch hen-lobster, are glued to the swimmerets as they are laid. This is usually in July or August, and development goes on slowly for ten or eleven months, so that the larvæ do not leave the eggs till the following June or so. Hen-lobsters 'in berry' are strictly protected. The newly-hatched larva is about $\frac{1}{4}$ of an inch long, it has biramous thoracic limbs, and swims on the surface. After five or six months, when about half an inch long, it assumes the lobster characters,

Norway Lobster (*Nephrops norvegicus*).

sinks to the bottom, and crawls towards the shore, where the adolescence is passed.

Lobsters can reflexly surrender a limb when seized or injured, the breaking-plane being between the fused second and third joints near the base. After the 'autotomy' a new limb begins to be formed under a papilla at the breaking-plane. Lobsters are caught in traps of basket-work or the like, which are baited with decaying fish, and have re-entrant openings. They are sometimes kept for a time in captivity, and fed on fishes before being sent to the market. The Norway Lobster (*Nephrops norvegicus*), common in the North Sea, has more slender claws of prismatic form, kidney-shaped eyes, and a somewhat carrot-like colour. The Rock Lobster or Spiny Lobster (*Palinurus vulgaris*)—the French *langouste*—is abundant in the Mediterranean and not uncommon on the rocky coasts of the English Channel. It is a very decorative spinose animal, without specialised great claws. Its flesh, like that of the Norway Lobster, is much esteemed.

Lobworm (*Arenicola marina*).

Lobworm, or LUGWORM (*Arenicola*), a genus of Polychæt worms, widely represented in the littoral zone. The commonest British species is *A. marina*, which makes U-shaped burrows in the sand and coiled castings. It is usually head downwards when the tide is out. The average length is 7-9 inches, but specimens of 14½ inches have been recorded. A variety found among the Laminarians at very low tide makes a vertical burrow, and may attain a length of 16 inches. The lobworm's body shows a protrusible proboscis, an anterior region with vestiges of bristled appendages,

thirteen segments with gills, and a narrower 'tail.' Lobworms feed on the organic matter in the sand, and it has been estimated (at the Holy Island) that they bring up 1911 tons of sand per acre in a year. The breeding is in spring. There are many species, some with no tail. Lobworms are of great value as bait. See J. H. Ashworth's memoir, *Arenicola* (1904).

Local Government is a term used, in the United Kingdom, to express the control and administration of the local affairs of separate divisions and districts of the country by subordinate authorities. It is thus contrasted with imperial government, or the control and administration of affairs for the whole country by the supreme legislative and executive authority. Prior to the Reform Act of 1832 local government in the United Kingdom was of a very rudimentary character. The management of local affairs was almost entirely in the hands of the propertied and privileged classes; the great mass of the people had little or no participation in it. As regards the counties and rural districts, the justices of the peace in England, the commissioners of supply and justices in Scotland, and the grand-jury and justices in Ireland were the principal governing authorities; while burghal affairs were practically in the hands of close corporations, either self-elected or chosen by privileged classes of burghesses. The first step towards realising local self-government was the reform of the municipal corporations in 1832-35, whereby the town-councils were made elective. Since then the course of legislation in this direction has been one of steady progress. Thus, in settling the government of urban communities—such as the urban districts of England and the police-burghs of Scotland—the legislature has given them almost as full control of their affairs as the reformed municipal boroughs. So the establishment of the poor-law systems for each of the three kingdoms between 1835 and 1845, and the creation of poor-law unions in England and Ireland, first introduced life and activity into the rural districts. The great area of local administration is, especially since the Local Government Act of 1888, the county, and is fully treated under that head. Other important areas, separately treated, are the parish and borough, for both England and Scotland. In Ireland, besides the county and town, the union had exceptional importance; and till the Irish Local Government Act of 1898 superseded it by County Councils, the grand-jury (see JURY) had wide administrative powers. The (optional) transfer of most of the proceedings in Scottish private bill legislation to Scotland (by Act of 1899) increases the autonomy of the northern kingdom.

The Local Government Board, created in 1871 to take over work previously distributed between the Poor Law Board, the Home Office, and the Privy Council, was superseded in 1919 by the Ministry of Health. The work is done by the political heads of the department (the President and Parliamentary Secretary, both usually members of the House of Commons) and a staff of clerks. Among the matters placed under the supervision of the board may be mentioned the areas of parishes, &c., local taxation returns, the administration of the poor-law, sanitary improvements, baths and wash-houses, vaccination, and the prevention of disease. The Local Government Board of Scotland, presided over by the Secretary for Scotland, was superseded by the Board of Health. For further details see separate articles on COUNTY, EDUCATION, POLICE, POOR-LAW, PRISONS, RATES, ROADS, &c.

See Mr and Mrs Sidney Webb's *English Local Government* (1906 et seq.); A. Harrison, *Local Government in Scotland* (1901); Mackenzie Chalmers, *Local Government* (1871-83); *Local Government and Taxation* (1885); books by Odgers, Redlich, Ashley, and Clarke.

Local Option. See LICENSING LAWS, LIQUOR LAWS, and TEMPERANCE.

Locarno, a Swiss town at the N. end of Lake Maggiore. Here on 16th October 1925 the Treaty of Mutual Guarantee was initiated by Germany, Great Britain, France, Italy, and Belgium. The treaty, commonly called the Security Pact, was fully signed in London, 1st December 1925. It aims at European peace by providing for the inviolability of the frontiers between Germany, France, and Belgium. Disputes are, as far as possible, to be referred to suitable arbitration. All countries concerned are expected to co-operate towards the establishment of lasting peace.

Locha'ber, a district in southern Inverness-shire. The Lochaber Axe is a kind of Halbert (q.v.), with a long handle and a bill-like blade, behind which, on the other side of the shaft, is a hook. It was once used by the Highlanders of Scotland and by the native Irish, and 'is believed to have been introduced into both countries from Scandinavia' (see Scott's *Waverley*). It was carried by the old city guard of Edinburgh. The song 'Farewell to Lochaber' is by Allan Ramsay.

Lochleven, a beautiful oval lake of Kinross-shire, 23 miles NNW. of Edinburgh. Lying 353 feet above sea-level, and engirt by Benarty (1167 feet), the West Lomond (1713), and other hills, it measures 3½ miles by 2; discharges by the Leven, flowing 16 miles eastward to the Firth of Forth; is 10 to 90 feet deep; and has an area of 3406 acres, drainage operations having reduced its size by one-fourth in 1826-36. Of seven islands, the largest are sandy, treeless St Serf's Inch, an early seat of the Culdees (q.v.), and Castle Island, with the 14th-century keep of a castle which in 1567-68 was for ten months the prison of Mary, Queen of Scots. Since 1633 and earlier the loch has been famous for its delicate pink-fleshed trout, and since 1856 for its fly-fishing. The fishing is under the charge of the Lochleven Angling Association, and the season extends from 1st February till 31st August. There are also pike and perch in the loch. The water-weed *Anacharis* (q.v.) proved for a while extremely troublesome. There is a *History of Lochleven Castle* by R. Burns-Begg. See also LEVEN (LOCH); and for Lochs Lomond, Long, &c., see LOMOND, &c.

Lochma'ben, a market-town of Annandale, Dumfriesshire, 10 miles by rail NE. of Dumfries. It stands amid seven lochs, two of which contain the rare Vendace (q.v.), and has a town-hall (1878), with a statue of Robert Bruce. The ruined castle of the Bruces stands at the farther end of the Castle Loch. Lochmaben is a royal, and was till 1918 a parliamentary, burgh. Pop. 1000.

Lock, an arrangement for fastening doors, drawers, &c., and requiring a key or other similar contrivance to open it. The early Egyptians used locks of rude construction, generally made of wood; and locks and keys of bronze and iron have been found in large numbers in Pompeii and Herculaneum. Fig. 1 represents the ancient

Fig. 1.

Egyptian lock in section: *a* is the case, fastened to the door; *b*, the bolt; in the upper part of the case are three openings, *c*, each containing a pin with a head to prevent its falling too far down. When the bolt is pushed home towards *b*, the pins fall into the corresponding three holes, *d*, preventing its being withdrawn. The key is a piece of wood, *e*, which

is pushed into the opening, *f*, in the bolt, and by means of its three pins the pins in the case are pushed up while the bolt is withdrawn. The Chinese for many hundreds of years have had a much superior wooden lock with tumblers.

During the 15th, 16th, and 17th centuries very ingenious and complicated locks, richly ornamented with hammered iron-work, were made, especially in Germany, and in every collection may be seen more or less fine specimens. These, however, were necessarily very expensive, and could only be used by the wealthy, and the lock in ordinary use up to the beginning of the 19th century was the common

Fig. 2.

Fig. 3.

spring-lock shown in fig. 2, which is still used for ordinary purposes. The bolt, *a*, passes through an opening in each side of the case, and is held in position by the two notches, *bb'*, which are pressed against the bottom of the opening, *c*, by the spring, *d*, as the bolt is locked or unlocked. The key, acting in the semicircular notch, *e*, in the bolt, pushes it either to one side or the other as required; the fig. represents the bolt midway between open and locked. Certain notches in the key fitting into corresponding wards, *f*, fastened to the plate of the lock, are supposed to prevent any other instrument but its own key from opening the lock. The first improvement on this was the common tumbler-lock (fig. 3), which represents the simplest form of it: *a* is the bolt; *b*, the tumbler, with a projection, *c*, which is pressed by the spring, *d*, into the notches, *e*, *e'*, according as the lock is open or shut. The key, by the one movement, raises the tumbler and moves the bolt.

Barron's lock, patented in 1778, was a development of the tumbler principle. By putting the notches in the centre of the bolt instead of on the top edge, the pin in the tumbler had to be lifted to an exact height to pass the bolt, rendering it much more difficult to pick. Barron subsequently added a second tumbler which had also to be passed by the bolt. Barron's form of construction is still in use, and it may be considered the parent of the modern many-tumbler or lever lock, of which Moses Bird's (1780) was the first.

The lock patented by Joseph Bramah in 1788, and still one of the recognised best locks for

Fig. 4.

certain purposes, is of a different construction. An inner barrel turning inside a fixed cylinder has a central pin on which the key works. The key (fig. 4) is a simple pipe with generally four slits, *a*, *a*, and *a* pin, *b*; when it is inserted and pressed down, the slits press on corresponding slides working in the inner barrel, till, arriving at a certain point, the barrel is released and can be turned round by the pin, *b*; another pin on the barrel moves the bolt. A spiral spring on the central pin keeps the slides in their original position till pressed down by the key. The varying depths of the slits in the key agree with the distance which the different slides have to be pressed down; and, as no two locks are alike in this respect, each key can only open its own lock. So much confidence had the Messrs Bramah in this lock that during the Great Exhibition of 1851 they offered a prize of two hundred

guineas to any one picking it, which prize was gained by Mr Hobbs, an American, who occupied fourteen days in devising and making tools, and fifty-one hours actually at work on the lock.

Fig. 5.

Chubb's lock, originally patented in 1818, is a further development of the many-tumbler principle. It is shown in fig. 5, which represents it unlocked, and with the inner plate removed the better to show the movement: *a* is the bolt; *b*, the tumblers, six in this instance, which move independently on the common pin, *c*, each having one of the six springs, *d*, to keep it in position. The stump, *e*, riveted to the bolt, must pass through the gate, *f*, in all the tumblers before the bolt can be shot. As this gate is in a different position in every tumbler, they must be raised to correspondingly different heights before they coincide for the stump to pass. For this purpose the key, *k*, has different steps so arranged that, when it is turned in the lock, each step raises its own tumbler to the proper height, and the step nearest the end of the key, *l*, shoots the bolt; the stump passing through the coinciding gatings and slipping into the space, *g*, as the tumblers, released by the key, resume their original position. In opening the lock the reverse of this movement takes place. A pin, *h*, fixed on the backmost tumbler and reaching over the tops of the others is called the detector. Should any false key be tried in the lock when locked, or any other means used which should raise either of the tumblers too high, an ingenious arrangement fixes it so that the lock is obstructed and cannot be opened, even with its own key, till the fixed tumbler is released. This is done by making an extra forward movement of the key, when the tumbler will resume its normal position. This detector movement is intended as a precaution against burglars, and also to record any attempt to pick the lock. False notches, *i*, *i*, are made in the tumblers to defeat attempts to pick the lock by feeling for the different gatings by backward pressure of the bolt applied by ingenious instruments—a method, difficult as it may seem, which has been successfully used against all tumbler-locks, unless specially safeguarded. A movable circular curtain attached to the keyhole in the inner plate is moved by the aftermost step of the key, *m*, as it is turned round. This prevents an inspection of the tumblers for picking purposes by means of a reflector introduced into the keyhole, while they are moved by any instrument, as nothing can be turned round in the lock without also turning the curtain.

Hobbs's protector lock has a series of tumblers as in Bird's and Chubb's locks, but, in addition, has what is termed a *protector*, shown in fig. 6. It

consists of a shaped lever, *a*, *b*, working on the pin, *c*, which is riveted into the bolt, *A*, and it is kept in position by the friction spring, *e*. The stump, *b*, is fixed to the protector, and, passing through a hole in the bolt, acts on the tumblers (not seen in the fig.) at the other side of the bolt. This arrangement entirely prevents feeling for the gatings of the tumblers by pressing back the bolt. If any attempt is made to push back the bolt when locked, it only moves the protector enough to bring down

Fig. 6.

the long arm, *a*, in front of the pin, *d* (fixed in the back plate of the lock), as shown in the fig. This prevents any further movement of the bolt till the protector is set free by a slight turn of the proper key. This lock, when in combination with another ingenious arrangement called the *revolving nozzle*, which prevents tampering with false keys, has successfully resisted all attempts to pick it.

Lord Glimthorpe invented a modification of the tumbler-lock which locks with a handle, only requiring a small key to open it. The key-hole is so narrow that no instrument strong enough to injure the lock can be introduced. It has other advantages, and its inventor claimed that it was unpickable. It was apparently not patented. He was also the inventor of a dust excluder for the key-holes of locks, operated by a spiral spring.

Many other varieties of the tumbler or lever lock have been invented which we have not space to describe.

Combination locks are sometimes used for burglar-proof safes. In these locks the tumblers are represented by wheels, generally four in number, which can be turned independently in connection with an index on the outside of the safe. The lock can only be opened by making certain movements of the handle on the index, which cause the gatings in the wheels to coincide. The combination of numbers on the index with the different wheels can be altered at pleasure, and, of course, the lock can only be opened by those knowing this combination. The weak point of this lock is that the combination may be forgotten. The Yale time-lock is an improvement, by Mr Yale of Philadelphia, on the time-lock invented by Rutherford of Jedburgh, Scotland, in 1831. A watch in combination with the lock may be set so that the lock can only be opened at a particular hour even by the owner.

Changeable-key locks were first introduced into England by Mr Hobbs, who brought Day and Newell's *parautoptic* lock to London in 1851. After many improvements, Mr Hobbs perfected this lock in 1862, and in 1865 the firm of Hobbs, Hart, & Co. introduced a simpler and cheaper form of it. By an ingenious modification of the tumblers, which we have not space to describe, the lock may be locked by any one of a great number of keys, but can only be opened by means of the one which locked it. Some of these locks afford a possible choice from about 60,000,000 keys, any one of which will lock it, and must be used to open it again. To avoid the necessity of having a number of keys, different webs are supplied which fit on the key-pipe to form the key. The webs may be kept in the safe, one taken out at random to lock up with; the web removed from the key carried away in the waistcoat pocket, and the key hung up anywhere, useless till the web is brought back.

In the ordinary safe locks the bolts are necessarily on a large scale, and, to prevent the carrying about of a key of corresponding magni-

tude, the bolts are usually shut by means of a handle, and a small lock with a small key locks one of them and fastens them all.

Latch-locks used on street doors which shut of themselves, and are opened by means of a handle

Fig. 7.

d is a movable barrel turning inside the lock; 1, 2, 3, 4, 5 are five pins pressed down by spiral springs working in holes in the fixed part; *e, f, g, h, i* are five corresponding pins moving in holes in the inside barrel; they are of irregular lengths, and when the key is out, *e, f, g, h, i* drop down, as shown by the dotted lines, allowing 1, 2, 3, 4, 5 to drop into the holes in the barrel, fixing the lock. As the key, which has indentations exactly corresponding with the varying lengths of *e, f, g, h, i*, is pushed in, it raises those pins till they and 1, 2, 3, 4, 5 coincide at the junction of the barrel and the fixed part of the lock. The barrel may then be turned and a pin on it shoots the bolt, not shown in the fig. The key is a thin piece of tempered steel weighing only a small fraction of an ounce, and the keyhole correspondingly narrow.

Locks made for various purposes, such as doors, drawers, writing-desks, portfolios, cupboards, &c., however differing in arrangement, are all constructed on the same principle. The *padlock*, in which the lock is a separate arrangement, is precisely similar to other locks except in shape. It has also a movable bow which is hooked into a staple or other fastening and then locked.

Locks for drawers, cupboards, and the like, which only require to be opened on one side, are generally made with a central pin on which the key, with a pipe, works; but in locks which must be opened from both sides this arrangement is impossible, and the key is solid, working through a hole in the lock. It must, however, be symmetrical, so as exactly to reach the turning place of the lock from either side. Locks mortised into the thickness of the door are called mortise locks.

Many ingenious automatic latches have been invented for cabinets and the like, which shut of themselves when the door is closed, and can be pulled open without a key or turning a handle; they are used when security is not required, but only a means of keeping the door closed.

Lock, on a river or canal, is an arrangement of two parallel floodgates, by which communication is secured between two reaches of different levels. Without locks, canals are an impossibility in any but exceptionally level country. The principle is explained at CANAL. The invention of the lock has been claimed for the great Leonardo da Vinci or other Italian engineer of the 15th century; but there seems ground for affirming that the principle was known and used in Holland a hundred years earlier.

Lock of a gun. See GUN, FIREARMS, and BREECH-LOADING.

Locke, JOHN, one of the most conspicuous figures in the intellectual history of modern

Europe, in whom, directly or indirectly, the course of opinion, especially in the 18th century, is probably more represented than by any other man. Locke was a native of Somerset; Beluton, the rural home of his youth, is 6 miles from Bristol. It was at Wrington, 10 miles from Beluton, that he was born, on the 29th of August 1632. Our picture of his boyhood is faint. He lost his pious mother when he was a child. His father, a country attorney, was a considerable factor in the formation of his mind, during fourteen years of home-training in the small Puritan household, which consisted of the father and an only brother, who died young. In Locke's tenth year the Civil War broke out. He was at Westminster School in the years in which the assembly of Puritan divines was discussing Calvinistic theology, and in one of which he may have seen the tragedy at Whitehall in which the Puritan revolution culminated. In 1652 we find Locke at Oxford, after which the picture becomes more distinct. Christ Church was then ruled by John Owen, the Puritan divine, and Cromwell was chancellor of the university. The Aristotle of the schoolmen still determined the course of study, much to the dissatisfaction of young Locke, who preferred facts to words, and persons to books. But free experiential inquiry was finding its way into Oxford, though not into college lectures, and Locke afterwards confessed the early influence of the spirit of Descartes upon himself. The Restoration found him in 1660 a senior student in Christ Church. For a time he lectured as a college tutor, till the little property of Beluton became his by inheritance after the death of his father in 1661. He had now to determine his career. Notwithstanding an inclination to theology, his growing sympathy with free inquiry, in reaction against scholasticism, and against the intolerance and fanaticism of which he complained among the Puritans, discouraged an ecclesiastical career. 'I found,' he says sarcastically, 'that a general freedom is but a general bondage, and that the popular asserters of liberty are the greatest engrossers of it too, and not unjustly called its keepers.' Experiments in medicine, which much engaged him in these years, show his bent to the inductive interpretation of external nature, and aversion to the 'vermiculate' questions of the schools. Before 1666 he was in a sort of amateur practice in Oxford, and, although he never took this degree, he was in after-life familiarly known among his friends as 'Doctor Locke.' The philosophic temperament is apt to make a merely professional career irksome; and, besides, he inherited a delicacy unfavourable to medical practice, which ended in the chronic consumption and asthma against which he bravely struggled in later years. Thus medicine did not absorb his attention. Problems of society, the relations of church and state, and above all the right and duty of religious toleration, as his commonplace books prove, were revolved in his thoughts in those Oxford years, always in sympathy with individual freedom and in a spirit of prudential utilitarianism.

It was in the summer after his return from Germany, where he had spent the winter of 1665, that an incident occurred which finally determined this last disposition, for thenceforward he was 'often a man of business, and always a man of the world, without much undisturbed leisure.' Medical practice accidentally brought him into connection with Lord Ashley, soon after first Earl of Shaftesbury, who was visiting Oxford for his health. The meeting ended in a lasting friendship, sustained by common interest in liberty; and in the following year Locke, at Exeter House, became Lord Ashley's confidential secretary. The change

did not check his scientific experiments, in which he was encouraged by Sydenham and other savants with whom life in London opened intercourse, while the political experience of Exeter House was in the line of previous interests. It was not long after he entered it that the turning-point in his intellectual career was reached. A reunion of friends, meeting in the winter of 1670-71 for the discussion of problems social and theological, perplexed in certain inquiries, welcomed Locke's suggestion, that before pursuing them they should face a previous investigation—as to what questions the human understanding was or was not fitted to deal with. This problem, then undertaken by Locke himself, proved unexpectedly large. His best energies, given to it during the seventeen following years, issued in 1690 in the famous *Essay Concerning Human Understanding*.

Those seventeen years were spent partly in England, amidst the tumult of public affairs, partly on the Continent in comparative retirement. In 1672, when Shaftesbury became chancellor, Locke was made Secretary to the Board of Trade. The fall of Shaftesbury three years later enabled his secretary to retire to France, where he lived till 1679, for health and study, chiefly at Montpellier and at Paris. In France he formed friendships with physicians, naturalists, and travellers more than with metaphysicians; although it was the brilliant era when French metaphysics was represented by Arnauld and Malebranche, whilst Spinoza was (till 1677) in Holland and Leibnitz in Germany. In 1679 Locke returned to London and to Shaftesbury, who was restored to power for a short time, and lived with him in the years of plots and counterplots which preceded the earl's flight to Holland in November 1682. Locke, under suspicion in England, as the confidant of Shaftesbury, became before the end of 1683 an exile in Holland, then the European home of religious and civil liberty. There, during five years of exile, he resumed the studies which affairs in England had often interrupted, and matured voluminous writings for the press. At Amsterdam Limborch, the leader of liberal theology in Holland, and Le Clerc, its most eminent man of letters, became his intimate friends. The intercourse strengthened Locke's theological liberalism, and soothed the pains of exile, aggravated by the withdrawal of his senior studentship in Christ Church, of which he was suddenly deprived in 1684 by the king's command. His first home in Holland was at Amsterdam; his last was at Rotterdam, where the *Essay* was finished.

The political struggle which had been going on for half a century in England was consummated by the Revolution of 1688-89, of which, then unknown to fame, he was to be the philosophical defender. This opened the way for his return, to play his part in authorship, with London at first as the stage of operations. Immediately afterwards, in February 1689, he declined, for health's sake, the post of ambassador at Brandenburg, contented with a modest Commissionership of Appeals as official recognition by the new government. The course of affairs after the Revolution fell short of his hopes. The Toleration Act of 1690 was inadequate, and the withdrawal of the Comprehension Bill, for uniting England in a liberal national church, was another disappointment. Locke made his first appearance as an author late in life. He turned to authorship in the public interest of individual freedom—religious, political, and intellectual. An *Epistola de Tolerantia* was his first contribution, written in 1685, addressed to his Dutch friend Limborch, published anonymously at Gouda in Holland in 1689, a few

weeks after his return to England, and translated into English in the following summer by William Popple. A treatise on *Civil Government*, ready for publication when he came home, followed early in 1690; this was also anonymous, and, like the *Epistola*, a defence of individual liberty in another relation. Its economical principles anticipate Hume and Adam Smith, and its principles of jurisprudence are in advance of Grotius and Puffendorf. The *Essay Concerning Human Understanding* appeared in March 1690, unfolding the philosophy of which the tractates on Toleration and on Government were special applications. The *Essay* was Locke's first public acknowledgment of authorship. His philosophy is embodied in these three works.

His ailments had increased in London. It was then, in 1691, that the home of his old age, the brightest of all his homes, opened to receive him. This was the manor-house of Oates in Essex, near Epping, the country-seat of Sir Francis Masham. Lady Masham was the accomplished daughter of Cudworth (q.v.), the philosophical theologian: Locke had known her family before he went to Holland. Here, for the fourteen remaining years of his life, he enjoyed as much domestic peace, literary leisure, and social intercourse as was consistent with broken health and occasional public service in London, and his work in the study was resumed with characteristic industry and method. The abundant authorship of the two preceding years now involved him in controversies which lasted to the end of his life. The *Answer* of a certain Jonas Proast of Queen's College, Oxford, to the *Epistola de Tolerantia* had led to Locke's *Second Letter* in 1690. A rejoinder in 1691 was followed by an elaborate *Third Letter* in 1692. Questions of economics and the currency were subjects of other tractates in 1691 and 1695. When he was in Holland he had corresponded with his friend Edward Clarke of Chipping in Somerset about the education of his son, and those letters made the substance of the *Thoughts on Education* in 1693, a characteristic work which still holds its place among educational classics. Proposals for ecclesiastical comprehension, and his own desire for union among Christians, made him anxious to show how few and simple the essential facts of Christianity were, and to bring men to agree to differ about all beyond. One result was the anonymous volume, in 1695, on the *Reasonableness of Christianity*, in which he tried, in the spirit of the *Essay*, to recall Christianity from the verbal reasonings of dogmatic divines, which had disturbed the unity of the church, to its original simplicity in Scripture. This theological departure, followed by excursions in criticism in the last years of his life, which appeared as posthumous *Commentaries on St Paul's Epistles*, was a distinctive feature of the literary life at Oates. In 1696, as a Commissioner of the Board of Trade, with an income of £1000 a year, he was again involved for the four following years in official cares. But they were not years of literary idleness. Successive editions of the *Essay*, in 1694, 1695, and 1700, with important additional chapters in the first and last; defence of its philosophy against the adverse criticism of Norris, Stillingfleet, Sergeant, Burnet, Lee, and Leibnitz; an *Examination* of Malebranche, and *Remarks* on Norris, published posthumously; vindications of the *Reasonableness of Christianity* against theological critics; and the well-known tractate on the *Conduct of the Understanding*, kept him busy in the study at Oates. The *Essay*, translated into Latin and French, was spreading over Europe. But he was now gathering himself for the end. In 1700 he ceased to publish. One attack only moved him in the four years which followed. In

1704 his old adversary Proast renewed the contest, and the fragment of a *Fourth Letter on Toleration*, published in the posthumous volume, exhausted Locke's remaining strength upon the theme that had engaged him at Oxford forty years before, and had been the ruling idea ever since. All that summer he declined, nursed by Lady Masham and her step-daughter Esther. On the 28th October 1704 he passed away, as he said, 'in perfect charity with all men, and in sincere communion with the church of Christ by whatever names Christ's followers call themselves.' His tomb may be seen on the south side of the parish church of High Laver, a mile from Oates, bearing a Latin inscription prepared by his own hand.

Locke's *Essay* presents the philosophical foundation of the right of the individual thinker to follow freely the findings of experience; and, partly even by its metaphysical defects, it has suggested the chief problems which have occupied modern thinkers since it appeared. Its 'design,' according to its own words, was, 'to inquire into the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent';—and this as a means to correct the chief cause of human error, which its author found in men's proneness to extend their inquiries to matters beyond their reach, and then to cover their ignorance by empty phrases, or by dogmas which they assumed to be 'innate,' and therefore out of the reach of criticism. He wanted to make a faithful report, founded simply upon mental facts, as to how far a merely human understanding can go, in the way either of certain knowledge or of more or less probable presumption; and in what man must be contented with ignorance. Although a true report might show that human knowledge must for ever 'fall far short of perfect comprehension of whatsoever is,' it might be 'sufficient for our state;' and at anyrate we cannot overcome facts.

The *Essay* is divided into four books. Only the fourth deals directly with its 'design.' The first book is a preliminary argument against the innateness of any part of our knowledge, meant to open the way for the statement of Locke's main position—that whatever any man can know, or reasonably believe in, or even conceive, is dependent on human experience. The essence of the *Essay* is in its proof that knowledge cannot in any degree have been consciously innate in each man; for it must be in all cases a gradual growth, dependent upon experience, in which we are liable to error. The argument might be thus put: All truths and all errors are expressed in propositions, and every proposition contains two terms, which, if the proposition is intelligible, must each contain an 'idea' or meaning. We may have ideas without having knowledge, but we cannot have knowledge, or even opinion, without having ideas; for 'having ideas,' Locke tells us, means 'speaking intelligibly.' Propositions which contain *idealess* terms cannot express truth, or even error, and only connect empty sounds. Now, how do the ideas or meanings which can form the subjects and predicates of our propositions enter into human consciousness? All our ideas, the most complex and abstract, as well as the simplest, Locke undertakes to show, are ideas which refer either to data that happen to have been presented through our five senses, or to operations of mind which have been made objects of reflection. If we pretend in words to extend our range further, 'we shall succeed no better than if we went about to clear the darkness in the mind of one born blind, talking into him the ideas of light and colours.' Words which do not mean either what is *sensuous* or what is *mental* must be empty words. The

proof of this fundamental thesis is offered throughout the second and third books, which thus prepare for the settlement of the proper problems of the *Essay* in the fourth. Much of the proof consists of logical and psychological analysis of the metaphysical ideas of space, duration, infinity, substance, personality, causality, and power, which are taken as 'crucial instances.' If even those ideas must depend upon experience in order to become ideas, *a fortiori* none others can have been consciously born with us before we had experience. The proof is that, if all elements due to experience are left out, the ideas now mentioned must disappear. In the 13th and most of the remaining chapters of the second book this argument is worked out. But here Locke seems too ready to take for granted that, if those crucial ideas are unrealisable without data of experience, it necessarily follows that they involve nothing else than accidents of external or spiritual experience. He was led to interpret 'innateness' as he did partly by his assumption that nothing can be 'in a mind' of which the mind is not at the moment conscious. He thus overlooks the fact that we are conscious at each moment only of a small part of what—because potentially involved in, and presupposed by, our spiritual experience of the universe—responds consciously in each man's mind on an adequate appeal.

After this analysis of the possible range of man's ideas, Locke passes to the intuitive and demonstrable, the probable, and the erroneous judgments into which ideas enter. We are thus led into the fourth book, which reports upon the intuitive facts and principles which constitute knowledge. Locke's refusal of innateness (in his meaning of 'innate') to ideas, and *a fortiori* to knowledge which depends upon ideas, does not imply that he ignores intuition. On the contrary, after arguing strenuously against the innateness of our ideas of morality and of God, he is not less strenuous in arguing for our having an intuitive certainty of the truths of pure mathematics and abstract ethics, and for our being intuitively certain of the individual fact of our own existence as self-conscious, as well as of the existence of external things, as far as they are actually felt, and above all for our having a demonstrable knowledge of the existence of God or Eternal Mind 'as certain as any conclusion in pure mathematics.' Indeed, in his 'demonstration' of God's existence he presupposes in our idea of causality transcendental elements with which his description of that idea in the second book can hardly be reconciled. On the whole, we have intuitive knowledge (so Locke reports) in abstract logic, in abstract mathematics, and in abstract ethics; and we have also an intuitive knowledge of the facts of our own existence, of the existence of actually felt things of sense, and of the existence of an Eternal Spirit: it is on the light of intuition, he says, 'that all the certainty of this knowledge depends.' But all else upon which human understanding can be exercised is referred by the *Essay* to the spheres either of more or less probable presumption or of ignorance. All judgments about absent things of sense; about the relations among the qualities of matter, primary and secondary, or about its laws; and about the attributes of spirits human or divine, can at the most be probable presumptions. Hence probability is virtually the guide of human life. Science of absent facts of sense (if science means intuitively demonstrated truths) is beyond man's reach. The chief exercise of a human understanding must be balancing of probabilities and comparing the relative weight of objections, alike in the so-called physical sciences and in common life. Whether physical science, or even the probable propositions

of ordinary life, could be formed without the latent presence in experience of universal and necessary judgments, presupposed in, while incapable of being referred to, its contingencies, Locke does not inquire. His aversion to presuppositions and maxims, to which he traced the empty verbalism and dogma against which he constantly warred, seems here to influence him. He sometimes wrote as if he failed to see that, without presuppositions and principles of some sort, intellectual and moral, being ready to spring out of their latency into experience, there could be neither reasoned scepticism nor reasonable faith. The most significant philosophical discussions of the last two centuries have been about the presence or absence of transcendental presuppositions and principles in our experience; and about man's consequent relation to the infinite and the eternal. Berkeley's *Principles of Human Knowledge*, Hume's *Inquiry* into the understanding, Reid's *Inquiry* into the principles of common sense, Kant's *Kritik of Pure Reason*, Hegel's ontological dialectic, Comte's positivism, and Herbert Spencer's generalisations of universal evolution and involution, are all in their respective ways concerned with questions about the roots of experience which Locke left indeterminate.

Locke's teaching in his other works is influenced by what is taught in his *Essay*. Thus, his favourite idea of free toleration for the individual expression of religious belief—then a paradox, now a commonplace—is founded on the dependence of man's knowledge on experience and on the unsuitness of persecution as a means of introducing truth to a human mind; while his refusal of toleration to atheists is in harmony with that 'mathematical certainty of God's existence' which he reports to be attainable by every man who uses his faculties enough. The same intellectual individualism pervades what he wrote about government, the education of the young, and the reasonableness of Christianity.

Locke's character is reflected in his works. In all that he wrote and did he is pre-eminently himself, in his caution and calculation with an approach to timidity, steady adherence to the concrete of experience, indifference to abstract speculation, suspicion of mystical enthusiasm, calm reasonableness, love for truth, and ready submission to facts even when they could not be reduced to system in a human understanding. His temperate aim was not to explain the universe, but to adapt his own intellectual life and that of others to the actual conditions. He sought to awaken the intellectual spirit, and to bring about an amendment of the operations of the understanding, more than to solve the enigmas of existence. Hence the lasting educational value of his authorship.

Numerous editions of Locke's works, individually and collectively, have appeared, about 40 of the *Essay* alone, besides translations into Latin, French, and German. Of the collected editions none are adequate, but the best is probably that of Bishop Law in 4 quartos (1777). Among criticisms of the *Essay*, the *Nouveaux Essais* of Leibniz (1765) still takes the foremost place. Cousin's *Lectures on Locke* (1829), Webb's *Intellectualism of Locke* (1857), and Green's criticism in his Introduction to Hume (1874), are noteworthy. See also Fowler's *Locke* (1880); Campbell Fraser's *Locke* (1890), and his critical edition of the *Essay* (2 vols. 1894); Pringle-Pattison's abridgment of it (1924); books by Alexander (1909), Lamprecht (1918); Seth's *English Philosophers and Schools of Philosophy* (1912); and Sorley's *English Philosophy* (1920).

Lockerbie, a police burgh in Annandale, Dumfriesshire, 15 miles ENE. of Dumfries, has a large town-hall, and great lamb and sheep sales; pop. 2300.

Lockhart, JOHN GIBSON, was born in Cambusnethan manse, near Wishaw, 14th July 1794. All his boyhood was spent in Glasgow, where at eleven

he passed from the high school to the college, and whence at thirteen, with a Balliol Snell exhibition, he went up to Oxford. In 1813 he took a first-class in classics; then, after a visit to the Continent (to Goethe at Weimar), studied law at Edinburgh, and in 1816 was called to the Scottish bar. But he was no speaker; and having while still at Oxford written the article 'Heraldry' for the *Edinburgh Encyclopædia*, and soon after translated Schlegel's *Lectures on the History of Literature*, from 1817 he took more and more to literature, and with Wilson became the chief mainstay of *Blackwood's Magazine*. In its pages he first exhibited the sharp and caustic wit, his most salient characteristic, that made him the terror of his Whig opponents. *Peter's Letters to his Kinsfolk* ('2d ed.' 1819), a clever skit on Scottish society, was followed by four novels—*Valerius* (1821), a romance of the times of Trajan; *Adam Blair* (1822); *Reginald Dalton* (1823), a tale of university life; and *Matthew Wald* (1824). Of these *Adam Blair* alone retains its vitality—the strong, sad story of a good man's fall and repentance: Henry James has likened it to Hawthorne's *Scarlet Letter*. The spirited *Ancient Spanish Ballads* appeared in 1823; *Lives of Burns and Napoleon* in 1828 and 1829; and the *Life of Scott*, Lockhart's masterpiece, in 1837–38. He had met Scott first in May 1818, in April 1820 had married his eldest daughter, Sophia, and for five and a half years had divided his time pretty equally between Edinburgh and Chieftwood, near Abbotsford. In 1825 he removed to London to assume the editorship of the *Quarterly Review*, at a salary of £1000 to £1300; and this post he retained till 1853, in 1843 becoming also auditor of the duchy of Cornwall, a sinecure worth £400 a year. But his closing years were clouded by illness and deep depression; by the secession to Rome of his only daughter, with her husband, Mr Hope-Scott (q.v.); and by the loss of his wife in 1837, of his two boys in 1831 and 1853. The elder of them was the 'Hugh Littlejohn' of Scott's *Tales of a Grandfather*; the younger, Walter, was a scapegrace in the army. Like Scott, Lockhart visited Italy in search of health; like Scott, he came back to Abbotsford to die—25th November 1854. He is buried in Dryburgh at Sir Walter's feet. See his *Life and Letters*, by Andrew Lang (1896).

Lock Hospital, in London, for venereal diseases, was founded in 1746. The Loke or Lock, in Southwark, was an ancient lazaret-house, and was perhaps so-called from French *loques*, 'rags' or 'lint,' more probably because it was specially isolated. It was used later as a hospital for venereal diseases, and the name came to be extended to similar hospitals elsewhere.

Lock-jaw. See TETANUS.

Lockport, capital of Niagara county, New York, on the Erie Canal, 25 miles NNE. of Buffalo by rail. The canal here passes through a deep channel, several miles long, cut in the solid limestone, and falls 66 feet by locks. Its surplus water drives a number of flour, pulp, paper, and cotton mills, besides other factories, foundries, machine-shops, &c. Pop. 21,000.

Lockyer, SIR JOSEPH NORMAN, was born at Rugby on 17th May 1836, and in 1857 became a clerk in the War Office, being subsequently transferred to the Science and Art Department. In 1869 he was elected an F.R.S., and in 1870 was appointed secretary to the Royal Commission on Scientific Instruction, made lecturer on Astronomy at the Normal School of Science at South Kensington, and sent out to Sicily as head of the eclipse expedition. In subsequent years he headed many similar expeditions. In 1871 he was

elected Rede lecturer at Cambridge. He had already in 1866 discovered a new method of observing the sun; and in 1874 he gained the Rumford medal of the Royal Society. Founder (1869) and editor of *Nature*, he was also an able popular lecturer on astronomical physics, and wrote many books on solar chemistry and physics, eclipses, the meteoritic hypothesis, and on the orientation of temples and stone circles, which he connected with primitive astronomy. On some of these subjects his views have not been generally accepted. He was President of the British Association in 1903, and died 16th August 1920.

Locle, LE, a Swiss town, 10 miles NW. of Neuchâtel, is one of the chief seats of the Swiss watch-making industry; pop. 12,500.

Locomotives. See STEAM-ENGINE, RAILWAY, INTERNAL-COMBUSTION ENGINE, &c.

Locomotor Ataxia, or TABES DORSALIS, is a chronic degenerative disease of the nervous system, the most characteristic symptom of which is want of power to co-ordinate the muscles. The lower limbs are almost always first and most severely affected, and the patient walks with a peculiar gait; he lifts the feet high and brings them down with a stamp; he has difficulty in balancing himself; and though he may be able to walk pretty well in a straight line on level ground, any more complicated movement (turning round, surmounting or avoiding obstacles, &c.) much increases his unsteadiness. When he is deprived of the aid of sight (in the dark, or on closing the eyes) these difficulties are much aggravated. In the great majority of cases sensation is early affected; and he may complain that he always feels as if he were walking upon a thick carpet. The power of the muscles is in many cases quite unimpaired.

Besides the symptoms of inco-ordination, and often long preceding them, are others, some of which are so characteristic that they may lead to the recognition of the disease. Loss of the knee-jerks; severe shooting pains, especially in the lower limbs (called *lightning pains*); similar pains in the region of the stomach, associated with vomiting, faintness, &c. (*gastric crises*); paralysis, often transient, of one of the eye-muscles; extreme contraction of, and loss of the reflex to light in, the pupil; atrophy of the optic nerve; a peculiar form of inflammation of one or more joints, all occur in a certain proportion of cases.

The progress of the disease is always slow and uncertain; it may generally be measured by years, often by decades; but, although in some cases the condition of the patient may remain stationary for years, it generally becomes gradually worse. Death usually results from some intercurrent disease. Locomotor ataxia generally begins between the ages of thirty and fifty, and is much more common in the male sex. Its onset seems sometimes traceable to severe acute illness, to chill, over-fatigue, injury, &c., but the degeneration in the nervous system which causes it is really a late result of syphilis.

After death a fibrous degeneration (sclerosis) of the whole or part of the posterior columns of the spinal cord is found. The extremely uncertain course of the disease renders it very difficult to be certain of the effect of treatment, though many different methods have been advocated, and asserted to produce amendment if not cure. The most hopeful cases are those which follow closely upon

syphilis; for in them a prolonged antisyphilitic treatment seems to lead to great improvement or even disappearance of the symptoms.

Locri, a people of ancient Greece, divided into two distinct tribes, differing in customs and civilisation. The one, known as Locri Epicnemidii and Opuntii, dwelt on the mainland over against the island of Eubœa, whilst the other, called Locri Ozolæ, lived on the northern shore of the Gulf of Corinth. The chief town of the eastern Locri was Opus, of the western Amphissa.—A colony from one or the other of these tribes founded (*circa* 680 B.C.) in South Italy the celebrated city of Locri, which stood near the southern extremity of the Bruttian peninsula. Locri was generally in opposition to Rome, first as the ally of the Syracusans, then of the Carthaginians. Excavations were carried out here in 1889–90, and subsequently.

Locus, in Geometry, denotes the line or surface traversed by a point which is constrained to move in accordance with certain determinate conditions. Thus, the locus of a point which must always preserve the same uniform distance from a fixed point is the surface of a sphere; but if the motion be at the same time confined to a plane, the locus then will be a circle: this is an illustration of the division into *solid* and *plane* loci which prevailed among the ancients. In modern Geometry plane loci are treated under the name of Curves (q.v.).

Locust, a name applied to many members of the grasshopper family Acridiidae, which occasionally increase greatly in numbers and then move in huge swarms in search of food. It is unfortunate that the family Locustidae does not include any locusts in the ordinary use of the term; it includes forms like the green grasshoppers, e.g. the British *Locusta viridissima* and the Katydid (q.v.). Both locusts and Locustidae have elongated hind-legs with great powers of leaping, but locusts have short antennæ with fewer than thirty joints, no exerted ovipositor in the female, short tarsi with three joints, and an auditory organ on the side of the upper part of the first abdominal segment, whereas Locustidae have very long antennæ with more than thirty joints, usually an elongated exerted ovipositor in the female, tarsi with four joints, and usually an auditory organ on the front legs below the knee. But an Acridiid is not called a locust unless it is given to over-population and mass-movements.

The eggs are laid in a hole excavated in compact ground, and an exuded fluid hardens to form a

Locust (*Pachytylus migratorius*).

protective encasement. In some cases several holes are filled, it may be at considerable intervals of time. These sometimes remain for more than a year in the ground. Fortunately for man, there are a good many insects which are fond of them. When the young locusts are hatched and come to the surface they at once begin to devour the available vegetable food. Thereafter they may go on the march on foot, as in the case of the South African

'Voetgangers,' which can cover several miles in a day with their indefatigable jumping, and will even, at considerable cost, cross rivers. In some other cases there is little mass-movement until the wings develop. Of the hugeness of the aerial swarms it is difficult to form any conception. A flight that passed over the Red Sea on one day in November 1889 was estimated at 2000 square miles in extent, and there was another as large next day. The distances traversed may be great if the wind helps, and a swarm of *Schistocerca peregriana* is recorded as invading a ship which was 1200 miles from the nearest land. Of their ravages the prophet Joel gave a vivid and accurate description. They change a garden of Eden into a desolate wilderness and cause widespread famine and ruin, and their rotting corpses bring a pestilence. In many countries they are eaten, roasted or fried in butter, plain boiled, or dried in the sun. Among the famous locusts may be mentioned the Rocky Mountain Locust, *Caloptenus spretus*; the North-African and Indian *Schistocerca peregriana*, probably the locust of the plagues of Egypt; the widely distributed *Pachytylus cinerascens*, occasionally reaching Britain and extending to China and New Zealand; the East African *P. migratorius*, probably in great part the locust of the Scriptures; and the two leading species in South Africa, *P. sulcipectus* and *Acridium purpuriferum*.

Locust Destruction.—Numerous systems have been adopted for destroying these terrible swarms. They were beaten down as they flew; they were pushed into bags as they crawled, and their eggs were collected and burned on a very large scale before the young were hatched. In 1870 an enterprising land-owner in Cyprus, Mr Richard Mattei, suggested a system which was modified and perfected by Mr Samuel Brown, government engineer-in-chief in the island in 1881. By this system, based upon a close observation of the nature and habits of the insects during many years, the locusts are caught while they are on the march—that is to say, while (some ten days after they are hatched) they march across the country in countless hosts or armies. Mr Mattei, having observed that no obstacle causes them to turn back in their onward progress, but that they climb and crawl over everything that bars their direct course, and that furthermore they are unable to obtain foothold on any perfectly smooth or polished surface, hit upon the ingenious expedient of barring their progress by means of long canvas screens put up on stakes and furnished at the top with a band of varnished leather or what is called American cloth. Deep pits are dug at intervals of some few yards on the side of these screens facing the advancing hosts, and the locusts, reaching the obstacle and being unable to surmount it owing to the polished surface on the upper edge, fall down and are caught in the pits, which are themselves edged and lined to a depth of a few inches with polished zinc. Finally, the locusts as they fall into the pits are rendered incapable of crawling out, not only by the smooth surface of the zinc, but by the superincumbent weight of the tens of thousands of fresh victims that are perpetually pouring in upon them. By this system the locusts in Cyprus were in five years entirely and cheaply destroyed. The number of the slain in 1883 alone is estimated at nearly 200,000,000,000. Other methods have since been employed in South Africa, where two species have caused trouble. These are the red-winged locust (*Cyrtocanthacris septemfasciata*) and the brown locust (*Pachytylus sulcipectus*). The former, which is supposed to breed in the Zambesi region, almost confines its attention to the eastern part of South Africa. The brown locust breeds in the Kalahari Desert. A South

African Central Locust Bureau was founded in 1906. As in Cyprus, it has been found best to attack the young locusts whose wings have not yet grown—voetgangers, as the Boers call them. The Mattei system, however, has proved less successful than poisoning with sodium arsenite. The poison is sprayed over the vegetation, or, better, is sweetened with crude treacle and mixed with bran or cut-up green forage deposited in heaps where stock cannot get at it.

Locust-tree, a name given in different parts of the world to different trees of the natural order Leguminosæ. The Carob-tree (*Ceratonia siliqua*) is often so called in the countries bordering on the Mediterranean, and its pods are the locust-beans of our shops (see CAROB). The Locust-tree of America (*Robinia pseud-acacia*), also called the False Acacia, or Thorn-acacia, and in Europe the Acacia, is a beautiful tree (see ROBINIA), valued for its wood, known as *Locust-wood*. The Honey Locust-tree (q.v.) of America is a *Gleditsia*. The Locust-tree of the West Indies is *Hymenaea Courbaril*, a gigantic tree whose pods also supply a nutritious matter, a mealy substance in which the pods are embedded. The anthelmintic bark yields a resin called Anime (q.v.), and it is valuable as a timber-tree.

Lodève (anc. *Luteva*), a town in the French department of Hérault, at the foot of the Cévennes, 43 miles NW. of Montpellier. A bishop's see till 1790, it has an old cathedral. Pop. 12,000.

Lodge, EDMUND (1756-1839), successively Lancaster, Norroy, and Clarenceux herald, published *Illustrations of British History* (3 vols. 1791), a *Life of Julius Cæsar* (1810), and other works; but is best known as author of the *Portraits of Illustrious Personages of Great Britain* (4 vols. fol. 1821-34), the cost of engraving and printing which exceeded £40,000.

Lodge, SIR OLIVER JOSEPH, born at Penkull in Staffordshire, 12th June 1851, was educated at University College, London, and was professor of Physics at University College, Liverpool, from 1871, principal of Birmingham University from 1900 to 1919. He is specially distinguished in electricity, nearly discovered the Hertzian waves, and by his coherer and otherwise has notably advanced wireless telegraphy. He has written on electricity, on lightning-conductors, on the pioneers of science; and has given much time to problems of telepathy, subliminal consciousness, and survival of the dead. He was knighted in 1902. He contributed several articles to this Encyclopædia.

Lodge, THOMAS, English dramatist, romance-writer, and poet, was born at West Ham about 1558. After studying at Trinity College, Oxford, he entered at Lincoln's Inn, but seems to have led a wild and rollicking life, using his pen occasionally, as in a duel with Gosson, against whom he defended stage-plays in a couple of pamphlets (edited by D. Laing for the Shakespeare Society in 1853). In 1589-91 he varied his life by taking part in two sea-expeditions against the Spaniards, in the neighbourhood of the Azores and Canary Islands. On the first of these voyages he wrote a euphuistic romance, *Rosalynde* (1590); reprinted in Hazlitt's *Shakespeare's Library*, vol. ii., and separately in 1907, &c.), which supplied England's great dramatist with the chief incidents, and even more than the chief incidents, of *As You Like It*. Lodge himself wrote two second-rate dramas, *The Wounds of Civil War* (1594; reprinted in Hazlitt's *Doddsley's Select Collection of Old Plays*, vol. vii.), and *A Looking-glass for London and England* (1594), written in collaboration with Robert Greene (q.v.), another dissipated author. He was generally stated to have been a player, until the point was

effectively disproved by C. M. Ingleby in 1868. But he is believed to have taken a medical degree at Avignon, and to have written a *History of the Plague* (1603). He died himself of the plague in 1625. Of his remaining writings we may mention *A Fig for Momus* (1595; reprinted in Sir A. Boswell's *Frondees Caduceus*, 1817); translations of Seneca (1614) and Josephus (1602); *Life of William Longbeard* (1593); *History of Robin the Divell*, *Wits Miserie*, and *Glaucus and Silla* (poems, one of which suggested the plan of Shakespeare's *Venus and Adonis*, 1589). See the *Works*, edited by Gosse (4 vols. 4to, 1884).

Lodgings in another person's house may or may not constitute the relation of landlord and tenant. It depends upon the nature of the lodger's right in the premises. If he has an agreement relating to land, and may maintain a possessory action for disturbance, he is a tenant; if his only remedy is a contractual action against the 'landlord,' he is not. It is not necessary that the contract should be in writing, though it is highly expedient. In England, unless there has been part performance, a verbal contract to let lodgings cannot be enforced if it is an agreement relating to land, and so void by the Statute of Frauds. There was formerly a risk that if the landlord, L, were himself a tenant to A, then, if L's rent were in arrear, the lodger's goods might be taken by A to pay this, for the rule was that all goods found on the premises (with certain definite exceptions, of which this was not one) could be taken under a distress for rent; but by the 34 and 35 Vict. chap. 79, 1871, it was provided that, if the lodger has paid the mesne (or intermediate) landlord, the superior landlord must leave his goods alone; if he has not paid the mesne landlord, then he may pay the superior landlord in lieu of the mesne landlord, and again obtain protection for his goods. The statute 2 and 3 Vict. chap. 71, sect. 38, provides that a police-magistrate may award compensation up to £15 for wilful damage done by lodgers. The Larceny Act, 1861, makes the stealing of chattels or fixtures by lodgers a felony punishable by imprisonment for two years or penal servitude for seven years, according to the value of the thing stolen.

A lodger is entitled to the use of the door-bell and knocker, and the landlord impliedly promises that the rooms are fit for occupation. In letting an unfurnished house there is no such implication. A lodging-house keeper, even where he keeps a boarding-house, which nearly resembles an Inn (q.v.), is not liable for the safe custody of the lodger's goods. He is merely liable for ordinary care; but he does not warrant at all hazards that the goods will not be stolen. Even if the lodger's goods are stolen by a servant of the house, the lodging-house keeper is not liable. The notice to quit depends on how the lodgings were taken. If they were taken by the week, a week's notice is sufficient; if by the month, a month's; and if by the quarter, a quarter's notice, unless some other agreement was made. Hence, if the lodger quits without notice, he is liable for one week's, or month's, &c. rent, even though the landlord put a notice in the window. The lodging-house keeper, if the lodger is a tenant, may distrain for rent. When a lodger refuses to quit the lodgings after a notice has expired he cannot be put out by force, but in many cases a summary remedy is given for recovering possession. Since 1868 a lodger is entitled to vote for members of parliament in boroughs, if he pays rent of the clear annual value of £10, provided also that he has resided twelve months in the district, and put in his claim to be registered. The lodger-franchise was extended to counties by the Representation of the People Act of 1884. In Scotland the lodger's

goods cannot be taken by the landlord of the lodging-house keeper for rent, nor is it yet decided whether the householder's liability in case of loss of the lodger's goods is equal to or less than that of an innkeeper.

Common Lodging-houses, where poor people lodge by the night, are subject to police supervision. The Public Health Acts, 1875 to 1907, provide (in continuation of earlier acts) for their registration and inspection, and enact that they are only to be kept by registered keepers. Before being licensed they are inspected by the medical officer of health, every room being measured and restricted to a specified number of lodgers. Every room has this number painted on the door, and a copy of the police regulations is posted up in a conspicuous part of it. The keepers are bound thoroughly to cleanse all the rooms, stairs, &c., as often as by-laws shall direct, and to keep a proper supply of water. If fever break out notice must be given to the local authority. These duties are enforced by means of penalties. The same act directs that, if any person suffering from any dangerous infectious disorder has lodged in any rooms, such rooms must be disinfected to the satisfaction of a legally qualified medical practitioner, as testified by a certificate signed by him, before they are again let. Similar provisions are in force in Scotland and Ireland. Of recent years very great improvements have been effected in common lodging-houses. In most large towns in Great Britain 'model lodging-houses' have been erected on approved plans, wherein greater privacy is ensured in the sleeping quarters, and a complete system of ventilation secured. The latest inventions in cooking apparatus, washing-houses, &c. have been introduced; while reading, recreation, and bath rooms form indispensable parts of these establishments. See VAGRANTS.

Lodi, a town of North Italy, stands on the Adda, 18 miles by rail S.E. of Milan. It has a Romano-Gothic cathedral dating from the 12th century; manufactures of linens, silks, and Majolica porcelain; and a great trade in Parmesan and Stracchino cheese and wine. Pop. 30,000.—**LODI VECCHIO**, a ruined village, 4 miles W., was destroyed by the Milanese in 1111-58. Here Bonaparte, on 10th May 1796, forced the long and narrow bridge in the face of a tremendous fire from the Austrian batteries.

Lodomeria (Lat. for Vladimir), formerly an independent principality in Volhynia, became part of the Austrian 'kingdom of Galicia and Lodomeria.' See GALICIA.

Łódź, sometimes called 'the Manchester of Poland,' lies 76 miles S.W. of Warsaw on a branch railway. It consists chiefly of one main street, 6 miles or more long, and has cotton and woollen manufactures. Pop. 450,000, 40 per cent. Germans.

Loess. See LÖSS.

Loetschberg. See LÖTSCHBERG.

Loewe, JOHANN CARL GOTTFRIED, composer, was born 30th November 1796, between Köthen and Halle, the twelfth son of a schoolmaster. He became a choir-boy at Köthen, later studied music and theology at Halle, and in 1821 settled at Stettin, where he became successively professor in the gymnasium, musical director to the city, and organist. He made visits to Norway, Sweden, and France, and in 1847 sang and played before the English court in London. He died 20th April 1869. He composed five operas (of which only one, *The Three Wishes*, was performed), sixteen oratorios (several of them for voices only, without accompaniment), and numerous symphonies, concertos, duets, and other works for the pianoforte. But his ballads are his most notable bequest to posterity; they are, many of them, remarkable

dramatic poems, and in some respects Loewe may claim to have done for the ballad what Wagner did for opera. Gehring, in *Grove's Dictionary* (1880), said that Loewe's 'music has gone for ever'; but more recently a good deal of attention has been called to the ballads. See *The Art Ballad, Loewe and Schubert*, by A. Bach (Edin. 1890).

Lofft, CAPEL, described by Byron in *English Bards* as 'the Mæcenas of shoemakers and preface-writer-general to distressed versemen; a kind of gratis accoucheur to those who wish to be delivered of rhyme, but do not know how to bring forth.' This description, though not the ill-nature of it, was so far just that Lofft was the patron of Bloomfield, and stood sponsor to his *Farmer's Boy*. Lofft himself was a London barrister of the Whig persuasion, with a taste for letters, especially poetry; he wrote some legal treatises and magazine articles, and books on theological, astronomical, political, and poetical subjects. All are now forgotten. He was born in London on 14th November 1751, and died at Moncalieri, near Turin, on 26th May 1824. See REAPING.

Lofoten, or LOFODEN, a chain of islands on the north-west coast of Norway, between 67° and 69° 15' N. lat., stretching south-west and north-east for 150 miles. They include the Lofoten proper and the Vesteraalen, lying farther north. The largest islands are Hiud, And, and Lang in the Vesteraalen group, and East Vaag, West Vaag, Flakstad, and Moskeniis in the Lofoten proper. Total area, 2247 sq. m. All of them are rugged and mountainous, many of the summits being crater-shaped. In several places they present walls of bare rock rising sheer from the ocean. The highest point is 3090 feet above sea-level. The waters on the east side of these islands are visited in January to March every year by vast shoals of cod-fish, which attract a large fleet of fishermen. The fishing is attended with considerable danger, on account of the sudden and violent storms from the west, and of the strong currents which set in between the islands (see MÆLSTRÖM). Besides fishing, sheep-farming is also carried on, as, owing to the Gulf Stream, the winters are mild and grass grows abundantly.

Log is the instrument by which a ship's rate of motion through the water is measured. In its oldest and simplest form it is a quadrantal piece of teak-wood called a log-ship, loaded in the arc so as to float vertically, point upwards. Every hour or two hours it is hove overboard for twenty-eight seconds, or, if the ship is going very fast, for fourteen seconds. It is attached to a line called the log-line. The supposition is that when hove into the sea it will remain stationary in the water while

Fig. 1.—Rotator with four vanes.

the log-line is freely paid out from a reel held by hand on board. In actual practice a conical canvas bag, called a log-bag, with its open mouth facing the vessel, is often used instead of the log-ship. The log-line, which is attached to the log-ship or to the log-bag, is divided into equal sections by

pieces of marline which are tucked through its strands, each section being that part of a geographical mile which twenty-eight seconds is of an hour, so that the number of sections of the log-line which run out during twenty-eight seconds is the same as the number of geographical miles which the ship is going per hour at the time of testing the speed. To facilitate counting the number of sections of the log-line which have been paid out, one, two, three, &c. *Knots* (q.v.) are tied on the tails of the pieces of marline. In practice, each section is made 46 feet 8 inches long, which is designedly rather shorter than the theoretical length.

A ship's progress through the water is, however, much more generally obtained, especially near land, by towing continuously a small cylindrical tube to which are attached oblique vanes, usually four in number. This rotator, as it is called, revolves as it is towed with a speed which is proportional to the speed of the vessel. This proportion is ascertained by experiment by the makers, and a registering apparatus, consisting of the usual cog-wheels and pinions, records the revolutions of the rotator, and so records the progress of the ship. In the older form of this log the registering gear is attached directly to the rotator, and is towed with it through the water. The progress of the ship can in this case only be ascertained by hauling the log

Fig. 2.—Log Register (A), with governing fly-wheel (B) attached, the tow-line being hooked on at C.

on board. In the newer forms the rotator alone is in the water. The registering gear is contained in a small case which is secured to the taffrail of the ship, or to an outrigger, so that it can be conveniently read at any moment, the revolutions of the submerged rotator being transmitted to the taffrail register by the tow-line, which also rotates. A fly-wheel or rotating triangle or dumb-bells are placed on the tow-line between the rotator and the register, but close to the register, to secure greater smoothness in the working of the latter. The registering dial is usually graduated to nautical miles up to 100, and a smaller dial gives subdivisions of a quarter of a nautical mile. An automatic bell rings at every mile. But even under the most favourable circumstances a navigator is not justified in regarding any form of log as an instrument of precision.

Log-book.—The courses steered, distances run, wind, state of the weather and sea, leeway, daily employment of the crew, and other incidents, which in the first instance are noted at the moment in the bridge-book or deck-book, are daily entered in the log-book, which thus becomes the diary of the ship.

Official Log-book.—The official log-book is a book issued by the Board of Trade at the beginning and returned to that department at the end of each voyage. It contains a record of the crew and their characters, ship's draught of water, offences committed, desertions, sickness, deaths, medical treatment, collisions, &c., and is thus a sort of civil or police record of the voyage.

Logan, JOHN, poet and sermon-writer, was born at Soutra, in Midlothian, in 1748. His father

was a small farmer, but was able to send his son to college. In 1773 he was licensed as a preacher, and from his eloquence and fervour in the pulpit soon became so popular that he was chosen minister of the second charge of South Leith parish that same year. In 1786, however, owing to intemperate habits, and for kindred reasons, he was constrained to resign his charge, after which he proceeded to London, and there engaged in literary work. He died there, 23th December 1788. Besides two volumes of sermons and lectures which were published after his death he was the author of a tragedy called *Runnemedie*, but this, after a single performance at the Edinburgh Theatre, was withdrawn from the stage. In 1781 he published a volume of poems, which, though coldly received in critical circles, speedily reached a second edition. His name is best known now in connection with that of Michael Bruce (q.v.) and the controverted authorship of the 'Ode to the Cuckoo' and certain of the Paraphrases. The most effective statement in behalf of Logan's claims which has yet appeared will be found in two papers by the Rev. Robert Small, Edinburgh, which were published in the *British and Foreign Evangelical Review* for 1879. That Logan is entitled to a place among the minor poets of Scotland is sufficiently attested, though there were nothing more, by his exquisite lyric, 'The Braes of Yarrow.'

Logan, JOHN ALEXANDER, an American statesman, was born in Illinois, the son of an Irish doctor there, in 1826. He served in the Mexican war, was admitted to the bar in 1852, and was elected to congress as a Democrat in 1858. He raised an Illinois regiment at the beginning of the civil war, and served with credit to the last battle, retiring with the rank of major-general. In 1866 he was returned to congress as a Republican, and was one of the managers of the impeachment of President Johnson. He was chosen a United States senator in 1871, and was returned to the senate in 1879 and in 1885. In 1884 he was nominated by the Republicans for the vice-presidency of the United States, but was defeated along with James G. Blaine (q.v.). He died in Washington, 26th December 1886. There is a *Life* by G. F. Dawson (Chicago, 1887).

Logan, SIR WILLIAM EDMOND, geologist, was born, a Scottish baker's son, at Montreal, on 20th April 1798, was sent to Edinburgh High School (1814) and University. For ten years he worked in a commercial counting-house in London, and was then, about 1828, sent to Swansea to take charge of the finances of a copper-smelting company. Whilst living in South Wales he prepared geological maps of the coal-basins in that part of the country, and his work was so well done that it was incorporated in the 1-inch maps of the Geological Survey. In 1842-71 he was director of the Canadian Geological Survey. He discovered the Stigmæria underclays and the Eozoön (q.v.). He was knighted in 1856, and died in Wales, 22d June 1875. See the *Life* by Harrington (1883).

Logan. See ROCKING-STONE.

Loganberry, a hybrid between raspberry and blackberry, raised by the American Judge Logan.

Loganiaceæ, a natural order of sympetalous dicotyledons, consisting of trees, shrubs, and herbaceous plants, with opposite entire leaves, and usually with stipules, which adhere to the foot-stalks, or form sheaths. A few species occur in Australia and temperate North America; the rest are tropical or sub-tropical. No order is more strongly characterised by poisonous properties. It includes *Strychnos* (q.v.); and see *CURARI*, *NUX VOMICA*) and *Spigelia* (q.v.).

Logansport, capital of Cass county, Indiana, is 75 miles N. by W. of Indianapolis, at the crossing of three railways, where the Eel River joins the Wabash. There are extensive manufactures of automobiles, trucks, machinery, castings, &c., and the town has a large shipping trade in grain, pork, &c. Pop. (1880) 11,198; (1921) 38,333.

Logarithms, a series of numbers having a certain relation to the series of natural numbers, by means of which many arithmetical operations are made comparatively easy. The nature of the relation will be understood by considering two simple series such as the following, one proceeding from unity in geometrical progression, the other from 0 in arithmetical progression:

Geom. series, 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, &c.

Arith. series, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, &c.

Here the ratio of the geometrical series is 2, and any term in the arithmetical series expresses how often 2 has been multiplied into 1 to produce the corresponding term of the geometrical series; thus, in proceeding from 1 to 32, there have been 5 steps or multiplications by the ratio 2; in other words, the ratio of 32 to 1 is compounded five times of the ratio of 2 to 1. It was this conception of the relation that led to giving the name of *Logarithms* to the terms of the arithmetical series, the word *logarithm* (Gr. *logōn arithmos*) meaning 'the number of the ratios.' As to the use that may be made of such series, it will be observed that the sum of any two logarithms (as we shall now call the terms of the lower series) is the logarithm of their product—e.g. $9 (= 3 + 6)$ is the logarithm of $512 (= 8 \times 64)$. Similarly, the difference of any two logarithms is the logarithm of the quotient of the numbers; a multiple of any logarithm is the logarithm of the corresponding number raised to the power of the multiple—e.g. $8 (= 4 \times 2)$ is the logarithm of $256 (= 16^2)$, and a submultiple of a logarithm is the logarithm of the corresponding root of its number. In this way, with complete tables of numbers, and their corresponding logarithms, addition is made to take the place of multiplication, subtraction of division, multiplication of involution, and division of evolution.

In order to make the series above given of practical use, it would be necessary to complete them by interpolating a set of means between the several terms, as will be explained below. We have chosen 2 as the fundamental ratio, or base, as being most convenient for illustration; but any other number (integral or fractional) might be taken; and every different base, or *radix*, gives a different system of logarithms. The system now in use has 10 for its base; in other words, 10 is the number whose logarithm is 1.

The idea of making use of series in this way would seem to have been known to Archimedes and Euclid, without, however, resulting in any practical scheme; but by the end of the 16th century trigonometrical operations had become so complicated that the wits of several mathematicians were at work to devise means of shortening them. The real invention of logarithms is now universally ascribed to John Napier (q.v.), Laird of Merchiston, who in 1614 printed his *Mirifici Logarithmorum Canonis Descriptio*. His tables give logarithms of sines, cosines, and other functions of angles; they labour under the three defects of being sometimes + and sometimes -, of decreasing as the corresponding natural numbers increase, and of having for their *radix* (the number of which the logarithm is 1) the number which is the sum of $1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \dots$, &c. In many calculations, however, the latter is an advantage rather than a defect. These defects were, however, soon

remedied: John Speidell in 1619 amended the tables in such a manner that the logarithms became all positive, and increased along with their corresponding natural numbers. He also, in the sixth edition of his work (1624), constructed a table of Napier's logarithms for the integer numbers, 1, 2, 3, &c., up to 1000, with their differences and arithmetical complements, besides other improvements. Speidell's tables are now known as *hyperbolic logarithms*. But the greatest practical improvement was made in 1615 by Professor Henry Briggs (q.v.) of London, who calculated the logarithms of natural numbers to the radix 10. Before his death he carried the calculation to 30,000. Briggs's exertions were ably seconded; and before 1628 the logarithms of all the natural numbers up to 100,000 had been computed. Computers have since chiefly occupied themselves rather in repeatedly revising the tables already calculated than in extending them.

Construction of Tables.—The following is the simplest method of constructing a table of logarithms on Briggs's system. The log. of $10 = 1$; the log. of 100 (which is twice compounded of 10) $= 2$; the log. of 1000 $= 3$, &c.; and the logarithms of all powers of 10 can be found in the same manner. The intermediate logarithms are found by continually computing geometric means between two numbers, one greater and the other less than the number required. Thus, to find the log. of 5, take the geometric mean between 1 and 10, or $3.162\dots$, the corresponding arithmetic mean (the log. of 1 being 0, and that of 10 being 1) being 0.5; the geometric mean between $3.162\dots$ and 10, or $5.623\dots$, corresponds to the arithmetic mean between 0.5 and 1 or 0.75; the geometric mean between $3.162\dots$ and $5.623\dots$, or $4.216\dots$, has its logarithm $= \frac{1}{2}(0.75 + 0.5)$ or 0.625; this operation is continued till the result is obtained to the necessary degree of accuracy. In this example the twenty-first result gives the geometric mean $= 5.000,003$, and the corresponding arithmetic mean $= 0.698,970$, which is in ordinary calculations used as the logarithm of 5. Since division of numbers corresponds to subtraction of logarithms, and since $2 = \frac{1}{2}10$, the log. of 2 $= \log. 10 - \log. 5 = 1 - 0.698970 = 0.301030$. The logarithms of all prime numbers are found in the same way as that of 5; those of composite numbers are obtained by the addition of the logarithms of their factors; thus the log. of 6 $= \log. 2 + \log. 3 = 0.301030 + 0.477121 = 0.778151$. This method, though simple in principle, involves an enormous amount of calculation; and the following method, which depends on the modern algebraic analysis, is much to be preferred. According to this method, logarithms are considered as indices or powers of the radix; thus, $10^0 = 1$, $10^{0.301030} = 2$, $10^{0.477121} = 3$, $10^2 = 100$, &c.; and the laws of logarithms then become the same as those of indices. Let r represent the radix, y the natural number, x its logarithm; then $y = r^x$, or, putting $1 + a$ for r , $y = (1 + a)^x$; and it is shown by the binomial and exponential theorems (see the ordinary works on Algebra) that $y = 1 + px + \frac{p^2x^2}{1.2} + \frac{p^3x^3}{1.2.3} + \&c.$, where $p = r - 1 - \frac{1}{2}(r - 1)^2 + \frac{1}{6}(r - 1)^3 - \&c.$, the former equation expressing a number as the sum of different multiples of its logarithm and the radix. If $1/p$ be substituted for x , then $y = 1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \&c. = 2.71828182\dots$ which, as before mentioned, is Napier's radix, and is generally called e . Hence $r = e^p$, or p is the logarithm of r to the base or radix e . Then, referring to the above-mentioned value of p , we have $\log. r$ (i.e. log. of r to the base e) $= r - 1 - \frac{1}{2}(r - 1)^2 + \frac{1}{6}(r - 1)^3 - \&c.$, or, as before, putting $1 + a$ for r , $\log. (1 + a) = a - a^2/2 + a^3/3 - \&c.$; a series from which $\log. (1 + a)$

cannot be found, unless a be a proper fraction. But if we put $-a$ for a , $\log. (1 - a) = -a - a^2/2 - a^3/3 - \&c.$; and, subtracting this expression from the former, $\log. (1 + a) - \log. (1 - a)$ or $\log. \frac{1 + a}{1 - a} = 2(a + a^3/3 + a^5/5 + \&c.)$; and, for the sake of convenience, putting $(u + 1)/u$ for $(1 + a)/(1 - a)$, in which case $a = 1/(2u + 1)$, we finally obtain $\log. (u + 1)/u = 2\{1/(2u + 1) + 1/3(2u + 1)^3 + 1/5(2u + 1)^5 + \&c.\}$, or $\log. (u + 1) = \log. u + 2\{1/(2u + 1) + 1/3(2u + 1)^3 + 1/5(2u + 1)^5 + \&c.\}$. If 1 be put for u in this formula, the Napierian logarithm of 2 is at once obtained to any degree of accuracy required; if 2 be put for u , the Napierian logarithm of 3 can be calculated, &c. Now, as logarithms of any system have always the same ratio to one another as the corresponding logarithms of any other system, no matter what its base, if a number can be found, which, when multiplied into the logarithm of a certain number to one base, gives the logarithm of the same number to another base, this multiplier will, when multiplied into *any* logarithm to the first base, produce the corresponding logarithm to the other base. The multiplier is called the modulus, and, for the conversion of Napierian into common or Briggs's logarithms, is equal to $0.4342944\dots$; so that, to find the common logarithm of any number, first find the Napierian logarithm, and multiply it by $0.4342944\dots$

As in Briggs's system the logarithm of 10 is 1, and that of 100 is 2, it follows that all numbers between 10 and 100 have for their logarithms unity + a proper fraction; in other words, the integer portion of the logarithms of all numbers of two figures is unity; similarly, the integer portion of the logarithms of numbers between 100 and 1000 is 2, and, in general, the integer portion of the logarithm of any number expresses a number less by unity than the number of figures in that number. This integer is called the *characteristic*, the decimal portion being the *mantissa*.

As the logarithm of 1 $= 0$, the logarithms of quantities less than unity would naturally be negative; thus, the logarithm of $\frac{1}{2}$ would be -0.30103 . But, for convenience in working, the mantissa is kept always positive, and the negative sign only affects the characteristic; the logarithm of $\frac{1}{2}$ or 0.5 would thus be $\bar{1}.69897$, the characteristic in this and similar cases expressing, when the fraction is reduced to a decimal, the number of places the first figure is removed from the decimal point; thus, the logarithm of 0.0005 is $\bar{4}.69897$.

Directions for the use of logarithms in calculation will be found prefixed to any set of mathematical tables. The tables most distinguished for accuracy are the French ones of Callet, Lalande, Bagays; Hutton's, those which Babbage produced with the aid of his calculating machine, Shortrede's, and Sang's; and the German ones of Gauss, Schr n, Bruhns, Von Vega, Bremiker. A serviceable handbook is *Chambers's Mathematical Tables*, edited by Pryde. Chappell's *Five-figure Mathematical Tables* (1915) includes 'ologs' or logs of logs, and 'antilogogs,' specially useful for engineers and those who have to deal with fractional indices.

Loggia, an Italian word signifying an open arcade, enclosing a passage or open apartment. It is a favourite class of building in warm countries. The Loggia de' Lanzi at Florence is one of the finest examples. The Loggie of the Vatican, arched passages round the interior of the cortile of the palace, are ornamented with beautiful paintings and arabesques by Raphael and his pupils.

Logia (Gr. 'sayings'—*logia I sou*, 'sayings of Jesus'), a name assigned to 'Q,' the hypothetical source of the synoptic gospels (see GOSPELS), and to certain fragments recovered from 1897 onwards among the *Oxyrhynchus papyri* (ed. Grenfell and Hunt).

Logic may be most briefly defined, in accordance with the etymology of the word, as the science of reasoning or 'the art of thinking.' It is a scientific account of the laws which regulate the passage in thought from one statement to another, and which must be observed if the thinking process is to be valid. The theory of every operation is later than its performance, and men were accustomed to think correctly long before they began to reflect upon their thinking faculties and the processes by which their results were reached. The attention which Socrates devoted to the meaning and justification of general names is signalised by Aristotle as the beginning of logical theory. It was Aristotle himself, however, who first elaborated the idea of the science, and defined its sphere by separating it from the metaphysical questions with which logical discussions are always associated in his predecessors. The six treatises afterwards collected under the name of the *Organon* contain the gist of what is still taught as formal logic; but the term logic was probably first used by the Stoics in the wide sense with which we are familiar. Aristotle himself possessed no single name for the science of which he was the founder.

The independence which Aristotle conferred upon the new science has enabled it to survive to the present day almost without change, and with very few additions of importance. But, while the edifice of Aristotle remains architectonically complete upon its own basis, it has become customary to add to this science of logic proper a second part, called Mixed, Material, or Inductive Logic, embracing an account of the methods of science and the conditions of scientific proof. The modern version of the Aristotelian Logic is then called, by way of distinction, Pure or Formal Logic. The meaning of this designation is that logic, as such, takes no account of the *matter* of our reasonings—i.e. of the things reasoned about: it deals solely with the *form* or skeleton of the reasoning process itself. Thus, if we say, 'Englishmen are white-skinned,' logic has no occasion to consider the truth of this statement as a matter of fact or science; it deals only with the form of the proposition or judgment as a general logical mould into which any pair of notions may be fitted. It treats the proposition, in short, only so far as it is expressible in the form, ' X is Y .' To this abstraction from all questions regarding the adequacy of our notions, and the material truth of our assertions, formal logic owes its completeness as a science. It looks upon thought, not as the expression of the truth of things, but as a series of mechanical operations, and its aim is to lay down the general or symbolic forms which these operations must assume in order to insure that the end shall be consistent with the beginning. It is apparent, then, that in any reasoning process formal logic only guarantees that the conclusion is true *if* the premises from which we started were true. It has accordingly been called the logic of consistency, as opposed to induction, which seeks to be a logic of truth. Pure logic takes its material, as it were, ready-made from the hands of observation, and merely watches over its correct manipulation. Reasoning in the strict logical sense is, in fact, merely analytic; the conclusion only brings to explicit consciousness what was implied or involved in the premises. Formal logic is thus, in its most general aspect, an application, by means of many subordinate rules, of the laws of identity and non-contradiction. Practically, however, it is of great service in clarifying the thought of the individual, though, in a sense, merely teaching him what he knows already.

Formal logic is usually treated under the three heads of Notions, Judgments, and Reasonings; or,

if regard be had to the verbal expression of thought, the Notion, Judgment, and Reasoning appear respectively as Term, Proposition, and Syllogism. Though pure logic has strictly nothing to say about the formation of general names or the adequacy of our notions, it is customary for logical writers to expound under the first head the nature of generalisation and definition—the processes by which our notions are formed and tested. The Judgment, however, may be taken as the unit in logic, for it is only in their relation as subject and predicate of a judgment that notions become susceptible of logical treatment. The combination of two judgments (involving three notions), in such a form that a third judgment is deduced from them, constitutes a Syllogism—e.g. 'All fishes are cold-blooded. The whale is not cold-blooded. Therefore the whale is not a fish.' The variations of this fundamental type of reasoning constitute the scholastic doctrine of the moods and figures of the Syllogism. As an appendix to this exposition of the normal forms of inference there follows a discussion of the different classes of fallacies to which any deviation from them may give rise. It is in this aspect that logic vindicates its claim to be 'a cathartic of the human mind.' For, like ethics, logic is a normative science; that is to say, it does not, like the physical sciences, or like psychology, simply generalise facts. Its laws are not statements of what always happens, but rules of what ought to be done. This distinction contains the answer to the question, once much debated, whether logic is a science or an art. The question is essentially a dispute about words.

The perception that pure logic treats thought simply as a process of comparison and classification has induced a number of recent logicians (chiefly English) to attempt an extension of Aristotle's scheme by a thorough-going application of the notion of logical quantity. Thus, Sir W. Hamilton maintained that the relation between subject and predicate in a proposition is that of logical equation. The proposition, 'All men are mortal,' means, when fully expressed, 'All men are some mortals.' If the predicate be thus explicitly quantified, it is evident that we may substitute for the copula the algebraical symbol of equation. This doctrine, which is known as the Quantification of the Predicate, was expounded by Archbishop Thomson, Spencer Baynes, and others. It leads to a multiplication of the old propositional and syllogistic forms, but in its Hamiltonian form it has been shown by Venn to rest on a confusion of views. A similar line of thought has been worked out by Jevons, who defines inference as 'the substitution of similars.' He would make the proposition run—'All men are mortal men' ($All\ a\ is\ ab$). De Morgan's formula for the proposition resembles this; but his innovations, as well as Boole's development of logic into a branch of mathematics, are rather specimens of the ingenuity of their authors than transcripts of actual thought-processes. They show no signs of taking their place as a permanent addition to logical doctrine. The same may be said of Jevons' Method of Indirect Inference, by which he claims to have reached the same results as Boole without the use of mathematics. The Method consists in 'developing' all the possible combinations of the terms mentioned in the premises, and then proceeding, by elimination of those which violate the conditions there laid down, to reach those combinations which are consistent with our data. Jevons applied his principle in the invention of a logical machine which effects this process of counting out with unerring accuracy; but where the terms are multiplied to any extent the operation is, of course, cumbrous in the extreme.

Bacon is commonly regarded as the founder of Inductive Logic. In his *Novum Organum* he put himself at the head of the revolt against the scholastic logic which marked the men of the Renaissance, and, though his own apprehension of scientific method was gravely defective, his eloquence and his position made him the most influential prophet of the scientific movement which Galileo and others had initiated. In point of fact he came to supplement the old, not to supersede it; but he allowed his dislike of the abuses of the Aristotelian logic to carry him away into indiscriminate denunciation. Bacon's animus is perhaps excusable as the zeal of the reformer; and it may be granted that in the Aristotelian logic, as in Greek philosophy generally, there is a tendency to let the study of words usurp the place of the investigation of facts. The middle ages had exaggerated this tendency by habitually assuming the distinctions existing among things to be correctly and adequately rendered by traditional names. Beyond this, Bacon's diatribes against 'syllogism' betray a misapprehension of the real function of formal logic, which, as has been seen, makes no pretensions to be an instrument of scientific discovery. Inductive theory has received many developments since the time of Bacon, notably at the hands of J. S. Mill. The progress of science has made it easier to formulate its methods and to determine the conditions of valid scientific proof. It is sufficient here to point out that, whereas in formal or deductive logic, reasoning proceeds from a whole to the particulars included under that whole, we seem in inductive logic to rise, in reliance on the uniformity of nature, from observation of particulars to the enunciation of a universal proposition. The nature of the certainty which belongs to such scientific generalisations is one of the subjects which the philosophy of induction has to deal with. The profound interest and value of these investigations, when compared with the rigid framework of symbols with which pure logic presents us, may well lead men to overestimate the former at the expense of the latter. But the two disciplines are essentially distinct; and the exactness and scientific completeness of pure or formal logic will always constitute it a valuable educational instrument.

Elementary manuals of logic are those by Jevons and by Fowler, to which may be added Whately's *Logic* and Keynes's *Formal Logic* (more advanced). F. C. S. Schiller's *Formal Logic* (1912) impeaches the syllogistic method as a pseudo-science. Among larger treatises in English may be mentioned Mill's *Logic*, Hamilton's *Lectures on Logic*, Ueberweg's *Logic* (translated), Bradley's *Principles of Logic*, Bosanquet's *Logic* (2d ed. 1912), Venn's *Empirical Logic*, Jevons's *Principles of Science*, Lotze's *Logic* (translated). The German works of Sigwart and Wundt should also be named. Thomson's *Outlines of the Laws of Thought*, Baynes's *New Analytic of Logical Forms*, Jevons's *Pure Logic and Other Papers*, Venn's *Symbolic Logic*, and the works of De Morgan and Boole deal with proposed developments of logic on algebraic lines. There is an elaborate history of logic by Prantl in German, and a short history in English by Adamson (1912); see also the works of Trundelburg in German and of Hamilton and Mansel in English.

Logogram (Gr. *logos*, 'a word,' and *gramma*, 'a letter') is simply a complicated or multiplied form of the Anagram (q.v.), where the puzzlemonger, instead of contenting himself with the formation of a single new word or sentence out of the old by the transposition of the letters, racks his brain to discover all the words that may be extracted from the whole or from any portion of the letters, and throws the whole into a series of verses in which synonymic expressions for these words must be used. The puzzle lies in ascertaining what the concealed words are, and, through them, what

is the primary word out of which they have all been extracted. A specimen is given in Henry B. Wheatley's book on *Anagrams* (1862), in which, out of the word 'curtains,' no less than ninety-three smaller ones are framed.

Logos (Gr. 'word,' and also 'reason,' corresponding in Latin to both *oratio* and *ratio*) is a term that has played an important part in philosophical and theological speculation, long ere the 'Word of God' came, through the fourth gospel, to be identified with the second person of the Christian Trinity. The notion of a certain self-manifestation or revelation of the Godhead, standing in some way between the infinite and the finite, has from time immemorial been the property of the whole East. With the Stoics the Logos is the active principle living in and determining the world (see *Stoics*). The apocryphal writers of the Old Testament personify the 'Wisdom' spoken of in Prov. viii. 22, and give it the functions of a Logos. In the Targums *Memra*, 'Word,' is constantly used instead of God or Jehovah. In the Jewish-Alexandrine philosophy (see *PHILO*) the Logos is the Divine Reason, the Power of all Powers, the Spirit of God. The doctrine of the Logos reaches its fullest development in St John's Gospel, where it is the Word of God incarnate. See *JOHN (GOSPEL OF)*, *CHRIST*, *TRINITY*.

Logroño (Lat. *Julia Briga*), the capital of a Spanish province, on the Ebro, 65 miles E. by N. of Burgos. It has manufactures of woollens, machinery, and leather goods. Pop. 27,000.

Logwood, the dark red heart-wood of *Hæmatoxylon campechianum*, a tree of the natural order Leguminosæ. This tree, which is a native of Mexico and Central America, and has been naturalised in some of the West India Islands, grows to a height of 20 to 50 feet. The tree is generally felled when about ten years old, and the sawwood being worthless is hewed off with the bark. The heart-wood is slightly heavier than water, hard, and close-grained. It has a slight smell resembling that of violets, is astringent, and has a sweetish taste. The source of the colouring properties of logwood is a crystalline substance called hæmatoxylin, $C_{18}H_{14}O_6$, itself colourless when pure, but in an alkaline solution in the presence of oxygen (air) it becomes converted into hæmatein, $C_{16}H_{12}O_6$, which is of a purple-red colour. For dyers' use ground or rasped logwood is moistened and made up into heaps or layers in a moderately warm place, where, turned over at intervals, it undergoes fermentation, ammonia being one of the products of the process. The result is that hæmatoxylin is first formed and afterwards hæmatein, crystals of which, of a reddish-brown colour and greenish lustre, coat the particles of wood. The hæmatein or colouring matter is easily dissolved by placing the rasped wood, so treated, in hot water. Extracts of logwood also are made for dyeing purposes. Logwood, although itself dark red, does not produce red colours either alone or with any of the ordinary mordants in use for it. Shades of purple, blue, lavender, drab, and gray are obtained from it with suitable mordants, but none of these are permanent. Its most important application is for dyeing black colours (see *DYEING*). It is also used in the manufacture of writing ink (q.v.) and as a stain for microscopic preparations. As a medicine logwood is sometimes given in cases of chronic diarrhœa. The introduction of coal-tar colours did not materially diminish the use of logwood as a dyeing substance. The name is sometimes given to the rhamnaceous *Ceanothus Chloroxylon*. *Acacia Berteriana* is called bastard logwood.

Lohengrin, the hero of an old High German poem, written in the end of the 13th century. He was the son of Parzival, and a knight of the Grail.

At King Arthur's command he was taken by a swan through the air to Mainz, where he fought for Elsa, daughter of the Duke of Brabant, overthrew her persecutor, and married the lady. Then he accompanied the emperor to fight against the Hungarians, and subsequently warred against the Saracens. On his return home to Cologne, Elsa, contrary to his prohibition, persisted in asking him about his origin. After being asked a third time he told her, but was at the same time carried away by the swan back to the Grail. Rückert's edition (1857) of the poem is the best. The poem is a continuation of Wolfram (q.v.) von Eschenbach's *Parzival*. Wagner made it the subject of his great Opera, *Lohengrin* (1848).

Loir. See DORMOUSE; also LOIRE.

Loire (anc. *Liger*), the longest river in France, has its source in the Cévennes, in the department of Ardèche, at an elevation of 4511 feet, flows in a north and north-western direction through the centre of France as far as Orleans, where it bends round to the south-west and continues on to Tours; thence it follows, in general, a western course to its embouchure in the Bay of Biscay. It is tidal to Nantes (q.v.), 35 miles from its mouth. Entire length, 620 miles. It becomes navigable a little above Roanne, 550 miles from the sea. At one time the depth of the water at its mouth was 19½ feet at ebb-tide; now it is only about 6½ feet. This is due to the vast quantity of sedimentary matter the river brings down with it. To the same cause are due the numerous islands that obstruct its lower course and the sandbanks that lie athwart its mouth. The Loire is notorious for the destructive inundations it causes, although the lower part of its course is protected by large dykes or *levées*, 20 feet high. The principal tributaries are the Nièvre and the Maine (which is formed by the Sarthe, its affluent the Loir, and the Mayenne) on the right; and the Allier, Cher, Indre, and Vienne on the left. The Loire is canalised along considerable stretches of its course, and is connected with the Seine, the Saône, and the harbour of Brest by canals. Its valley is extremely fertile. Area of drainage basin, 44,450 sq. m.

Loire, a department in the south-east of France, formerly part of the province of Lyonnais and the county of Forez, comprises the arrondissements of Montbrison, Roanne, and St Etienne, with St Etienne for its capital. Area, 1838 sq. m.; pop. (1891) 616,227; (1921) 637,130. The basin of the Loire in this department is a rather unfruitful valley, but the mountains yield iron and lead, and the coalfields are the richest in France. Important also are the iron, silk, and cotton industries. Woollens, linen, glass, paper, leather, &c., are likewise manufactured. Wine, fruit, fodder, and potatoes are the principal agricultural products. Timber and turpentine are yielded by the pine woods. Mineral springs abound, as at St Galmier, St Alban, &c.

Loire, HAUTE, a department of central France, formed out of the former province of Languedoc, the duchy of Auvergne, and the district of Forez, and bounded on the south by Lozère and Ardèche. The Loire crosses it going northwards, the Allier going north-westwards. Area, 1915 sq. m.; pop. (1891) 316,735; (1921) 268,910. The surface forms a plateau, deeply trenched by river-courses; it ranges in elevation from 2000 to 3000 feet, and rises in peaks and domes up to 5755 feet above sea-level (Mount Mézenc). In spite of the ungenerous nature of the soil, agriculture is the chief calling of the inhabitants. But many find employment at home in making lace from wool, cotton, flax, silk, gold, and silver. Some thousands of the inhabitants leave their houses for a time every year to work in other parts of France. Coal,

iron, lead, and building-stone are worked. The arrondissements are Le Puy, Yssingeaux, and Brioude; the capital, Le Puy.

Loire-Inférieure, a maritime department in the west of France, formed out of the southern portion of the old province of Brittany, and comprising the arrondissements of Nantes, Ancenis, Paimbœuf, Châteaubriant, and St Nazaire, with Nantes for its capital. Area, 2654 sq. m.; pop. (1891) 645,263; (1921) 649,723. It has a coastline of 78 miles. The Loire intersects it and forms a wide estuary. The interior is on the whole flat, and the soil fertile, producing wine, cider, cereals, potatoes, beetroot, hemp, and fodder. There are fine oak and pine forests. Salt marshes are numerous along the shore.

Loiret, a department of central France, formed out of the old provinces of Orléanais and Berri, and comprising the arrondissements of Orléans, Montargis, Gien, and Pithiviers, is named from the Loiret, a tributary of the Loire. Area, 2614 sq. m.; pop. (1891) 377,718; (1921) 337,224. The country is mainly an elevated fertile plain, except in the sandy Sologne to the S. of Orléans, the chief town.

Loir-et-Cher, a department of France, formed out of the old province of Orléanais, comprises the arrondissements of Blois, Vendôme, and Romorantin. The Loire bisects it, the Loir crosses it. In the south-east is the infertile Sologne. Area, 2452 sq. m.; pop. (1891) 280,958; (1921) 251,528. The principal town is Blois.

Loiseleuria. See AZALEA.

Loisy, ALFRED, born in 1857 at Ambrières in Marne, was educated at the seminary of Châlons-sur-Marne, and was professor of Oriental Languages and Biblical Exegesis in the Catholic Institute of Paris, and from 1900 till his resignation in 1904 at the Sorbonne, and of History of Religions at the Collège de France from 1909. He has published works in biblical criticism, on the history of religion, mysteries pagan and Christian, &c., besides defences against his critics and condemnations. The condemnation in 1903 by Leo XIII. was followed by the more comprehensive crusade against Loisy and 'Modernism' as such under Pius X. (a decree of the Holy Office and a papal encyclical having been issued against them in 1907), and by the greater excommunication of Loisy in 1908. It is difficult to harmonise his contentions in criticism and in theology (e.g. on the Virgin Birth and the Resurrection) with Catholic doctrine. See his *Choix Passées* (1913).

Loja, or LOXA, a city of Ecuador near the southern frontier, capital of the province of Loja. It has a college and a cathedral, and there are manufactures of wool; pop. 10,000.

Loja, a decayed town of Spain, on the Genil, 32 miles by rail W. of Granada. It suffered severely from earthquake in 1885. Pop. 20,000.

Lokeren, a town of Belgium, 11 miles by rail N.E. of Ghent, with manufactures of linen, cotton, and woollen goods, lace, chemicals, and tobacco, and large bleach-works; pop. 23,000.

Loki, a demigod in the Scandinavian mythology. He did not belong to the race of the Æsir, but to an older dynasty. His appearance is beautiful, and he is possessed of great knowledge and cunning. He often brings the new gods into difficulties, from which, however, he again extricates them. Hence he is to be regarded as the principle of strife and disturbance in the Scandinavian mythology; the 'Spirit of Evil,' as it were, mingling freely with, yet essentially opposed to, the other inhabitants of the Norse heaven, very much like the Satan of the Book of Job. By his artful malice he caused the death of Balder (q.v.). See SCANDINAVIAN MYTHOLOGY.

Lokmân, the reputed author of a certain number of Arabic fables, who gives a title to a *Sura* of the Koran. He is variously said to have been a Nubian slave contemporary with David, and the son of Job's sister or daughter; but others again follow M. Derenbourg (*Fables de Lokmân le Sage*, 1850) in identifying him with Balaam, both names signifying 'devourer.' It is now generally admitted that the fables attributed to his name are late and of Greek origin. See *The Thousand Nights and a Night*, Lady Burton's edition, vi. p. 260.

Lokoja, a town of Northern Nigeria at the junction of the Niger and Benue River. Founded in 1860, it is a military post, and an important commercial centre. Pop. 10,000.

Loliée, FRÉDÉRIC (1856-1915), French historian, was born at Paris. His earlier works, as *Histoire des Littératures Comparées*, dealt mainly with literary history, and he wrote also a history of the 'Comédie Française' (1907). Latterly he devoted himself almost entirely to the study of the Second Empire, and, stressing the romantic aspects of history, produced among other works *Les Femmes du Second Empire* (1906-7), and books on Napoleon III., Talleyrand, Eugénie de Montijo, Morny, the Countess of Castiglione, &c. Several of his works have been translated into English.

Lolium. See DARNEL, and RYE-GRASS.

Lollards, a name given to the followers of Wyclif. *Lollardus* was a Latinised form of the old Dutch *lollaerd*, literally 'a singer of psalms,' a term which had been applied to a sect in Brabant akin to the Fraticelli and Beghards; but in English usage it was confounded with the native word *loller*, 'a lazy fellow.' Wyclif's Bible had supplied England with the phraseology and the seminal ideas of a popular theology, and his peripatetic 'poor priests' preached evangelical religion fearlessly throughout the land. Oxford University was a stronghold of the new doctrines, which were most widely spread in the district between the Thames and the Trent. The Lollards' petition to parliament in 1395 contained the famous twelve *Conclusions* against temporal possessions of the church; the ordination of unfit priests, the celibacy of the clergy, and all vows of chastity; exorcism, and blessing of inanimate objects; transubstantiation, the holding of secular offices by priests, prayers for the dead, pilgrimages, image-worship, compulsory auricular confession, war, capital punishment, and such trades as fostered luxury, like those of the goldsmith and the armourer. Many also objected to oaths, denied the necessity of baptism for salvation, and held marriage a mere civil contract. The corruptness and ignorance of the preaching friars made the progress of the new doctrines the easier, and ere long they had obtained enormous influence. There is no doubt that Lollardism prepared the soil for the Peasant revolt of 1381. Its popularity was imperilled by the extravagance of its devotees, and its adherents fell off rapidly under Henry IV., being vigorously persecuted by Archbishop Arundel. The statute, *De Hæretico Comburendo*, was passed, and William Sawtre, a Norfolk priest, was burned in 1401, John Budby in 1410. Yet the Lollards remained numerous enough to be formidable at the accession of Henry V. Its most prominent supporter at that period was the martyr Sir John Oldcastle (q.v.), of Cobham, on whom many mocking ballads were written, and whose name was travestied for nearly two centuries after as a fat, dissolute old knight, his mouth full of Scripture phrases: he was the prototype of Falstaff. Early in 1414 occurred the obscure attempted rising near London, which sent forty Lollards to their doom and proved the death-blow of the cause, but it was not till four

years later that Oldcastle himself was captured and put to death. During the early years of Henry VI. the Lollards were sharply persecuted in London and the eastern counties, and some individuals were burned at London and Norwich. But ere long the government ceased to be strong enough for anything beyond self-preservation, though it need not be supposed, because the persecution ceased, that the opinions had died out. After the accession of Henry VII. the persecution was renewed, and henceforward the Lollards appear as a secret brotherhood, called the 'known-men' or 'just-fast' men, marrying only among themselves, and instructed by itinerant readers in conventicles. Amersham, Colchester, and Newbury are noted as strongholds. From the time of Henry VIII. Lollardy becomes merged in the rising Protestantism, but it is worth noting that most of the Marian martyrs came from Lollard districts, and that much of their spirit and teaching reappears strongly in Puritanism. Lollardism made its way into Scotland in the 15th century, and became especially strong in the south-western counties, in later times the stronghold of the Covenant. In 1494 thirty persons belonging to the district of Kyle in Ayrshire were tried before James IV. in person, and dismissed with a caution to adhere to the doctrines of the church. *Piers Plouman* reflects closely the religious unrest of its time; but the same is by no means true of Chaucer, whose Parson, when he objects to profane swearing, is denounced as a Lollard.

An interesting account of Lollard principles may be gathered from Reginald Pecock's *Trepressor of Overmuch Blaming of the Clergy* (ed. by Churchill Babington, Rolls series, 1860), written about 1450. Here the writer assails the three erroneous 'trowings' maintained by Lollardists, or Biblemen, as he styles them. These were (1) that Christian men owe allegiance to nothing but the law of God as stated in Holy Scripture; (2) that any Christian is capable of grasping its plain meaning, if meek and willing to understand; (3) that no one who has so grasped the meaning of Scripture need listen to any clerk's interpretation from Scripture or reason, especially the latter. In the Lollardist assertion that there was no need of human learning to open up Scripture, they but anticipated a delusion not unknown among 19th-century evangelicals. Their claim that none but those enlightened by grace could understand Scripture opened a wider door for self-delusion and error.

See Shirley's *Fasciculus Zizaniarum* (1858); Gairdner's *Lollardy and the Reformation* (1908-13); (J. M. Trevelyan, *England in the Age of Wycliffe* (1899), with relative Lollard documents; an article by Lindsay in the *Scottish Historical Review*, April 1904; WYCLIFFE.

Lolos, a fair-complexioned aboriginal people on the frontiers of China and Tibet.

Lomaria, a genus of ferns of the order Polypodiaceæ. About forty species are known, mostly natives of the south temperate zone. *L. Spicant* or *Blechnum boreale* is the hard-fern, or northern fern, common on hills in Britain.

Lombard, PETER, one of the most famous of the Schoolmen, was born about the beginning of the 12th century, at a village near Novara, in Lombardy. He was educated at Bologna, and came to France with recommendations to Bernard of Clairvaux. His uncommon talents soon procured him a chair of theology in Paris. In 1159 he was appointed Bishop of Paris, but he died in the following year. He was very generally styled *Magister Sententiarum*, or the 'Master of Sentences,' from his work *Sententiarum Libri IV.*, an arranged collection of sentences from Augustine and other Fathers, on points of Christian doctrine, with objections and replies, also collected from other authors of repute. The first book treats of God; the second of the

creature; the third of the incarnation, redemption, and the virtues; the fourth of the seven sacraments and eschatology. A subtle heresy, *Nihilianism*, was detected by some in Peter's teaching, and the theological doctors of Paris in 1300 denounced it in sixteen propositions culled from his writings. Peter Lombard's work was the subject of many commentaries down to the time of the Reformation. His writings were edited by Aleaume (Louvain, 1546).

Lombard Architecture is the style which was invented and used by the Gothic invaders and colonists of the north of Italy, from about the age of Charlemagne till it was superseded by the importation of the Pointed style from France in the beginning of the 13th century. The architecture of the Lombards was derived from the debased Roman style which they found in the country—the general plan of the churches, and the general form of the pillars, arches, &c., being almost identical with those of the Roman Basilicas (q.v.). But in detail, Roman traditions are almost entirely abandoned, and instead of the debased acanthus leaves and fragments of entablatures the Lombards adopted a freer imitation of natural forms in their foliage, and covered their buildings with representations of the fights and hunting-expeditions in which they delighted. The north of Italy belonged at the time of Charlemagne to the great German empire, and thus we find nearly the same style of architecture in Lombardy and in Germany as far north as the Baltic (see RHENISH ARCHITECTURE). Few early examples of Lombard architecture exist. In the unruly times when the style originated, the buildings were no doubt frequently destroyed by fire; this seems to have led to the desire to erect fireproof structures, and thus the earlier as well as almost all the later examples are vaulted with stone. The earliest example is a small chapel at Cividale nel Friuli, built probably during the 8th century, and it is covered with an intersecting vault. Examples of this date are rare in Italy; but in Switzerland, where the style is almost identical, several interesting specimens of early architecture remain, such as the churches of Romain-Motier, Granson, Payerne, &c. We there find the peculiar arch-ornament so characteristic of Lombardy and the Rhine (fig. 1), and we can trace the timid steps by which the Goths advanced in the art of vaulting.

The vaulting is the leading feature of Lombard architecture, and from its spring the other distinguish-

Fig. 1.

Fig. 2.
Plan of the old Cathedral
of Novara.
Scale 1 inch = 100 feet.

ing forms of the style. Thus, the plain, round pillars, with a simple base and capital, which served to support the side-walls and roof of a basilica, are changed for a compound pier, made up of several shafts, each resting on its own base, and each provided with a capital to carry the particular part of the vaulting assigned to it. This change is deserving of particular notice as the first germ of that principle which was afterwards developed in the Gothic (q.v.) styles. Buttresses are also introduced for the first time, although with small projection.

The cathedral of Novara (destroyed 1863-65) was one of the most striking examples of Lombard architecture. The plan (fig. 2) is derived from the old basilican type, having at the west end an open atrium, with arcade around, from which the church was entered by a central door. The interior was divided into central and side aisles, with vaulted roof, and terminated with an apsidal choir. At the end of the atrium opposite the church still

Fig. 3.

stands the 10th century baptistery. The same general arrangement of plan was common in the German churches, where the atrium was sometimes at a later period roofed over and included in the nave, and the baptistery changed into the western apse of the double-apsed churches.

San Michele at Pavia and San Ambrogio at Milan are also good early examples of this style. In both the grouping of the piers into vaulting shafts, wall-arch shafts, &c. is complete, and that beautiful feature of

the style, the arcade round the apse (fig. 3), is fully developed. The atrium and west front of San Ambrogio form one of the finest groups of Lombard architecture. See a work by Rivoira (1901 et seq.).

Lombards, a people of Germanic descent, who were called by the Latin writers Longobardi or, more correctly, Langobardi, a name which is differently derived by different authorities. 'Long heard,' *Lange Börde* = 'a long fertile plain beside a river,' *börde* being used in that signification in the Lower Elbe district, and *longa parva* or *barte* = 'a long battle-axe,' have all been suggested as original forms of the name. The people so designated first appear in history as settled about the Lower Elbe, in Hanover and western Prussia, at the dawn of the Christian era. In the two centuries that followed they came more than once into conflict with the Romans; and then till the end of the 5th century nothing more is known about them. When next mentioned (*circa* 455) the Longobardi were settled in Moravia, and were tributary to the Herulians. The oppression of these masters stung them into revolt: they subdued the Herulians, and after them the Gepidae, and established themselves as the ruling race in Pannonia. Under Alboin, their king, they invaded Italy in 568, and at the end of three years had possessed themselves of the greater part of Northern and Central Italy, Pavia being the last city to submit. They subsequently extended their power as far south as Spoleto and Benevento, both of which duchies were held by Lombard dukes. His second successor, Authari, assumed the Roman

title of Flavius, and under the influence of his queen, Theodelinda, a Frankish princess, the nation began to change its Arian faith for the Catholic. The Longobardi, though never a numerous race, were distinguished above most of their Germanic brethren for their fierce love of war and their rude manners. But in Italy they soon fell under the influence of the existing civilisation: they adopted the Latin language, began to build churches and found monasteries, and gradually became assimilated with the Italians. King Rothari in 643, and his successors, embodied the legal customs of the Lombards in a code, written, however, in Latin—*Leges Longobardorum*. Liutprand, king from 712 to 744, made an unsuccessful attempt to subdue all Italy. His strongest opponent was the pope, who summoned the Franks to his assistance. Charlemagne in 774 overthrew the Lombard dynasty, and had himself crowned king of the Franks and the Lombards; and thenceforward the Lombards were entirely merged in the Italians. The only traces extant of the Longobard language are a few names. Their earliest historian whose works survive, Paul the Deacon, wrote in Latin. See LOMBARDY.

The 'Lombards' in England.—In the 13th century Italian merchants from Lucca (even as early as the 9th century), Florence, and Piacenza, and at a later date from Venice and Genoa also, visited England for purposes of trade. They came originally to collect the taxes and dues payable to the pope, which they transmitted in large part in the shape of wool. They also traded on their own account, and in course of time, settling in the country, were granted special privileges, such as the right to farm the customs and to conduct the transactions on exchange. The merchants of Florence, for instance, had branches at Boston, Lynn, and Northampton, as well as at London, and regularly bought the wool of some 200 monasteries in England and Scotland. On occasion they lent large sums on loan, and gradually took up the business of banking, as it was understood in those days: Edward III. owed the Florentine house of Bardi the sum of 900,000 gold ducats, and another house of the same city, that of Peruzzi, 600,000 ducats. The Jews even took advantage of the favourable position of these Italians: many of them braved Edward I.'s edict of expulsion (1290), and stayed behind under the character of Lombard merchants, the name by which these Italians were generally known to the English. In London the Lombards dwelt principally in the street now called Lombard Street, still the chief centre of the banking interest. They eventually incurred as much odium as the Jews, not only because they exacted interest for their loans, but also because the commercial privileges accorded to them were believed to affect injuriously the native English merchants.

Lombardy, that part of Upper Italy which lies between the Alps and the Po, having the territory of Venice on the east, and Piedmont on the west. Its geographical characteristics are discussed under ITALY. Its history begins with the conquest by the Romans in 222, who called it Gallia Cisalpina. After the break up of the Roman empire it was successively in the hands of Odoacer, the Ostrogoths, the Byzantine emperors, and the Lombards (q.v.). Charlemagne incorporated it in his empire, but from 843 it was ruled by a separate line of kings, though before the kingdom ended (961) it had broken up into a number of independent duchies and civic republics. The Lombard cities, like those of Flanders at a later epoch, grew wealthy by industry and trade, and nurtured a vigorous love of freedom and independence. They resisted sturdily and successfully the attempts of the emperors Frederick I. and II. (q.v.) to curtail their

liberties, forming themselves into strong leagues, which were powerful enough to rout the emperors in pitched battles. But, freed from threatening danger, they began to quarrel amongst themselves, and the country was for many years more or less distracted by internal dissensions. After the death (1447) of the last duke of Milan, whose ancestor, Count Azzo, had acquired the sovereignty over nearly all Lombardy in 1337, the country was made an object of contention between the king of France and the emperor. The last named having got the better in the contest, Lombardy passed through Charles V. to Spain, which held possession of it till 1713, when the duchies of Milan and Mantua came into the hands of Austria. Napoleon made it part of the Cisalpine republic, the Transpadane republic, and the kingdom of Italy successively. But in 1815 it was restored to Austria, and associated with the newly-acquired Venetian territory. In 1859 Lombardy was given up to Italy, and divided into the provinces of Bergamo, Brescia, Como, Cremona, Mantua, Milan, Pavia, and Sondrio. See Hodgkins, *Italy and her Invaders* (vols. v. and vi.); W. K. Williams, *The Communes of Lombardy* (1891).

Lombok, one of the Sunda Islands, between Java and Timor. It is mountainous—some volcanic peaks reach 11,620 feet—but fertile, producing maize, cotton, tobacco, indigo, sugar, and coffee. Area, 2000 sq. m. The people, mainly aborigines, are Moslems, with a few Brahminical immigrants from Bali.

Lombroso, CESARE (1836–1909), founder of the science of criminology, was born of Jewish stock at Verona, and after acting as an army surgeon, professor of Mental Diseases at Pavia, and director of an asylum at Pesaro, became professor of Forensic Medicine and Psychiatry at Turin. His great work is *L'Uomo delinquente* (1875); others have been translated—*The Man of Genius* (1891), *The Female Offender* (1895), *Crime* (1911). See *Life* by H. Kurella (trans. 1911).

Lomond, LOCH, the 'queen of Scottish lakes,' in Dumbarton and Stirling shires, lies 23 feet above sea-level, and is 23 miles long, $\frac{3}{4}$ mile to 5 miles wide, 6 to 623 feet deep, and 27 $\frac{1}{2}$ sq. m. in area. It is studded with thirty wooded islands; receives the Endrick and six other principal streams; sends off the Leven 7 miles southward to the Clyde; contains trout, pike, and perch; is sometimes frozen over as far northward as Luss; and is enlaid by hills and, towards its head, Highland mountains, the highest of which, Ben Lomond (q.v.), attains 3192 feet. In 1263 Norsemen launched their galleys on Loch Lomond, having drawn them across the narrow isthmus of Tarbet; on Inchcailloch stood of old a nunnery; and a cave is associated with both Bruce and Rob Roy.

Lomza, a city of Poland, 80 miles NE. of Warsaw, was formerly one of the most important in the country, but is now of secondary rank only; pop. 22,000.

London (the City) lies on the north or left bank of the Thames, about 60 miles from the sea, in 51° 30' 48" N. lat. and 5° 48" W. long. It may be reckoned the capital of the British empire, but the Houses of Parliament and the offices of government are in the adjoining city of Westminster (q.v.), which forms part of the county of London. The Thames at London Bridge is about 900 feet wide, being much wider both above and below. This fact probably accounts for the original foundation of the city, which, according to many authorities, took place in 43 A.D., when Aulus Plautius was the Roman governor of Britain. The name is Celtic (*Llyn-dun*), and appears to mean a fort on a lake or lagoon, the Thames being here a tidal estuary

which covered all the low-lying land on which Rotherhithe, Newington, Southwark, and Lambeth are now situated. It seems likely that the easiest ford across the river was at Westminster, where it was widest (more than 1200 feet), and that by the building of London Bridge at the narrowest place the old Watling Street from Dover toward Chester was diverted. The old line led from Edgware through Tothill Fields to Westminster, where the bridge now marks the place of crossing. The newer road turned eastward at what we call the Marble Arch, and, passing diagonally from Newgate through the city, crossed by the bridge, and was carried on towards Dover on embankments among the shallows, the sites of which are still marked by such local names as Stone Street and Newington Causeway. The course of Watling Street in the city was again diverted, probably in the 13th century, to make way for the extension of St Paul's Cathedral, and now no longer leads in the direction of Newgate.

During the greater part of the Roman occupation of Britain London consisted of two forts, one at either end of the bridge; and Ptolemy, the geographer, puts London in Cantium, where, and not on the left bank, it is very possible the largest of these forts may have stood. The unwall'd suburbs seem to have been populous and wealthy from an early period; and, when abandoned by Suetonius, they were burned by Boadicea in 61 A.D. They were still undefended in 286 and the subsequent years, when the rebel emperors, Carausius and Allectus, held both sides of the Channel, making Clausentum (Bitterne, near Southampton) their headquarters in Britain. Asclepiodotus, the general of Constantius, defeated Allectus in the neighbourhood of London, and under one of the Constantines the place began to be looked upon with favour and to be extensively fortified. The wall which for so many centuries was destined to defend the boundaries of the city was built between 350 and 369, and enclosed a space which has been computed at 380 acres. In this Roman wall there was a gate due north of the bridge in what is now Camomile Street, and another at the spot at which the Watling Street, crossing the Fleet or Holborn, took its course towards Tyburn. The new city was defended on the east by the Lea and its extensive marshes, and on the west by the Fleet, whose waters were tidal as far up as what we call King's Cross. Traversing the middle of the city was the narrow stream of the Wallbrook, with the harbour of Dowgate at its confluence with the Thames, and from the remains which have been discovered it is probable that the chief Roman fort, before the building of the outer wall, was on the east or left bank of the Wallbrook, and extended far enough eastward to cover the approaches to the bridge. Some bastions of peculiar strength where the wall reached the Thames on the site of the Tower gave rise to the medieval tradition that the Tower of London was built by Julius Caesar. From 369 till 412 London was reckoned the capital of Britain, and enjoyed the title of *Augusta*, or *Londinium Augusta*. After the Roman departure London disappears from history until 457, when the Britons, fleeing before the victorious Hengest, took refuge behind the Roman wall. How far it availed them for defence we know not. London does not again emerge from complete obscurity for about a century and a half, but in 604 we find it named as the 'Metropolis'—i.e. the ecclesiastical capital—of the East Saxons. Mellitus was appointed first bishop, but the Saxons soon expelled him, and Christianity did not make much way with them until Ethelbert, king of Kent, the over-lord of the East Saxon king, took the matter in hand. A little later we hear

for the first time of a tribe of Middle Saxons, but London was evidently a place of but small importance, apart from its bridge, as the Saxons preferred to fight without walls, and as no doubt the Roman defences had become greatly dilapidated. At length during the Danish wars they became completely ruinous, and London was abandoned and lay desolate during the long period of thirty years, a whole generation.

To King Alfred we must look as the real founder of modern London. He saw the possibilities of the place as a bulwark against the Danes, and, repairing the wall and gates, made the place again habitable. There is a tradition that he specially rebuilt and strengthened a work on the site of the Tower. During the long period of disaster which followed his reign the kingdom of some of his successors consisted of little else but London, which the Danes were never able to take, even though they made a canal round Southwark, and half rowed, half dragged their ships to Westminster. Undoubtedly the settlement made in London, whether by Alfred or by one of his immediate successors, formed the germ of the subsequent municipal government. Athelstan is often pointed to as the king who chiefly restored London, and as we have nothing else, tradition must be received with some respect. The Roman lines of road and the gate were abandoned. New gates at Aldersgate, Newgate, and Bishopsgate were constructed, and posterns seem to have been opened at Ludgate (O.E. *Lydgæat*, 'a postern'), Cripplegate (O.E. *Crepulgeat*, 'a covered way'), and possibly at what was afterwards Moorgate. There were two great market-places, one near the western gate, in which the folk-moot was held, and where stood the church of St Paul; and the other in East Cheap, of which the only modern remains are Leadenhall Market and the fish-market at Billingsgate. The West Cheap was bordered by the highway still called Cheapside, which led from Cornhill, the northern extremity of the East Cheap, by a bridge over the Wallbrook to the Westgate, now Newgate. There were many empty spaces within the circuit of the walls, and, if we may judge by the comparative size of the local divisions, the first settlers chose the shores of the Thames and the lines of the two great roads for their habitations. It is very probable that ecclesiastically the city was divided into three great parishes; one, of which St Paul's was the church, to the westward; a second, of which St Mary Aldermary was the church, in the centre; and a third, possibly dedicated to All Saints, or All Hallows, in the east.

The municipal government before the Norman conquest was not very complicated in form, and may be compared to that of a county elsewhere in England. The lords of manors in the city were represented by aldermen of wards, and the ward division is the oldest with which we are acquainted. Every magnate had his ward; and the government was carried on by the bishop who was alderman of the ward about St Paul's, and the portreeve who had the Portsoken outside the city to the east. It is not easy to unravel the knot presented to us by the names we meet with in old records of city officials in and before the 11th century. A guild, composed chiefly or wholly of aldermen, was perhaps, under the name of *Knighten Guild*, the governing body; but this is by no means certain, nor is the tradition that King Edgar was their first founder. Some such body existed; its members transmitted their rights to their sons, and they may or may not have become the governing guild of the city. The king's reeve, or port-reeve—*port* probably denotes a market—answered to the sheriff or shire-reeve of a county; and the aldermen of wards had many and extensive

powers on their respective estates, answering to those exercised in a county by the lords of manors. The reeve united in his own person many offices afterwards separated. He was chamberlain or treasurer; he was 'vicecomes,' and accounted to the king's exchequer for the farm of the city; he was coroner; he was escheator; and he often bore office as a royal minister, like Ansgar, 'the staller,' who fought at Hastings. William the Conqueror recognised the great position and ancient rights of London in a special charter by which the privileges enjoyed by the citizens under Edward the Confessor were confirmed to them; but the most important grant from the crown was that of Henry I., who, in 1101, in recognition no doubt of the assistance London had given him in his successful attempt to seize the crown, allowed them, among other things, (1) the right to elect their own chief-magistrate, and (2) the farm of Middlesex at an annual rent, with power to appoint a sheriff of that county. These extraordinary grants, with that of leave to hunt in the neighbourhood of London, are so unlike what we should expect from a Norman king, that some have been tempted to suppose that they were all renewals of privileges enjoyed under the Saxon kings, and there is much plausibility in this view, but their recognition led eventually to the establishment of the mayor. The sheriffs of London and sheriff of Middlesex were no longer 'high' sheriffs; they were the nominees and deputies of the whole body of the citizens. As at Winchester, and some other places, the mayor does not seem to have received any royal acknowledgment during his first years of office; but the date 1189 is generally assigned as that of the first year of Henry, the son of Ailwin, an alderman of old family. There seems to be a question whether this Ailwin is to be identified with a citizen of that name who in 1125, with all his brethren of the Knights Guild, became canons of the priory of Holy Trinity at the newly-opened Algate (now corruptly called Aldgate), and conferred, with the king's leave, the title of an alderman (of the ward of Portsoken) on their prior, Norman. Be this as it may, the necessities of the kingdom, and the difficulties consequent on the payment of the ransom of Richard I., must be taken as causes for the recognition of the new chief-magistrate; and down to our own day, when (Local Government Act, 1888) this ancient custom was abolished, the citizens elected annually, on Midsummer Day, two sheriffs for the city, one of whom was sheriff also of Middlesex on alternate days. They are now elected for the city only. They enter on their office on Michaelmas Day, and the Liverymen then proceed to choose the Lord Mayor. Legally any citizen is eligible for the mayoralty, but for many generations the senior alderman who has not passed the chair is chosen.

This may be the most convenient place in which to name the chief municipal officers. The mayor, who has been called 'Lord Mayor' from time immemorial, has the title of 'Right Honourable,' and ranks within the city boundaries next to the sovereign. In legal commissions of Oyer and Terminer his name precedes even that of the Lord Chancellor, and since the reign of Edward III. he has sat as a judge. At first the Lord Mayor was a representative of the city in the House of Commons, and he still takes a seat at the opening of parliament on the ministerial bench. He attends at the Law Courts to be sworn in on the 9th November, and holds office for a year. He is in the city in the position of the lord-lieutenant of a county, and a commission of lieutenantancy is issued to him and the magistrates he may nominate. The Chamberlain is the city treasurer. The office was separated from that of mayor when the mayor-

alty was temporarily superseded in the reign of Edward I. He is the Keeper of the Freeman's Roll. He is annually re-elected by the Livery during good conduct. The Recorder is the legal adviser of the Court of Aldermen. Geoffrey Hartpole (1304) was the first Recorder. The Common Serjeant stands in the same position toward the Common Council, who have also their Common Clerk, now called town-clerk. The first Common Serjeant was Thomas Juvenal (1290). The Recorder and Common Serjeant have also judicial functions. The Court of Aldermen consists of twenty-six members, of whom the senior sits for the merely nominal ward of Bridge Without, or the borough of Southwark. The others are elected by the city wards.

The Common Council was first elected in 1200, when twenty-five citizens were chosen by the wards to take council with the aldermen. There are now 206 common councillors.

The Common Hall consists only of members of the Livery Companies, and has obtained or usurped many of the rights of the whole body of citizens. An act passed in 1725 regulates admission to the franchise of the city through the livery, but seems to have been founded on a misapprehension, as the Act of 1475 which it was supposed to confirm does not seem to have ever existed. Admission to the citizenship could be obtained by application to the Husting Court, as well as by joining a company, but the latter course, being the easiest, became usual, and so was supposed necessary.

The husting, a meeting of the whole body of the citizens, was called in other cities *Portmannimote*, and was an assembly under cover, as distinguished from the folkmoot, held at first in the open space between St Paul's and West Cheap, and afterwards in Smithfield.

The growth of this municipality was slow. At first the rights of the aldermen possessed of hereditary jurisdiction interfered with its progress; but by degrees all the wards were able to elect their aldermen. The interference of the crown also greatly retarded the prosperity of the city. Nevertheless, commerce increased, and the settlement of such foreign merchants as those of the so-called Steelyard, and of the Lombard and other Italian bankers, raised London by the time of Edward III. to a wealthy and prosperous condition. In reading a detailed history it is observed that weak sovereigns caused a depression of trade, while under a strong government confidence was restored and capital was safe. Henry III. was constantly at feud with the citizens, whom he greatly oppressed, leaving to his successor the task of dealing with the disorder he had created. Edward I., to use the language of contemporary chroniclers, 'took the city into his own hands,' and his ministers, Sandwich and Breton, governing like mayors, with the help of the aldermen and the common council, brought everything into order. In 1290 they expelled the Jews. After twelve years the mayoralty was restored. Under Edward II., again, there was disorder and discontent in the city, the great body of the citizens adhering to the party of the queen. Under Edward III. London prospered, new privileges were granted to the mayor, and the French wars were extremely popular. In the end, however, a reaction ensued, and under the weak government of Richard II. things did not improve. The usurpation, as many deemed it, of Henry IV. could hardly have succeeded had it not been for the support of the city; and Henry V., whose French victories inflated trade, was most popular with the citizens. Henry VI. was unable to grapple with the inevitable period of depression which naturally followed; and his queen, Margaret

of Anjou, failing to gain the confidence of London, whose importance to the Lancastrian cause she did not know, contrived to divert the weight of the city influence into the opposite scale. The reign of Edward IV., with his strong commercial instinct, by reviving and creating outlets for foreign trade, restored the prosperity of the city. Under the Tudors there were great fluctuations. Although the settled government of Henry VII. tended on the whole to the satisfaction of the city, his continual exactions and the heavy fines he imposed for trivial offences, alienated its loyalty. The accession of Henry VIII. was an occasion of rejoicing. The tenets of the Reformation were warmly welcomed in London, where the priests, monks, and friars had become a heavy burden; and at first the high-handed proceedings of the king in the suppression of the religious houses and the confiscation of their endowments was a popular measure. The further suppression of guilds under his successor led to a considerable change in the feeling of the citizens, many of whom, but for the religious persecution under Queen Mary, would have been very willing to return to the old faith.

The guilds had for centuries been an integral part of the social life of the citizens. The municipal guild, or what we know of it, has already been mentioned. At an early period after the Conquest we hear of 'trade guilds,' that is, of combinations of men of one calling for religious and other purposes. The many attempts made of late to distinguish between trade guilds and religious guilds have ended in failure, for all guilds were religious, and most religious guilds were trade guilds as well. As time went on the governing body occasionally found it convenient to consult a trade guild on the regulation of their particular business. This was especially the case under such mayors as Walter Harvey (1271-72), who, indeed, made an endeavour to enrol every citizen under the banner of a guild of his trade, and to formulate rules for each. Though he failed, his ideas took root; and in a few years many of the guilds obtained royal charters forming them into companies, able to hold lands, and in some cases, as that of the goldsmiths and that of the fishmongers, to regulate the conduct of their respective trades. The old guilds were thus generally merged in the companies whose governing bodies acted as trustees of the funds of the guilds. There was probably a good deal of confusion between the guild property and the companies property, but for the most part that of the guild could be distinguished, because it was applied to religious purposes. The act which confiscated these funds made, of course, a profound impression on the city. Some companies were wholly ruined, having perhaps no funds but those which might be applied to a 'guildable use;' and others, more prosperous, found it expedient, and even necessary, to sell their company estates in order to buy the guild estate which they had administered. The companies which recovered from this heavy blow prospered for the most part eventually, and those now extant deal with large charitable funds and hold large estates, to the great benefit of their tenants and their pensioners.

Under Queen Elizabeth the work of the Reformation was continued and completed. The history of the church in London was greatly complicated with that of the municipality. We have seen that the bishop was an alderman; but at a very early period, a period in fact so early that no record of its date survives, the ecclesiastical and lay administrations drifted apart, and the church had less and less concern in the affairs not strictly religious. There are historical reasons for believ-

ing that St Paul's was at first a parish church, but before the end of the 12th century, perhaps as a consequence of the great fire of 1136, the parochial arrangements of the whole city were readjusted, new parishes were formed and their boundaries marked, and a great number of new churches were built. The dean and the lordly canons of St Paul's no longer cared to have the common people worshipping in their church, and built St Peter-le-Querne, at the corner of Cheap, with St Gregory and St Faith closely adjoining St Paul's, the one at the east end, the other at the west. The canons of St Martin's built St Vedast's, and the friars of Newgate Street St Ewen's; and private individuals or wealthy aldermen increased the number of churches as long as they could obtain parishes to attach to them. When land failed for this purpose, they founded chantries, some in St Paul's, some in other monastic and parochial churches. No doubt the act *Quia Emptores*, which in 1290 practically forbade the subdivision of manors, had its influence in restricting the multiplication of churches, but the number of city parishes (114) was out of all proportion to the population, great comparatively as that must have been; and, since churches were built rather as chapels where mass might be celebrated than for any other purpose, the later Puritan and Protestant idea, that they should be places where a large number of people could listen to sermons, had no influence on their dimensions. Although there was no abbey in the city, if we except St Mary's in East Smithfield, a Cistercian house founded by Edward III., and sometimes called Eastminster, which never flourished, the number of priories, colleges, and hospitals was immense. The Whitefriars had a large house on the south side of Fleet Street in the western suburb. The Blackfriars occupied the south-western corner of the city, and had leave to divert the course of the wall between Ludgate and the Thames. The Greyfriars were within Newgate, on the site once occupied by Christ's Hospital, and now by the main building of the General Post Office. Close to them was St Martin-le-Grand, a very ancient foundation for canons, which, in later years, having fallen into decay, was attached to Westminster Abbey. The site (at present vacant) was occupied for some years by the main building of the General Post Office. Close by, but without the wall, was the Austin Canons' house in Smithfield. Elsing Spital was within Cripplegate. The Austin Friars had great buildings near Moorgate, and St Helen's Priory, for nuns, occupied the eastern side of Bishopsgate Street. The canons of the Holy Trinity held Aldgate, and south of their priory was that of the Crutched Friars. The suburbs teemed equally with religious houses, and there were several minor foundations within the city. The mass priests attending altars in St Paul's alone were reckoned at over one hundred. In the 15th century this state of things became an intolerable burden, and contemporary literature is full of complaints. Unfortunately, in abolishing monasticism the beautiful churches of the monks and friars were not respected, and although one or two were named as worthy of preservation as preaching-houses, all perished except a portion of Austin Friars and the nuns' aisle of St Helen's. The Austin Friars' church, after 'restoration,' still remains as a Dutch church. Even St Paul's was mutilated: the campanile and the cloisters known as Pardon Churchyard were ruined; and after the destruction of the lofty spire, 520 feet high, by fire in 1561, the whole church fell into a very dilapidated condition.

The influence of the church told also upon London in another way. The addition of suburbs

to the city as 'wards without' was prevented by the ring of ecclesiastical estates which gradually closed round it. On the east was Stepney, a manor belonging to the bishop. The mayor and corporation obtained a lease of the manor of Finsbury from a prebendary of St Paul's in 1315, and held it till 1367. To the westward there were several prebendal manors, and outside Temple Bar was the great parish and manor of St Margaret, Westminster, which belonged to the abbey. Southwark was annexed to the city in 1327, and was made a 'ward without' in 1550. It has become a metropolitan borough, with a cathedral (St Mary Overies, now St Saviour's). But in addition to Portpool (now Gray's Inn), St Pancras, Rugmere (now St Giles's), and Bloomsbury, the Moor (or Mora), at Cripplegate, Islington, Hoxton, and Eald Street (now Old Street), St Luke's, all of which were manors belonging to canons of St Paul's, the Knights of St John had Clerkenwell; the canons of St Bartholomew, Canonbury; the abbey of Barking had Tyburn, or the eastern half of the parish of St Marylebone; the Knights of St John had the western half, or Lylleston; the abbey of Westminster owned Paddington and Westbourne; and the abbey of Abingdon, Kensington. Finally, the abbey of Westminster held Chelsea for a time. It will be seen that every extension of the city jurisdiction was effected with great difficulty, and the effects of the division of the monastic estates by the Tudor dynasty did not greatly benefit the city, which in fact only obtained St Bartholomew's Hospital and the Grey Friar's from Henry VIII., and Bridewell from Edward VI.

The accession of Queen Elizabeth gave a considerable impetus to London trade. Her reformation of the coinage was only one item of a settled policy; and the Merchant Adventurers, chartered by her father, now stepped into the place previously occupied by the Germans of the Steelyard, which was abolished at the instance of the famous Gresham. The last charter of Queen Elizabeth was granted to the East India Company. The silk manufacture, driven out of Flanders by the cruelties of the Spaniards, was naturalised in England; and even the short-sighted policy of the first Stuart could not repress the rapidly-growing enterprise of the Londoners, whom the discovery of America and of a sea-passage to India stimulated to greater and greater exertions.

While the wealth and population of London thus increased during the 16th and part of the 17th century, the city itself became less and less fit for habitation. Its unhealthiness was partly caused by the deficiency of the water-supply, partly by overcrowding. The plague scarcely ever left its narrow streets and filthy alleys. The sanitary arrangements of the time of Edward I. were scarcely suited to the needs of the time of James and Charles. But, known only to a few Londoners, Sir Hugh Myddelton, by bringing clean water to the city in abundant quantity, bestowed upon it the greatest possible boon. This was in 1620; but some forty or fifty years elapsed before the New River was made generally available. In the meantime the citizens were overwhelmed with one great misfortune after another. James I. had reverted as far as he could to the mistaken policy of such kings as Henry III. and Richard II.; but it was reserved for Charles I., after a long series of high-handed proceedings, to seize the money of the city goldsmiths deposited in the Tower. His downfall was certain when the city turned against him; but, except for a very brief period, the Commonwealth found little favour in London, and Cromwell imposed one humiliation after another upon the citizens. Charles II. was

warmly welcomed, and it was mainly owing to the co-operation of the wealthy merchants with Monk that his return was possible. But Charles followed in the footsteps of his father. Extortion and oppression were the instruments of his policy, and in 1672 he closed the Exchequer, and ruined nearly all the London bankers at a blow. He never afterwards was able to win the confidence of the citizens, on whom two other disasters of even greater vehemence had already come—the Great Plague of 1665 and the Great Fire of 1666.

There had been many previous visitations of the plague, and to that of 1625, long known as the Great Plague, 35,000 deaths were attributed. But the epidemic of 1665 threw all others into the shade. It commenced at St Giles's, in the suburbs, and the official statements enumerated the deaths during the year at 97,306. As the population was reckoned at about 500,000, it will be seen that nearly a fifth perished.

There had also been many great fires, but that of 1666 exceeded them all. It commenced on the 2d September, at 1 o'clock A.M., in Pudding Lane, and raged for five days. It was estimated that 396 acres of houses were destroyed, fifteen city wards were consumed utterly, and eight others damaged, comprising 400 streets, 13,200 private houses, 88 churches and St Paul's Cathedral, and 4 city gates. The loss in mere money was estimated at about 4 millions. It took London many years to recover from this terrible misfortune. Sir Christopher Wren built a new St Paul's, and also gave us St Stephen's, Wallbrook (until 1888, when it was in great part ruined by the parochial authorities), the chief monument of his powers after the cathedral, the spire of St Maryle-Bow in Cheapside, and many other beautiful buildings, including the Monument, set up near where the fire began. This is a Tuscan Doric fluted column 202 feet high. St Paul's has a dome 365 feet high and 145 feet in external diameter; the length of the building east and west is 500 feet. Street, commenting on the superiority of St Paul's to St Peter's as an architectural composition, says: 'The great magnitude of the latter may strike the vulgar eye with admiration in the contrast; but the rudest taste must appreciate the surpassing merit of the former in the form and arrangement of the cupola and the noble peristyle' (see WREN). It contains many memorials, the best of which are Wellington's, since the year 1895 under one of the arches of the nave, by Stevens; Lord Melbourne's, by Marochetti; and a recumbent figure of General Gordon, by Boehm. In the crypt are buried Lord Nelson (1805), Reynolds (1792), Turner (1851), Wellington (1852), Landseer (1873), and Wren himself (1723). The Exchange (q.v.) of Sir Thomas Gresham was burned, rebuilt, and then burned again, and finally rebuilt in 1844 by Sir William Tite. The Guildhall, partly of the 13th century, partly of the 15th, which had been the scene of so many historical events, was damaged in 1666, but not destroyed, and was handsomely restored first by Jarman, an eminent contemporary of Wren, and more recently by Sir Horace Jones. Among the churches spared by the fire are St Bartholomew's, in part, a fine Norman structure; St Giles's, Cripplegate, built 1545, in which John Milton (born in Bread Street, 1608) was buried, 1674; St Helen's, Bishopsgate, full of fine monuments; St Katharine Cree, said to have been designed by Inigo Jones, 1631; and St Andrew Undershaft, in which is Stow's monument.

During the rest of the reign of Charles II. and the whole of that of his successor the city and the court were more or less at variance; and in 1683 Charles took London, to use the old phrase, into his own hands. The Lord Mayor was deposed, the

charter was seized, and both aldermen, and also a so-called Lord Mayor, in reality a warden, were appointed by the king. At first James II. carried on his brother's policy towards the city. At the news of the landing of the Prince of Orange the charter was sent back, but the concession came too late, and the judicial murder of Alderman Cornish was too fresh in the minds of the citizens. In December 1688 they formally petitioned William to assume the crown, and in a few hours found ample funds for his use. Subsequent events were largely influenced by the city, and it has often been observed that the opposition of London, in old times fatal to a king or his family, has of late considerably affected the fortunes of a ministry. King George III. was galled by the supremacy of the citizens as Henry III. had been before him; but he made no way against them. The last events that need be noticed here are the establishment of the Bank of England in 1694; the removal of the old wall and its gates in 1760; the clearing of the houses from London Bridge about the same time, and its complete rebuilding in 1831, when it was only one of a large number of bridges. The Tower Bridge is an engineering work of great importance, which adds considerably to the picturesque aspect of the east of London. St Paul's Bridge is a new proposal. See BRIDGE.

The population of the city has dwindled year by year, and especially since the multiplication of railways, buses, and trams. Very few people now live in their place of business, and the difference between the number of those who actually reside within the ancient boundaries and of those who only come in to business is immense. In 1881 there were 6493 inhabited houses and a population of 50,526; but in the day the population rose to 261,000. In 1921 the night population had decreased to 13,706, but the day population had increased to over 1,000,000. Meanwhile the suburbs have spread in all directions, and the houses of Londoners are found in Berkshire, Buckinghamshire, Hertfordshire, and Sussex, as well as in Kent, Surrey, Essex, and Middlesex.

The city has its own police force, with two courts—one at the Mansion House, the official residence of the Lord Mayor, and one at the Guildhall. The Central Criminal Court—which practically constitutes the Assizes for 'Greater London'—has a magnificent building, erected in 1907, in the Old Bailey, on the site of Newgate prison. Near Trinity Square are the handsome new offices of the Port of London Authority, adjoining the ancient Trinity House. Several railway stations have been made within the precincts of the city, as Blackfriars, the Mansion House, the Monument, and Mincing Lane on the Metropolitan Railway, others on the tube railways, also the termini—Liverpool Street, Broad Street, and Fenchurch Street, with Cannon Street, which stands on the site usually claimed for the Roman *prætorium*. The diocese of London has varied very frequently in extent, having at one time comprised Middlesex, Essex, and Hertfordshire, besides the city. It now consists of the city with Middlesex, and that part of the new county of London which was formerly reckoned in Middlesex. The bishop resides in Westminster, and at an ancient manor house of the see at Fulham. There is a dean of St Paul's who resides close to his church.

London, i.e. the city, formerly returned as many as six members to parliament, of whom two were supposed to be on duty at a time. From about 1357 the number was usually four. Under the Reform Act of 1885 it was reduced to two; and the Representation of the People Act, 1918, left it at that number.

Like other ancient towns the city of London had

its own customs, some of which still have the force of law. Thus, by the custom of London, every shop is deemed an 'open market' for the goods usually sold there. There were also special rules as to the prosecution of certain classes of offenders, &c. There is a customary right of foreign Attachment (q.v.).

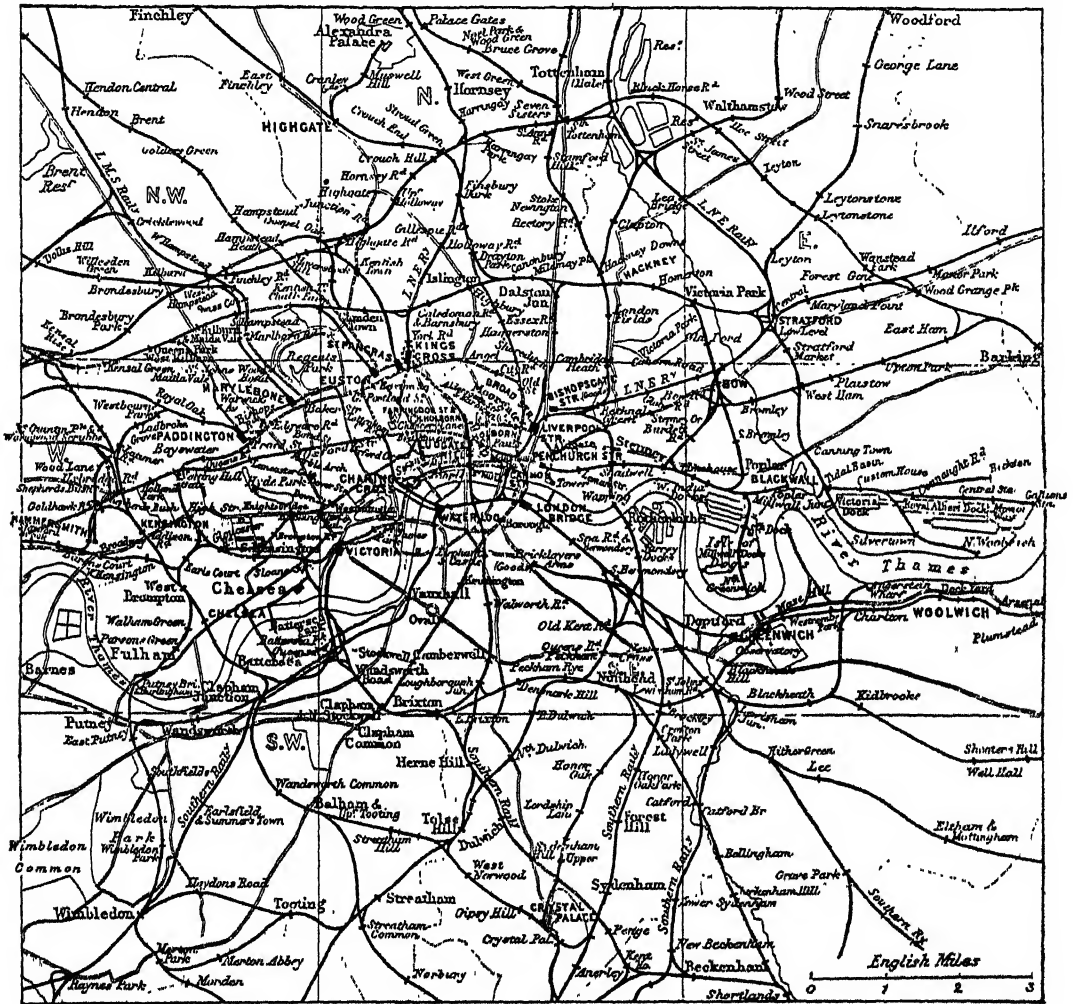

THE COUNTY OF LONDON. Under the Local Government Act of 1888 a new county was defined, to consist of the suburban parishes of Middlesex, Surrey, and Kent. These parishes, or a great part of them, had previously been described in certain acts as 'the Metropolitan Area,' a term quite inappropriate. By the Act of 1888 a county council was provided for this district, and the jurisdictions formerly existing of the city of London and the authorities of the three counties, were abolished. Before describing the new county we may point out that under this act the county of Middlesex (q.v.) was removed from the sheriffship of the citizens, and divided, one part forming a new county of Middlesex, and the other, united with parts of Surrey and Kent, forming the new county of London. The work of the County Council has been multifarious and far-reaching, and has evoked a corresponding amount of criticism. By the London Government Act of 1899 the administrative county of London, with the exception of the City, which had heretofore been under the authority of more than a hundred and twenty local authorities (vestries, district boards, burial boards, &c.), was reorganised into twenty-eight municipal boroughs, each under a municipal council. These boroughs are: Westminster (a city since 1900), Battersea, Bermondsey, Bethnal Green, Camberwell, Chelsea, Deptford, Finsbury, Fulham, Greenwich, Hackney, Hammersmith, Hampstead, Holborn, Islington, Kensington, Lambeth, Lewisham, Paddington, Poplar, St Marylebone, St Pancras, Shoreditch, Southwark, Stepney, Stoke Newington, Wandsworth, Woolwich. The councils have all the powers and duties of the old vestries and district boards, and some of those of the London County Council.

The ancient suburbs surround the city, and the efforts of the mediæval rulers were directed—first, to restricting as much as possible their growth; and, secondly, to bringing them, when they were settled, under the control of the city. In this policy the Londoners were unsuccessful. The suburbs grew in spite of city and parliament; and by 1222 a continuous street united Westminster with London; another stretched beyond the Tower to Stepney; and a third, flowing out of Bishopsgate, reached northward to Islington. In the same 13th century the city made its final attempt to keep the suburbs under control. A great 'ward without' was formed westward, extending to the Temple and Holborn Bars; and, on the north, part of Moorfields was made a 'ward without' in the jurisdiction of the alderman of Bishopsgate. But, except for the formal addition of Southwark in Surrey, made in 1327, confirmed and defined in 1550, no further extension of the city liberties took place. The estates of the church stopped the way. London was surrounded by manors, of which ecclesiastical dignitaries and monastic bodies were the lords. Foremost among these were the canons of St Paul's and the Bishop of London. Stepney, an immense parish to the eastward, belonged to the bishop, all, that is, except such parts of the precinct of the Tower as were taken out of it. On the west the Abbot of Westminster had the parish of St Margaret, which at first came up to the Fleet, at what we know as Ludgate Circus, and was with difficulty pressed back beyond Temple Bar. The abbot continued to hold the churches in the new ward, and the dean and chapter still present to St

Bride's, Fleet Street. On the north, the canons of St Paul's held Cantler's, now Kentish Town, Eald Street, Hoxton, Islington, and St Pancras, while Mora and Wenlocksbarne were parts of the parish of St Giles, Cripplegate. Other canons, monks, and friars, and the knights of St John and of the Temple had holdings in Smithfield and Canonbury, at Clerkenwell and in St John's Wood, and in the Temple. All these church estates were in hands which bitterly resented any interference on the part of the city; and when the monastic orders were abolished, their estates were for the most part granted to individuals at least as tenacious of their independence. The canons of

St Paul's had already for the most part ceased, owing to the prevalence of a corrupt system of leasing, to own except in name the manors of which they had been the lords. In the more distant parishes similar influences were at work, and except in Westminster, where the abbot and his successor, the dean, held the reins of local government, the parishes of the so-called Metropolitan Area were governed by elected vestries and other such institutions, and the lands were divided and parcelled out in freeholds, some large and a few small, among owners who had little general control or influence.

The precinct of the Tower, eastward of the city

wall, was formed partly by aggressions on the citizens, partly by acquisitions from the lord of Stepney, and partly by reclamations from the Thames. Two bastions of the old wall, generally called Roman, and certainly dating back to the reign of Alfred (see *City* above), were removed, and the White and Wakefield towers were built on them. They were fenced round by a palisade at first, but by the end of the 12th century the precincts comprised 26 acres, about 12 being covered with buildings. Gundulf, a monk of Bec, designed the White Tower, begun in 1078. The works went on steadily, the chapel of St John in the White Tower being supplemented by the parish or precinct church of St Peter 'ad Vincula' on the Green in the reign of Henry II. The keep is

approximately in the centre, and is surrounded by walls and towers forming the inner and outer wards. The towers of the inner ward were those chiefly used for prisoners' lodgings, but a complete royal palace was in the south-eastern corner. Of this palace, from which Queen Anne Boleyn went to her death on the adjoining green, scarcely a vestige remains. The lieutenant's lodgings, where, or in the chief-warder's house next door, Lady Jane (Grey) Dudley lived, is in good preservation, but is now, for some unknown reason, called the King's House. The Beauchamp and Devereux towers seem to have held the most illustrious prisoners; they, with the Bell Tower, in which Fisher, Bishop of Rochester (1534), and Mary, Countess of Lennox (1565), were confined,

form the western side of the inner ward, being united by a curtain wall, on which the prisoners walked. Unfortunately, the inscriptions from many different chambers have been brought together in the principal room of the Beauchamp Tower, by which their historical significance has been in some cases wholly lost. Here we see, among others, memorials of the incarceration of the six sons of John Dudley, Duke of Northumberland (beheaded 1553). Of them, John, the eldest, was released and died; Ambrose, the second, became Earl of Warwick, and lived till 1599; Guildford, the third, was beheaded on the same day as his wife, 12th February 1554; Robert, the fourth, is best known as Queen Elizabeth's Earl of Leicester, and died in 1588; and Henry, the youngest, was killed in the French wars in 1558. Other illustrious prisoners were Edward, Earl of Warwick, called the last of the Plantagenets, beheaded 1499, and his sister Margaret, Countess of Salisbury, beheaded 1541; Edward Seymour, Duke

by which the visitor enters the fortress, is on the site of a menagerie which dates back to the time of Henry I., whence the saying 'to see the lions,' meaning to visit the Tower. The principal feature of the outer ward is St Thomas's Tower, or the Traitor's Gate, facing the Bloody or Garden Tower, the entrance of the inner ward. The view of the Tower from the westward is much interfered with by the Tower Bridge, but, except for some ugly barracks and the demolition of the palace, has still very much the aspect it bore in the 17th century.

The bridge just mentioned starts from the boundary between the precincts of the Tower and that of St Katharine's Hospital, an institution founded by Matilda, the queen of Stephen, and refounded in 1273 by Eleanor, queen of Henry III. It still subsists, having been spared at the Reformation, but was removed in 1827 to the Regent's Park, and St Katharine's Dock made on the old site. A little farther east, still on the Thames bank, we come to one of the former parliamentary

divisions, known as the Tower Hamlets, into which the original parish of Stepney was parcelled. This used to be Ratcliffe and Wapping, but has long been known as St George's in the East. Next to it is Limehouse, a name whose original form, Limehurst, sufficiently denotes the old character of the region. Next to Limehouse is Poplar, which includes the Isle of Dogs, a kind of delta formed by the river Lea, which, some suppose, derives its name from its docks. Farther inland is Bethnal Green, a vast district, chiefly covered with factories and with the houses of artisans and labourers. Then come Mile End, Old and New Towns, whose names show their situation on the great eastern road made through Aldgate (see above) in the 12th century, which led to an arched bridge, locally known as the Bow, where there had

The Tower of London from the River.

of Somerset, beheaded 1552; Sir Thomas More, 1535; Thomas Cromwell, Earl of Essex, 1540; Queen Catharine Howard, 1541; Henry Howard, Earl of Surrey, 1547; Henry Grey, Duke of Suffolk, 1554; Sir Walter Raleigh, beheaded at Westminster in 1618; Thomas Wentworth, Earl of Strafford, 1641; William Laud, Archbishop of Canterbury, 1645; James Scott, Duke of Monmouth and Buccleuch, 1685; James Radcliffe, Earl of Derwentwater, 1716; and the Scots lords implicated in the risings of 1715 and 1745—Kennure, 1716; Kilmarnock and Balmerino, 1746; and Lovat, 1747. Many of these prisoners were buried in St Peter's Church, which having been burned in 1512 was rebuilt in time to receive the bodies of Queen Anne Boleyn and other victims of the Tudor times. Since then it has been 'restored' in a very thorough manner, every vestige, except some monuments, of the period which witnessed these sad scenes being carefully obliterated. The crown jewels were long kept in the Brick Tower, at the north-eastern corner, but in 1867 were removed to a chamber in the Wakefield Tower. This chamber, in which they are now exhibited, has shared the fate of the chapel, every vestige of its occupation by Henry VI., probably at the very time of his death, having been carefully 'restored' away. The great collection of armour, founded by Henry VIII., in his palace at Greenwich, is on the upper floor of the White Tower. Two or three pieces date from before the time of the Tudors. The ticket-office,

previously been only the dangerous Stratford over the Lea. These parishes, with Whitechapel north of the Tower, form a complete ring round Stepney, where an ancient church, dedicated to St Dunstan, still stands among surroundings very different from those which marked the district when the bishops of London had a palace here, with wide parks, and the noble hunting-grounds of Hackney and Hornsey on the hills beyond; when Edward I. held a parliament in 1299 at the house, near the church, of the mayor, Henry le Waleys; when the good Dean Colet had a country house here, where he was visited by More and Erasmus; and when Bishop Ridley, the martyr, surrendered the manor to Lord Wentworth, the same whose loss of Calais is said to have been the proximate cause of the death of Queen Mary I. Since Wentworth's death the estate has been divided among many owners, and there are few traces of antiquity anywhere. The Bethnal Green Museum under the Board of Education is a branch of the Victoria and Albert Museum, and has housed and exhibited various fine collections of pictures and works of art. Much of Hackney, which adjoins Stepney on the north, has been kept open: an old park of the bishops being now laid out as Finsbury Park, and the commons and fields eastward to the Lea having been rescued from the builder. South of this district, which stands high, are Haggerston and Hoxton, densely populated parishes, comprising the ancient Shoreditch, and reaching to the city wall. Westward are

the two divisions of Finsbury, St Luke's and Clerkenwell. In St Luke's was the 'Artillery Ground,' or place of exercise for volunteer bowmen, from which the modern Artillery Company took its rise. In Clerkenwell, but not strictly speaking of it, is the Carthusian monastery, now a kind of refuge for decayed gentlemen, known as the Charterhouse. Here was formerly a school, in which John Leech was educated as well as Thackeray, who describes the place under the name of the Slaughterhouse. In the Liberty of Saffron Hill was a palace of the bishops of Ely, and their chapel, a beautiful building sold to the Roman Catholics in 1874, still exists in Ely Place. Clerkenwell, the site of the house of the Hospitalers, has still its St John's Gate, with memories of Dr Johnson. Northward and westward, we come to a group of old prebendal manors. Islington has a very ancient history extending back to the time of the Conquest; Stoke Newington with a curious old church and a new one; St Andrew's, Holborn, in which Lord Beaconsfield was baptised, and in the cemetery of which, in Shoe Lane, Chatterton was buried in 1770; Portpool, the original name of the ground now covered by Gray's Inn, whose great ornament was Lord Bacon; and Rugmere, now known as St Giles's and Bloomsbury. The last-named district, in which the British Museum is situated, was brought by the good Lady Rachel Wriothesley to her second husband, William, Lord Russell (beheaded in Lincoln's Inn Fields in 1683), and still belongs to her descendants, the dukes of Bedford. Here is University College (University of London); and the suggested site for new headquarters of the university is close to the museum. The celebrities of Bloomsbury have been too numerous to mention; but we cannot forget Richard Baxter, who lived in Southampton, now Bloomsbury Square; Charles Dickens, who lived long in Gower Street and in Tavistock Square; and Charles Lamb, who lived in Little Queen Street.

In St George the Martyr, a small parish taken out of Holborn, is Queen Square, called after Queen Anne. Macaulay lived at 50 Great Ormond Street while he was a boy. St Giles's, long a rookery of wretched tenements, has been greatly improved. Some of the streets and squares of the district were places of repute two centuries ago. Nell Gwynn lived in Wardour Street, the Duke of Monmouth in Soho Square, Dryden in Long Acre and in Gerard Street. The small parish of St Paul, Covent Garden, boasts of a church designed by Inigo Jones, of the greatest vegetable and flower market in London, and of innumerable literary associations. In Bow Street was Will's Coffee-house, where Pepys met Dryden; Turner, the landscape-painter, was born in Maiden Lane; Charles Lamb lived in Russell Court; and Pope, Sheridan, Butler, and Prior are associated names.

In the Strand, and next to the site of Temple Bar, are the great buildings of the Law Courts (1874-82), of which George E. Street was the original designer; but so thwarted by meddling authorities that only the best features, such as the noble hall (238 feet long) and the tower, can be considered his. Since then buildings have been added. North of the courts is Lincoln's Inn Fields, London's largest square. Here are situated the College of Surgeons and the museum of Sir John Soane. Close to the Law Courts is the church of St Clement Danes, by Wren. Kingsway, connecting Holborn with the Strand through crescent-shaped Aldwych (of which the two ends are both in the Strand), was opened in 1905. A conspicuous new building here is Australia House (Commonwealth of Australia). On the south side are

Arundel and Norfolk Streets on the old site of Arundel House. A brook ran through Milford Lane, and in Strand Lane is a bath of Roman origin. Next, to the westward, we come to the Church of St Mary, by Gibbs, and to Somerset House, now a government office, built mainly by Chambers (1786), after a design of Inigo Jones. The name is derived from the Protector Somerset, who built a palace here. Adjoining is King's College (University of London). The streets on the north side compete with Fleet Street as the headquarters of periodical literature. Before we reach Waterloo Bridge (see BRIDGE) we are in the precinct of the Savoy, contemporaneous with a manor granted by Henry III. to Peter of Savoy, uncle of Queen Eleanor. Here John of Gaunt resided till the palace was burned by the rioters of 1381. Chaucer, who married a sister of the duke's third wife, was much here. It afterwards became a hospital, of which the chapel, dedicated to St John the Baptist, only remains. In it Gavin Douglas, Bishop of Dunkeld (died 1522), lies buried. The hospital was suppressed in 1703, and the chapel made 'royal' in 1773.

The Thames Embankment (1864-70) borders the Strand from the city round a great bend of the Thames at Charing Cross to Westminster Bridge, and in 1903 was extended to Lambeth Bridge. When we pass the city boundary near the Temple, with its two Inns of Court and an interesting church which is partly Norman, we next come, with a short interval, to the river-front of Somerset House, by Chambers, one of the best elevations in London. Gardens beautifully laid out conduct us past the Savoy, the Adelphi Terrace, an Egyptian obelisk ('Cleopatra's Needle') bearing the names of Thothmes III. (18th dynasty) and Rameses II. (19th dynasty), and the old gateway which marks the site of Buckingham or York House, where Bacon was born in 1561. Charing Cross station occupies the site of Hungerford Market. The cross in the court toward the Strand is believed to be a copy of the Eleanor Cross erected by Edward I. The statue of Charles I. stands on its exact site. Northumberland Avenue was made in 1874 over the site of the last of the great riverside palaces with which the Strand was formerly lined on the south. Trafalgar Square is on the site of the old King's Mews. Its chief ornament is the church of St Martin 'in the Fields,' by Gibbs (1726). The National Gallery is a poor building (by Wilkins, 1838). The National Portrait Gallery behind it was opened in 1895.

The monumental Corinthian column to Nelson is very conspicuous, with four lions by Landseer at its base. Behind it is a statue of General Gordon by Thornycroft. For Whitehall, see WESTMINSTER. A statue of George III., by Wyatt, is in Cockspur Street, which leads us past the Haymarket (with theatre, hotel, &c.) to Waterloo Place, where are Bell's Guards' Memorial, a figure of Victory in bronze; the Duke of York's (Tuscan red granite) column with statue by Westmacott; the King Edward VII. Memorial; and other monuments—to Franklin, Lord Clyde, Lord Lawrence, Florence Nightingale (1913), and Captain Scott (1915). The clubs in Pall Mall are in many cases justly admired, and, except some most recently built, are in good proportion, especially the Reform, designed by Barry, and the Carlton, by Smirke, and give a stateliness to the street, sadly wanting as a rule in London. On the site of the old War Office (which included Schomberg House, occupied by Gainsborough) is the new palatial Automobile Club. When we reach St James's Palace, dating from the reign of Henry VIII., we note on one side of it Marlborough House (a minor royal residence), and, on the

other, Lancaster House (formerly Stafford House), now used for the London Museum. Near the top of St James's Street are White's, Boodle's, Brooks's, and Arthur's clubs, all celebrated in the social annals of the 18th century, and on the site of Crockford's, the Devonshire. In Bennett and Arlington streets we are reminded of one of the members of the Cabal. In Arlington Street resided Sir Robert Walpole, and afterwards his son, Horace Walpole.

Piccadilly begins a little to the eastward of Waterloo Place and its continuation Regent Street, and is called from a kind of tea-garden, Piccadilla (*Sp. picadillo*) Hall, which stood where the Criterion is now. The formation of Regent Street, which was to lead from Carlton House (where the York column now stands) to the Regent's Park, must be ascribed to Nash, who also designed the older street fronts, often very beautiful, although executed only in stucco. But its aspect is being much altered by loftier buildings with stone fronts. In Regent's Park are situated the Zoological and Botanic Gardens. In Piccadilly there are still some fine palaces, as Northampton House and Apsley House, but the finest of all, Burlington House, has been altered and added to, and the architect-earl's design can hardly be made out. Here are lodged the Royal Academy, also the Royal, the Antiquarian, the Linnean, and several other learned societies. The gardens are covered by the exhibition rooms of the academy; and, till 1900, here were the central offices of the University of London (now at the Imperial Institute; see below). Devonshire House, after being sold, was pulled down in 1924. The only church in Piccadilly is St James's, the parish having been taken out of Westminster in 1684. It was built by Wren, at the expense of Jermyn, Earl of St Albans, who is generally believed to have been the second husband of Queen Henrietta Maria, and who is commemorated in the adjoining Jermyn Street. The exterior is plain.

Northward and westward is the great parish of St George, Hanover Square (separated from Westminster in 1724, but now included in that city), which comprises Mayfair, Grosvenor Square, and Belgravia, extending from Oxford Street on the north to the Thames on the south. It contains many churches, more or less dependent on St George's, but though some of them are very costly, not one calls for separate mention. The mother-church is heavy in design, except the portico. It is by John James. The parish nearly all belongs to the Duke of Westminster, whose ancestor, Sir Richard Grosvenor, married in 1676 Mary Davies, the heiress of two city families, by which these then open fields had been acquired, not without litigation, in the reign of Queen Elizabeth. The whole estate consists of an almost circular portion around Grosvenor Square, extending along Oxford Street from Davies Street to Park Lane, and bounded on the east by the water-course of the Tyburn; and a southern portion, bounded on the west by the Westbourne, which divides it from Chelsea, and on the east by Grosvenor Place, Vauxhall Bridge Road, and some irregular streets down to St George's Square, which is on a site named in a map of 1723 as 'Mr Weston's garden.' Most of the houses on this magnificent estate are, like the churches, poorly designed; but lately there has been much rebuilding in better style, near Park Lane especially. Belgrave Square and Eaton Place and the adjacent region are all in stucco. Grosvenor Place is in a French style, very debased. Dorchester House, not on, but bordering the estate in Park Lane, is handsome, having been designed by its owner with the assistance of Vulliamy. In Stanhope Street is Chester-

field House, much pulled about, but still fine, and worthy of its designer, Ware. Grosvenor House, sold in 1924, has a picture-gallery in Park Lane in a fair classical style, and the screen in Grosvenor Street has been admired.

Of St Pancras, large as the parish is, there is very little to be told. It contained, apparently, several of the manors of the canons of St Paul's, and a curious little church, much injured by modern restorations, shows Norman features. It is close to the St Pancras terminus of the London, Midland, and Scottish Railway, and is well worth a visit for the sake of the graveyard adjoining, which, though much curtailed by the railway, still comprises some interesting monuments, those, for example, of the Greys, lords of Portpool, now Gray's Inn; of Walker, the lexicographer; and of Sir John Soane. Many refugees during French and Italian troubles were buried here. In the parish is Kentish Town, the old prebendal manor of 'Cantler's' or Cantelupe's, called after an ancient canon, and now the estate of Lord Camden. Somers Town used to belong to the family of Somers Cocks. The parish church of St Pancras is a very conspicuous object in the Euston Road. It was built in what was thought to be a Grecian style in 1822 by the Inwoods. Another remarkable building is the L. M. & S. terminus with a hotel, by Sir George G. Scott, one of the largest buildings of the kind.

Tyburn was anciently the name of the parish which we know as St Marylebone. It presents some curious and interesting features. Unlike most parishes it seems never to have been contained in a single manor, but was divided before the dawn of history into two at least, if not three. This division, or inclusion, may have been caused by its remote and lonely situation. A brook ran through it, 'the bourne from which no traveller returns,' its source hidden among the wooded hills of Middlesex; and the little church of St John was in 1400 pulled down because it had been so often broken into and robbed. A new church was built higher up the brook, where there were a few houses, and the place is still known from its new dedication, St Mary 'le Bourne.' The brook was known as the Tyburn, the earlier form of which points to a double stream, and the original church probably stood on a kind of island, a site now covered by the bookseller's shop of Bumpus, Ltd. The eastern part of the parish formed the manor of Tyburn, and belonged to the abbey of Barking. It was leased out to various people, and in the 15th century was held by Thomas Hobson. Henry VIII. held the manor, and Queen Elizabeth granted it on lease to Forset, who in the succeeding reign bought it. His descendants sold it to John Holles, Duke of Newcastle, for £17,500. The western part of the parish was the manor of Lillleston, now commemorated in Lisson Grove, and descended, much like the eastern half, through leaseholders, who held from the Knights of St John (whence St John's Wood) down to Sir William Portman. At St John's Wood is Lord's Ground belonging to the Marylebone Cricket Club; near the upper end of Baker Street is one terminus of the London and North Eastern Railway. The western boundary is the Edgware Road. The place of execution for the city of London and the county of Middlesex was at first by the burn-side. As the suburbs increased and crept towards St Marylebone, the gallows were removed farther west. In 1512 they stood in the adjoining manor of Lillleston, close to the modern Marble Arch, and eventually they were set up for each execution at the foot of Edgware Road. At one or other of the places thus indicated the Holy Maid of Kent (1534), many priests in the reign of Elizabeth, Felton, the

assassin of Buckingham (1628), Jack Sheppard (1724), Jonathan Wild (1725), Lord Ferrers (1760), Mrs Brownrigg (1767), and the Rev. W. Dodd (1777) were hanged, with an innumerable company of less notable criminals. The last execution here was that of John Austen (1783). In the Marylebone Road is the fine new building of the Royal Academy of Music. The number of eminent inhabitants and natives of St Marylebone is very great. Hogarth represented the church, now a parish chapel, in his 'Rake's Progress.' Gibbs the architect, Gibbon the historian, Hoyle, who wrote on games, and Charles Wesley the hymn-writer, may be mentioned as having lived or died in the borough. Besides these, we must not omit the Harley family and their famous collection of MSS. now in the British Museum; Oxford Street is called after Edward Harley, second Earl of Oxford and Mortimer, who married the Holles heiress.

North of St Marylebone is Hampstead (q.v.), with its splendid open heath, some parts of which are as much as 450 feet above the sea. Paddington lies wholly westward of the Edgware Road. It was early divided into two manors, Paddington and Westbourne, the latter named after a little stream the original source of the Serpentine. Both belonged to Westminster Abbey, but the eastern manor having been appropriated to the bishopric of Westminster, with most of the other estates of that short-lived see, went to the see of London, while Westbourne is still the property of the abbey. There is little of interest in either division. The Great Western Railway and its terminus cover a large part of both, obliterating Westbourne Green where Mrs Siddons once lived. A small part of Kensington Gardens is in Westbourne, and in the adjoining manor is a cemetery which belongs to St George's, Hanover Square, and contains the grave of Lawrence Sterne.

Westward of Kensington (q.v.) is Hammersmith, a populous suburb, taken out of Fulham, which reaches down to the Thames, and forms the western extremity of the county. A very interesting church, St Paul's, built here in 1631 by Sir Nicholas Crispe, has recently been pulled down, and a new church of great size, but otherwise unworthy of the site, has been built in its place. St Paul's School, founded in 1509 by Colt the Dean of St Paul's, was moved from the city (St Paul's Churchyard) to this neighbourhood in 1884.

Fulham boasts of an ancient church and of the so-called 'palace' of the bishops of London. The manor which is, or was, continuous with the parish, has been the property of the see from time immemorial, and remains the one residential estate of the bishop. The house, which has sometimes been described as the oldest inhabited house in England, surrounds a courtyard. A chapel, consecrated by Bishop (afterward Archbishop) Taft in 1867, is adjoining the house in the grounds. The exterior is unnecessarily plain, but the interior is handsome. The house contains a hall built by Bishop Fletcher (1695), and the arms of Bishop Fitzjames (died 1522) are in the courtyard and in the garden, which lies very low but contains many fine trees and shrubs. The church of Fulham is very plain but contains a few fine monuments. In the churchyard are the graves of eight bishops. Close to them is a tomb which bears the name of Theodore Hook (died 1841), who had a house, now removed, in the village. Of late years the numerous pleasure-grounds and open spaces of Fulham have been covered with second-class houses, and we have but scanty remains of Parson's Green, North End, and other classical localities. Chelsea (q.v.) adjoins Fulham.

Crossing the Thames, we reach that part of

the county of London which has been taken from Surrey. Battersea is chiefly remarkable now for the beautiful park, opened in 1852, close to which was the residence of Henry St John, Viscount Bolingbroke (died 1751). Westward of Battersea is Wandsworth, south of it is Clapham, and beyond that Penge, in which, for the most part, is the Crystal Palace, usually associated with the neighbouring Sydenham. All these are covered with streets, interspersed here and there with villas and open spaces. Kennington, the site of a manor-house of the princes of Wales, Brixton a little farther south, and Norwood, on the summit of the southern line of hills which enclose the London Basin, come next. Lambeth Palace faces Westminster. The archbishops of Canterbury at first rented the house from the see of Rochester, on account, no doubt, of its convenient situation. They finally acquired it by exchange in 1196. The domestic parts of the house are modern, but the chapel was built about 1250, the 'Lollards' Tower,' 1440, the gateway, 1490, and the hall, now the library, in 1663. There are many beautiful MSS. and rare printed books in the library. The associations of Lambeth with the greatest men in England are too numerous to be detailed here, but we may remember that Bishop Parker (died 1575) is buried in the chapel, and that this was the scene of More's refusal to accept the king's supremacy. St Mary's parish church is close to the gate, and contains monuments of archbishops Bancroft, Tenison, and Secker. On the river embankment, facing the houses of parliament, are the modern buildings of St Thomas's hospital, which was removed to this site in 1871 to make way for London Bridge station; and a little lower down, the London County Hall (the offices of the London County Council), costing about £3,000,000, opened in 1922, but not yet completed.

From this point eastward to Southwark (see above) the low peninsula, formerly submerged at every high tide, is occupied with mean streets and lanes, and with great warehouses, stores, and wharves; the only point of interest being that on which Shakespeare's Bankside theatre the Globe stood. The north side of Park Street probably covers the site. Eastward of Southwark are Bermondsey, where a fine and famous abbey flourished before the Reformation, and Rotherhithe. Farther inland and to the southward are Newington, Walworth, the immense borough of Camberwell, with Dulwich College and picture-gallery, and Peckham.

Eastward of Camberwell we enter those districts which are taken from Kent. They comprise Lewisham, Deptford, Greenwich, and Woolwich. At Deptford was Sayes Court, which John Evelyn lent to Tsar Peter; Woolwich has Eltham Palace, with its ancient hall, built by Edward IV.; and the Woolwich Academy, for Royal Engineers and Artillery; and Greenwich (q.v.) has its Hospital (now Royal Naval College), park, and observatory.

While the London Government Act of 1899, establishing the borough councils, simplified the management of the capital, there is still much overlapping and conflicting of authorities. Amongst over 300 different authorities engaged in public administration are: London County Council, City Common Council, Metropolitan Borough Councils (28), Commissioners of London Police, Boards of Guardians (31), Metropolitan Asylums Board, Metropolitan Water Board, and the Port of London Authority. The administrative county of London, established in 1889, has an area of 117 square miles, and consists of the City and the districts which had grown up round it, known as the metropolis. Greater London (the Metropolitan and City of London Police District) includes the

counties of London and Middlesex, and parts of Kent, Surrey, Essex, and Herts. It contains all the parishes of which any part is within twelve miles of Charing Cross, or of which the whole is within fifteen miles of that centre, and has an area of 693 square miles. The metropolitan water area is 537 miles in extent, and differs in boundary. The metropolis for criminal jurisdiction has an area of 420 square miles. The County Court and Police Court areas differ from all these and from each other. The population of the City (37,702 in 1890) was in 1921 13,706, reckoning only persons sleeping within the area; the number entering the City during the day has been enumerated as considerably over 1,000,000. The administrative county (4,228,317 in 1891) had in 1921 a pop. of 4,484,523, including the City. The Metropolitan and City Police District had 7,480,201. The rateable value of the City in 1921 was £6,479,164, and of the administrative county £48,708,752. Originally, the County of London was divided into 58 parliamentary divisions, each returning one member, except the City, which has two; in 1918 the number was raised to 61.

The tonnage of steam and sailing vessels which entered the port of London, with cargoes and in ballast (excluding coast trade), in 1921 was 11,114,792; and it had a third of the total trade (excluding coastwise goods) of the United Kingdom. The proportion of imports into London as compared with the United Kingdom has increased from 35 per cent. in 1872 to 38 per cent. in 1921. In 1909 the new Port of London Authority took over the docks, and also the functions of the Thames Conservancy below Teddington Lock. It is composed of members (1) appointed by the County Council, the City Corporation, the Board of Trade, the Admiralty, and Trinity House; and (2) elected by representatives of the Port's trading interests. The docks were considerably extended in 1921, and more improvements are being made.

The death-rate of London in 1855 was 24.3 per 1000; in 1901 it was 17.1 per 1000; in 1919 16.8. At the census of 1921 there were resident in London 49,881 persons of Scottish birth, and 52,206 of Irish birth. Of 138,382 foreigners, 34,559 were Russians, 30,596 Poles, 13,527 French, 11,356 Italians, 8855 Germans, 6714 Americans (U.S.), 4756 Belgians, 4681 Swiss, 3700 Dutch, 1488 Austrians, 1228 Danes, 1205 Swedes, and 609 Norwegians. A large proportion of the Russians and Poles and many of the Germans (by country) were Jews by race.

London, UNIVERSITY OF. This title was originally assumed by the non-sectarian institution afterwards known as University College, London, the fine building of which, situated in Gower Street, W.C., was opened in the autumn of 1828, largely owing to the initiative of Thomas Campbell, the poet. The functions of the college were confined to teaching; but in 1834 its promoters applied to the government of the day for power to grant degrees. Meanwhile, King's College (q.v.) had been founded by adherents of the Church of England; and it seemed not improbable that other colleges of similar character would be (as indeed they were) established. To allow the degree-giving power to one college would have meant allowing it to all. Hence, to avoid the multiplication of little universities, the government resolved to institute a body which should examine, but not teach, leaving the colleges to teach, but not examine—at least, not for degrees. A charter constituting such a body (the University of London) was issued by the crown on 28th November 1836, and this charter was up to that of 1863 (valid till 1900) followed by four others, as well as by two or three supplemental charters, varying the constitution or extending the powers of the university. For the first twenty-two years of its existence the university comprised (a) the governing body, or senate, made up of a Chancellor, a Vice-chancellor, and thirty-six 'Fellows;' and (b) the affiliated colleges and medical schools. At first University and King's were the only affiliated colleges; but in twenty years the number of the arts colleges had grown to about fifty, and of the medical schools to nearly twice as many; and of each class only a small minority were in London. Almost a revolution in the university was effected by the charter of 1858 (of which the charter, dated 1863, and in force till 1900, was an amended form). Previously candidates for degrees in arts, although they might matriculate from anywhere, had been required to produce a certificate of two years' study at an affiliated college; but now this requirement was abolished, and candidates might acquire their knowledge when, where, and as they chose. The requirements from medical candidates, however, were not relaxed, and indeed were subsequently made more stringent. The same charter also introduced the graduate body, under the title of 'convocation,' into the constitution; and all masters of arts, all doctors, and all bachelors of a certain standing, upon payment of a trifling fee, became members of convocation. This body was, until 1918, the parliamentary constituency. Again, this charter instituted the Science faculty; and it took away from the fellows the power (which some of them had exercised) of acting as examiners. The chief organic changes between 1858 and 1899 were the institution of degrees in music and the opening of the university to women. The latter change was gradual: at first women were admitted to a series of special examinations under a supplemental charter of 1867; but under a later supplemental charter (1878) all the examinations and degrees, and all the exhibitions, scholarships, prizes, and medals were thrown open to them upon precisely the same conditions as to men. The field covered by the operations of the university may be described as imperial rather than local. Its charter declares it to have been founded for the benefit of all classes and denominations of Her Majesty's faithful subjects, without any distinction whatsoever, both in the United Kingdom and elsewhere. In conformity with the character thus professed, certain examinations were to be held at numerous provincial centres in Great Britain and at a few colonial centres. But the university itself originated none of these; they were instituted only upon the appli-

cation of recognised authorities at the several centres.

This very feature, however, and the detachment of the university from the once affiliated colleges, were the immediate cause of a lively agitation for a 'Teaching University' for London, which sprang up in 1884, and led to negotiations which in 1900 issued in the reconstitution of the university. The senate in 1887 made some concessions, but rejected the claim of the colleges to be represented at its own board. University and King's Colleges, in combination, thereupon petitioned the Privy-council for a university charter of their own; while the Royal Colleges of Physicians and Surgeons, also in combination, petitioned for the power of granting degrees in medicine only. To investigate the merits of the points at issue, a Royal Commission was appointed in the spring of 1888. The report of the commission, issued in May 1889, propounded a scheme for the reorganisation of the university which offered harsher terms to the senate than those that were rejected in 1887, without, however, satisfying the two great London colleges. The senate therefore reopened negotiations with these colleges, and offered still more extensive concessions than those prescribed by the commission. The University of London Act of 1898 made provision for its reconstitution as a teaching body, and for the appointment of a commission, whose statutes for the reorganisation and regulation of the university received the royal sanction in 1900; the two colleges being constituted 'Schools of the University' (along with other teaching institutes). In 1907 University College, in its faculties of Arts, Laws, Medicine, Science, Engineering, and Economics, was transferred to the university of which it now forms an integral part; and in 1910 King's College, in respect of all the departments except theology. Matriculated students working at University College or King's College are 'internal students of the university.' The senate now consists of a chancellor, a chairman of convocation, and fifty-four persons nominated by the crown, by convocation, by University and King's Colleges, the Royal Colleges of Physicians and Surgeons, Lincoln's and Gray's Inns, and the Inner and Middle Temples, by the Incorporated Law Society, the corporation of London, and London County Council, the Guilds Institute, and the faculties (consisting of teachers of the university). Convocation consists of the chancellor, the vice-chancellor, all members of certain committees of the senate, and the registered graduates. Men graduates of full age, and women graduates (or those who have passed the final examination) of the required age, constitute the parliamentary constituency, who elect one member to parliament. There are now eight faculties—Theology, Arts, Laws, Music, Medicine, Science, Engineering, and Economics. The faculties consist of university teachers, nominated by the Royal Commission, appointed by the university, and admitted by the senate. The schools of the university in 1922 comprised among others six in theology (including the theological department of King's); the East London College in arts, science, and engineering; Birkbeck College, and the Holloway College and Bedford College for women in arts and science; in medicine eighteen (including Bartholomew's, St Thomas's, Guy's, and Westminster, the Royal Army Medical College); in science and engineering, besides these named, the Imperial College of Science and Technology in both faculties; and the Wye College of Agriculture for agriculture. There are besides 'recognised teachers' in various institutions—including City of London College, several local Polytechnics, the Royal Academy of Music, the Royal College of Music, and Trinity College of

Music. These 'recognised teachers' constitute a part of the teaching staff of the university, having been appointed to the university by one of its schools, or by the institutions recognised by the senate as conducting work of university standard. The 'appointed teachers' of the university itself are professors and readers, besides assistants. Boards of studies consisting of teachers of the university and others are appointed by the senate to deal with groups of subjects. The series of examinations for both sexes begins with matriculation, from which there is no exemption. Numerous exhibitions and other prizes are open to competition among honours candidates at many of the examinations. The regulations for these examinations and all bylaws are laid down by the senate, often upon the recommendation of colleges, examiners, or convocation; but no such rules are valid until they have been approved by the Home Secretary.

The growth of the university, at least in point of numbers, was rapid, especially after 1858. In 1838 there were 23 candidates for matriculation, of whom 22 passed; in 1858 there were 299 candidates, of whom 249 passed; in 1922 there were 9216 candidates, of whom 3258 passed. The present number of internal students is about 9000. For the first thirty years the university had no fixed abode; but in 1868 the government ordered the erection of a new building, specially for it, in Burlington Gardens, W., which was occupied in 1870. In 1900 arrangements were made and sanctioned by the Treasury for housing the newly reorganised university in parts of the buildings of the Imperial Institute at South Kensington. The government has since offered, under certain conditions, a site for new central offices near the British Museum, and not far from University College. But other sites have been suggested, and the matter remains unsettled. As the university was the child of the government of 1836, both that and succeeding governments recognised the duty of supporting it; and year by year an estimate of expenses was laid before parliament, and covered by a vote. On the other hand, all the receipts from fees have been claimed by the Exchequer; but up to the year 1876 these scarcely equalled a third of the total cost of the university. Owing, however, to the increase in the number of candidates, the fees received in 1889 (nearly £15,000) more than covered the whole vote for working expenses, leaving the Treasury chargeable with the costs of the building, stationery, &c. In 1922-23 the expenditure was £155,801, the fees received amounted to £97,959, and the parliamentary grant was £18,000. See *University of London and its Colleges*, by Gordon Wilson (1923); and the *University Calendar*.

London, a city and port of entry, capital of Middlesex county, Ontario, is situated at the junction of the two branches of the Thames, 116 miles by rail SW. of Toronto. It is a handsome city, regularly built, and contains many fine buildings; and the aim of its founders is visible in the names of the principal streets—Pall Mall, Oxford Street, Piccadilly, Cheapside, &c.—as well as of the river, which is crossed by a Westminster and a Blackfriars Bridge, and of the Covent Garden Market, Hyde Park, and St Paul's Cathedral. The centre of a rich agricultural district, and connected by railway with all parts of Canada, London carries on an extensive trade in the produce of the country; while it has also numerous and important manufactures—farm implements, cars, chemicals, &c. It has several colleges (including the Western University) of good standing, lunatic and orphan asylums, a convent, and a hospital; and its white sulphur-springs attract many invalids. London is

the seat of Anglican and Roman Catholic bishops. Pop. (1881) 19,746; (1901) 37,983; (1921) 60,959.

London, JACK, was born at San Francisco 12th January 1876. After years of adventurous life as 'oyster pirate' and sealer, 'hobo' (tramp), and Klondike miner, he merged the whole into Jack London the writer. His books have vastly different subjects, such as *Martin Eden* (1909); *Burning Daylight* (1910), a stirring tale of the Klondike and business life in the west of America; *South Sea Tales* (1911); *Adventure* (1911); *John Barleycorn* (1913); *The Valley of the Moon* (1913); *The Mutiny of the 'Elsinore'* (1914), one of the greatest ever written about a mutiny at sea; *The Little Lady of the Big House* (1916); and *The Turtles of Tasman* (1916). He affords a striking example of story triumphing over style, although in some of his books he even here reached a high level. Vivid, headlong narratives, which were developing into a definite greatness, were his output, when in 1916 he died at the early age of forty. Full of great promise, his most striking characteristics were his full-blooded desire to live his life to the uttermost and an amazing gift for story-telling.—**CHARMIAN LONDON**, his wife, has published *Jack London* (1921), *Voyaging in Wild Seas* (1909), and *The New Hawaii* (1923), and shows that she also is able to produce work of merit.

London Clay. See EOCENE SYSTEM.

Londonderry, a maritime county of the province of Ulster, in Ireland, 40 miles long by 34 broad, is bounded N. by the Atlantic, and elsewhere by Antrim, Lough Neagh, Tyrone, and Donegal. Area, 816 sq. m. Pop. (1841) 222,174; (1861) 184,206; (1901) 144,404; (1911) 140,625, of whom 43,000 were Presbyterians, 27,000 Protestant Episcopalians, and the remainder Catholics. The surface rises the further one travels inland, Mount Sawell, on the southern border, being 2236 feet high. The coast-line (30 miles long) is generally bold and precipitous; but the shore of Lough Foyle is in most places an unvarying plain, large tracts having been reclaimed. The river Bann from Lough Neagh forms part of the eastern border of the county. The river Foyle intersects its western extremity. The principal crops are oats, potatoes, flax, and turnips. Over one-third of the area is permanent grass, and a large proportion of the cultivated soil is meadow land and clover. Linen (shirt-making) is the staple industry. The fisheries, both off the coast and in the rivers and lakes, are valuable. The towns are Londonderry (q.v.), Coleraine, and Limavady. The county owned in ancient times the sovereignty of the O'Neil sept. It was subjected to English authority in the end of Elizabeth's reign. In 1609 the confiscated estates of the native Irish chieftains were granted by the crown to the corporation of London, the management being vested in the Irish Society, a body twenty-six in number, elected by the common council, one-half retiring each year. Portions of the county were assigned to twelve of the livery companies.

Londonderry, or **DERRY**, a city, seaport, parliamentary and county borough of Ireland, chief city of County Londonderry, is situated on an eminence overlooking the river Foyle, 3 miles from its mouth and 18 miles from the entrance to Lough Foyle, by rail 95 miles NW. of Belfast. Pop. (1851) 19,888; (1871) 24,242; (1891) 33,200; (1911) 40,780. Londonderry grew up around a monastery founded here in 546 by St Columba. It was frequently held by the Danes from the 9th to the 11th century. The town formed part of the escheated territory granted to the London companies, and under their management rose to some importance,

and was strongly fortified. In the Irish war of the Revolution thirteen Londonderry apprentices closed its gates against James II.; and the townsfolk, shouting 'No surrender,' manned the walls. The 105 days' siege that then ensued, from April to August 1689, is one of the most celebrated events in Irish history, and its memories are among the most stirring causes of party animosity. The walls still surround a part of the town one mile in circumference, but now the greater part of the city lies outside them. The four main streets diverge from a square in the centre of the city called the Diamond. The left bank of the river is connected by an iron bridge, 1200 feet in length, with an extensive suburb called Waterside. The Protestant cathedral dates from 1633; it was restored in 1886. A handsome Roman Catholic cathedral, the courthouse, guildhall, harbour-offices, post-office, custom-house, and banks are the other chief buildings of note. The historical events of the siege are commemorated by a triumphal arch—one of the gates of the city—erected in 1789 and a column in honour of the Rev. George Walker, who was governor of the city and the soul of the defence. The Presbyterian theological M'Crea-Magee College was founded in 1865. The industries include linen (shirt and collar making), distilling, iron-founding, flour-milling, and shipbuilding. Derry yeast claims to be the best in the world, and Derry is the headquarters of the Donegal knitted woollen trade (home industries). There are salmon-fisheries in Lough Foyle. The harbour is large, deep, and safe. Great Atlantic liners stop at Lough Foyle both in going to and coming from America. The imports include grain, flour, timber, and spirits; the exports are chiefly agricultural produce.

Londonderry, MARQUIS OF. See CASTLE-REAGH.

Londonderry, LORD. See SAXIFRAGE.

Long, LOCH, a beautiful Scottish sea-loch, striking off from the Firth of Clyde, 17 miles north-north-eastward between the counties of Argyll and Dumbarton, and 3 furlongs to 2 miles broad. It sends off Loch Gail (q.v.); is flanked by steep and fantastic mountains, 2000 feet high; and at Arrochar, near its head, approaches to within 1½ mile of Tarbet on Loch Lomond. The highland estate of Ardgail, on the peninsula between Loch Long and Loch Gail, was given to the city of Glasgow as a public park by Lord Rowallan.

Long, GEORGE, scholar, was born at Poulton, Lancashire, 4th November 1800, and from Macclesfield went up in 1818 to Trinity College, Cambridge. In 1821 he was bracketed with Malden and Macaulay for the Craven scholarship; in 1822 graduated as a wrangler and senior Chancellor's medallist, and in 1823 was made Fellow of his college. In 1824 he accepted the chair of Ancient Languages in the university of Virginia, United States; but he returned to England in 1828 to become Greek professor in London University. Subsequently, at different periods of his life, he taught as professor of Latin at University College, London (1842-46), reader in jurisprudence and civil law to the Middle Temple (1846-49), and classical lecturer at Brighton College (1849-71). He had a share in founding the Royal Geographical Society (1830), and from 1831 took an active interest in the Society for the Diffusion of Useful Knowledge, writing books for its library and editing its *Journal of Education*. But the *magnum opus* of his life was the editing (1833-46) of the *Penny Cyclopædia*, to which he was one of the most valuable contributors. Besides this he edited the *Biographical Dictionary* (1842-44), a Knight's *Political Dictionary* (1845-46), the excellent *Bibliotheca Classica* series, and many admirable versions

of classic authors. He also translated *Selections from Plutarch's Lives, Thoughts of M. Aurelius* (1862), and *Discourses of Epictetus* (1877), contributed extensively to Smith's Classical Dictionaries, and wrote *Decline of the Roman Republic* in 6 vols. He died 10th August 1879.

Longan (*Nephelium Longana*), one of the finest of fruits, nearly related to the Litchi (q.v.), but reckoned superior to it.

Long Beach, a city of California, 20 miles S. of Los Angeles, a summer resort, with shipbuilding, oil-wells, and various manufactures; pop. (1900) 2252; (1910) 17,809; (1920) 55,593.

Long Branch, a fashionable bathing-place of New Jersey, on the Atlantic Ocean, some 30 miles S. of New York City and 13 S. of Sandy Hook. Here are many costly 'cottages,' occupied only in summer. Pop. 13,500.

Longchamp, the racecourse, lying on the south-west side of the Bois de Boulogne, on the west of Paris, where the race for the *Grand Prix* is run. It was formerly the custom for the great folk of Paris to drive out in this direction, as far as the old nunnery of Longchamp (founded in 1260), during the week preceding Easter.

Longchamp, WILLIAM DE, a Norman of low birth, and a favourite of King Richard I. The latter, on his accession, made Longchamp Bishop of Ely, and in 1190 joint-justiciar of England with Hugh de Pudsey; in 1191 he was likewise made papal legate. But his ambition, his arrogance, and his unpopular manners, combined with his oppressive taxation, made him greatly disliked, and Richard was obliged to send him back to Normandy. He regained the royal favour by his energy in raising the king's ransom; his reward came in the appointment of chancellor. He died in 1197, having been overthrown by the parties of John, Geoffrey Plantagenet, the Barons, and Walter de Coutances, some time before. He disliked the English, and displayed his contempt for them in the coarsest way, declaring that he did not understand their language and would not speak it. Nevertheless he was a clever and energetic ruler, administered strict justice, and was faithful to his prince. See the French monograph by L. Boivin Champeaux (Livreux, 1885).

Longevity. A term which in popular usage has come to mean great length of life instead of merely length of life; therefore, after a discussion of centenarianism, will follow a short account of the general theory.

The wide-spread belief that there are cases on record of persons living to the age of 150 or even 200 years, and that centenarians are numerous, is owing to a general love of the marvellous backed by superstition, and also to the fact that noted writers, such as Haller the physiologist, accepted and reasoned upon many such stories. But in 1862 Sir G. C. Lewis wrote in *Notes and Queries* an article in which he professed disbelief in any case of a life exceeding 100 years; he pointed out that neither the peerage and baronetage nor the books of insurance companies contained any evidence of such, and further that the current stories were nearly all of persons of humble rank, careless of registration, so that their statements could not be verified. This led to great correspondence in *Notes and Queries* and elsewhere; the editor, Mr Thoms, took the matter up, went into it with great care, and compiled his work on longevity which is authoritative. He examined many stories of very ancient persons, showing them to be baseless; while as to stock historical cases of Thomas Parr, Henry Jenkins, and the Countess of Desmond, reputed to be 152, 169, and 140 respectively, he found that

there was no satisfactory evidence. For Jenkins there was none save his own assertion. Parr was before his death a celebrity, the poet Taylor wrote his life with numerous dates of various events, and Harvey in his post-mortem report repeats the popular hearsay—this is all the evidence to be found. As to the Countess of Desmond, Mr Thoms gives conclusive reasons for believing that the stories from which her age is deduced really relate to two, if not three, ladies of that title.

The evidence which is often said to exist in the registers has been proved in many cases to refer to two persons of the same name; and in one noted case, Carr of Shoreditch, said to be 207, the 2 was found to have been written upon the top of 1. As to tombstones, the age 309 in one case being certainly some village chiseller's manner of writing 39, will serve as an example. In fact, a review of the evidence shows that while Lewis was right in renouncing his contention that no certain instances of a greater age than 100 existed, a belief in lives of 150 years is no longer possible. It remains to add that there is no scientific evidence to support the belief that the length of human life was once much greater than it is in modern times, nor the converse opinion that the length of life has been increasing since the Psalmist cited it at three-score and ten. All that we certainly know is that in civilised countries the average length of life has been for many obvious reasons emphatically on the increase for several centuries.

There is another question of common interest: How shall we live to attain great age? There have been many teachers with many fads; but from the varied modes of life of those who have lived long it is probable that as no amount of feeding will make a man tall who is destined to be short, so no amount of care will prolong the life of one destined to die young. St Antony lives a life of excessive austerity and he dies at 105. Titian is all his life about a court and he paints a fine picture at ninety-six. Longevity is probably a resultant of several constitutional factors, but careful statistical investigations have shown that it is a heritable quality. A notable fact is that the average duration of human life in different peoples and countries is about the same.

There are great differences in the ages attained by different kinds of organisms, from the Sequoias or Big Trees, which have been known to survive for more than two thousand years, to some insects whose span is but a few days. It does not seem possible to interpret these differences as directly associated with differences in size, complexity, rate of growth, or intensity of life. If it be said, for instance, that large animals live longer than small ones—an elephant two hundred years, a horse forty, a blackbird eighteen, a mouse six, and so on—it may be recalled that a cat or a toad may live as long as a horse (forty), a pike or a carp as long as an elephant (two hundred), a crayfish as long as a pig (twenty), and the sea-anemone 'Grannie,' which died a natural death in Edinburgh on 4th August 1887, was at least sixty-seven years old. If it be said, again, that sluggish creatures live long while those of great activity wear themselves out quickly, it may be recalled that some birds have a long life, for there are cases of ravens, falcons, eagles, and vultures living for more than half a century. Industrious work-ants may live for several years, while worker-bees may exhaust themselves in a few months. It must be remembered, however, that it is very difficult to find data as to the average length of life of wild animals in natural conditions.

In a special category, perhaps, should be ranked unicellular organisms, which in favourable surroundings seem to elude natural death, continuing to

multiply by division without limit. Thus for the Protozoa, Weismann claimed a natural 'immortality.' This exemption seems to be associated with the relative inexpensiveness of the process of multiplication and with the perfection with which these relatively simple organisms make good their wear and tear—that is, secure physiological rejuvenescence. This points to the general idea that the duration of life in different organisms is connected with the possibilities of repair and rejuvenescence, especially perhaps in the nervous system. It may be that some simple multicellular animals are as 'immortal' as the Protozoa. But this is not inconsistent with Weismann's view that the duration of life in particular species is adaptive, punctuated from without as well as from within; being, in fact, gradually adjusted by natural selection in relation to the welfare of the species, especially the rate of multiplication and the average mortality. Golden-eagle, fox, and hare are three very active, very complex creatures, but while the hare lives ten years and the fox fourteen, the eagle lives sixty. On Weismann's theory the differences are to be interpreted in view of the fact that the two mammals are more prolific, that there is less mortality among their young, that the young eagles require much longer nurture, and so on. The eagle's age is adaptive.

For general aspects of human longevity, see W. J. Thoms, *Longevity of Man*; G. M. Humphrey, *Old Age*; Burn Bailey, *Modern Methuselahs*. For general theory, see E. Ray Lankester, *Comparative Longevity*; and August Weismann, *Essays upon Heredity* (trans. by Poulton, &c.), which contain abundant references to other literature on the subject. See also INFUSORIA, PROTOZOA, REPRODUCTION, INSECTS; F. Hildebrand, *Die Lebensdauer, &c. der Pflanzen*, in Engler's *Botan. Jahrbuch*, Bd. ii. (Leip. 1881); and, for further literature, Geddes and Thomson, *Evolution of Sex* (1889, revised 1911); also E. Metchnikoff, *The Prolongation of Life* (1910); C. S. Minot, *The Problem of Age, Growth, and Death* (1908); C. M. Child, *Senescence and Rejuvenescence* (1915).

Longfellow, HENRY WADSWORTH, was born in Portland, Maine, on the 27th February 1807, and died in Cambridge, Massachusetts, on the 24th March 1882. He graduated from Bowdoin College in Brunswick, Maine, in the class with Hawthorne. His rank in college was high, especially in languages, ancient and modern; his translations then and afterward were noted for a felicity and point quite beyond the reach of ordinary scholars. In 1826 the trustees of the college sent him to Europe to qualify for the chair of Foreign Languages and Literatures; and he spent more than three years with this end in view in France, Spain, Italy, and Germany. After his return home he married in 1831 Miss Potter of Portland, who died in Rotterdam in 1835, while they were making a tour in Europe; she is commemorated in the touching poem, *The Footsteps of Angels*. His first book, omitting his numerous linguistic works, was a version of *The Coplas of Don Jorge Manrique*. *Outre-Mer*, an account of his first tour, appeared in 1835; and *Hyperion*, which is a journal of a later trip, in 1839. Both are interspersed with translations of German poems, and both have a permanent value as indicating the development of the poet's mind and art. In November 1836 he became professor of Modern Languages and Literature in Harvard College, and held the chair nearly eighteen years, being succeeded by Lowell. *Voices of the Night*, his first book of original verse, appeared in 1839. This gave to the world a distinctly new impression of tenderness, manly sentiment, and melody, and to the author an assured place among poets. The impression was deepened by the *Ballads* (1841), including 'The Skeleton in Armour,'

'The Wreck of the Hesperus,' 'The Village Blacksmith,' 'Excelsior,' and others. *Poems on Slavery* appeared in 1842. By this he gave evidence of his moral convictions and courage, for at that time anti-slavery poets and orators were unpopular to the last degree. In 1843 was published *The Spanish Student*, a drama slight in substance, but full of movement and gaiety, and brilliant in local colour.

He made a third visit to Europe in 1842, and on his return the following year was married to Miss Frances Appleton of Boston. He made collections of poems, including some of his own translations: *The Waif* (1845), *The Estray* (1847)—both now very scarce—and *The Poets and Poetry of Europe* (1845). This last is a large and important work, in which he was aided by his friend C. C. Felton. *The Belfry of Bruges and other Poems* appeared in 1846. In the following year he gave to the world *Evangeline*, a tale of the French exiles of Acadia. *Kavanagh*, a prose tale, appeared in 1849. *The Seaside and the Fireside* (1850) contains 'The Building of the Ship,' one of the finest of his poems, which has a great hold upon the people of the United States on account of the grand patriotic invocation with which it closes. *The Golden Legend* (1851), based upon an ancient German ballad, *Der Arme Heinrich*, by Hartmann von Aue, is a striking poem, medieval in tone and well sustained, though not a masterpiece. His genius is shown at its best in *Hiawatha* (1855), founded upon traditions and legends of the North American Indians. The light and tripping measure, the simplicity of phrase, and the well-calculated repetitions at first give an impression of artlessness, almost of baldness; but whoever reads the poem with enlightened eyes finds, under this easy flow of words, a series of poetic conceptions, the suggestion of noble and enduring images, and the mastery of just expression. *The Courtship of Miles Standish* (1858) is a story in hexameters of the early days of the Plymouth colony in Massachusetts. To the people of New England this poem has an inexpressible charm on account of its historical associations: it is a mirror of the life of the Pilgrims. The story is interesting in itself, and is told with easy grace. The poet was descended from the Priscilla of this poem, whose well-known question, 'Why don't you speak for yourself, John?' is the keynote of the book. *Tales of a Wayside Inn* is a poem which appeared in parts, in different volumes (1863, 1872, 1874)—its plan suggested evidently by the *Canterbury Tales*. The Inn was in Sudbury, Massachusetts, famous a century ago, and the poet has gathered there a company of well-known men whom he portrays, and who in turn tell stories, some of which are from Boccaccio and other early writers, and some original. *Flower-de-Luce* (1867), though not so famous as other collections, shows in its twelve short poems some of the poet's most exquisite workmanship. *The New England Tragedies* (1868), in blank verse, treats mainly of the Salem witchcraft in the latter part of the 17th century. The next work was a complete and faithful translation of the three parts of Dante's *Divine Comedy* (1867-70). *Christus, a Mystery*, being the gospel story in blank verse, appeared in 1872. This was afterwards printed with *The Golden Legend* and *The New England Tragedies* consecutively. *Three Books of Song*, containing the conclusion of *Tales of a Wayside Inn*, *Judas Maccabæus*, &c., was published in 1872; *Aftermath*, in 1874; *The Masque of Pandora*, in 1875. This last volume contains a poem, 'Morituri Salutamus,' written for the fiftieth anniversary of the poet's graduation from college. The occasion, which was noticed throughout the United States, was most impressive and affecting. *Keramos* (1878) and *Ultima Thule* (1880) were the

last of the long series. *Poems of Places*, a collection undertaken by the poet without too much thought of the magnitude of the task, reached 31 volumes.

He paid a last visit to Europe in 1868-69, and was received in England with honour and love. The greater and most fruitful part of Longfellow's life was passed at Cambridge, Massachusetts, where he lived in a stately colonial house which had been the headquarters of Washington during the siege of Boston, and which remains as he left it. His striking features, his full beard, and his massive head, crowned with abundant silvery hair, gave him a singularly noble look. He was free from envy or jealousy, and preserved always a serenity and amiability that won the hearts of all who met him. His relations with his contemporaries—Emerson, Hawthorne, Holmes, Lowell, and Agassiz—were intimate and hearty, and the literary society in which he moved was simple and charming.

See *Lives* by his brother, the Rev. Samuel Longfellow (3 vols. 1886-87; recast, 1891), Dr Underwood (1882), Higginson (1902).

Longford, an inland county of Leinster, Ireland, bounded on the W. by the Shannon and on the SW. by Lough Ree. Its maximum length is 29 miles, its maximum breadth 20. Area, 421 sq. m. Pop. (1841) 115,491; (1861) 71,694; (1891) 52,647; (1911) 43,820—92 per cent. Roman Catholics. The surface is for the most part flat, and the soil on the whole fertile, though extensive tracts of bog exist. Oats and potatoes are the principal crops; half of the area is permanent grass. The county is studded with numerous small lakes, and is crossed by the Royal Canal. Marble of good quality is found. Linen and coarse woollens are manufactured, and large quantities of butter are made. Longford anciently formed part of the kingdom of Meath, and was included in Henry II.'s grant to Hugh de Lacy. It was erected into a county in 1564. The antiquities are of much interest, the islands of Lough Ree being especially rich in monastic remains.—**LONGFORD**, the county town, on the river Camlin and a branch of the Royal Canal, 76 miles NW. of Dublin by rail. Its best building is the new Roman Catholic cathedral (1840-93). Pop. 3800.

Longinus, **SAINT**, a name given by tradition to the soldier who pierced Christ's side on the cross, perhaps from Greek *lonchē*, 'spear.'

Longinus, **DIONYSIUS CASSIUS**, a famous Platonic philosopher and rhetorician of the 3d century, born at Emesa or at Athens, about 213 A.D. He studied at Alexandria, under Ammonius, and he himself taught rhetoric in Athens, where the famous Porphyry was a pupil. Later he settled at Palmyra, and became chief counsellor to the celebrated Queen Zenobia, whom he abetted in her determination to shake off the Roman yoke. For this he was beheaded as a traitor, by command of the Emperor Aurelian, 273 A.D. The only work of his that remains is the famous treatise *Peregrinatio* ('On the Sublime'), the authenticity of which is doubtful; the Paris MS. attributes it to 'Dionysius or Longinus,' the Laurentian to 'an anonymous author.' See the edition by Rhys Roberts (1899), which reckons over sixty translations and editions; the text and translation by Prickard (1906), and Saintsbury's *History of Criticism* (vol. i. 1900).

~ **Long Island**, forming part of the state of New York, and bounded by Long Island Sound, the Atlantic Ocean, and East River (see **NEW YORK CITY**), is 115 miles long, and from 12 to 24 in width, with an area of 1682 sq. m. On its south shore are lagoons, in the interior low hills. There are numerous small lakes and watercourses, and market-gardening especially is carried on with

success—for the most part by Germans. But much of the island is waste land or forest, and such popular watering-places as Coney Island (q.v.) are planted among deserts of sand. There is still a good deal of game, and the fisheries and oyster-beds are very valuable. Brooklyn, Long Island City, and Flushing are now parts of New York City. Long Island was the scene of a campaign in 1776, in which Sir Henry Clinton finally compelled Washington to evacuate the island.

LONG ISLAND SOUND, lying between Long Island and the mainland of New York and Connecticut, is from 2 to 20 miles wide, and from 75 to about 200 feet in depth. It is navigated by an immense number of coasting-vessels and steamers, and receives the Thames, Connecticut, Housatonic, and other rivers on its northern shore.

Long Island. See **LEWIS-WITH-HARRIS**.

Long Island City is now included in the borough of Queens, New York City (q.v.).

Longitude. See **LATITUDE**.

Longmans, a well-known firm of London publishers, whose name has been associated with high-class literature for five generations. Thomas Longman (1699-1755), descended from a line of Bristol merchants, was bound apprentice to John Osborne, bookseller, Lombard Street, whose daughter he married. The imprint of T. Longman appears on the title-page of the eleventh edition of Part I. of Bishop Beveridge's *Private Thoughts*, which was printed in 1724. Longman bought in 1724 the business of William Taylor, publisher of *Robinson Crusoe*, conducted in Paternoster Row, and moved there, the present site of the firm. As was the custom at that time, the first Longman held shares in many important publications, such as Boyle's *Works*, Ainsworth's *Latin Dictionary*, the *Cyclopædia* of Ephraim Chambers, and Johnson's *Dictionary*. His nephew and successor Thomas Longman (1731-97) brought out a new edition of Chambers's *Cyclopædia*. Under Thomas Norton Longman (1771-1842) the firm reached a high point of literary and commercial success, and from time to time fresh blood was introduced in the partners, Messrs Hurst, Rees, Orme, Brown, Green, and Roberts. When the government was about to impose an additional duty on paper, subsequent to that of 1794, the Longman firm used such arguments as averted that calamity. At that time the house had nearly £100,000 sunk in various schemes. Lindley Murray's *Grammar* was a good property, while the firm had a literary connection with Wordsworth, Southey, Coleridge, Scott, Moore (who received £3000 for *Lalla Rookh*), Sydney Smith, and others. Byron's *English Bards* was rejected because of its severe handling of the Lake poets, whose works were issued by Longman. After Constable's (q.v.) failure in 1826 the *Edinburgh Review* became the property of the firm. Some of the foremost authors of the day were contributors to Lardner's *Cabinet Cyclopædia* (1829-46) in 132 volumes. The next guiding spirits of the firm were Thomas Longman (1804-79), eldest son of T. N. Longman, who issued under his special care a beautifully-illustrated New Testament, and William Longman (1813-77), the third son. The latter figured as an author and historian, and printed privately a *Six Weeks' Tour in Switzerland*, contributed to the *Alpine Journal*, was a president of the Alpine Club, and wrote *Lectures on the History of England* (1859), *History of the Life and Times of Edward III.* (1869), and *History of the Three Cathedrals of St Paul* (1873). The event of this generation was the publication in succession of Macaulay's *Lays* (1842) and *Essays* (1843), and *History*. The famous cheque for £20,000 paid to Macaulay 'on account' of his share of the profits

of the third and fourth volumes for the first few months (1855) is still preserved. The absorption of the stock-in-trade and business connection of the Parkers in 1863 introduced the works of J. S. Mill, Froude, and Sir Cornewall Lewis. The *Traveller's Library* was an excellent cheap series. As partners of the fifth generation there succeeded Thomas Norton Longman and George Henry Longman, sons of Thomas Longman, and Charles James Longman and Sir H. H. Longman, sons of William Longman. One of the earliest ventures of this generation was Lord Beaconsfield's *Endymion*, for which they gave the author £10,000. Lord Beaconsfield's other works had come into possession of the firm in 1870, when they published *Lothair*. After the stoppage of *Fraser's Magazine* a sixpenny magazine was till 1905 published by the house—*Longman's*. In 1890 Rivington's business and stock were bought by the Longmans. Rivington's was the only business which exceeded that of the Longmans in antiquity, and by this purchase a friendly rivalry of over 150 years came to an end.

Long Parliament, the name by which the fifth parliament summoned by Charles I. is known. It succeeded the Short Parliament, dissolved after three weeks, and met November 3, 1640. It began its work by reversing all the tyrannical and illegal acts of the past eleven years, with the abolition of the Star Chamber and High Commission, and the impeachment of Strafford; while it secured itself by an act that it could not be dissolved without its own consent. Just before Charles I.'s trial it was 'purged' by Colonel Pride of 96 members displeasing to the army, and the remnant—the 'Rump'—continued to sit until its members were turned out by the Lord General Cromwell, April 20, 1653. The 'Rump' was recalled by the officers on the failure of Richard Cromwell to maintain his authority, and of the 160 members who had continued to sit after the king's death about 90 returned to their seats. Proving once more displeasing to the army, they were again turned out by General Lambert. They were restored amid the dissensions of the officers, as the only body in the country having any kind of legal authority, and, on the motion of Ashley Cooper, the members ejected by 'Pride's Purge' returned to their seats. After issuing the writs for a new election it dissolved itself, March 16, 1660. Thus ended the Long Parliament, which, twice expelled and twice restored, had lasted for twenty years.

Longridge, a small manufacturing town of Lancashire, $6\frac{1}{2}$ miles by rail N.E. of Preston, on the side of the Longridge Fell, which extends $5\frac{1}{2}$ miles N.E. to the boundary of Yorkshire. Here are quarries, Preston reservoirs, and manufactures of cotton goods, &c. Pop. 4300.

Longships. See SCILLY ISLANDS.

Longstreet, JAMES (1821–1904), an American general, born in South Carolina, graduated at West Point in 1842, fought in the Mexican war, and in 1861 entered the Confederate service. He took part in both battles of Bull Run, that of Williamsburg, those around Richmond, and at Fredericksburg, Gettysburg, Chickamauga, and the Wilderness. Known to the soldiers as 'Old Pete,' he 'was considered the hardest fighter' in the Confederate service. He was minister to Turkey in 1880–81.

Longton. See STOKE-ON-TRENT.

Longueuil, BARONY OF. See LE MOYNE.

Longueville, DUCHESS OF (1619–79), the soul of the Fronde (q.v.).

Longwood. See ST HELENA.

Longwy, a small town and fortress in the extreme north of the French department of Meurthe-

et-Moselle, 18 miles WSW. of Luxemburg. The fortress capitulated to the Prussians in 1792, 1815, and 1871. Before its destructive bombardment and capture by the Germans in August 1914 it had some 11,000 inhabitants.

Lönnrot, ELIAS, a great Finnish scholar and folklorist, was born at Sammatti in Nyland, 9th April 1802. He studied medicine, and practised for twenty years in Kajana, but in 1853 on Castrén's death succeeded to the chair of Finnish at Helsingfors, from the duties of which he retired in 1862. He helped to found the Finnish Literary Society at Helsingfors in 1831, and made throughout his life journeys through the whole of Finland, as well as the neighbouring parts of Lapland, Russia, and Sweden, in order to collect the remains of poetry and tradition lingering among the people. The first fruit of these inquiries was a collection of more or less ancient Finnish folk-songs, *Kantele* (1829–31), after which followed in 1835 the great epic of the *Kalevala*. His *Kanteletar* (1840) was a collection of lyrical folk-poetry; *Sanalaskuja* (1842), of proverbs; *Arvoituksia* (1844; 2d ed., much enlarged, 1861), of riddles. No less important were the contributions to Finnish philology which his profound knowledge of the popular dialects enabled him to make. His latest work was the great Finnish Dictionary (2 vols. 1866–80). He died at his native place, 19th March 1884.

Lons-le-Saunier, capital of the French department of the Jura, stands in a basin of the Jura Mountains, surrounded with vine-clad hills, 42 miles by rail E. by S. of Chalon-sur-Saône. It was founded in the 4th century, when its salt-springs were discovered; these are still in use for bathing, and salt is manufactured from them. Wine, carpets, and brushes are made. Pop. 14,000. Rouget de Lisle was born in the neighbourhood.

Loo, a round game at cards, formerly called launterloo. About five players make the best game. Each puts down a stake to form a *pool*; the dealer stakes double. Three cards are dealt to each player as at whist, and an extra hand, called *miss*. The top card of the stock is then turned up for trumps. Each player in rotation looks at his hand, and *declares* whether he will play, resign, or take *miss*. If he takes *miss* he must play it. The declared players play one card each in rotation, the cards thus played forming a *trick*. The highest whist card wins, or if trumped, the highest trump. The winner of a trick leads to the next. The cards played remain face upwards before the players. If the leader holds ace of trumps (or king when ace is turned up), he must lead it; if he has two trumps, he must lead one. He is not obliged to lead the highest, unless (a) it is the ace (or king, ace being turned); or (b) there are only two declared players. Subsequent players must follow suit, and must head the trick if able. If not able to follow suit, and holding a trump, they must head the trick by trumping. The winner of the first trick must lead a trump if able. In other respects the play is as at whist. The winners of the tricks divide the pool, one-third for each trick. If only one declares, to play, the dealer plays *miss* for the pool; tricks won by *miss* remaining in to augment the next pool. If only the dealer declares to play, he takes the pool. If each declared player wins a trick it is a *single*, and a fresh pool is staked as before, the deal passing to the left of the previous dealer. If any declared player fails to win a trick, he is *looted* the amount in the pool; the player who now deals puts in a single stake, no one else contributing. It is advisable to fix a limit beyond which a player cannot be looted. If there is more in the

pool, the player is only looted up to the limit thus fixed.

Loo, THE. See APELDORN.

Loochoo. See RUKYU.

Loofah, the fibrous portion of the fruit of *Luffa cylindrica* and *L. acutangula* (nat. ord. Cucurbitaceæ), used as a bath-sponge or flesh-rubber, and also worked up into baskets and small ornamental articles. Both species are cultivated in tropical and sub-tropical regions.

Looking-glass. See MIRROR.

Lookout Mountain, a ridge extending from near Chattanooga, in Tennessee, across the north-west corner of Georgia, and into Alabama, and rising to 1600 feet above the Tennessee River. It was carried by General Hooker in the battle of 24th November 1863.

Loom. See WEAVING.

Loomis, ELIAS, an American physicist, was born at Willington, Connecticut, 7th August 1811, graduated at Yale in 1830, and was tutor there in 1833-36. After a year's study in Paris he was professor (1837-44) of Mathematics in Western Reserve College, Ohio, of Natural Philosophy (1844-60) in the University of New York, and of Natural Philosophy and Astronomy (from 1860) at Yale. He died 15th August 1889. Professor Loomis devoted much of his time to original research, was the author of over a hundred scientific treatises, and published a series of text-books on mathematics, natural philosophy, astronomy, and meteorology, of which more than 500,000 copies were sold.

Loon, or LOOM. See DIVER.

Loosestrife. See LYTHRACEÆ, LYSIMACHIA.

López. See AYALA, PARAGUAY.

Lophobranchii. See BONY FISHES.

Lophocolea, a genus of Liverworts (q. v.).

Lop Nor. See LOB NOR.

Loquat (*Eriobotrya japonica*), an esteemed Chinese and Japanese fruit, of the natural order Rosaceæ, closely allied to *Mespilus* (Medlar). It has been introduced into Australia, and is now abundant there. The tree or shrub which produces it attains a height of 20 or 30 feet, but in cultivation is seldom allowed to exceed 12 feet. It is a beautiful evergreen, with large oblong wrinkled leaves, and white flowers in terminal woolly panicles, having a fragrance like that of hawthorn-blossom; the fruit is downy, oval, or pear-shaped, yellow, and about the size of a large gooseberry. The seeds have an agreeable flavour. The loquat produces inferior fruit in the open air in the south of England. It may be grafted on any species of *Mespilus*. *E. grandiflora*, from SW. China, has very large flowers on long pedicels and a large fruit.

Lorain, a city of Lorain county, Ohio, on Lake Erie, ships coal, iron ore, grain, and timber, and builds steel ships and machinery. Much damage was done by a hurricane in 1924. Pop. 37,000.

Loranthaceæ. See MISTLETOE.

Lorca, a town of Spain, 36 miles SW. of Murcia. The gloomy and decayed Moorish part of the town is picturesquely situated on an eminence crowned by a fortified castle, whilst the modern town spreads out on the fertile plain at its foot. Here are salt-petre, gunpowder, and lead-smelting works, and cloth factories, and in the neighbourhood silver and sulphur mines, &c. Pop. 75,000.

Lord (O.E. *hlāford*; from *hlaf*, 'loaf,' and, probably, *weard*, 'keeper,' 'master'—i.e. master of the house), a title given in Great Britain to persons noble by birth or by creation. Peers of the

realm are so styled, including such archbishops or bishops as are members of the House of Lords, who are Lords Spiritual. By courtesy, the title Lord is given to the eldest sons of dukes, marquises, and earls, prefixed to an inferior title of the peerage, and to the younger sons of dukes and marquises, prefixed to their Christian name and surname (see COURTESY TITLES). The following persons, amongst others, bear the title Lord in virtue of their employments—the Lords-lieutenant of counties, the Lord Chancellor, Lord Privy Seal, Lords of the Treasury and of the Admiralty, the Lord High Admiral, Lord Great Chamberlain and Lord Chamberlain, Lord High Constable, Lord High Almoner, Lord High Steward, Lord Steward of the Household, Lords in Waiting, Lords Justices, the Lord Chief-justice, the Lord Mayors of London, York, Dublin, and certain other boroughs, and the Lord Provosts of Edinburgh, Glasgow, Aberdeen, Perth, and certain other burghs, and the Lord Advocate of Scotland (see TREASURY, JUSTICE, MAYOR, &c.). The judges of the Courts of Session and Justiciary in Scotland have the title 'Lord' prefixed to their surname or some territorial designation assumed by them; and throughout the three kingdoms judges are addressed as 'My Lord' when presiding in court. See ADDRESS (FORMS OF), NOBILITY, and PARLIAMENT.

Lord Howe Island, a main island, 5 sq. m. in extent, with some small islets, lying in the Pacific, in 31° 33' S. lat. and 159° 5' E. long., 300 miles E. of Port Macquarie in New South Wales. It was discovered by Lieutenant Ball in 1788, colonised in 1834, and is attached administratively to New South Wales. The flora is very rich, banyan-trees being particularly conspicuous. The surrounding waters are full of fish. The island consists of three volcanic ridges, rising to 2840 feet, and is crescentic in shape. Pop. (1859) 300; (1921) 111.—A group of the Solomon Islands bears the same name; and a Lord Howe's Island is one of the Society Isles.

Lord-lieutenant OF A COUNTY, a permanent provincial governor appointed by the sovereign by patent under the Great Seal. The office in England arose from the occasional commissions of array issued by the crown in times of danger or disturbance, requiring experienced persons to muster the inhabitants of the counties to which the commissioners were sent, and set them in military order. The right of the crown to issue such commissions was denied by the Long Parliament, this question proving the immediate cause of the breach between Charles I. and his subjects. Their legality was established at the Restoration by a declaratory act. The lord-lieutenant, who is usually a peer or other large land-owner, as a rule is also the *Custos Rotulorum* (q. v.). He is at the head of the magistracy, and is the chief executive authority. Under him, and of his appointing, are permanent deputy-lieutenants. He recommends qualified persons for the office of justice of the peace. Under the Territorial Forces Act of 1907, he takes a position like that he held in respect of the militia (q. v.).

Lord-lieutenant OF IRELAND, the viceroy or deputy of the sovereign to whom the government of Ireland was nominally committed till the setting up of the Free State, when a Governor-general was appointed (1922). The office existed from a remote period under different designations. The powers of the lord-deputy, as the viceroy was frequently called, were in early times very extensive, almost regal. In the latter part of the 18th century the lord-lieutenant resided little in Ireland, visiting it only once in two years, to hold the session of parliament. Some lords-lieutenant never went to Ireland at all, and occasionally, instead of a viceroy,

lords justices (see JUSTICES, LORDS) were appointed. After the Union the lord-lieutenant constantly resided in Dublin.

Lord of the Isles, a title borne by a race of chiefs who ruled the Western Islands of Scotland with almost regal authority. They were descended from Somerled the Lord of Argyll, on whom David I., having in 1135 expelled the Norwegians from Arran and Bute, conferred these islands. Afterwards, however, he quarrelled with Malcolm IV., and with a powerful force sailed up the Clyde, and, near Renfrew, encountering the royal army under the High Steward of Scotland, was defeated and killed, 1164. His three sons, Dugal, Angus, and Reginald, by his marriage with the daughter of Olaf the Red, the Norwegian king of the Isles, inherited the south isles along with a share of his mainland possessions. One of his grandsons left a daughter and heiress, married to Alexander, son and heir of Walter, High Steward of Scotland, who in her right obtained the isle of Bute. Somerled's sons alternately sided with the Norwegians and the Scots in their contests for the sovereignty of the Western Isles, which repeatedly changed masters. But after the defeat of Haco, his successor in 1266 ceded all the Western Islands to Scotland, on condition that a certain annual sum should be paid to Norway. Henceforward the descendants of Somerled held their possessions as vassals of the Scottish crown. They were represented at this time by three great nobles—the Lord of Lorn, who in the war of independence took part with Comyn and Baliol, Angus of Isla, and Allan of the North Isles, who supported the claims of Bruce. Angus fought at Bannockburn, and it is said that Bruce, when he was about to bring up the reserve, addressed him in words adopted as a motto by some of his descendants, 'My trust is constant in thee.' John, his son and heir, joined the party of Edward Baliol, but he was ultimately pardoned by David II., and confirmed in his possessions. By his first marriage he obtained the isles of Uist, Barra, Eigg, and Rum, and assumed henceforth the title of Lord of the Isles. He married, secondly, Margaret, daughter of Robert, High Steward of Scotland (afterwards Robert II.), who bore him three sons. Donald the eldest, second Lord of the Isles, in right of his wife claimed the earldom of Ross in opposition to the Regent Albany, and in attempting to make good that claim he fought in 1411 the celebrated battle of Harlaw. His son Alexander, third Lord of the Isles, was allowed by James I. to inherit the earldom of Ross from his mother; but notwithstanding he took up arms against the king, wasted the crown-lands near Inverness, and burned that town. James promptly attacked and routed the rebels, and their leader was fain to throw himself on the mercy of his sovereign. He presented himself before the king in the church of Holyrood, clothed only in his shirt and drawers, and holding his unsheathed sword by the point, and falling upon his knees, surrendered his sword and implored the royal clemency. His life was spared, but he was imprisoned for two years at Tantallon. During the minority of James II. he held the important office of Justiciar of Scotland north of the Forth. In 1445 he entered into a secret and treasonable league with the Earls of Douglas and Crawford, but died at his castle of Dingwall before any overt acts of rebellion had been committed. His eldest son John succeeded to his titles and estates, and carried on similar insurrectionary proceedings. But after the murder of the Earl of Douglas by James II. he took fright, and entreated the forgiveness of the king, which with some hesitation was granted to him, and he was made one of the wardens of the Marches.

After the death of James II., the earl, along with the exiled Douglasses, entered into a treasonable league with Edward IV. of England for the conquest and partition of Scotland, and raised the standard of rebellion. His estates were in consequence forfeited, but on his submission he was restored to the lordship of the Isles; the earldom of Ross was annexed to the crown. In his old age his nephew and heir, apparently with his approbation, at the head of his vassals endeavoured to recover possession of that earldom. James IV., who at this time filled the throne, availed himself of the opportunity to break up that confederacy of the islanders, which had proved so troublesome to the peace of the country; and in the parliament of May 1493 John, fourth and last Lord of the Isles, was forfeited and deprived of title and estates. He retired to the monastery of Paisley, and dying about 1498, was buried beside his ancestor Robert II. In 1540 the Lordship of the Isles was annexed to the Scottish crown, and from it the Prince of Wales derives one of his titles. See A. Mackenzie's *History of the Macdonalds and Lords of the Isles* (Inv. 1882).

Lords-and-Ladies, a popular name for the common Arum (q.v.).

Lord's Day. See SABBATH.

Lord's Supper, one of the sacraments of the Christian religion, so called from its being instituted at supper by the Lord Jesus Christ. It receives also the names of Eucharist and Communion. With the exception of the Quakers, all sects of Christians, however different their views as to its nature, agree in celebrating it as one of the most sacred rites of religion. The present article is written from the point of view of those who admit more or less the idea of a historical development of the doctrines connected with the Lord's Supper; the views of Roman Catholics, who hold that the doctrines of their church on the subject were delivered by our Lord and His apostles, and have from the first centuries been taught in substance in the church, will be found under TRANSUBSTANTIATION.

The circumstances of sorrow amid which it was instituted, and its intimate relation to the crowning work of Jesus, His death, had, at the very outset, made a deep impression upon the early church. We have four accounts of the institution, one from each of three evangelists, and one from St Paul (1 Cor. x., xi.); and those who hold the doctrine of the Real Presence see in John vi. an allusion to the Eucharist. Not only was the solemnity, in conformity with the original institution, repeated daily in conjunction with the so-called 'Love-feasts' (*Agape*, q.v.), and retained as a separate rite when these feasts were set aside, but at a very early period it was believed to possess a peculiar efficacy, and soon ideas of the wonderful and mystical became associated with it. The Lord's Supper was celebrated on every important occasion of life—as when entering on marriage—or to commemorate departed friends and martyrs; to those that could not be present at the meeting of the congregation, such as prisoners and sick persons, the indispensable food of heaven was carried by the deacons, and in some churches the communicants took part of the materials of the feast home with them, that they might welcome the gift of a new day with consecrated food. Heathens and unworthy persons, and Catechumens (q.v.) also, were excluded from this holy mystery. As early as the 2d century, Ignatius, Justin Martyr, and Irenæus advance the opinion that the mere bread and wine become, in the Eucharist, something higher—the earthly, something heavenly—without, however, ceasing to be bread and wine.

Though these views were opposed by some eminent individual Christian teachers, such as Origen, who took a figurative conception of the sacrament, and depreciated its efficacy, yet both among the people and in the ritual of the church, more particularly after the 4th century, the miraculous or supernatural view of the Lord's Supper gained ground. After the 3d century the office of presenting the bread and wine came to be confined to the ministers or priests. This practice arose from, and in turn strengthened, the notion which was gaining ground, that in this act of presentation by the priest a sacrifice, similar to that once offered up in the death of Christ, though bloodless, was ever anew presented to God. This still deepened the feeling of mysterious significance and importance with which the rite of the Lord's Supper was viewed, and led to that gradually increasing splendour of celebration which under Gregory the Great took the form of the mass. See LITURGY.

For a long time there was no formal declaration of the mind of the church on the presence of Christ in the Eucharist. At length, in the first half of the 9th century, a discussion on the point was raised by the Abbot of Corvei, Paschasius Radbertus, and Ratramnus, a learned monk of the same convent; they exchanged several violent controversial writings, *De Sanguine et Corpore Domini*, and the most distinguished men of the time took part in the discussion. Paschasius maintained that the bread and wine are, in the act of consecration, transformed by the omnipotence of God into that very body of Christ which was once born of Mary, nailed to the cross, and raised from the dead. According to this conception nothing remains of the bread and wine but the outward form, the taste, and the smell; while Ratramnus would not allow that there is any change in the bread and wine themselves, but granted that an actual transformation of their power and efficacy takes place. The greater accordance of the first view with the credulity of the age, its love of the wonderful and magical, as well as with the natural desire for the utmost possible nearness to Christ, in order to be unfailingly saved by Him, and the apparently logical character of the inference that, where the power, according to universal admission, was changed, there must be a change also of the substance—all these concurring influences brought it about that, when the views of Ratramnus were in substance revived by Berengarius, Canon of Tours, in opposition to Lanfranc, Archbishop of Canterbury, and Cardinal Humbert, the doctrine of Transubstantiation, as it came to be called, triumphed, and was officially approved by the Council of Rome in 1079. In the fourth Lateran Council at Rome (1215), under Innocent III., Transubstantiation was declared to be an article of faith; and it has continued to be so held by the Roman Catholic Church to the present day. The Greek Catholic Church sanctioned the same view of Transubstantiation at the Synod of Jerusalem in 1672. For the Calixtines and Taborites, see HUSS.

The Reformation of the 16th century again raised the question of the nature of the Eucharist. The Lutheran Church rejected from the first the Catholic doctrine of Transubstantiation, as well as of the mass—i.e. the constant renewal of the sacrifice of Christ—and merely taught that, through the power of God, and in a way not to be explained, the body and blood of Christ are present in, with, and under the unchanged bread and wine ('Consubstantiation'). In opposition to this doctrine, it was laid down by Zwingli that the Lord's Supper is a mere commemoration of the death of Christ, and a profession of belonging to His church, the bread and wine being only symbols: a view which is adopted in substance by Socinians and Arminians. Luther

bitterly opposed the symbolical view, especially towards the latter part of his career; Zwingli's doctrine was more repugnant to him than the deeper and more mystic Catholic doctrine.

Calvin sought to strike a middle course, which has been substantially followed by the Reformed Churches. According to him, the body of Christ is not actually present in the bread and wine, which he also holds to be mere symbols. But the 'faithful' receiver is, at the moment of partaking, brought into union with Christ, through the medium of the Holy Spirit, and receives of that heavenly power (efficacy) which is always emanating from His glorified body in heaven. Melancthon, in this controversy, was inclined to the views of Calvin; but he thought a union might be effected by adopting the declaration that Christ in the Eucharist is 'truly and really' present (not merely in faith). The endeavours of Melancthon and his party, by arbitrary alterations of the Augsburg Confession and other means, to effect a public reconciliation only served to rouse among the partisans of Luther a furious theological storm, and the result was the establishment of the views of Luther, and the final separation of the Lutheran and Reformed Churches.

The whole controversy relates to the *mode* in which the body and blood of Christ are present in the Lord's Supper; for it was agreed on all hands that they are present in some way. The Reformed theologians argued that *presence* is a relative term, opposed not to distance, but to absence; and that presence, in this case, does not mean local nearness, but presence in efficacy. Here they parted company both with the Roman Catholic Church and with the Lutherans. They were willing to call this presence 'real' ('if they want words,' as Zwingli said), meaning true and efficacious, but they would not admit corporal or essential presence. But while the Reformed Churches were at one in holding that by receiving the body and blood of Christ is meant receiving their virtue and efficacy, there is some difference in their way of expressing what that efficacy is. Some said it was their efficacy as broken and shed—i.e. their sacrificial efficacy; others, in addition to this, speak of a mysterious supernatural efficacy flowing from the glorified body of Christ.

With regard to the Reformed Churches, it may be remarked that their Confessions on this point were mostly formed for the express purpose of compromise, to avoid a breach with the Lutherans. Hence the language of these Confessions contains more of the mystical element than the framers of them seem, in other parts of their writings, to favour. And it is remarkable that the Anglican Confessions, which were framed under different circumstances, lean more to the symbolical view of Zwingli than do those of most of the Reformed Churches. The Thirty-nine Articles, after laying down that, 'to such as with faith receive the same, it is a partaking of the body of Christ,' repudiate the notion of Transubstantiation, and add, 'The body of Christ is given, taken, and eaten in the Supper only after an heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the Supper is faith.' The Anglican Church is divided on this, as on several kindred topics, into two parties: with one the symbolical view of the rite is predominant; the other party reprobate this view as 'low,' and maintain an *objective* 'mystical presence' of the thing signified, along with the sign. The view of the latter party as to the sacrificial nature of the Sacrament approaches very closely that of the Church of Rome. For the various points of difference amongst Anglicans as to vestments, the eastward position, &c., reference must be made to the books

cited below. In the Mackonochie case (1869) it was decided that the celebrant had no right to kneel during the prayer of consecration; in the Purchas case (1871), that he had no right to adopt the eastward position.

The Presbyterian Church adopted substantially the views of Calvin. The words of the Westminster Confession are: 'That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called Transubstantiation) by consecration of a priest, or by any other way, is repugnant not to Scripture alone, but even to common sense and reason. . . . Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of His death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine; yet as really, but spiritually, present to the faith of believers in that ordinance as the elements themselves are to their outward senses.' But the tendency is nowadays to regard the rite in its commemorative character, and the signs as means of working upon the mind and feelings subjectively, rather than as the vehicle of any objective, mystically operating grace.

This variety of dogmatical opinion as to the Eucharist naturally gave rise to variety in the ceremonial of its observance. The Catholic notion of a mysterious transformation produced the dread of allowing any of the bread and wine to drop, and led to the substitution of wafers (*hostiae, oblate*) for the breaking of bread. The doctrine of the 'real union,' which declares that in the bread as well as in the wine, in each singly and by itself, Christ entire is present and tasted—a doctrine which was attested by wafers visibly bleeding—caused the cup to be gradually withdrawn from the laity and non-officiating priests (see LITURGY); this practice was first authoritatively sanctioned at the Council of Constance, 1415. All the Reformed Churches restored the cup: in the Greek Church it had never been given. From the same feeling of deep reverence for the Eucharist the communion of children gradually came, after the 12th century, to be discontinued: the Greek Church alone admits the practice. Grounded on the doctrine of Transubstantiation, the Greek and Roman Catholic Churches hold the 'elevation of the host' (*hostia*, 'victim or sacrifice') to be a symbol of the exaltation of Christ from the state of humiliation: connected with this is the 'adoration of the host,' and the carrying it about in solemn procession. The use of leavened bread in the Greek Church, and of unleavened in the Roman Catholic and Lutheran, of water mixed with wine in the Roman Catholic and Greek Churches, and of unmixed wine in the Protestant Churches, magnified into importance by symbolical explanations, have given occasion to the hottest controversies. The greater part of the Reformed Churches agree in breaking the bread and letting the communicants take it with the hand (not with the mouth); and this practice is owing to the original tendency of those Churches to the symbolical conception of the Eucharist, in which the breaking of the bread and the pouring out of the wine are essential elements.

It has been contended that the early Christians celebrated the Lord's Supper daily, but a weekly celebration—originally in the evening along with the agape—is more probable. Abuses at the Agapæ (q.v.) led to the separation from them of the Lord's Supper, which now took place in the morning. Early synods ordained that the faithful should receive the communion at all the higher

festivals—Epiphany, Easter, Pentecost, Christmas. Early morning communion, received fasting, is the rule with Catholics and High Anglicans, mid-day communion being allowed to aged and invalid persons. The Moravians always celebrate the communion in the evening. In the Roman Catholic Church it is usual to reserve portions of the Sacrament after celebration for the purpose of permitting the sick to communicate in their own houses. For kneeling or sitting at communion, see KNEELING. In the English Church it was usual to exclude non-communicants from being present during the rite, as the ancient church excluded catechumens; but neither the modern Catholic Church, the High Anglican, nor the Presbyterian practises this exclusion. In the Highlands of Scotland, through a morbid awe of eating and drinking unworthily, it is customary for devout Christians to postpone communicating till late in life. Of late some teetotalers insist on the use of unfermented wine in the Lord's Supper.

But although the great divisions of the Christian world have continued as churches to adhere to those doctrines about the Lord's Supper which were fixed and stereotyped in Acts of Council and Articles and Confessions about the time of the Reformation, we are not to suppose that the opinions of individuals within those churches continue equally uniform and fixed. Even Roman Catholic theologians, like Bossuet, have sometimes endeavoured to understand the doctrine of the church in a philosophical sense; and in the Lutheran Church the greatest variety of opinion prevails. Some uphold unmodified the dogmas of Luther; others accept them with explanation; Hegel even undertook to ground them on speculative reason. Others, as Schleiermacher, would have recourse to the views of Calvin as a means of reconciliation with the Reformed Churches. Even all 'supernatural' theologians do not adhere strictly to the formulas of the church; while rationalism in all its phases tends to the pure symbolism of Zwingli.

See the relevant works of Hooker, Barrow, Jeremy Taylor, Waterland, Burnet, Calvin, Hodge, Oosterzee, Dörner, Schmid, Wilberforce, Pusey, and Father Dalgairns; Hagenbach's and Harnack's histories of dogma; relevant articles in the *Catholic Encyclopedia*, Hauck-Herzog, and Hastings's *Encyclopedia of Religion and Ethics*, and other works cited at LITURGY; Ebrard (1846), Kahnis (1851), Ruckert (1856); Armstrong, *The Sacraments of the New Testament* (New York, 1880); Dean Stanley, *Christian Institutions* (1881); Father Bridgett, *History of the Holy Eucharist in Great Britain* (1881); *Clerical Symposium on the Lord's Supper*, by Luthardt, Pressensé, Littledale, and others (1881); several works by Bishop Gore (1895-1902); and for the influence of the Pagan mysteries on the development of the Christian cult, and the liturgy as a drama of Redemption, see the works of Aurich, Rohde, and Reitzenstein; Miss Underhill's *The Mystic Way* (1913), and W. K. Fleming's *Mysticism in Christianity* (1913).

Lorelei, or **LURLEI** (*lei* = slate-rock), a rock which rises perpendicularly from the Rhine, to the height of 427 feet, near St Goar. It used to be dangerous to boatmen, and has a celebrated echo. But the name is best known from Heine's song of the siren who sits on the rock combing her hair and singing so ravishingly that the boatmen are drawn upon the rock and perish. The legend is not, however, 'a *märchen* of olden days'; the first form of it was an invention of Clemens Brentano, published in his ballad 'Zu Bacharach am Rheine wohnt eine Zauberin' (1800). It soon passed into a popular legend, and has suggested several variants to modern German poets. Max Bruch and others have composed operas on it.

Lorentz, **HENDRIK ANTOON**, Dutch physicist, was born at Arnheim, 18th July 1853, took his doctorate at Leiden in 1875, and three years later

became professor of mathematical physics there. With lecturing at Leiden he has lately combined the direction of physical research at the Teyler Institute in Haarlem. The first volume of his collected papers in theoretical physics appeared (in German) in 1907. See RELATIVITY.

Lorenzo. See MEDICI.

Lorenzo Marques. See LOURENÇO MARQUES.

Loreto, an interior department of Peru, watered for thousands of miles by the Marañon and its tributaries. Area, 288,450 sq. m.; pop. 200,000. The quickest route from the coast to this province, which is only some 700 miles distant in a direct line, is round the north coast of South America and up the Amazon, a journey of 6500 miles. The capital is Iquitos.

Loretto (properly LORETO), a city of Italy, stands 3 miles from the Adriatic and 15 by rail SSE. from Ancona. It has a royal palace (designed by Bramante), and 7000 inhabitants; but is chiefly noticeable as the site of the sanctuary of the Blessed Virgin Mary called the *Santa Casa*, or Holy House, which is reputed to be the house in which the Virgin lived in Nazareth. It was miraculously translated, first, in 1291, to the neighbourhood of Fiume, thence in 1294 to a wood near Recanati, and was finally transferred to its present site in 1295. It was grievously injured by fire in 1921. The church of the *Santa Casa* stands near the centre of the town, before it a colossal bronze statue of Pope Sixtus V. Its great central door is surmounted by a splendid bronze statue of the Madonna; and in the interior are three bronze doors with bas-reliefs, representing the principal events of scriptural and ecclesiastical history. The Holy House itself is a single apartment of no great size, originally of rude material and construction, but now cased with white marble, and exquisitely sculptured, after Bramante's designs, by Sansovino, Bandinelli, and other artists. The subjects of the bas-reliefs are taken from the history of the Virgin Mary, with the exception of three on the eastern side, which are devoted to the legends of the Holy House itself. The image of the Virgin which it contains is traditionally believed to have been carved by St Luke. The rest of the interior of the church is rich with bas-reliefs, mosaics (by Domenichino and Guido Reni), frescoes, paintings, and bronze-work. Cardinal Newman accepted the miracle of the translation. This shrine is still visited by thousands of pilgrims; once the number averaged 200,000 a year.

Lorient, a seaport in the French department of Morbihan, situated on a good bay, 116 miles by rail NW. of Nantes, is a well-built town with a deep and spacious harbour. It was founded in 1664 by the French East India Company; but, after the ruin of their trade by the English towards the close of the next century, their plant was acquired by the government, who since 1815 have made Lorient the principal naval shipbuilding-yard in France. The dockyard and arsenal are consequently among the best and largest in the country, and the place ranks as a fortress of the second class. Lorient has schools of navigation and marine artillery, and an observatory. The inhabitants are engaged chiefly in shipbuilding and its cognate trades, and in fishing (especially for sardines). The trade has rapidly increased since the beginning of the 20th century. Pop. (1872) 30,928; (1921) 46,314. Off this port the British fleet under Lord Bridport defeated the French under Villaret-Joyeuse on 23rd June 1795.

Lorimer (Fr. *lormier*, from Lat. *lorum*, 'a thong'), a maker of bits, spurs, stirrup-irons, metal mountings for saddles and bridles, and generally of metal parts of horse-furniture. In London the

lorimers, who had previously formed part of another guild, were incorporated by letters-patent in 1712; in Scottish burghs they have been comprehended as a branch of the corporation of Hammermen.

Lorimer, JAMES, jurist, was born at Aberdalgie, in Perthshire, on 4th November 1818, studied at Edinburgh, Geneva, Bonn, and Berlin, was called to the Scottish bar in 1845, and in 1862 appointed professor of Public and International Law in the university of Edinburgh. In 1873 he took a principal share in founding the Institute of International Law. He died on 13th February 1890. Besides being a busy contributor to the first edition of this *Encyclopædia* and to the *Edinburgh* and *North British Reviews*, he wrote, from the standpoint of the historic-political school, *Handbook of the Law of Scotland* (1862; 5th ed. 1885); *Constitutionalism of the Future* (1865; 2d ed. 1867); *Reasons for the Study of Jurisprudence as a Science* (1868); *Institutes of Law* (1872; 2d ed. 1880); and *Institutes of the Law of Nations* (1883-84), besides *The Universities of Scotland* (1854); *Political Progress not necessarily Democratic* (1857); and *Studies, National and International* (1891).

Loris (*Loris gracilis*), a small lemur of southern India and Ceylon, with very large eyes and slender limbs. It catches birds sleeping on the branches, and also eats vegetable food. The larger Slow Loris is *Nycticebus tardigradus*, widely distributed in the East, a shy, nocturnal, arboreal lemur, with deliberate and noiseless movements, chattering when angry, whistling when pleased, and ever hiding its face in its hands. In the same sub-family Lorisinae there is another quaint form, the African Potto (*Perodicticus*).

Lorn, or LORNE. See ARGYLL and ARGYLL (DUKES OF).

Lorrain, Lorraine. See CLAUDE LORRAINE.

Lorraine was incorporated in the German empire in 855, when Lothair II., son of the Emperor Lothair I., obtained the lands between the Scheldt, Meuse, and Rhine, called Lotharingia, or Lorraine (Ger. *Lothringen*). It at first included Alsace and Friesland; but these provinces were separated from it in 870. About 911 the ruler was elevated from the dignity of count to that of duke. In 954 Lorraine was divided into two duchies, Upper and Lower Lorraine. The latter came into the hands of the Dukes of Brabant in the beginning of the 13th century, and from that time was known as Brabant. It was incorporated in Burgundy (q.v.) by Philip the Good in 1429, and now forms part of the kingdom of Belgium, and the provinces of Brabant and Guelderland in Holland. Upper Lorraine continued to be governed by its own dukes till 1736, when it was given to Stanislas, ex-king of Poland, and on his death in 1766 was united to France. It was afterwards subdivided into the departments of Meuse, Moselle, Meurthe, and Vosges. The district lying between Metz and the Vosges, called German Lorraine, was ceded to Germany in 1871, to France in 1919. See ALSACE-LORRAINE.

Lorraine, CLAUDE. See CLAUDE LORRAINE.

Lorris, GUILLAUME DE. See MEUNG (JEAN DE).

Lory, a common name for the members of a family of parrots, technically known as Trichoglossidae, rigidly confined to the Australian region. They are beautiful, gregarious, noisy, quick-flying birds, feeding on fruits, and gathering the nectar of flowers with their brush-like tongues. Among the genera are *Lorius*, *Trichoglossus*, and *Eos*. The name lory is also applied to the genus *Eclectus* in a different family of parrots, and to a South African Turaco (*Turacus corythaix*).

Los Angeles, the most populous city of the western United States, and capital of Los Angeles county, southern California, is 483 miles S.E. of San Francisco by the Southern Pacific Railroad. It is one of the oldest towns in the western states, and was already a thriving place when the Franciscan fathers established a mission there in 1781; its full name being *Pueblo de la Reina de los Angeles*. In 1835-47 it was the capital of the Mexican state of California. To-day it possesses a handsome opera-house, the university of southern California (Methodist Episcopal), Presbyterian and Catholic colleges, a Roman Catholic cathedral. There are botanic gardens, over twenty parks, many fine public buildings, libraries, Indian collections, and a crematory. The Spanish population is rapidly disappearing. The pop. in 1870 was only 5728; in 1900, 102,479; in 1920, 576,673. Los Angeles is the centre of a great orange and fruit-growing industry, much of the surrounding country being admirably irrigated for the purpose by artesian wells. Petroleum refining, meat-packing, machine-making, milling, lumber work, railway engineering, and printing are carried on, and cinematograph films are made; but the main interests are the cultivation and export of oranges, grapes, and other fruits, as well as the manufacture of wine. A great number of invalids and others seeking a fine climate resort to Los Angeles in the winter.

Löss, or **LOESS**, a loamy deposit of Pleistocene age, abundantly developed in the valleys of the Rhine, the Danube, the Rhone, and many of their tributaries. It is a pulverulent yellowish-gray or brownish loam, homogeneous and non-plastic, and consists principally of clay with small angular grains of quartz, and extremely minute scales of mica, together with a larger or smaller admixture of carbonate of lime and some iron oxide. It has a tendency to cleave in vertical planes, and thus forms cliffs where streams intersect it. The organic remains of the löss consist principally of land-shells of existing species, but now and again freshwater shells are met with. Occasionally, also, the remains of man and the Pleistocene mammals are encountered, such as mammoth, woolly rhinoceros, reindeer, glutton, &c. In some places again are found relics of lemming, marmot, jerboa, &c., and other forms which are suggestive of steppe conditions. Geologists are still in some doubt as to the origin of the löss. The deposit is of such variable thickness (from a few feet up to 100 yards), and occurs at such very different levels, that it seems probable that more than one agency was concerned in its formation. Much of the löss was probably deposited from the flood-waters that escaped from the great ice-fields and melting snows of glacial times. Some of it again seems to have been the result of the weathering and disintegration of pre-existing accumulations, and the washing down of the disintegrated material by rain. And it seems likely enough that the superficial portions of fluvioglacial loams may have been modified to some extent by the action of wind. Richthofen, indeed, has maintained that the löss is essentially a wind-blown accumulation—a conclusion he came to from a study of the löss of China (q.v., p. 181). This theory, however, does not explain many of the phenomena, and the general opinion of geologists is in favour of the aqueous origin of löss as a whole. The European löss is undoubtedly associated with the glacial deposits of the Continent, and in North America, where löss is strongly developed, the same relationship obtains. The geologists of the United States Geological Survey maintain that the lössic accumulations which cover enormous areas in the great basin traversed by the Mississippi and its affluents are essentially of fluvial origin.

For a general account of the European löss, see J. Geikie, *Prehistoric Europe* (1881), and *Address to Geol. Section, Brit. Assoc., Newcastle Meeting* (1889). For American löss, see *Sixth Annual Report, U.S. Geol. Survey* (1885). For Chinese löss, see Richthofen's great work on China. See also **BLACK EARTH**.

Lost Property. In point of law, the finder of lost property is entitled to keep it until the owner is found; but there are certain circumstances in which the keeping of it will amount to larceny. The rule in England is that, if the finder find the property in such circumstances that he either knows the owner, or has reasonable grounds for believing that he can be found, then the taking of the property with intent to keep it will be larceny. If, for example, a servant finds a sovereign in her master's house, and keeps it, that is larceny; so, too, where the prompter on the stage of a theatre picked up a £50 note which had been dropped by one of the actors. On the other hand, if at the time of finding there be no reasonable probability of ever discovering the true owner, then there is no larceny, even though the finder does afterwards acquire knowledge of or reasonable probability of discovering the true owner. Again, there cannot be a conviction if the finder did not when he took the goods intend to convert them, or if he was under the reasonable impression that the owner had abandoned his right of property therein. It has also been decided that the mere keeping of a lost article, in hopes of getting a reward for giving it up, though the owner be known, does not amount to larceny. There is also no obligation on the finder of lost property to incur expense in advertising for the owner; and it is to be borne in mind that the real owner is not divested of his property by the loss, but can demand it from whosoever is in possession of it. But lost bills of exchange and notes, if transferred for valuable consideration without notice, become the property of the transferee. Moreover, the loser of a bill or note payable to bearer could not at English common law sue the party liable either on the bill or note itself, or on the indorsement, but by sec. 69 of the Bills of Exchange Act, 1882, the court may order the drawer to furnish the loser with another bill of the same tenor if a proper indemnity be given. In Scotland, also, the tenor of a lost bill may be established by a process for proving the tenor. The finder of lost property is not entitled to it, where the property consists of gold, silver, &c., hidden in the earth, in which case the treasure belongs to the crown or its grantee; the finder must give notice thereof, under a penalty. The right to wreck was long in controversy, but now the finder must notify the receiver of wreck; if not claimed within a year it falls to the crown.

Lost Tribes. See **BABYLONISH CAPTIVITY**, **ANGLO-ISRAELITE THEORY**.

Lot (anc. *Oltis*), one of the largest tributaries of the Garonne in France, rises in Mont Lozère, a section of the Cévennes, flows in a generally western direction, being known at first as the Olt, through the departments of Lozère, Aveyron, Lot, and Lot-et-Garonne, and joins the Garonne from the right at Aiguillon, after a course of nearly 300 miles, nearly two-thirds being navigable.

Lot, a department in the south of France, formed out of the old province of Guienne, and comprising the arrondissements of Cahors, Gourdon, and Figeac, is watered by the Dordogne and the Lot. Area, 2012 sq. m.; pop. (1872) 281,404; (1921) 176,889. The eastern districts are invaded by the Causses plateaus of the Cévennes. The valleys are fertile. Wheat, maize, tobacco, fruits, chestnuts, and wine are the more important products. Sheep-breeding is largely carried on.

Milling, tanning, and the manufacture of woollens are the only branches of industry. Capital, Cahors.

Lot. See DIVINATION, SORTES VIRGILIANÆ.

Lot-et-Garonne, a department in the south-west of France, formed out of the old provinces of Guienne and Gascony. It comprises the arrondissements of Agen, Villeneuve, Marmande, and Nérac, and is watered by the Garonne and its tributaries, the Gers and Lot. Area, 2067 sq. m.; pop. (1841) 347,073; (1921) 239,972. The department is a rolling plain and extremely fertile, except in the south-west, where it is invaded by the Landes (q.v.), of which much has been reclaimed by planting pines. The principal products are wheat, maize, wine, hemp, fruits (the plums of Agen are particularly celebrated), tomatoes, tobacco, potatoes, flax, and oil-plants. Pine, cork, and chestnut woods are numerous. Poultry are reared in great numbers for exportation. Manufacturing industry is exhibited chiefly in metal-works, paper-mills, woollen and cork factories, distilleries, and tanneries.

Lothian, anciently the whole territory between the Tweed and the Firth of Forth, which, from 547 a portion of Bernicia or of Northumbria, was not finally annexed to Scotland till 1018. The name is now restricted to Haddington, Edinburgh, and Linlithgow shires, which are called respectively East, Mid, and West Lothian. See SCOTLAND and BORDERS.

Loti, PIERRE, the pen-name of LOUIS-MARIE-JULIEN VIAUD, a charming but hardly a great writer, who quickly reached the heart of France, and climbed into a chair at the Academy as early as 1891. Born in a Huguenot home at Rochefort, 14th January 1850, he entered the navy at an early age, and was thus enabled to reap in his voyages round the world that harvest of exotic impressions which was to give him a literary stock-in-trade of a quite individual character. *Lieutenant-de-vaisseau* by 1881, he was a year in disgrace for a too truthful series of lectures in *Figaro* on the conduct of the French soldiers at Hué in 1883. His first work, *Aziyadé* (1879), a series of pictures of life on the Bosphorus, was weak and spoiled by affectation; the second, *Le Mariage de Loti* (1880), carried the imagination captive with all the charm of the coral seas. To Tahiti and the story of Rarahu followed Senegal and the story of Fatou-gaze in *Le Roman d'un Spahi* (1881); next with *Mon Frère Yves* (1883), Brittany and the seas of Southern Europe; and again in his masterpiece, *Pêcheur d'Islande* (1886), Brittany and the seas of the frozen North. To the standard of these two the later works have not attained: *Propos d'Exil* (1887), *Madame Chrysanthème* (1887), *Japoneries d'Automne* (1889), *Le Roman d'un Enfant* (1890), *Au Maroc* (1890), *Le Livre de la Pitié et de la Mort* (1891; Eng. trans. by T. P. O'Connor, 1892), *Fantôme d'Orient* (1892), *Le Desert* (1894), *La Galilée* (1895), *Ramuntcho* (1897), *L'Inde sans les Anglais* (1903), *Madame Prune* (1905), *Les Désenchantées* (1906), *La Mort de Philae* (1908), *Le Château de la Belle au Bois Dormant* (1916). The simplicity yet intensity of his sensuous impressions, the pervading emotional sympathy with all nature, the tenderness and elemental melancholy, largely explain the charm of Pierre Loti. *Capitaine-de-vaisseau* from 1906, he participated in the Great War. He died 10th June 1923.

Lotions, or WASHES, are remedies, usually dilute, of a liquid, but not of an oily nature, which are applied to circumscribed portions of the surface of the body. The yellow and black mercurial lotions are used generally, particularly the latter, in cases of syphilitic origin. The most important groups are antiseptic, solutions of corrosive sublimate, carbolic acid, boracic acid, &c.; sedative,

containing opium, belladonna, acetate of lead, &c.; stimulating, containing capsicum, sulphur, chloride or sulphate of zinc, &c.

Loto'phagi (Gr. 'lotus-eaters'), a name applied by the ancients to a peaceful and hospitable people inhabiting a district of Cyrenaica, on the north coast of Africa, and much depending for their subsistence on the fruit of the lotus-tree, from which they also made wine. According to Homer, they received Odysseus hospitably, and the lotus-fruit made his compatriots lose all desire to return home. This happy languor was happily expressed by Tennyson in 'The Lotus-eaters.'

Lotos. See LOTOPHAGI, LOTUS.

Lötschberg, in the Berenese Oberland, was pierced in 1906-11 by a tunnel 9½ miles long, a northern outlet to the Simplon traffic, which connects the Swiss railway system with the French.

Lottery. See GAMING.

Lotto, LORENZO, painter, was born about 1480 in Venice, and died about 1556 in Loretto, where he was latterly supported by the Santa Casa, on which he had bestowed his property. He painted mainly religious and allegorical subjects. See monograph by Berenson (London, 1895).

Lotus. The name *Lotos* (Lat. *Lotus*) was given by the Greeks to a number of different plants whose fruit was used for food. One of the most notable of these is the *Zizyphus Lotus* of the north of Africa and the south of Europe, a shrub belonging

Nymphaea Lotus.

to the natural order Rhamnæ (see JUJUBE).—The fruit of the *Diospyros Lotus*, or Date Plum (q.v.), is the European *Lote*.—The name lotus was also given to several beautiful species of Water-lily (q.v.), especially to the Blue Water-lily (*Nymphaea stellata*) and the Egyptian Water-lily (*N. Lotus*), which grow in stagnant and slowly running water in the south of Asia and north of Africa. The *Nymphaea Lotus* grows in the Nile and adjacent rivulets, and has a large white flower. The root is eaten by the people who live near the lake Manzaleh. The rivulets near Damietta abound with this flower, which rises 2 feet above the water. It was the rose of ancient Egypt, the favourite flower of the country, and was often made into wreaths or garlands, placed on the foreheads of women, or held in their hands, and smelt for its fragrance. It frequently appears in the hieroglyphs, where it represents the Upper Country or Southern Egypt, and capitals of columns, prows of boats, and heads of staves were often fashioned in its shape. In mythology it was the emblem of Nefer-Tum; Harpocrates is seated upon it; and there was a mystical lotus of the sun. The lotus of Chinese and Hindu mythology is the Nelumbo (q.v.).—By botanists the name *Lotus* has been appropriated to

a genus of the order Leguminosæ, consisting of some 80 species, natives of the temperate regions of the eastern hemisphere. One of the British species is the bird's-foot Trefoil (*Lotus corniculatus*), whose yellow or orange-coloured flowers are familiar on the sandy soils of golf-links and elsewhere.

Lotze, RUDOLF HERMANN, philosopher, was born at Bautzen in Saxony, on 21st May 1817, studied both medicine and philosophy at Leipzig, was appointed professor of the latter subject at the same university in 1842 and at Göttingen in 1844; in 1881 he moved to Berlin, but died on 1st July of that year. It was as a physiologist that he first attracted notice by his articles contributed to Wagner's *Handwörterbuch der Physiologie*. In these he combated the then accepted doctrine of vitalism or a specific 'Lebenskraft', and argued for a thorough-going mechanical treatment of the phenomena of life. The same views were expressed in his *General Physiology of Bodily Life* (1851), and led many to rank him with the materialistic thinkers of the day, though his real philosophical position, to which he remained constant through life, had been already expressed in his *Metaphysik*, published in 1841. The most comprehensive statement of his views on nature and man is contained in his *Microcosmus* (3 vols. 1856-64). By this 'attempt at an anthropology,' in which he invokes the example of Herder, he is most widely known. Its attractive style and the semi-popular character of some of its disquisitions have contributed to make it read beyond the schools. A more systematic presentation of his thought was cut short by death. Only two of the three promised volumes appeared, the first on *Logic* (1874), and the second on *Metaphysics* (1879). In addition to the works named, his *Medizinische Psychologie* (1852) and his *Geschichte der Ästhetik in Deutschland* (1868) deserve mention. Philosophically, Lotze comes of the lineage of Leibniz and Herbart; he starts, that is to say, from the standpoint of individualism or monadism. But he has also been powerfully influenced by Hegel and the German idealists, and he rounds off his individualism with the doctrine of one infinite real Being, within which individuals act and live. He considers this the only supposition which can explain the action of individual things upon one another. Lotze carries on, however, a constant polemic against what he considers the exclusively intellectual and abstract character of Hegelianism, and his own philosophy may be treated as in great part a justification and reassertion of feeling—in other words, of the demands made by man's ethical, æsthetic, and religious instincts. His other polemic is against the so-called scientific philosophy of the age. While conceding to mechanism its fullest rights in the explanation of events, Lotze everywhere insists that mechanism gives only, as it were, the scaffolding of existence, and that the meaning of the universe can only be read in the light of the Highest Good. Mechanism must be regarded philosophically as the instrument of purpose. Lotze's doctrine is therefore a teleological idealism, largely based on ethical considerations. His distinction, however, is not that of a systematic thinker, and he combats the deductive tendency of his predecessors. See books by H. Jones (1895), Falckenberg (1901 *et seq.*), Schoen (1902), E. E. Thomas (1922).

Loubet, ÉMILE, born in 1838 at Marsanne (Drôme), was French president in 1899-1906, the period of the Dreyfus affair, the Algéiras conference, and the breach between church and state.

Loudon, GIDEON ERNST, FREIHERR VON (1716-90), Austrian generalissimo, was born at Tootzen, in Livonia, whither his ancestor had migrated from

Ayrshire in the 14th century. In 1732 he entered the Russian service, but ten years later exchanged into that of Austria, soon afterwards marrying and turning Catholic. In the Seven Years' War he won the title of Freiherr (Baron) at Hochkirch (1758); at Kunersdorf (1759) he turned defeat into victory; and his loss of the battle of Liegnitz (1760) was due mainly to Lacy and Daun. As field-marshal he commanded in the war of the Bavarian Succession (1778), and against the Turks (1788-89), capturing Belgrade and Semendria. See Life by Malleson (1884).

Loudon, JOHN CLAUDIUS (1783-1843), born at Cambuslang, became a gardener, and from 1803 published, with an ardour that neither ill-health nor poverty could abate, a long series of books on forestry, gardening, and botany, mostly of popular character. His *Arboretum et Fruticetum Britannicum* (8 vols. 1838), a very full account of the trees and shrubs, indigenous or introduced, growing in the open air in Britain, involved him in money difficulties.

Loughborough, a municipal borough, incorporated in 1888, of Leicestershire, 11 miles NNW. of Leicester. The Decorated parish church dates from the 14th century, but has a Perpendicular tower. The grammar-school was founded in 1495, the girls' grammar-school in 1849, and a free library in 1885. Hosiery is the staple manufacture; and bell-founding was introduced in 1840, the great Bell (q.v.) of St Paul's being cast here in 1881. A bell-tower was erected as a war memorial (1923). Other industries are dyeing, brick-making, and the manufacture of machinery. There is an active trade in coal. John Howe and Cleveland were natives, and Wedderburn took hence his title Lord Loughborough.

Loughrea, a market-town in County Galway, beautifully situated on a little fresh-water lake, 17 miles SW. of Ballinasloe. It has ruins of a castle and Carmelite monastery, both dating from about 1300. Pop. 2400.

Louis I. of Bavaria. See BAVARIA.

Louis IX., or ST LOUIS, king of France, born at Poissy, April 25, 1215, succeeded his father, Louis VIII., in 1226. His mother, Blanche of Castile, a woman of great talent and sincere piety, was regent during his minority, and bestowed on him a strictly religious education, which materially influenced his character and policy. When Louis attained his majority he became involved in a war with Henry III. of England, and by his victories compelled the English king to acknowledge French suzerainty in Guienne. During a dangerous illness he made a vow that, if he recovered, he would go in person as a crusader, and accordingly, having appointed his mother regent, he sailed in August 1248, with 40,000 men to Cyprus, whence, in the following spring, he proceeded to Egypt, thinking by the conquest of that country to open the way to Palestine. He took Damietta, but was afterwards defeated and taken prisoner by the Mohammedans. A ransom of 100,000 marks of silver procured his release on May 7, 1250, with the remnant (6000 men) of his army. He proceeded by sea to Acre, and remained in Palestine till the death of his mother (November 1252) compelled his return to France. Having a large number of blood-relations among the dukes and counts of France, he used these to strengthen the 'legitimist' loyalty to his house, determined by the Pragmatic Sanction the relation of the French Church to the pope, founded the theological college in Paris famous under the name of 'La Sorbonne,' gave France a new judicial organisation by setting up in the provinces royal courts of justice or parliaments, which superseded the juris-

diction of the 'lord of the manor,' and gradually gave rise to the *noblesse de robe*, from amongst which the kings recruited their civil servants. A code of laws was brought into use, known as the *Établissements de St Louis*. Louis embarked on a new crusade, July 1, 1270, and proceeded to Tunis; but a pestilence breaking out in the French camp carried off the greater part of the army and the king himself. He died August 25, 1270; and his son, Philip III., was glad to make peace and return to France. Pope Boniface VIII. canonised him in 1297. See the *Vie de St Louis* by Joinville (q.v.), Louis's friend, Wallon's *Life of him* (4th ed. 1893), Perry's (1901), and Miss W. S. Knox's (1909).

Louis XI., king of France, the eldest son of Charles VII., born at Bourges, July 3, 1423, was from his boyhood eminently cruel, tyrannical, and perfidious. He made unsuccessful attempts against his father's throne, was compelled to flee to Brabant, and sought the protection of Philip the Good, Duke of Burgundy, with whom he remained till his father's death in 1461, when he succeeded to the crown. The severe measures which he immediately adopted against the great vassals led to a coalition against him, at the head of which were the great Houses of Burgundy and Brittany. Louis owed his success more to his artful policy than to arms; and, the war threatening to break out anew, he invited Charles the Bold, Duke of Burgundy, to a friendly conference at Péronne in October 1468. His agents meanwhile had stirred up the people of Liège to revolt against the duke, in return for which deed Charles made him a prisoner, and compelled him to associate in the punishment of Liège. Full of resentment, Louis then stirred up against Charles the Flemish towns and the Swiss republics. It became from that time a practice with French kings to have Swiss mercenaries in their pay. The Swiss defeated Charles twice, and killed him in a last battle (1477). Louis then claimed Burgundy as a vacant French fief, but was prevented from gaining possession of Charles's Flemish lands by the marriage of Mary, the rightful heir, to Maximilian of Austria. The troops of the latter defeated the French at Guinegate (1479), but the war was renewed on the death of Mary. A peace was concluded at Arras, December 25, 1482, by which the counties of Burgundy and Artois were handed over to France. Louis was also successful—after the use of means far from honourable—in annexing Provence to the crown as a lapsed fief. In order to weaken his feudal vassals he greatly increased the power and number of parliaments, an institution agreeable to the towns and to the middle class, and to which he began to grant a voice in matters of state. His favourite residence was the château of Plessis-lez-Tours, close to Tours. His chief advisers and favourites were Olivier le Dain, originally a barber, but made a count; Tristan l'Hermite, and Cardinal Baluc. He spent the latter years of his reign in great misery, in excessive horror of death, which superstitious and ascetic practices failed to allay. He died at Plessis-lez-Tours, August 30, 1483. He is said to have been the author of part of A. de la Sale's *Les cent Nouvelles nouvelles*, a sort of imitation of the *Decameron*, and of the *Rosier des Guerres*, a book of instruction for his son. He founded three universities.

See the *Mémoires* of Philippe de Comines (q.v.); the *Lettres* (ed. Vaesen and Charvay, 1883-1909); works by Legeay (1874), Willert (English, 1876), Buet (2d ed. 1886), and Hare (1907). *Quentin Durward* gives a brilliant caricature. The play *Louis XI.* is by Delavigne.

Louis XIII., king of France, son of Henry IV. and Marie de' Medici, born at Fontainebleau, 27th September 1601, succeeded to the throne on the

assassination of his father, 14th May 1610, his mother being called to the regency by an edict of the parliament of Paris, which had acquired a right to speak in the name of all the others. She entered into close alliance with Spain and the pope, and betrothed the king to Anne of Austria, daughter of Philip III. of Spain, upon which the Huguenots took up arms; but peace was concluded at St Menesbould on 5th May 1614. The king, who was now declared of age, confirmed the Edict of Nantes, and in the same year the French *États Généraux*—consisting of members of the clergy, the nobility, and the middle classes, a body more ancient than the parliaments, and in which the *bourgeoisie* sided with the kings—were summoned for the last time, as the events proved, till the reign of Louis XVI., for this constitutional chamber showed itself powerless to agree upon and follow out a policy. The restoration of Catholic church-rights in Béarn led to the religious war, in which the Protestants lost almost all their places of security, and which ended in 1622. After the death of De Luynes, in 1624, Richelieu, afterwards Cardinal and Duke, became the chief minister of Louis. His powerful mind obtained complete control over that of the weak king, and his policy effected that increase of monarchical power, at the expense of Protestants, nobles, and parliaments, which reached its consummation in the reign of Louis XIV. The overthrow of the Huguenots was completed by the capture of Rochelle, 20th October 1628, at the siege of which the king took part in person. Richelieu now led Louis to take part in the Thirty Years' War, openly supporting Gustavus Adolphus and the Dutch against the Spaniards and Austrians. The latter years of Louis's reign were signalled by the getting possession of Alsace and of Roussillon, acquisitions which were confirmed in the following reign. Louis died 14th May 1643. Under his reign was prepared the period of French ascendancy in Europe. His queen, after twenty-three years of married life, bore a son in 1638, who succeeded to the throne as Louis XIV.; and in 1640 a second son, Philip, Duke of Orleans, the ancestor of the present House of Orleans.

See MARIE DE' MEDICI, RICHELIEU; and works by Bazin (new ed. 4 vols. 1846), Topin (1876), Zeller (1879), Batiffol (1907-10), K. A. Patmore (1909).

Louis XIV., king of France, born at St Germain-en-Laye, 16th September 1638, succeeded his father, Louis XIII., in 1643. His mother, Anne of Austria, became regent, and Mazarin (q.v.) her minister. During the king's minority the discontented nobles, encouraged by Spain, sought to shake off the authority of the crown, and the civil wars of the *Fronde* (q.v.) arose. Peace was concluded in 1659; and in the following year Louis married the Infanta Maria Theresa, a princess possessing neither beauty nor other attractive qualities. Little was expected from the young king; his education had been neglected, and his conduct was dissolute; but on Mazarin's death in 1661 he suddenly assumed the reins of government, and from that time forth carried into effect with rare energy a political theory of pure despotism. His alleged saying, '*L'état c'est moi*' ('I am the state'), expresses the principle to which everything was accommodated. He had a cool and clear head, with much dignity and amenity of manners, great activity, and indomitable perseverance. The distress caused by the religious wars had created throughout France a longing for repose, which was favourable to his assumption of absolute power. He was ably supported by his ministers. Manufactures began to flourish under the royal protection. The fine cloths of Louviers, Abbeville, and Sedan, the tapestries of the Gobelins, the

carpets of La Savonnerie, and the silks of Tours and Lyons acquired a wide celebrity. The wonderful talents of Colbert (q.v.) restored prosperity to the ruined finances of the country, and provided the means for war; whilst Louvois (q.v.) applied these means in raising and sending to the field armies more thoroughly equipped and disciplined than any others of that age.

On the death of Philip IV. of Spain Louis, as his son-in-law, set up a claim to part of the Spanish Netherlands; and in 1667, accompanied by Turenne (q.v.), he crossed the frontier with a powerful army, took many places, and made himself master of that part of Flanders since known as French Flanders, and of the whole of Franche Comté. The *triple alliance*—between England, the States-general of Holland, and Sweden—arrested his career of conquest. The treaty of Aix-la-Chapelle (1668) forced him to surrender Franche Comté. He vowed revenge against the States-general, strengthened himself by German alliances, and purchased with money the friendship of Charles II. of England. He seized Lorraine in 1670; and in May 1672 again entered the Netherlands with Condé and Turenne, conquered half the country in six weeks, and left the Duke of Luxembourg to lay it waste. The States-general formed an alliance with Spain and with the emperor, but Louis made himself master of ten cities of the empire in Alsace, and in the spring of 1674 took the field with three great armies, of which he commanded one in person, Condé another, and Turenne a third. Victory attended his arms; and, notwithstanding the death of Turenne and the retirement of the Prince of Condé from active service, he continued in subsequent years, along with his brother, the Duke of Orleans, to extend his conquests in the Netherlands, where, by his orders, and according to the ruthless policy of Louvois, the country was fearfully desolated. The peace of Nimeguen in 1678 left him in possession of fortresses in the Spanish Netherlands and of Franche Comté. He now established *Chambres de Réunion* in Metz, Breisach, and Besançon, packed courts of law, in which his own will was supreme, and which confiscated to him, as feudal superior in right of his conquests, territories which he wished to acquire, seignories belonging to the Elector Palatine, the Elector of Trèves, and others. He also, on 30th September 1681, made a sudden and successful attack on Strasburg, a free German city, the possession and fortification of which added greatly to his power on the Rhine. The acquisition thus made a treaty in 1684 confirmed to him.

Louis had now reached the zenith of his career. All Europe feared him; his own nation had been brought by tyranny, skilful management, and military glory to regard him with Asiatic humility, admiring and obeying; all remnants of political independence had been swept away; no Assemblies of the States or of the Notables were held; the nobles had lost both the desire and the ability to assert political power; the municipal corporations no longer exercised any right of election, but received appointments of officials from the court; the provinces were governed by *intendants*, who were immediately responsible to the ministers, and they to the king, who was his own prime-minister. Even the courts of justice yielded to the absolute sway of the monarch, who interfered at pleasure with the ordinary course of law, by the appointment of commissions, or withdrew offenders from the jurisdiction of the courts by *Lettres de Cachet* (q.v.), of which he issued about 9000 in the course of his reign. He asserted a right to dispose at his pleasure of all properties within the boundaries of his realm, and took credit to himself for gracious moderation in exercising it sparingly. The court

was the very heart of the political and national life of France, and there the utmost splendour was maintained; and a system of etiquette was established which was a sort of perpetual worship of the king.

It was a serious thing for France and the world when Louis fell under the control of his mistress, Madame de Maintenon (q.v.), whom he married in a half-private manner in 1685, and who was herself governed by the Jesuits. One of the first effects of this change was the adoption of severe measures against the Protestants. When it was falsely reported to Louis that his troops had dragooned all heretics into conversion, he revoked the Edict of Nantes in 1685, and then ensued a bloody persecution; whilst more than half a million of the best and most industrious of the inhabitants of France fled, carrying their skill and industry to other lands. Yet Louis was by no means willing to yield too much power to the pope; and, quarrelling with him concerning the revenues of vacant bishoprics, he convened a council of French clergy, which declared the papal power to extend only to matters of faith, and even in these to be dependent upon the decrees of councils.

The Elector of the Palatinate having died in May 1685, and left his sister, the Duchess of Orleans, heiress of his movable property, Louis claimed for her also all the allodial lands; and from this and other causes arose a new European war. A French army invaded the Palatinate, Baden, Würtemberg, and Trèves in 1688. In 1689 the Lower Palatinate and neighbouring regions were laid waste by fire and sword. This atrocious proceeding led to a new coalition against France. Success for a time attended the French arms, particularly in Savoy and at the battle of Steinkerk. Reverses, however, ensued; the war was waged for years on a great scale, and with various success; and after the French, under Luxembourg, had gained, in 1693, the battle of Neerwinden, it was found that the means of waging war were very much exhausted, and Louis concluded the peace of Ryswick on 20th September 1697. The navy destroyed, the finances grievously embarrassed, the people suffering from want of food, and discontent becoming deep and general, Louis placed the Count D'Argenson at the head of the police, and established an unparalleled system of espionage for the maintenance of his own despotism. The power of Madame de Maintenon and her clerical advisers became more and more absolute at the court, where scandals of every kind increased.

When the death of Charles II. of Spain took place, on 1st November 1700, it was found that Louis had obtained his signature to a will by which he left all his dominions to one of the grandsons of his sister, who had been Louis's queen. Louis supported to the utmost the claim of his grandson (Philip V.), whilst the Emperor Leopold supported that of his son, afterwards the Emperor Charles VI. But the power of France was now weakened, and the war had to be maintained both on the side of the Netherlands and of Italy. One bloody defeat followed another; Marlborough was victorious in the Low Countries, and Prince Eugene in Italy; whilst the forces of Louis were divided and weakened by the employment of large bodies of troops against the Camisards in the Cévennes, for the extinction of the last relics of Protestantism. On the 11th April 1713 peace was concluded at Utrecht, the French prince obtaining the Spanish throne, but France sacrificing valuable colonies. A terrible fermentation now prevailed in France, and the country was almost completely ruined; but the monarch maintained to the last an unbending despotism. He died, after a short illness, 1st September 1715. He was succeeded by his great-

grandson, Louis XV. His son, the dauphin, his eldest grandson, and his great-grandson had died in 1711-12. Louis had a number of natural children, and he had legitimised those of whom Madame de Montespan was the mother; but the Paris parliament, which made no objection to recording the edict when required by him, made as little objection to annulling it when required by the next government. The 'works' of Louis XIV. (6 vols. Paris, 1806), containing his Instructions for his sons, and many letters, afford important information as to his character and the history of his reign. The reign of Louis XIV. is regarded as the Augustan age of French literature and art, in which France produced poets like Corneille and Racine in tragedy, or Molière in comedy, satirists like Boileau, or church orators and divines like Bossuet, Fénelon, Bourdaloue, and Massillon.

See Voltaire's *Siècle de Louis XIV.* (1740); Saint-Simon (1788); Lavisse's *Histoire de France* (vii.-viii. 1908); *The Cambridge Modern History* (v. 1908); and works by Gaillardin (6 vols. 1871-76), Cosnac (8 vols. 1874-81), Chéruel (4 vols. 1878-80), Michelet (3d ed. 1875), Michaud (1882-83), Chotard (1890), Du Cause de Nazelle (1899), Pardoe (1836), Hassall (1895).

Louis XV., king of France, the great-grandson of Louis XIV., born at Versailles, 15th February 1710, succeeded to the throne 1st September 1715. The Duke of Orleans, as first prince of the blood, was regent during the minority of the king, whose education was entrusted to Marshal Villeroi and Cardinal Fleury. The regent and the country became incomprehensibly infatuated with the financial schemes of the Scotsman Law (q.v.). All available capital was drawn away from agriculture and trade, pocketed by the financial cliques, the court, and the state, whose debt was thereby substantially reduced, and worthless paper-money issued instead. Every kind of indulgence in luxury and vice accompanied in high places this financial insanity. When Louis was fifteen years of age he married Maria Leszczynska, daughter of Stanislas, the dethroned king of Poland. At the death of the regent and of his shameless prime-minister Cardinal Dubois, Louis reigned personally, and put at the head of affairs his old, wise, and prudent teacher Cardinal Fleury, who repaired somewhat the economic disasters of his predecessors, and set his face against a warlike policy.

Louis having become involved in the war of the Polish Succession through his father-in-law, the duchy of Lorraine was without much fighting obtained for the latter, and for the French crown after him. When the war of the Austrian succession broke out (1740) Cardinal Fleury was averse to burdening the state with fresh debt and new military charges in support of the claims of the prince-elector of Bavaria to the imperial crown. Louis was then falling under the influence of a number of voluptuous and immoral noblemen, who set up a barrier between him and his wife, and delivered him into the hands of vice. Fleury lost ground; the government became a toy for ambitious courtiers and dissolute women, in the satisfaction of whose vanity war was declared against Austria. After a course of easy conquest in 1741 the French were badly beaten in 1742: regret and worry brought Fleury to the grave in the next year. But in the following years France, in alliance with Frederick the Great of Prussia, was repeatedly victorious on land, at Fontenoy (1745), for instance, where Louis delighted his latest mistress with the flight of English, Dutch, and Austrian troops, though on the sea the English put an end to the French navy and seafaring trade. When peace was signed at Aix-la-Chapelle France had nothing to show save the ruinous disorganisation of her finances.

The king now sank completely under the control of Madame de Pompadour, who was both concubine and procuress, and to whom he gave notes on the treasury for enormous sums, amounting in all to hundreds of millions of livres. War broke out again with Britain concerning the boundaries of Acadia (Nova Scotia), and was for some time prosecuted with considerable vigour. In 1756 an extraordinary alliance was formed between France and Austria, contrary to the policy of ages, and chiefly through the influence of Madame de Pompadour. Directed against Prussia as a threatening Protestant power, this alliance had no other result than Frederick the Great's complete victory over the French at Rossbach. The state of the finances, the dispirited condition of the army, and the outcry of the distressed people were not sufficient to induce the king to make peace; but, governed by his mistress, he obstinately persevered in war, even after the terrible defeat of Minden in 1759; whilst the British conquered almost all the French colonies both in the East and West Indies, with Cape Breton and Canada. A peace most humiliating to France was at last concluded in 1763.

Louis, although indifferent to the ruin of his people, and to everything but his own vile pleasures, was reluctantly compelled to take part in the contest between the Paris parliament and the Jesuits (q.v.), the result of which was the suppression of the order in 1764. The parliament, emboldened by success in this contest, now attempted to limit the power of the crown by refusing to register edicts of taxation; but the king maintained his own absolute and supreme authority, thanks to the indifference with which the people and the middle class viewed the privileges of the *noblesse de robe*. The Duc de Choiseul was now displaced from office, a new mistress, Madame du Barry, having come into the place of Madame de Pompadour; and a ministry was formed under the Duke d'Aiguillon, every member of which was an enemy of the parliaments and abjectly immoral. The councillors of the parliament of Paris were removed from their offices, and banished with great indignity; an interim parliament was appointed (January 1771), which duly obeyed the court. The princes of the blood protested against this arbitrary act, which left them without any means of appeal against the royal will. The king, when told of the ruin of the country and the misery and discontent of the people, only remarked that the monarchy would last as long as his life, and continued his course of sensual pleasures and trifling amusements. He boasted of being the best cook in France, and was much gratified when the courtiers ate eagerly of the dishes which he had prepared. His gifts to Madame du Barry, notwithstanding the embarrassment of the finances, in five years amounted to 180 millions of livres. At last Louis, whose constitution was already shattered from the effects of a life of vice, was seized with smallpox, and on 10th May 1774 he died in abject misery, so far from being regretted that his funeral was a sort of popular festival, and was celebrated with pasquils and merry ballads. Such was the end of Louis 'le Bien-aimé.'

See Voltaire's *Siècle de Louis XV.* (1768-70); works by Tocqueville (2d ed. 1847), Bonhomme (1873), Broglie (Eng. trans. 1879), Vaudal (1882), Perkins (1897), Waddington (1897), Imbert de Saint-Amand (1887-95), Haggard (1906).

Louis XVI., king of France, born 23d August 1754, was the third son of the dauphin, Louis, only son of Louis XV. He was styled Duc de Berri until, by the death of his father and his elder brothers, he became dauphin. He had a vigorous frame, was fond of hunting and manly exercises,

took great pleasure in making locks and such mechanical labours, and showed an aptitude for geometry but none for political science. In the midst of the most corrupt of courts he grew up temperate, honest, and moral. He was married on 10th May 1770 to Marie Antoinette, the youngest daughter of the Empress Maria Theresa.

When Louis ascended the throne (1774) the public treasury was empty, the state burdened with a debt of 4000 millions of livres, all borrowing credit was exhausted, the people were crushed under the weight of taxes, and all respect had gone from king, court, church, and governing classes. Personally full of good-will, he failed to restrain the excesses of his brothers and to resist the influence of his proud and high-handed consort. He yielded unwisely to the advice of his first prime-minister, Maurepas, an incompetent and narrow-minded courtier, in restoring to the Paris and provincial parliaments their semi-political rights in the matter of public expenditure and local taxation. The accession of Malesherbes and Turgot to the ministry heralded thorough-going reforms, which Voltaire hailed as the 'dawn of the age of reason' in French politics. But these proposals, accepted by the king, were rejected by the court, the aristocracy, the parliaments, and the church. Turgot resigned his office. Yet Louis succeeded in the remission of some of the most odious taxes, the abolition of the last relics of serfdom, the abolition of torture in judicial investigations, a reduction of the expenditure of the court, and the foundation of institutions for the benefit of the working-classes. He was for a time extremely popular, though deeper reforms were rendered impossible by the opposition of the privileged classes and the obstinacy of the queen. In June 1777, when the state of the finances seemed nearly desperate, Necker was made Director-general, and succeeded in bringing them to a more tolerable condition, without any very radical change; but, from the interference of France in the American war of independence, he was obliged to propose the taxation of the privileged classes hitherto exempted. Their resistance compelled him to resign. The American war swallowed up the revenue of three years. The appointment in 1783 of Calonne (q.v.), a spendthrift, to the finances renewed for a while the splendour of the court. At his wits' end, he advised the calling together of an Assembly of Notables, such as the monarchy, especially under Richelieu's premiership, had occasionally summoned to its help. The noblemen, clergymen, state-officials, councillors of parliaments, and municipal officers thus collected showed him bitter hostility, and, when he revived Necker's proposals, compelled him to fly to London. His successor, Loménie de Brienne, obtained some concessions and some new taxes. But the parliament of Paris refused to register the edict of taxation, as oppressive to the people; for the extravagance of the court and the queen began to be freely spoken of in a nation now fully acquainted with the facts. The convening of the States-general was demanded from every corner of France. The king registered the edicts in a *lit de justice*, and banished the councillors of parliament to Troyes, but ere long found it necessary to recall them, and experienced from them even a stronger opposition than before. On 8th May 1788 he dissolved all the parliaments and established a new kind of court (*Cour Plénière*) instead; but this act of despotism set the whole country in flames. Matters became still worse when on 16th August appeared the famous edict, that the treasury should cease from all cash payments except to the troops. Brienne was compelled to resign, and Necker again became minister. An Assembly of the States of the kingdom, in abeyance since 1614, was resolved upon;

and by the advice of Necker, who wished a counterpoise to the influence of the nobility, clergy, and court, the Third Estate was called in double number, while in other respects the precedent set in 1614 was adhered to.

The subsequent history of Louis is given under the head FRANCE. All readers of history are familiar with the melancholy incidents of his life, from the opening of the Assembly of the States (May 1789) down to his tragic execution. At ten o'clock in the morning of the 21st of January 1793 he died by the guillotine, in the Place de la Révolution. Great precautions were taken to prevent any rescue. As the executioner bound him Louis tore himself free and exclaimed: 'Frenchmen, I die innocent; I pray that my blood come not upon France.' The rolling of drums drowned his voice.

The share of the French in the American war of independence is a bright and almost romantic episode in the drama of this reign. Franklin kindled in excitable Paris such enthusiasm for liberty and democracy that Lafayette and some other ideal-loving gentlemen crossed the sea in defence of the colonists. A formal alliance ensued, and assistance was given in men, money, and ships.

See MARIE ANTOINETTE, NECKER, TURGOT, MIRABEAU; and works by Soulaye (1801), Bournisseaux (1829), Droz (2d ed. 1858), Capefigue (1844), Tocqueville (2d ed. 1850), Jobez (3 vols. 1877-93), Houssaye (1891), Beaucourt (1892), Souriau (1893), Haggard (1909), Ségur (1909-13).

Louis XVII., CHARLES, second son of Louis XVI. of France, born at Versailles, 27th March 1785, received the title of Duke of Normandy, till, on the death of his brother in 1789, he became dauphin. After the death of his father he continued in prison—at first with his mother, but afterwards apart from her—in the Temple, under the charge of a Jacobin shoemaker named Simon, who is said to have treated him with great cruelty and pushed him into vicious excesses, so that he became a mere wreck both in mind and body. After the overthrow of the Terrorists he was—perhaps intentionally—forgotten, and alleged to have died 8th June 1795. A report spread that he was poisoned, but a commission of physicians examined a body and declared the report unfounded.

All the attempts made by Louis XVIII. in 1815 to find the remains of this most hapless victim of the Revolution proved fruitless, and this fact gave room for the appearance of a succession of some forty pretenders, whose claims were believed in by many honest royalists in France. Of these the first was Jean Marie Hervagault, the son of a St Lô tailor, born in 1781, who ran away from home at fourteen, and soon found many supporters in Brittany, Normandy, Champagne, and Burgundy. In 1802 he was sentenced for his imposture to a four years' imprisonment, and later, under Napoleon's empire, was confined in the Bicêtre, where he died in 1812. Another false Louis, who attracted some attention under the name Charles of France, was Mathurin Brumeau, born in 1784 at Bezins, the son of a maker of wooden shoes. He early took to a roving life, was committed as a vagrant in 1803, next spent some years in North America, returned to push his claims in France, and was sent to prison for seven years at Rouen. After the July revolution he disappeared. The third false Louis XVII., who attracted much attention in 1833 and 1834, was the so-called Duc de Richemont, whose proper name was François Henri Hébert, a native of the Rouen district. The idea that he was a son of Louis XVI. first possessed him about 1823. After the July revolution he protested in a series of writings against Louis-Philippe, and attempted to push his claim by *Mémoires*. In 1834 he was

sent to jail for twelve years, but eight months later succeeded in making an escape to London, where he died in 1845. Perhaps the most remarkable claimant was the Potsdam watchmaker, Karl Wilhelm Naundorf, whose claim rested on a striking Bourbon resemblance. After many crosses in Berlin, Spandau, and Brandenburg, besides a three years' imprisonment, he found his way to France in 1833, but was expelled three years later. He made his way to England, and died in 1845. His children assumed the name of Bourbon, and in 1851 and 1874 raised fruitless actions before the Paris law-courts against the Comte de Chambord. See books by Welch (1908), Turquan (1908), Allen (1912).

Louis XVIII., STANISLAS XAVIER, the next younger brother of Louis XVI., born at Versailles, 17th November 1755, received the title of Count de Provence. In 1771 he married Maria Josephine Louisa, daughter of Victor Amadeus III. of Sardinia. After the accession of Louis XVI. to the throne he assumed the designation of *Monsieur*, and became an opponent of every salutary measure of the government. He fled from Paris on the same night as the king, and was more fortunate, for, taking the road by Lille, he reached the Belgian frontier in safety. With his brother, the Count d'Artois, he now issued declarations against the revolutionary cause in France, which had a very unfavourable effect on the situation of the king. The two brothers for some time held a sort of court at Coblenz. Louis joined the body of 6000 émigrés who accompanied the Prussians across the Rhine in July 1792, and issued a manifesto even more foolish and extravagant than that of the Duke of Brunswick. After the death of his brother, Louis XVI., he proclaimed the latter's son king of France, as Louis XVII., and in 1795 himself assumed the title of king. The victories of the republic and Napoleon's enmity to the Bourbon family compelled him frequently to change his place of abode, removing from one country of Europe to another, till at last, in 1807, he found a refuge in England, and purchased a residence, Hartwell, in Buckinghamshire, where his wife died in 1810, and where he remained till the fall of Napoleon opened the way for him to the French throne. On 26th April 1814 'le Désiré,' as the royalists style him, landed at Calais, after twenty-four years' exile. His return, under the protection of the allied armies, had been prepared for by Talleyrand. Then began the ascendancy of the 'legitimist' party. The powerless empress-regent was superseded by a provisional government, the Napoleonic constitution was set aside, and, in keeping with the doctrine of the 'divine right of kings,' all power was claimed by Louis XVIII. Using his discretionary rights, he granted to the nation a constitutional charter, establishing a House of Peers and a Chamber of Deputies, and vouchsafing a few elementary citizen-rights, but in every essential respect he resumed the baneful traditions of the ancient monarchy. See FRANCE.

The nobles and priests exercised an influence over the weak king which led to severe treatment of the Imperialists, the Republicans, and the Protestants. This opened the way for Napoleon's return from Elba, when the king and his family fled from Paris, remained at Ghent till after the battle of Waterloo, and returned to France under the protection of the Duke of Wellington. He issued from Cambrai a proclamation in which he acknowledged his former errors, and promised a general amnesty to all except traitors. But the Chamber of Deputies, elected with many irregularities, was so fanatically royalist and reactionary that the king, by advice of the Emperor Alexander of Russia, dissolved it; whereupon arose royalist

plots for his dethronement and the abolition of the charter. Bands of assassins were collected by nobles and priests in the provinces, who slew hundreds of adherents of the Revolution and of Protestants, and years elapsed ere peace and good order were in any measure restored. Driven by royalistic fanatics, the king dismissed his too moderate prime-minister Decazes, and could not prevent an army from passing into Spain to maintain there the right of absolute kingship. He died 16th September 1824. See Petit's *Louis XVIII.* (1885).

Louisa, queen of Prussia, was born 10th March 1776, at Hanover, where her father, Duke Karl of Mecklenburg-Strelitz, was then commandant. She was married to the Crown-prince of Prussia, afterwards Frederick-William III., on 24th December 1793, and was the mother of Frederick-William IV. and William I., afterwards emperor. After her husband's accession to the throne she became exceedingly popular, her great beauty being united with dignity and grace of manners, and with much gentleness of character and active benevolence. This popularity was increased by her conduct during the period of national calamity that followed the battle of Jena, when she displayed not only a patriotic spirit, but no little energy and resolution. She especially endeared herself to her people by her bearing when compelled to endure insult at the hands of Napoleon. She died in Strelitz, 19th July 1810. There is a beautiful monument and portrait-statue of her by Rauch in the mausoleum at Charlottenburg. See *Lives* by Miss Hudson (1877) and Miss Moffat (1906), and German works by Mommsen and Treitschke (1876) and Adami (19th ed. 1909).

Louisburg, a port on the south-east coast of Cape Breton Island, Nova Scotia, 27 miles SE. of Sydney. It is now inhabited only by a few fishermen; but there are the ruins of the old town, which under the French had a large export trade in cod, and was the strongest fortress in North America, until taken by the English in 1758. It had already been captured by the New England colonists and an English squadron in 1745, and restored in 1748; now its fortifications, which had been thirty years in building and cost over a million sterling, were demolished, and it gradually sank into ruin.

Louis-d'or (i.e. 'Golden Louis'), a gold coin which was introduced into France in 1641, and continued to be coined till 1795. The louis-d'or ranged in value from about 16s. 7d. to 18s. 9½d. sterling.—In some parts of Germany, in the old coinage, were gold pieces of five thalers, often popularly called *louis-d'or*, and the name has been occasionally applied to the French *napoléon* or 20-franc piece.

Louisiade Archipelago, a group of islands belonging to the territory of Papua, and forming an eastward extension of New Guinea. It embraces Sudest (45 miles long by 4 to 10 miles wide), Rossel, St Aignan's (28 miles long by 8 to 9 miles wide), and a vast number of smaller islands. All are mountainous, rising to 3500 in St Aignan's, and covered with vegetation. The people have both Malayan and Papuan characteristics.

Louisiana, one of the Gulf states of the American Union, extends about 200 miles from north to south and 290 from east to west, and includes the lower course of the Mississippi River, which higher up is its eastern frontier. Its land area, including the marshes bordering on the Gulf, is 45,420 sq. m.; its inland waters cover 3300 sq. m.; total area, 48,720 sq. m. This area is divided nearly equally between alluvial lands and uplands. The mean elevation of the state above sea-level is 75 feet, its

highest point 484 feet. For 25 miles inland from the Gulf marshes subject to tidal flow cover one-eighth of the state's entire surface; low, sandy pine flats and prairie lands occupy about one-eighteenth each, arable lands one-eighth, the flood-plains near the rivers one-tenth, and bluff lands, pine hills, and uplands more than one-fifth each. Most of the large rivers flow above the level of the surrounding country on ridges formed by their own deposits, and the plains around, protected by dykes (called levees), slope away into dense, wooded swamps. The bottom-lands of the Mississippi are from 20 to 70 miles in breadth, those of the Red, Ouachita, and other streams range from 6 to 20 miles. But although the flood-plains lie below, there is a large area above the rivers' high-water mark. The uplands embrace the north-western and north-eastern parts of the state, inclining gently towards the south, and crossing these are bluff lands, extending through the alluvial lands to the Gulf, and forming wonderful 'islands' covered with vegetation. Nor is the immense plain surrounding these bluffs ever inundated, but elevated and fertile, traversed by deep bayous (as minor and tributary streams are called here). Even in the coast marshes occasionally an island-hill rises, with soil firm and fertile; and at other points cattle graze, whilst thousands of acres yearly have been planted with rice. Besides the Mississippi the chief rivers are the Red, Sabine, Ouachita, and Pearl; and there are also several considerable lakes. The navigable waters of the state measure some 4800 miles.

The mean temperature of Louisiana is from 60° to 75° F., the climate being softened by the waters within and around the state, the profuse rainfall (47 to 73 inches), and the breezes from the Gulf. The vegetation in most parts is luxuriant. The forests are dense with trees—pine, cypress, oaks, cottonwood, magnolia, poplar, beech, &c. Louisiana is second among the States in output of lumber. Fruits are abundant, oranges and figs the most important. The staple crops are cotton, sugar, rice, and maize. The Louisiana rice crop is the largest of any of the States; and it produces nearly all the cane-sugar of the country.

The principal manufactures are lumber products, cotton goods, cotton-seed oil, tobacco, clothing, and boots and shoes, besides the cleaning and polishing of rice and the refining of sugar and molasses. The minerals are not generally of importance, but rock-salt is found in inexhaustible quantity at Petit Anse on Avery's Island; there is a great sulphur deposit in the south-west; hematite is got, and large quantities of petroleum. Natural gas is also very abundant.

Louisiana is divided not into counties but into parishes to the number of 64. The civil law prevails, a code based on the Code Napoléon having been adopted in 1825. The state returns eight representatives and two senators to congress. Education is fairly well provided for, and increased attention is being devoted to the free schools. The State University and Agricultural and Mechanical College is at Baton Rouge; the Tulane University is at New Orleans, where is also a university for coloured folk. See NEW ORLEANS.

The state forms part of the province of Louisiana, purchased from France in 1803, which occupied an enormously larger area than the state—namely, the whole western basin of the Mississippi from Mexico to the Canadian lakes. (See UNITED STATES, and the map there.) In 1682 La Salle (q.v.) sailed down the river and claimed the country for France, naming it Louisiana in honour of Louis XIV., and planting a colony at a point 38 miles below the present site of New Orleans. After an unsuccessful attempt at colonisation by Iberville the territory was handed over to the Mississippi

Company, under John Law (see MISSISSIPPI SCHEME), and New Orleans was founded. The company collapsed in 1720, and Louisiana reverted to the crown in 1732. It was ceded to Spain in 1762, retroceded to France in 1800, and sold to the United States by Napoleon for 60,000,000 francs three years later, being admitted as a state in 1812, although the portion between the Mississippi and Pearl rivers was not actually acquired until the Florida Purchase of 1819. The battle of New Orleans (8th January 1815) and several changes in the constitution are the only noteworthy events in its history until the civil war. Louisiana seceded in January 1861, and New Orleans was captured on 24th April 1862. More than a hundred battles were fought within the limits of the state, leaving ruin behind, whose effects long made themselves felt. Prosperity, however, has returned, and is established on a basis more sound and satisfactory than of old. Since 1877 political disturbances and outbreaks which had followed the period of reconstruction have ceased, railways have been extended, and the assessed valuation of property enormously increased; and Louisiana's chief troubles have been from the bursting of the levees, although no other has been so disastrous as the terrible flood of 1874, when one-sixth of the state was inundated.

Population.—In 1920 the urban population was 34.9 per cent. The principal cities are New Orleans, Shreveport, and Baton Rouge (the capital), all subjects of separate articles. The population is very mixed. The negroes were 38.9 per cent. in 1920 (against 43.1 in 1910), but in some parishes along the Mississippi they form three-fourths of the population. The whites are chiefly of French (some Acadian), German, or Irish descent. Those of French descent are called Creoles—a term which does not imply any admixture of African or Indian blood. There are also a number of Spanish and Italian descent. In most of the southern parishes French is habitually spoken by the people, and Spanish also is still retained to some extent. Pop. (1820) 153,407; (1860) 708,002, including 326,726 slaves and 18,527 free coloured people; (1880) 939,946; (1890) 1,118,587; (1900) 1,381,625; (1910) 1,656,388; (1920) 1,798,509.

Louis Napoleon. See NAPOLEON.

Louis-Philippe, king of the French, born in Paris, 6th October 1773, was the eldest son of Louis Philippe Joseph, Duke of Orleans. He received at his birth the title of Duke of Valois, and afterwards that of Duke of Chartres. His education was entrusted to the care of the celebrated Madame de Genlis. He entered the National Guard, and became a member of the Club of Friends of the Constitution, afterwards that of the Jacobins. Along with his father, he renounced his titles, and assumed the surname of *Égalité*. He showed both courage and capacity in the wars of the republic; but his situation became very dangerous after the unsuccessful battle of Neerwinden (1793), in which he commanded the centre. He was included in the order for arrest issued against his general-in-chief, Dumouriez, and on the 4th April escaped along with him into the Austrian territory. He sought in Switzerland a place of security for his sister Adelaide, wandered about amongst the mountains for four months, and accepted a situation as teacher of geography and mathematics in a school at Reichenau, near Chur, assuming the name of Chabaud-Latour. He afterwards wandered for some time in the north of Europe, and then went to the United States, where he spent three years. In 1800 he took up his abode at Twickenham, near London, with his two younger brothers, both of whom soon after died. In 1809 he

married Marie Amelie, daughter of Ferdinand I. of the Two Sicilies. On the fall of Napoleon he hastened to Paris, where he was received with distrust by Louis XVIII. After the second Restoration he recovered his great estates, which the imperial government had sequestered. Disliked by the court, he was very popular in Paris. The revolution of 1830—the 'July revolution'—having ended in a victory of the constitutional party over the republicans, he was appointed lieutenant-general, mainly on the proposal of the banker Lafitte and of General Lafayette. Throwing to the winds the divine right of the Bourbons, he accepted to reign as the elect of the sovereign people, under the tricolor flag of the republic and of Napoleon. He had against him the ultra-royalists and the republicans, and identified his rule with the *bourgeoisie*, who supplied him with a policy, ministers, and money, in return for their ascendancy. He was dubbed with the nickname of *roi-citoyen*, his system was called that of *Juste-milieu*, and his advisers were set down as *doctrinaires*. He reigned for the material interests of France, and for those of the House of Orleans; himself a most wealthy king, the country prospered under his rule, and the middle classes amassed considerable riches. Unfortunately, his kingship rested on a democratic basis, to which it grew more and more untrue. The revolution of 1830 had been an event of European importance, and rang in a revival of liberalism in many states where Louis-Philippe would have thought it quixotic to give it diplomatic or military assistance. Nor could he countenance the socialistic and communistic doctrines made popular among the republicans at home by Proudhon, Louis Blanc, and others. The parliamentary franchise rested on a franchise which limited the electors to the aristocracy of wealth and their hangers-on. The peasantry and working-classes were ignored, and left a prey to political agitators. The political corruption of the *bourgeoisie*, and its wholesale bribery by the king, united all extremists in a cry for electoral reform. Louis-Philippe ran the gauntlet of eight attempts at murder, which all failed. A man of great ability, but of little character, he was by fear carried, with his ministers, into paths of reactionary violence. The royalistic statesman Royer-Collard joined Odilon Barrot and the republican Left in resistance to the muzzling of newspapers. Trial by jury was tampered with. Prince Louis Napoleon Bonaparte seized this opportunity of acting twice the part of a pretender (1836, 1840). The Duke of Orleans' death in 1842 left the throne without a direct heir-apparent. Republicans, socialists, communists became more and more threatening. In vain did Louis-Philippe provide, by campaigning in Algeria, an outlet for the military spirit of his subjects; in vain did he fix their attention on foreign affairs by supporting the kingship of Mehemet Ali in Egypt. A home-policy of reform banquets, hit upon by the republican leaders as their most suitable form of attack, and severely repressed on the part of the government by recourse to an obsolete law of the 'ancien régime,' led to violent debates in the Chamber, in which Thiers, then in the opposition, helped to weaken the position of the prime-minister Guizot. Yet parliamentary means were about to foil the republican deputies, when the Paris mob rose in arms on the 22d and 23d of February 1848, with the complicity of the regular troops, the national guards, and the municipal police. Louis-Philippe dismissed Guizot, and promised reforms; but it was too late. He was compelled to abdicate, and, amidst the indifference of almost every Frenchman to his fate, ended a reign remarkable for the wave of liberalism in which it

took its rise and the whirlwind of democracy that swept it away. Deserted by his courtiers, he fled to the coast of Normandy along with his queen, concealed himself for some days, and at length escaped to Newhaven under the name of Mr Smith. He died at Claremont, 26th August 1850.

See the articles *BOURBON, FRANCE, GUIZOT, ORLEANS (DUKE OF)*; works by the Marquis de Flers (1892), Imbert de Saint-Amand (1893), Crétineau-Joly (2 vols. 1862), A. Dumas (2 vols. 1852), Nouvion (4 vols. 1861), Billault de Gerainville (3 vols. 1870-76), Vantibault (1889), Villeneuve (1889), Hamel (1890), and Cochin (1918).

Louisville, the largest city of Kentucky, a port of entry and capital of Jefferson county, is situated on the Ohio, 130 miles below Cincinnati. The river here forms a series of rapids—the 'Falls of the Ohio'—descending 22 feet in 2 miles; except at high-water steamboats pass these by a canal. The city, which covers about 40 sq. m., is handsomely built, with wide and regular streets, on a level plain, and sloping up from the river. It has a Roman Catholic cathedral, a law school, four medical colleges, colleges of dentistry and of pharmacy, a school of pharmacy for women, and a good system of public schools. Here also is the state institution for the blind, with many other institutions. Louisville is the greatest market for leaf tobacco in the world, and has large pork-packing establishments and tanneries. Extensive manufactures of ploughs, castings, machinery, and cement are also carried on, besides a vast number of other industries. The city is the terminus of a number of railway lines; the Ohio is crossed here by two railway bridges, one of them nearly a mile long. Louisville was founded in 1778, and in 1780 named in honour of Louis XVI. of France, whose troops were then assisting the Americans in the war of independence. A great part of the town was destroyed by a cyclone in March 1890. Pop. (1830) 123,758; (1900) 204,731; (1920) 234,891.

Loulé, a town in the extreme south of Portugal, 10 miles from the coast; pop. 22,500.

Louping-ill, or TREMBLING, a disease epidemic or endemic in sheep and lambs in cold spring weather, characterised by tremblings, loss of power, contraction of the gullet, and odd motions like involuntary 'louping' (leaping). The brain is affected, and sometimes the lungs and heart.

Lourdes, a French place of pilgrimage in Hautes-Pyrénées, 12 miles SSW. of Tarbes by rail; pop. 8000. The town nestles at the foot of a high rock on a plain bounded to southward by the foot-hills of the Pyrenees. The site was a Roman military station, and was successively held by Vandals, Visigoths, Franks, Basques, Saracens, Albigenses, English (after 1360), and the lords of Béarn. Here, in a niche above one of the caves of the Massabielle rocks, the Blessed Virgin is said to have appeared at noon on the 11th February 1858 to a poor girl fourteen years of age, called Bernadette Soubirous; the apparition was seventeen times repeated during the succeeding six months. A spring rising from the spot, which was hitherto unknown to exist, was endowed with miraculous powers; and many miracles were reported. Crowds flocked to the place; and the barriers erected by the sceptical local authorities (1858) were soon afterwards removed by command of the emperor. The Bishop of Tarbes then appointed a commission of ecclesiastics and scientists to inquire into the extraordinary events that had occurred at Lourdes during the last six months. After investigations extending over three years, the commission decided in favour of the apparition of the Blessed Virgin Mary, the ecstasies of Bernadette, and the miracles wrought by the water

of the spring. A great basilica (1876) now adorns the scene of the miracles, and on a level with its crypt has been added the church of the Rosary (1889) for the accommodation of the pilgrims who visit the spot. The miracles and other notable occurrences are recorded in the *Annales de Lourdes*, conducted by the Fathers of the Immaculate Conception. Bernadette (1844-79) was beatified by the Congregation of Rites in 1913. For the first fifty years are reported 4000 cures and 5300 pilgrimages, bringing 5,000,000 pilgrims (not including the more numerous single pilgrims). About 1,000,000 passengers arrive every year at the railway station.

Lourenço Marques, or **LORENZO MARQUES**, on Delagoa Bay (q.v.), the capital of Portuguese East Africa; population, 10,000 (4700 Europeans). It is the terminus of the railway to Pretoria, which was open to the Transvaal frontier in 1887, and completed in 1895. Another railway runs to the Swaziland border. In the Boer war of 1899-1900 Lourenço Marques was the scene of much intrigue, and hence Kruger sailed to Europe.

Louse. See **LICE**.

Lousewort. See **PEDICULARIS**.

Louth (pron. voiced *th*, as in *loathe*), a maritime county of the province of Leinster, and the smallest county in Ireland, is washed for 49 miles on the east, from Carlingford Lough to the river Boyne, by the Irish Sea. The average width of the county is 10 miles. Area, 202,123 acres; pop. (1841) 128,240; (1881) 77,684; (1911) 63,665. Potatoes, oats, barley, and turnips are the principal crops. The surface is flat, with the exception of a range on the north, which culminates in Carlingford Mountain (1935 feet), overlooking the bay of that name. The soil of the level districts is fertile, and agriculture reaches a high state of efficiency. Coarse linens are manufactured. The fisheries are valuable, especially the oyster-fishing in Carlingford Lough. The chief towns are Drogheda, Dundalk, and Ardee. Louth, which anciently formed part of the territory of Orgial or Argial, was occupied by De Courcy in 1183, and formed into a county by King John in 1210. It abounds with Celtic antiquities, some of great interest. There are two round-towers, at Monasterboice and at Dromiskin. At Mellifont are the remains of a beautiful abbey. In Drogheda several ruined abbeys are still visible, as also at Louth and Carlingford. But the most interesting of all the relics of antiquity are the sculptured crosses of Monasterboice, of which the larger is 18 feet in height.

Louth (hard *th*, as in *loth*), a municipal borough of Lincolnshire, on the rivulet Lud, at the foot of the Wolds, 27 miles ENE. of Lincoln, contains a beautiful parish church in the Perpendicular style, built in the 13th and rebuilt in the 15th century, with an octagonal spire (1501) 288 feet in height, 'one of the noblest in England,' and an Edward VI. grammar-school. Ruins of Louth Park Abbey, built by the Cistercians in 1139, exist $1\frac{1}{2}$ mile E. of the town. Iron-foundries, carpet-factories, breweries, and carriage-works are in operation. Louth is connected with the Humber by a canal (1761). Much damage was wrought in May 1920 by flooding due to a thunderstorm. Pop. (1851) 10,467; (1921) 9544. See the corporation records, ed. by Goulding (1892).

Louvain (Ger. *Löwen*, Flemish *Leuven*), a city in the Belgian province of Brabant, 19 miles by rail E. of Brussels. In the 14th century the town was rich, prosperous, and large (200,000 inhabitants), owing to its cloth manufactures and its position as the capital of Brabant (from 994). In 1382 the townsmen revolted against their rulers, and many fled to England. Louvain was sacked by the Germans in August 1914. The

university, founded in 1426, had in 1550 6000 students, but was suppressed in 1797. Reconstituted in 1817, it is still a Catholic university, with a famous medical school, and has such modern features as faculties of brewing and of agriculture. The university library was destroyed in 1914. The old walls, with a circuit of 5 miles, have been demolished. The modern town covers only part of the enceinte, the rest being occupied by gardens. Brewing is the chief modern industry, and there are iron-works, bell-founding, and manufactures of leather, paper, lace, starch, and chemicals. The town-house is a richly-decorated Gothic building (1448-69); the church of St Peter, grievously damaged in 1914, has a beautiful Flamboyant rood-loft, a wrought-iron chandelier by Quentin Matsys, and some good pictures; in St Gertrude's Church are fine carved oak stalls. The Weavers' Hall (1317), appropriated by the university in 1679, was destroyed in 1914. Rebuilding went on actively after the war. A new university Library was got together by the help of the John Rylands Library, Manchester, and others. Some schools of the university had sites assigned them in the park of the former chateau of the Duc d'Arenberg. Pop. (1877) 33,917; (1910) 42,123; (1922) 40,310. In 891 King Arnulf gained here a great victory over the Northmen, and built a castle against them. It used to be known as Caesar's Castle; a few fragments still remain. See *Histories* by Piot (1859), Molanus (1861), Noël (1891-1914).

Louviers, a town in the French department of Eure, 16 miles S. of Rouen, has a Gothic cathedral of the 13th to the 15th century, and celebrated cloth (since 1681) and ticking manufactures, besides spinning-mills, dye-works, &c.; pop. 10,000.

Louvois, **FRANÇOIS MICHEL LE TELLIER**, **MARQUIS DE**, the war-minister of Louis XIV., was born in Paris, 18th January 1641. His father was Chancellor and Secretary of State in the war department; the son joined him as assistant-secretary in 1662, and became war-minister in 1668. The first great task he set himself was to organise the armies of France. He created a standing army, gave it a corps of officers recruited by compulsion from among the nobility, established commissariat and hospital services, and founded the *Hôtel des Invalides* and various orders of merit. In the drilling of the armies he had a ready agent in Martinet, whose name is not yet forgotten in military life. His labours bore their fruit in the great war that ended with the peace of Nimeguen (1678). During the following years Louvois took a leading part in the capture of Strasburg, in 1681, in time of profound peace, and in the persecution of the Protestants through the dragonnades after the Revocation of the Edict of Nantes. Louvois, a man of strong will, was overbearing and autocratic, brutal and cynical, unscrupulous in his means, but consistent and single in his aims—the aggrandisement of France and the maintenance of his own position. He died suddenly on 16th July 1691. See *Life* by C. Rousset (6th ed. 4 vols. 1879); and Chotard's *Louis XIV., Louvois, Vauban* (1890).

Louvre (etymology unknown), an ornamental opening of a turret shape, placed on the roof, to allow the smoke or foul air to escape from large apartments, such as halls, kitchens, &c. These were particularly required in ancient times, when the fire was placed in the centre of the room, and there was no chimney to carry off the smoke. They are frequently used as ornaments where not required for use, and are then glazed and made into lanterns (q.v.). The sides of the louvre were lined with horizontal overlapped boarding, with a space

between the boards, which let out the smoke without admitting the rain.

Hence this sort of boarding, frequently used for the windows of bell-towers, &c., acquired the name of *louvre-boarding*.—For the palace of the Louvre, see PARIS.

Louvre.

Lovage (*Levisticum* and *Ligusticum*), two genera of the natural order Umbelliferae, allied to Angelica; the fruit is elliptical; each carpel has five sharp somewhat winged ribs; and there are many vittæ in the interstices. Common Lovage (*Levisticum officinale*) is a native of the south of Europe, with ternate decompound leaves, and obovate, wedge-shaped leaflets. It is sometimes cultivated in gardens, and, notwithstanding its strong and peculiar odour, is used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and are used to cure flatulency and to excite perspiration. A liquor called *lovage* is made from them.—Very similar in appearance and qualities is the only British species of *Ligusticum*, Scottish Lovage (*L. scoticum*), a native of the sea-coasts. It is eaten, both raw and boiled, by the Shetlanders. The flavour is aromatic, but acrid and very nauseous to those unaccustomed to it.

Lovat, SIMON FRASER, LORD, was born about 1676 at Tanich in Ross-shire. About the beginning of the 14th century his ancestor and namesake, after whom the clan Fraser were called in Gaelic *MacShimi*, 'sons of Simon,' had migrated from Tweeddale to Inverness-shire; and Hugh, his grandson, had been made Lord Lovat in 1431. Our Simon was educated at King's College, Aberdeen, took his M.A. in 1695, having the year before accepted a commission in a regiment raised for King William. In 1696 his father, on the death of his grand-nephew, Lord Lovat, assumed that title; and Simon next year attempted to abduct the late lord's daughter and heiress, a child only nine years of age. Baffled in this, he seized and forcibly married her mother, a lady of the Atholl family—a crime for which he was found guilty of high-treason and outlawed. After four years of petty rebellion (during which, in 1699, he succeeded his father as twelfth Lord Lovat) on Queen Anne's accession, in 1702, when the Atholl family became all-powerful, he fled to France, but a twelvemonth later returned to Scotland as a Jacobite agent. He was at the bottom of the 'Queensberry plot,' in which he professed to reveal the policy of the exiled court and a plan for a Highland rising; but the discovery of his duplicity obliged him once more to escape to France. There, by one (the more probable) account, he was kept for some years a prisoner at Saumur; by another, turned Jesuit, and became a popular preacher. He was still the darling of his clan; and in 1714 they sent Major James Fraser as a sort of ambassador to bring him over. Next year his cousin's husband, the holder of the estates, having joined the rebellion, Simon found it his interest to take the government side; his clan at once left the insurgents; and for this good service he obtained a full pardon, with possession of the Lovat ter-

ritory. His life for the next thirty years was active in intrigues for the consolidation of his influence; and the man who had heretofore had audience with Mary of Modena and the Grand Monarque now sought and obtained a sponsor for his first-born in George I. In the '45 Lovat tried to play a double game, sending forth the clan under his son to fight for the Pretender, whilst to his friend and neighbour, Duncan Forbes of Culloden, he made constant professions of loyalty. Culloden lost, and his castle fired by Cumberland's soldiery, he fled to an island on Loch Morar, where he was found hiding in a hollow tree. He was brought up to London, on the way being sketched at St Albans by his friend Hogarth, and, after trial by impeachment before the House of Lords, was beheaded on 9th April 1747. At his trial he defended himself with ability and dignity, and he met death gallantly, Horace's line on his lips, 'Dulce est decorum est pro patria mori.' He is buried in the Tower. A finished courtier, a good scholar, and a most elegant letter-writer, Lovat was also a ruffian, a liar, a traitor, and a hypocrite. A cultured savage, he stands as the incarnation of the clan system at its worst, the very opposite of Scott's 'Fergus MacIvor.' During the lifetime of the lady he had ravished he twice more married—in 1716 Margaret, daughter of the Laird of Grant, by whom he was father of Colonel Simon Fraser (1726–82) and three others; in 1733, Primrose Campbell, of the Argyll family, whom he had inveigled into a house of ill-fame in Edinburgh, and who bore him a third son, Colonel Archibald Fraser (1736–1815).

See Hill Burton's *Life of Lovat* (1847), and works there cited; the Autobiography of Dr Alexander Carlyle; Sir W. Fraser's *Chiefs of Grant* (1883); T. F. Henderson's article in the *Dict. of Nat. Biography*; *Major Fraser's Manuscript*, edited by Colonel A. Fergusson (2 vols. 1889); and W. C. Mackenzie's *Simon Fraser* (1908).

Love, FAMILY OF. See FAMILY OF LOVE.

Love-apple. See TOMATO.

Love-bird, a name given to various small parrots, but especially to those included in the genus *Agapornis*. These are at home in the forests of the Ethiopian region, are predominantly green in plumage, and are very affectionate both in their native haunts and in captivity. The name is, however, extended to the species of other genera and from other regions.

Lovedale, an important educational and mission station in South Africa, 650 miles E. by N. of Cape Town, and about 40 miles W. of King William's Town. It was founded in 1841, and has been supported by the United Free Church of Scotland. Besides giving a general education, it aims specially at training teachers for native schools, and teaching the arts of civilised life.

Love-feasts. See AGAPÆ.

Lovelace, RICHARD, Cavalier lyricist, was born at Woolwich in 1618, the eldest son of a Kentish knight of old family. Wood tells us he had his education at the Charterhouse, and at Gloucester Hall, Oxford, where his uncommon beauty and graceful yet modest manners made him the darling of the fair. Naturally he found his way to court, and went on the Scottish expedition in 1639, after which he retired awhile to his estate. In April 1642 he was committed to the Gatehouse at Westminster for presenting to the House of Commons a petition from the royalists of Kent 'for the restoring the king to his rights, and for settling the government,' and was only released on bail of £40,000. In the *Journals* of parliament this large sum is put as *personal bail* to the extent of £10,000, with a *surety* for £5000. Thus Lovelace throughout

the struggle was confined to the mortifying part of a prisoner on parole, but he spent his estate in the king's cause by furnishing money to his brothers and friends. In 1646 he took part in the siege of Dunkirk, and was flung into prison on returning to England in 1648. During this imprisonment he revised his poems, and in 1649 published *Lucasta*, the name formed from *Lux casta*, his epithet for his love, apparently not, as has been commonly supposed, Lucy Sacheverell, who married, says Wood, another on the stray report that Lovelace had died of his wounds at Dunkirk. After the king's execution he was set at liberty, but his estate was spent, and his last years were darkened by dejection and distress. He was dead by October 1657. His brother collected his poems as *Lucasta: Posthume Poems* (1659). His tragedy, *The Soldier*, and his comedy, *The Scholar*, were never published, and are lost. Most of Lovelace's work is slovenly, obscure, and insipid, but his name survives secure of its immortality from two of the most faultless lyrics in the language—'To Althea from Prison' and 'To Lucasta on going to the Wars.' See C. H. Wilkinson's edition (1925), in which some old biographical errors are corrected.

Love-lies-bleeding. See AMARANTH.

Lover, SAMUEL, artist, novelist, song-writer, and dramatist, was born in Dublin, the son of a Protestant stockbroker, 24th February 1797. In 1818, after three years' study, he established himself there as a marine-painter and miniaturist; and to about the same date belongs his début in literature, though it was not till 1832 that his first book appeared, *Legends and Stories of Ireland*, illustrated, like many of its successors, with his own etchings. *Rory O'More* (1836) at once became popular, and, as dramatised by him, ran through 108 nights; still, its success has been quite eclipsed by *Handy Andy* (1842), a rollicking story of Irish life. Meanwhile, in 1837, Lover settled in London, and wrote much for the periodicals, till, in 1844, his eyesight beginning to fail, he started an entertainment, called 'Irish Evenings,' which was a hit both at home and in America (1846-48). In 1856 he received a pension; and he died at St Helier, Jersey, 6th July 1863. Of his songs may be mentioned 'The Angel's Whisper,' 'Molly Bawn,' 'The Lowbacked Car,' and 'The Four-leaved Shamrock.' See *Lives* by Bernard (1874) and Symington (1880).

Low Archipelago, the most easterly group of Polynesian islands, known also as Paumotu, Tuamotu, Pearl or Dangerous Islands. They consist of about eighty coral atolls, very flat and thinly peopled (5000 in all). They include the Gambier group. The Low Archipelago is French. There are rich pearl-fisheries off these islands. See POLYNESIA.

Low Countries. See HOLLAND, BELGIUM.

Lowe, SIR HUDSON, the custodian of Napoleon in St Helena, was born at Galway, 28th July 1769. Entering the army in 1787, he served in various parts of the Mediterranean, and in 1808 capitulated at Capri to the French. But in the following year he helped to conquer Zante and Cephalonia, and then for nearly two years acted as governor of Santa Maura, Ithaca, and Cephalonia. He was afterwards for some time attached to the Prussian army commanded by Blücher. On 14th April 1816 he reached St Helena as governor of the island. Napoleon had landed there on the 17th October of the previous year. The strictness of Lowe's watch upon the disturber of the peace of Europe brought down upon him much obloquy, and exposed him to bitter and rancorous attacks from Napoleon's friends and admirers, especially from O'Meara (*Napoleon in Exile*, 1822). He was even assaulted in London in 1822. His defence of his conduct and acts may be read in W. Forsyth's

Captivity of Napoleon at St Helena (3 vols. 1853). In 1825 Lowe became commander of the forces in Ceylon. He died in 1844. See NAPOLEON.

Lowe, ROBERT. See SHERBROOKE.

Lowell, a manufacturing city of Massachusetts, the birthplace of Whistler, on the Merrimac River, and at the junction of several railways, 25 miles N. by W. of Boston. The site is uneven and hilly, and the river falls 33 feet, affording great water-power. Lowell is the largest producer of cotton goods in the United States. There are extensive woollen mills, foundries, and machine-shops. Other industries include bleaching, carpet-making, &c. Lowell was incorporated in 1826. The operatives were for years gathered from the rural districts fifty or a hundred miles round, and lived in boarding-houses built and owned by the corporations, and kept under strict management. Foreign emigration brought a large resident manufacturing population. Lowell has an important textile school and other colleges, and unusual attention is paid to the well-being of the workpeople. Pop. (1880) 59,485; (1920) 112,759.

Lowell, AMY (1874-1925), Imagist poet and critic, was born at Brookline, Mass., a distant relative of J. R. Lowell. Besides collections of narrative verse and 'polyphonic prose,' she wrote *Six French Poets, Tendencies in Modern American Poetry*, and a *Life of Keats* (1925).

Lowell, JAMES RUSSELL, poet, essayist, and diplomatist, was born in Cambridge, Massachusetts, 22d February 1819. He was of mixed English Puritan and Scottish (Orcadian) descent, and his family was distinguished. His father, a friend of Channing's, was minister of the West Church in Boston. The future poet entered Harvard College in his sixteenth year and graduated in 1838, but without any special rank. His abilities, however, were early recognised; all his youthful contemporaries were sure of his coming fame. His father had an unusually large library, not restricted to theological subjects, and the son was left to browse in it. The variety and extent of his reading was the foundation of his future scholarship, and the source of those stores of allusion and anecdote for which his writings and conversation are equally remarkable. The severe studies which made him a scholar came long after his university course.

In his twenty-second year he published *A Year's Life and other Poems*. He studied law, but never seriously sought to practise. In company with Robert Carter, in 1843, he edited *The Pioneer*, a monthly magazine, with Hawthorne, Poe, and Whittier for contributors; but after three issues the publishers failed. In 1844 he published a second volume of poems, in which were seen growing power and greater promise. In the same year he married Maria White, a beautiful and intellectual woman, herself the author of some charming poems. In 1845 he published *Conversations on the Old Poets*, an original and suggestive book, but immature in style and treatment. In 1846, at the outbreak of the Mexican war, he published a satiric poem in the Yankee dialect, purporting to have been written by a rustic named Hosea Biglow, and edited by the Rev. Homer Wilbur, an amusing pedant, in which the policy of the pro-slavery party and the conduct of the United States government toward an unoffending neighbour were held up to scorn and ridicule. It was apparently a trifle, but it had immediate and universal success; and from this slight beginning came the *Biglow Papers*, perhaps the highest expression of the poet's genius, and beyond doubt the first of modern satires in English. It is the soul of New England character; racy with its droll humour, and sparkling with its unborrowed wit; but its rare qualities are fully

appreciated only by those to whom the rustic life and the dialect are familiar.

The year 1848 was productive and memorable. It was the year of European revolutions and of boundless hopes among enthusiasts for the future of mankind. A great many serious poems were written at this time, and formed a third volume. He wrote *The Vision of Sir Launfal*, one of the best, as it is one of the most popular, of his poems; also *A Fable for Critics*, given to the world anonymously—a series of witty and dashing sketches of American authors. It is full of puns and grotesque rhymes, done in a 'happy-go-lucky' style, but is not ill-natured, and has a basis of good sense. After all these years it is seen that his judgments of men and tendencies were almost prophetic.

In 1851 he visited Europe with his wife, then in delicate health, and returned in 1852. Her death occurred early in 1853. In 1857 he was married in Portland, Maine, to Miss Frances Dunlap, who died in London in February 1885.

In 1855 he was appointed professor of Modern Languages and Literature in Harvard College, to succeed Longfellow, and thereupon went to Europe to prosecute his studies. While still holding this chair, and delivering lectures which were memorable, he edited the *Atlantic Monthly*, beginning in 1857, and afterwards, along with Charles E. Norton, the *North American Review*, from 1863 to 1867. *Commemoration Ode*, a notable poem, was written in 1865 in honour of the alumni who had fallen in the war of the rebellion. *The Cathedral* (1870), a poem marked by profound thought, but lightened by some playful passages, was suggested by a visit to Chartres. Three patriotic odes were written (1875-76), one for the anniversary of the battle at Concord, one for the Washington Elm in Cambridge, the other for the centennial of the Fourth of July.

His prose writings—*My Study Windows* and *Among my Books*—have high qualities, and are likely to be enduring. Some of the essays, such as those upon Chaucer, Dante, Shakespeare, and Dryden, are masterpieces of literary art. The sentences are animated, not so much with crackling epigrams as with airiness: they are (perhaps too frequently) studded with recondite allusions, and are often lustrous with poetic images. It is always evident that it is a poet who writes. To the author's friends the most delightful of his prose works is *Fireside Travels*, containing his recollections of *Cambridge Thirty Years Ago*.

The second series of *Biglow Papers* appeared during the civil war, in which the poet's three nephews and other near relatives gave their lives for the Union. This volume is naturally graver and upon a higher plane of thought and sentiment. Certain passages (probably the best he has written) show an intensity of feeling rare in human experience; in others the scenery and the seasons are painted with loving touches; and the rude dialect, so far from being a blemish, lends an indefinable charm to the tenderness and to the descriptive art.

Lowell was an ardent abolitionist, and from the first gave himself unreservedly to the cause of freedom. In this, as in all things, he showed himself an heir of Puritan blood, faithful to the right, without regard to popularity. In such poems as *The Present Crisis* he came to his countrymen with a 'burden' like a Hebrew prophet.

He was appointed in 1877 minister of the United States to the court of Madrid, and was transferred in 1880 to that of St James, where he remained until 1885. One of his volumes, *Democracy* (1886), contains some of the brilliant addresses he made while in England, and one volume, *Heartsease and Rue* (1888), embraces later poems, including a few written long before for the *Atlantic Monthly*.

The post of minister to Great Britain is the highest in the gift of an American president, and that Lowell should have been sent to represent his country in the old home of the race sufficiently shows the estimation in which he was held, for he had never been a politician. He wrote a life of Hawthorne in the 'American Men of Letters' series (1890): *The Old English Dramatists* appeared posthumously in 1893. He lived at Elmwood (in Cambridge), the house in which he was born; and there he died 12th August 1891. His *Collected Writings* were published in 1890-91, his *Letters* in 1893.

See Dr Underwood's *The Poet and the Man* (1893); Dr E. E. Hale's *Lowell and his Friends* (1899); and Lives by H. G. Scudder (1901) and Ferris Greenslet (1905).

Lowell Institute, at Boston, Mass., founded by John Lowell (1799-1836), a Boston merchant.

Lower Empire. See BYZANTINE EMPIRE.

Lowestoft, a municipal borough, is the chief seaport on the Suffolk coast, 118 miles N.E. of London by rail, and 49 from Ipswich. Its great popularity as a watering-place is due to its healthfulness, the picturesqueness of its neighbourhood, its easy means of access to the Broads (q.v.); Oulton Broad is now within the borough), and the splendid facilities it offers to yachtsmen (it is the headquarters of the Royal Norfolk and Suffolk Yacht Club), anglers, and golfers. The older part of the town, which lies between the north and south parades, is built on a cliff facing the sea, on its summit being a lighthouse (1874) 123 feet above sea-level, the most easterly point of Great Britain. The south esplanade is separated from the old town by the excellent harbour and Lake Lothing, a piece of water stretching inland 2 miles. Lowestoft is one of the chief fishing-ports in the kingdom, being noted for its important herring-fishery and its unrivalled fleet of trawlers. There are two piers: the South Pier (belonging to the L. & N.E. R.), with a pavilion, opened in 1890; and the Claremont Pier, constructed by the Coast Development Corporation. Other features of interest in the town include the parish church (14th century); town-hall with stained-glass windows; Sparrows' Nest, pleasure-grounds, with thatched house of Dr Whewell; Belle Vue Park, near which was found in the 18th century the clay formerly used in making Lowestoft china; Kensington Gardens. The principal incidents in the history of the town have been visitations of the plague in 1349, 1547, 1579, and 1603; its occupation in 1643 by Cromwell, who entered the town at the head of 1000 troopers, and, seizing several royalists, sent them prisoners to Cambridge; its partial destruction by fire in 1644; a great naval engagement, which took place off the coast on the 3d June 1665, when the Dutch were defeated with loss of eighteen ships. Pop. (1801) 2509; (1841) 5304; (1901) 29,850; (1911) 33,777; (1921) 44,326.

Low German. See GERMANY.

Low Latin, a term often applied loosely to the Latin spoken and written after the fall of the Roman empire, as well as during the middle ages. The process of deterioration from classical models had already begun even in the time of Cicero, but it rapidly grew until were formed gradually in different divisions of the dismembered empire those distinct varieties out of which grew the modern Romance tongues. See ROMANCE LANGUAGES.

Lowndes, WILLIAM THOMAS, a London bookseller (died 1843) to whom we are indebted for *The Bibliographer's Manual of English Literature* (4 vols. 1834) and *The British Librarian* (1839).

Low Sunday, in the Roman Catholic Church, is the first Sunday after Easter. It is so called in contrast to the great festival whose octave it ends.

In France and Germany it is usually called *Quasi-modo*, from the first word of the introit (1 Peter, ii. 2) in the Mass.

Lowth, ROBERT, a learned English bishop, was born November 27, 1710, at Winchester; his father was rector of Buriton. He was educated at Winchester, whence, with a reputation both as a scholar and poet, he passed to New College, Oxford, in 1730. In 1741 he was appointed professor of Poetry, and hence arose his famous *De Sacra Poesi Hebræorum Prælectiones Academicæ*, published in 1753. In 1750 Bishop Hoadley conferred on him the archdeaconry of Winchester, and in 1753 the rectory of East Woodhay in Hampshire. Lowth became D.D. of Oxford in 1754, prebendary of Durham and rector of Sedgfield in 1755, a Fellow of the Royal Societies of London and Göttingen in 1765, Bishop of St Davids in 1766, of Oxford a few months after, of London in 1777, and died November 3, 1787. Besides his lectures, his two chief works are a *Life of William of Wykeham* (1758) and his *Isaiah* (1778).

Loyalists, UNITED EMPIRE, Americans adhering to the British connection who, migrating to Canada after the United States had secured independence, constituted the best part of the population of Ontario (q.v.). See CANADA, and C. H. van Tyne's *Loyalists in the American Revolution* (1902).

Loyola, IGNATIUS DE, is the name by which history knows Iñigo Lopez de Recalde, the youngest son of Bertram de Loyola and Marina Salez de Baldi, who was born in the year 1491 at his ancestral castle of Loyola, in the Basque province of Guipuzcoa. After the scant training of that age in letters, he was received as a page in the court of Ferdinand; but the restraint and inactivity of court-life were distasteful to his enthusiastic mind, and under the auspices of his relative, the Duke of Najura, he embraced the profession of arms. The details of his career as a soldier display both the excellency and the irregularities of his ardent temperament, thrown undirected among the temptations as well as the duties of a military life. Of his bravery and chivalrous spirit many remarkable instances are recorded; and one of these proved the turning-point of his career. In the defence of Pampeluna he was severely wounded in both legs, one being fractured by a cannon-ball, and the other injured by a splinter; and having been taken prisoner by the French, he was by them conveyed to his paternal castle of Loyola, where he was doomed to a long confinement. After an operation, the results of which had well-nigh proved fatal, he eventually recovered; and with his returning strength he appears to have resumed his habitual levity. In order to remove a deformity which had resulted from the first setting of his wounded limb, he consented to the painful remedy of having it re-broken in order to be reset. After this operation his convalescence was even more slow; and, the stock of romances by which he was wont to relieve the tedium of confinement having been exhausted, he was thrown upon the only other available reading, that of the *Lives of the Saints*. The result was the creation of a spiritual enthusiasm equally intense in degree, although in kind very different from that by which he had hitherto been drawn to feats of chivalry. The spiritual glories of St Francis or St Dominic now took, in his aspirations, the place which had been before held by the knights of medieval romance. With souls like his there is no middle course: he threw himself, with all the fire of his temperament, upon the new aspirations which these thoughts engendered.

Renouncing the pursuit of arms, and with it all other worldly plans, he tore himself from home and friends, and resolved to prepare himself for the new course which he contemplated by a pilgrimage to

Jerusalem. With a view to his immediate preparation for this holy task, he retired in the garb of a beggar to the celebrated monastery of Montserrat, where, on the vigil of the Feast of the Annunciation, in 1522, he hung up his arms, as at once a votive offering significative of his renunciation of the works of the flesh, and an emblem of his entire devotion to the spiritual warfare to which he was from that moment vowed. From Montserrat he set out barefooted on his pilgrimage, the first step of which was a voluntary engagement which he undertook to serve the poor and sick in the hospital of the neighbouring town of Manresa. There his zeal and devotion attracted such notice that he withdrew to a solitary cavern in the vicinity, where he pursued alone his course of self-prescribed austerity, until he was carried back, utterly exhausted, to the hospital in which he had before served. To this physical exhaustion succeeded a state of mental depression, amounting almost to despair, from which, however, he arose with spiritual powers renewed and invigorated by the very struggle. From Manresa he repaired by Barcelona to Rome, whence, after receiving the papal benediction from Adrian VI., he proceeded on foot, and as a mendicant, to Venice, and there embarked for Cyprus and the Holy Land. He would gladly have remained at Jerusalem, and devoted himself to the propagation of the gospel among the infidels; but finding no encouragement, returned to Venice and Barcelona in 1524.

Taught by his first failure, he now resolved to prepare himself by study for the work of religious teaching, and with this view was not ashamed to return, at the age of thirty-three, to the study of the very rudiments of grammar. He followed up these elementary studies by a further course, first at the new university of Alcalá, and afterwards at Salamanca. In both places he incurred the censure of the authorities by some unauthorised attempts at religious teaching in public, and eventually he was induced to repair to Paris for the completion of the studies thus repeatedly interrupted. Here, again, he continued persistently to struggle on without any resources but those which he drew from the charity of the faithful; and here, again, he returned to the same humble elementary studies. It was while engaged in these studies that he first formed the pious fraternity which resulted in that great organisation which has exercised such influence upon the religious, moral, and social condition of the modern world. From the close of his residence in Paris Loyola's history has been told in the history of his order (see JESUITS). From the date of his election as the first general of his society he continued to reside in Rome. To him are due, not alone in the general spirit, but even in most of their details, all its rules and constitutions; from him also originated several works of general charity and benevolence, the germs of great institutions still maintained in Rome. But the great source of his influence upon the spiritual interests of the world is his well-known *Exercitia Spiritualia*, of which an account has been already given. He died at Rome, prematurely, worn out by his long austerities, July 31, 1556. He was beatified in 1609, and canonised in 1622.

His Life has been written in almost every European language. The biographies of Ribadaneira (1572), Maffei (1585), Bouhours (1679), Daurignac (1865), Denis (1885), are well known; and there are books by Stewart Rose (1891), Father Hughes (1892), Gothein (Halle, 1896), H. Joly (trans. 1899), F. Thompson (1909), H. D. Sedgwick (1923).

Loyson. See HYACINTHE.

Lozère, a department in the south of France, derives its name from Mont Lozère, one of the

summits of the Cévennes (q.v.). It comprises the arrondissements of Mende, Florac, and Marvejols. Area, 1996 sq. m.; pop. (1872) 135,190; (1921) 108,822. Capital, Mende. The department forms the south-east extremity of the central uplands of France, and embraces the highest peaks of the Cévennes (Pic de Finiels, 5584 feet). These mountains are the birthplace of numerous rivers, which go down to feed the Rhone, the Garonne, and the Loire. In the mountains the climate is severe, and little grain is produced. Potatoes, chestnuts, fruits, hemp, and flax are the more important products, and silkworms are bred. The department contains some of the grandest scenery of France in the eroded limestone districts of the 'Causses.' There are lead and copper mines, and serge and dye-works.

Luang Prabang, a Shan state on the Upper Mekhong, ceded to France by Siam, with other territory, in 1893. See SHANS.

Lubbock, SIR JOHN, BARON AVEBURY (cre. 1900), son of the astronomer and mathematician Sir J. W. Lubbock (1803-65), was born in London, 30th April 1834, and educated at a private school and at Eton. At fourteen he entered his father's banking-house, and in 1856 became a partner. He was chosen honorary secretary to the Association of London Bankers, first president of the Institute of Bankers, and served on the International Coinage Commission, as a member of the Public School Commission, the Advancement of Science Commission, the Education Commission, and the Gold and Silver Commission. In 1865 and 1868 he contested West Kent unsuccessfully in the Liberal interest, but was returned for Maidstone in 1870; and on losing his seat in 1880 he was returned for London University—from 1886 to 1900 as a Liberal-Unionist. As a politician he devoted himself chiefly to financial and educational subjects, and succeeded in passing more than a dozen important public measures, including the Bank Holidays Act (1871), the Bills of Exchange Act, regulating the whole law relating to cheques, bills, and promissory notes, the Ancient Monuments Act (1882), and the Shop Hours Act (1889). He was vice-chancellor of the university of London from 1872 to 1880, president of the British Association in 1881, president of the London Chamber of Commerce, and chairman of the London County Council. He is best known as a man of science for his researches on the ancient vestiges and remains of man, and on the habits of insects, especially bees and ants. He died 28th May 1913.

Besides more than a hundred memoirs to various societies, he published *Prehistoric Times, as illustrated by Ancient Remains and the Manners and Customs of Modern Savages*; *The Origin of Civilisation and the Primitive Condition of Man*; *The Origin and Metamorphoses of Insects*; *On British Wild-flowers, considered in Relation to Insects*; *Addresses, Political and Educational*; *Scientific Lectures*; *Monograph of the Thysanura and Collembola*; *Fifty Years of Science*, an inaugural address to the British Association; *Ants, Bees, and Wasps*; *Flowers, Fruits, and Leaves*; *On Representation*; *The Senses and Instincts of Animals*; *The Pleasures of Life*; *The Beauties of Nature*; *The Use of Life*; *The Scenery of Switzerland*; and *The Scenery of England*. See Life by H. G. Hutchinson (1914), and *Nature* (August 1924).

Lübeck, a free city of Germany, and great port on the river Trave, 12 miles from the Baltic, and 40 by rail N.E. of Hamburg. It was founded by Saxons in 1143, in place of a former Wendish town of the same name, lower down the Trave. The foundations of its prosperity were laid by Henry the Lion, Duke of Saxony, who gave it a charter, and took unusual pains to encourage its budding commerce. He also built a cathedral, and transferred the see

of Oldenburg to Lübeck. Frederick Barbarossa not only confirmed, but greatly enlarged, its privileges, and Frederick II. made it a free city of the empire. From this time it made rapid progress as a trading centre; it was from the first one of the most influential members of the Hanseatic League (q.v.), and eventually its head. The city became in short the commercial metropolis of the Baltic and northern Europe. This proud position was due in some measure to the liberal encouragement of several successive emperors, but in still greater measure to the prudent guidance of the oligarchical council, composed of men elected from the families of the great merchants. The decay of Lübeck was necessarily involved in the decay of the Hanseatic cities generally. The eventful dictatorship of Wullenwever (1533-37) was the last dying effort of the League. Full administrative rights were not conferred upon the burghers or citizens until 1848. The constitution of 1907, modified in 1919, embracing a senate (14 members) and a *Bürger-schaft* (80 members), is thoroughly democratic in spirit. The French held Lübeck from 1806, when they captured it and plundered it—except for nine months in 1813—down to the treaty of Vienna, which made it a free town of the German Confederation. The traditional connection with Hamburg and Bremen, the last survivors of the Hanseatic League, was kept up till 1879. Nevertheless, in 1866 Lübeck joined the North German Confederation, and in 1868 the Customs Union (*Zollverein*).

The free city possesses 115 sq. m. of territory, including the port of Travemünde, near the mouth of the river. The total population was 120,568 in 1919, of whom 113,124 were in the city of Lübeck (44,799 in 1875). The industries are more varied than important, the chief being the manufacture of cigars and vinegar, brewing, brandy-distilling, soap-boiling, and iron-founding. Lübeck is the great centre for trade between Hamburg and the cities of Germany on the one side and the countries that border the Baltic on the other. The traffic is mostly transit business. The port is entered annually by about 2300 vessels of 430,000 tons. The Trave was deepened to 15 feet in 1878-82, and since then to 25 feet. A canal connecting Lübeck with the Elbe was opened in 1900.

The streets of the city are mostly wide and pleasant. The city-wall was demolished in 1802 or converted into promenades. The churches include the handsome Gothic St Mary's, first erected in 1163-70, though the existing edifice dates from 1276-1310, with two towers 407 feet high, old sarcophagi, masterpieces of old German sculpture, and pictures by Overbeck and others; the cathedral, founded in 1173, and enlarged in the 14th century, with a tower 394 feet high, and an altarpiece by Memling; St James's, built before 1227, and St Peter's, before 1163, which contain fine old paintings and monuments; and St Aegidius, which has an excellent organ. The town-house is the most notable amongst the secular buildings; it is built of red and black glazed bricks. The hospital of the Holy Spirit, dating from the 13th century, is adorned with admirable wood-carving. There are a school of navigation, a library, ethnographic, antiquarian, zoological, and art collections, &c.

See Max Hoffmann, *Geschichte der Freien- und Hanse-Stadt Lübeck* (1889-90); Pauli, *Lübeck'sche Zustände im Mittelalter* (1872); Waitz, *Lübeck unter Wullenwever* (3 vols. 1855-56); and King, *German Free Cities* (1914).

Lübke, WILHELM (1826-93), author of a score of books on the history of art in Germany, France, Italy, &c., was born at Dortmund, studied at Bonn and Berlin, taught the history of art at Stuttgart and Karlsruhe, and was finally director of the art galleries of Baden.

Lublin, a town of Poland, on a sub-tributary of the Vistula, 96 miles by rail S.E. of Warsaw, once a great commercial city, has a 13th century cathedral, and was plundered by the Mongols. A university was founded in 1919. There are manufactures of cement, starch, sugar, machinery, &c., and a large trade in corn and wood. Pop. (1871) 24,456; (1921) 94,478. Here was signed in 1569 the treaty of union between Lithuania and Poland.

Lubricants, unguents interposed between surfaces in machinery which work on one another, with the object of lessening the Friction (q.v.), and thereby diminishing the wear and tear, and lessening the waste power taken up in overcoming friction. Various unguents are in use: animal fats and oils, such as tallow, sperm-oil, lard, &c.; vegetable oils, as, for example, olive-oil and rape-oil; and many mineral oils. The particular unguent best suited for any purpose is a matter of considerable importance. Where the pressure between the two surfaces is great it is necessary to use oils with body or thickness, since the lighter oils are readily squeezed out from position. Sperm-oil, for instance, is a very good lubricant, but not so satisfactory for heavy loads and high temperatures. Many oils again, especially vegetable oils, deteriorate much faster in use than others by evaporation of their volatile constituents.

Luca della Robbia. See **ROBBIA**.

Lucan. See **LUCANUS**.

Lucan, GEORGE CHARLES BINGHAM, EARL OF, British general, was born on 16th April 1800, and succeeded his father, the second earl, in the title in 1839. He was put to school at Westminster, and on leaving entered the army. He accompanied the Russian troops under General Diebitsch as a volunteer against the Turks in 1828. As commander of a division of cavalry in the Crimea he fought at the Alma, Balaklava, and Inkermann (see **CRIMEAN WAR**). Appointed lieutenant-general in 1858 and G.C.B. in 1869, he became field-marshal in 1887. He died 10th November 1888.

Lucania, a province of ancient Italy, south-east of Calabria, and bordering on the Gulf of Tarentum. It was inhabited by an Oscan people, and corresponds nearly to the present province of Potenza and part of Salerno.

Lucanus, M. ANNÆUS (39-65 A.D.), whose *Pharsalia* heads the epic poems of the silver age, was born at Corduba, capital of the province Bætica, the centre of Roman influence in Spain, and of a literary school which lasted on into mediæval times. Among the leading Corduban families were the Annæi, of whom Annæus Seneca, the rhetorician, had three sons—M. Annæus Seneca, the Gallio of the Acts of the Apostles; L. Annæus Seneca, the philosopher; and M. Annæus Mela, who married Acilia, daughter of Acilius Lucanus, a noted orator of the place, and by her became father of M. Annæus, who received the cognomen Lucanus from his maternal grandsire. Rome's irresistible attraction for the outlying world had already drawn thither Seneca, the philosopher; and Mela, with his wife, followed, to place their son, an infant prodigy, under his uncle's eye for the usual training in rhetoric and moral science. Young Lucan took kindly to the hereditary culture, and under Palæmon the grammarian, and Cornutus the Stoic, of whom Persius the satirist was also an admiring pupil, he became proficient in the merits which won the applause of the lecture-room. Indeed, his aptitude for prose and verse was ominous of the fatal fluency which evolved the first three books of the *Pharsalia* while yet in his teens. Hatred of tyranny was the prevailing note

of the patricians, and Lucan shared the hopes of his order as to Nero's government, not inauspiciously begun. But the imperial pupil of Seneca ere long betrayed the lower side of his character; and a morbid vanity, courting the applause of the circus and the theatre, made him the rival of charioteers and poets, and, among these, of Lucan. At first the young emperor and the young poet were friends, and Nero's favour had conferred on the latter the quæstorship, with which he entered the curia as well as the augural priesthood. But imperial vanity 'bears no brother near the throne,' and Nero's self-love was mortally wounded when, in a great public contest, the palm went over his head to Lucan. The emperor's marked discourtesies were returned by his successful rival with satire and with redoubled efforts to outshine him, till Nero was stung into forbidding Lucan either to publish poems or to recite them. About that time the Pisonian conspiracy had been hatching, and the emperor's increasing follies and barbarities hastened its development. Lucan became one of its ringleaders, and with characteristic impetuosity was already discounting its success, when the news came to him that it was discovered and he himself betrayed. At first his demeanour was worthy of a Stoic: then his courage declined, till it sank so low that—quite falsely, it is believed—he accused his own mother Acilia of being privy to the plot, in hopes that the matricidal emperor might be conciliated by a similar crime! But in vain. He was ordered to die, and, having had his veins opened, he bled to death in the bath, reciting an appropriate passage from one of his poems.

Except a few fragments, we now have nothing of Lucan's many writings but the *Pharsalia* in ten books, recounting the mighty duel of Pompey and Caius Julius for the empire of the world. Though always freely criticised, its acceptance in antiquity and in modern times has been great. From Tacitus to Scaliger and Macaulay it has found praise and censure in pretty even proportion. Its defects are mainly those of youth—inspired youth trained in a school where epigram and antithesis were sought after as the chief merit of style. It is frequently bombastic, sometimes obscure; so unsteady, moreover, in its delineation that it is open to doubt whether its hero is not Caius Julius after all, rather than the Pompey who is characterised as 'Magnus' throughout. When at its best its merits are those of eloquence rather than poetry; and for its many brilliant and apt 'sententiæ' it justly enjoys an 'immortality of quotation.' Its Roman patriotism strikes so true a note that with all pioneers of liberty it has been a favourite—particularly in the England of the 17th century. Indeed, the historian of the Long Parliament, Thomas May, not only wrote a respectable translation of it, but also a still more respectable continuation in the language and verse of the original. Rowe's translation, considered by Johnson to be one of the best in the English language.

There are other English translations in verse by Marlowe (Bk. I.), Sir Ferdinando Gorges, Sir E. Ridley (1897); and in prose by H. T. Riley (1853). There are editions by Oudendorp, Burmann, Haskins (1887), Hosius (1905), and Francken (1895-98).

Lucaris, CYRIL, a Greek theologian, was born in Crete in 1572, studied at Venice and Padua, and subsequently in Geneva, where he became imbued with the Calvinist doctrines. Taking holy orders, he rose by 1621 to the highest dignity in the Greek Church, Patriarch of Constantinople. For his public career, see **GREEK CHURCH**. In June 1637 he was seized in Constantinople, hurried on board a vessel, and it was never properly ascertained what became of him. According to some he was strangled in the ship which bore him off;

according to others, he suffered this fate in a castle on the shores of the Black Sea. His doctrines have been repeatedly condemned by Greek synods.

Lucas van Leyden, whose proper name was **LUCAS JACOBSZ**, Dutch painter and engraver, was born in Leyden in 1494. An extremely precocious artist, he painted a picture of St Hubert when only twelve, and the celebrated print, 'Mahomet and the Monk Sergius,' was engraved when he was only fourteen. But he was not enrolled in the guild of St Luke at Antwerp in 1522. He practised successfully almost every branch of painting, and as an engraver ranks as the equal of Albert Dürer in everything except fertility of design. His range of subjects was very wide, and embraced events in sacred history, incidents illustrative of the manners of his own period, and portraits. He was on terms of intimacy with Mabuse, and held friendly intercourse with Dürer, whose talents he admired without professional jealousy. He died in 1533, having been confined to bed for six years. Amongst his most celebrated pieces are the 'Hill of Calvary,' by some regarded as his masterpiece, 'Adam and Eve expelled from Paradise,' 'Ecce Homo,' 'A Girl and a Dog,' the 'Card Party,' 'St Jerome,' and 'Christ healing a Blind Man.'

Lucca, chief town of an Italian province, is situated in a plain, bounded by picturesque hills and irrigated by the Serchio, 14 miles by rail N.E. of Pisa; pop. (1921) 78,575. 'Lucca the Industrious' has a great trade in olive-oil and silk, the latter manufacture introduced in the end of the 11th century. The cathedral of St Martin, begun in 1063, has a cedar crucifix reputed to have been brought to Lucca in 782; this *Volto Santo* ('Sacred Countenance') is mentioned by Dante. The church also contains several fine paintings, the tomb of Maria Guinigi (cf. Ruskin's *Modern Painters*, vol. ii.), and valuable archives. There are nearly forty other churches, some dating from the 7th and 8th centuries. A splendid aqueduct (1820) supplies the town with water from the Pisan hills. The municipal buildings (1578) contain a valuable collection of paintings. Lucca is exceptionally rich in artistic and scientific institutions. The city was a bishopric as early as 347, and in 1726 was made an archbishopric. The environs abound in delightful villas. In a charming valley, 16 miles N. of the town, are situated the mineral baths of Lucca, which have been famous since the 15th century. Their temperature varies from 96° to 136° F.—The province, which has an area of 558 sq. m. and a pop. (1921) of 346,602, is famed for the fertility of its soil and the superiority of its agriculture. The Lucchesi are a frugal, shrewd race; numbers leave home in search of employment, and they form a large proportion of the itinerant figure-vendors, organ-grinders, and stucco-workers of Europe.

Lucca (anc. *Luca*) was made a Roman colony in 177 B.C. It was erected into a duchy by the Lombards, and its merchants traded in English wool from the 9th, but more especially from the 12th century. The town had a most chequered history down to 1369, when it became an independent republic, which lasted till 1797. In 1805 it was erected into a principality by Napoleon for his sister Elisa Baciocchi, and in 1815 passed to Maria Louisa of Spain, queen of Etruria. Her son, Charles Louis, ceded it to Tuscany in 1847, on obtaining possession of Parma and Piacenza.

Lucena, a town of Spain, 36 miles S. by E. of Córdoba, is famous for its wine and breed of horses; pop. 23,000.

Lucera (the ancient *Luceria* of the Samnite war), a town of Southern Italy, 12 miles by rail

N.W. of Foggia, has a cathedral (1302), and a famous ruined castle of Frederick II., who died at the neighbouring castle of Fiorentino; pop. 17,600.

Lucerne (*Medicago sativa*), a species of Medick (q.v.), one of the most valuable of the leguminous plants grown for the supply of green food to cattle. It is derived through cultivation in Asia from wild forms inhabiting China and Siberia, has been cultivated in south Europe from an unknown antiquity. It is not very largely grown in Britain, but in some places very successfully, chiefly in the drier parts of the south of England. It is largely cultivated in some parts of North and South America. It endures great droughts, its roots penetrating very deep into the ground. Sir John Bennet Lawes at Rothamsted found it the best of all forage-crops for a drought. It delights in a rich and calcareous soil, and never succeeds on damp soils or tenacious clays. It is a perennial, and if kept free from weeds affords good crops for six, seven, or more years. It is sown in rows, at 10 or 14 inches apart, and may be mown several times in a year, growing very quickly after being mown. The quantity of produce is very great—sometimes from 20 to 30 tons per annum—and few other forage-plants are ready for use so early in spring. Lucerne has a rather erect stem, leaves with three obovate-oblong toothed leaflets; purplish-blue or sometimes yellow flowers in many-flowered racemes, and pods twisted two or three times round. It ought to be mown before it comes into flower, as it then becomes fibrous and less nutritious. In Spanish lands, and in America generally, it is called *Alfalfa*.

Lucerne (Ger. *Luzern*), the capital of a Swiss canton, 59 miles S.E. of Basel. It is very beautifully situated at the point where the Reuss issues from the north-west extremity of the Lake of Lucerne, and is partly surrounded (on the north) with mediæval towers. Near the lake, rising from the middle of the Reuss, is an old tower, which is said to have been a lighthouse (*Lucerna*) in Roman times, whence the name of the town. Outside one of the gates is the Lion of Lucerne, a monument to the Swiss Guards who perished at the Tuileries in 1792; hewn (1821) out of the solid rock by Alorn, a Swiss sculptor, after a model by Thorvaldsen, it is now badly weathered. The rocks of the Glacier Garden illustrate ice-action. The town is a busy centre for tourists; pop. 44,000.—The canton has an area of 579 sq. m. and a population of 177,000. The soil is fruitful in the valleys; in the more mountainous parts the rearing of cattle is carried on to a great extent, large quantities of cheese being made. The highest elevation in this canton is 6998 feet, a peak of Mount Pilatus. The inhabitants are mostly of German race and language, and belong to the Roman Catholic Church, except about 15,000 Protestants, to whom the free exercise of their religion was first accorded in 1828. The canton threw off the yoke of Austria in 1332, and, joining Schwyz, Uri, and Unterwalden, formed the nucleus of the future Swiss Confederation. The constitution of Lucerne is a representative democracy. The legislative body is the Great Council, one member being elected by every 1000 citizens; the executive is vested in seven members, who are not of the council. See SWITZERLAND.

THE LAKE OF LUCERNE, called also *Vierwaldstättersee*, is one of the most beautiful in Europe. In shape it resembles roughly a cross with a crumpled stem; its shores are mostly steep and rocky. Length from Lucerne to Flüelen, 23 miles; average breadth, about 1½ mile; area, 44 sq. m. The chief places on its banks are Lucerne, Küssnacht, and Alpnach at the north-west, and Flüelen

near its south-west extremity. It is liable to sudden and violent storms. The lake is rich in associations of William Tell (q.v.) and his story.

Luchu. See RYUKYU.

Lucian, one of the most interesting, graceful, and amusing of Greek writers, was born in Samosata, the principal town of Commagene in Syria, probably about 125 A.D. Intended by his parents to be a sculptor, Lucian early asserted his own decided preference for letters. Having learned Greek and studied under some teacher of rhetoric, he practised as an advocate for a short time in Antioch. He then turned to the composition of show speeches (epideictic oratory) and to reciting them as a means of making a living. His professional career thus made him a travelling artist; and in the quest for suitable festivals at which to deliver his declamations he travelled through Asia Minor, Greece, Macedonia, Italy, and Gaul. Having thus made a fortune and a name, he settled in Athens, still the intellectual capital of the world, and there devoted himself to the study of philosophy. There, too, he produced a form of literature hitherto, as he claims, unknown. This was humorous dialogue. In his old age he reverted to his first love, recitation. He accepted a good appointment in Egypt, where at an advanced age, eighty or ninety years, he died. A Semite by race but not by education, a subject of Rome but not a Roman, a writer of Greek but not a Greek by birth, Lucian was by circumstances singularly freed from every tie, prepossession, or prejudice which might have stood at all in the way of his deriving the largest possible amount of amusement out of the world. Nor was this all that fortune did for him: she brought him into the world at an age when the old faiths, the old philosophy, the old literature, were all rapidly dissolving in decay, and when what the new would be was an insoluble problem. For satire, whose nature is simply to deny, never was there a fairer field; and Lucian revelled in it. The old faith was gone, and the inherent absurdity of retaining the old deities without the old belief is brought out by Lucian in the *Dialogues of the Gods*, *Dialogues of the Dead*, *Prometheus*, *Charon*, *Menippos*, *Icaromenippos*, and others. Whether the old philosophy was the more disgraced by the shallowness or the vices of those who professed it in Lucian's time, it would be hard to tell from his *Symposium*, *Habitus*, *Bion Praxias*, *Drapetes*, &c. The old literature had been displaced by novels or romances of adventure of the most fantastic kind, which Lucian parodies in his *True Histories*. In fine, there is no department of life with which he is unacquainted or from which he fails to raise a laugh. His extensive travels gave him abundant material, and his extensive reading gave him ancient instances to confirm and illustrate his own experiences. His Greek, though not absolutely pure Attic of the best times, is but little removed from it; and this is to be accounted for by the fact that he learned Greek as a foreign language, and consequently picked it up from Plato and not from the streets. Apart from the purity of his Greek, his style is perfectly delightful, simple, pellucid, and sparkling. The *editio princeps* is dated 1496, Florence.

See translations by H. W. and F. G. Fowler (1905), A. M. Harmon (with text, 8 vols. 1913 *et seq.*), H. A. Strong (*The Syrian Goddess*, with Life, 1913); books by Croiset (1882), Hime (1900); Jebb's *Essays and Addresses* (1907).

Lucifer (Lat., 'light-bringer'), the morning-star; see PLANETS. The church fathers attached this name to Satan in the belief that Isaiah, xiv. 12, which refers to the king of Babylon, contained a reference to the Prince of Darkness: cf. Luke, x. 18.

Lucifer Matches. See MATCHES.

Lucigen, a powerful lamp, which does not cast black shadows like electric light, but gives a broad glow resembling very much the effect of the sun. Creosote oil is forced up the tube, E, by compressed

Section of a Lucigen Lamp.

A, air supply; B, stopcock for controlling supply of air to burner; B', stopcock for controlling oil-feed; C, coil for heating air; D, burner; E, burner-tube; F, strainer-tube; G, drip-cock for condensed moisture; H, air to drum; I, oil-cone; J, for oil supply; L, oil-well.

air. Heated air from the coil, C, enters the annular space between the oil-cone, I, and burner, where the air and oil escape in a spray which is immediately inflammable. There are various forms of the Lucigen, which was first used in 1885.

Lucilius, Roman poet, the creator of that form of poetic satire which was wielded so brilliantly by his successors, Horace, Persius, and Juvenal. He was born at Suessa Aurunca, in Campania, probably in 164 or 166 B.C. Other dates given or suggested are 148 and 180. He was on intimate terms with the Younger Scipio, under whom he is said to have served at Numantia, and with Lælius Sapiens. He was a thorough man of the world, and wrote in a bold, independent tone, choosing for his subjects contemporary events, persons, affectations, vices, &c. He enjoyed great popularity during his lifetime, so much so that at his death in 102, at Naples, he was honoured with a public funeral, although he had never held any public office. He wrote thirty books of *Satires*, of which nothing but fragments remain, preserved in great part by the grammarians.

Lucina ('the light-bringing'), a name applied both to Diana and to Juno—to the latter, Juno Lucina, as the especial divinity that presides over childbirth, corresponding to the Eilithyia of Greek mythology. See JUNO.

Luck, or LUTZK, an ancient town of Poland on the Styr, 43 m. SE. of Kovel, has a castle, cathedral, and 20,000 inhabitants, mostly Jews.

Luck, good or bad fortune (a) in general, or (b) conceived of as dependent on occult causes, such as the use of mascots, &c. It is probable that the belief in 'luck' goes back to many distinct origins. Ominous animals are commonly regarded as bringers of good fortune: they do not merely indicate the future. The breaking of a tabu has

no doubt left its trace in our own days in the belief that it is unlucky to perform the forbidden action; casting a milk-tooth into the fire and other popular customs have their analogues in negro rites; historical facts may explain (first-foot) customs, for when a certain type of man was representative of the hereditary foe (red hair or light complexion generally), it was a short step to the belief that the year's luck depended upon the first visit to a house being paid by a friend (dark type).

Luckenwalde, a town of Prussia, 31 miles by rail SSW. of Berlin, has cloth manufactures; pop. 23,000.

Lucknow (*Lakhnao*), capital of a district and division in the United Provinces of Agra and Oudh, and the ninth largest city in India, stands on the Gumti, 42 miles NE. of Cawnpore. It is interesting, not only as the capital of the former kingdom of Oudh, and for the memorable part it played in the Mutiny, but also as a centre of modern Indian life, a chief school of native music and poetry and of Mohammedan theology. The appearance of magnificence and splendour which the city presents when seen from the outside is not borne out by close internal inspection, though a vast improvement has been effected since the Mutiny. The chief architectural glory of the place is the Imambara or mausoleum of Asaf-ud-Daula, the fourth Nawab, who did so much to embellish Lucknow with magnificent buildings. This edifice, built in 1784, stands within the Machi Bhawan fort (built by Asaf's predecessor), and is now converted into a British arsenal. The Rumi Dorrāza, a grand and massive gateway, leading out of the fort, the magnificent Residency palace, and the country palace of Bibiāpur, besides numerous minor buildings, were all erected by the same prince. The Jama Masjid or chief mosque, and the huge palaces of Chattr Manzil, Kaisar Bagh, Farhat Baksh, four royal tombs, and an observatory (head-quarters of the rebels during the Mutiny) are the most noteworthy amongst the remaining public buildings, though the palaces are remarkable for little else except their great size, debased style of architecture and gaudy decorations. The university, founded in 1920, includes King George's Medical College and Canning College. The staple industry is gold and silver brocade, besides which there are muslins and other light fabrics, embroidery in gold thread and silk upon cotton and velvet, glass, clay-moulding, shawls, jewellery (but declining), and paper. There are here extensive railway workshops. Lucknow is an important railway centre and a busy commercial town, trading chiefly in country products (grain, butter, sugar, molasses, spices, tobacco, oil-seeds), European piece-goods, salt, leather, &c. Pop. (1869) 284,779; (1881) 261,303; (1901) 264,050; (1911) 259,798; (1921) 240,566, of whom 23,000 were in the cantonments just outside; and in religion 88,000 were Muhammadans, 123,000 Hindus.

The site of the present fort was originally occupied by a small village called Lakshmanpur, founded by a brother of Rama Chandra, the hero of the epic *Ramayana*. The city did not, however, rise into importance until it was made (1732) the capital of the independent state of Oudh (q.v.). Lucknow covered itself with glory by the stirring events of which it was the scene during the Mutiny of 1857. The insurrection broke out on the night of 30th May. Sir Henry Lawrence had already fortified the Residency and garrisoned it with 750 British troops. An attempt to check the advance of the enemy at a place 8 miles from the city was defeated on 29th June, and two days later the British were besieged. On 4th July Sir Henry Lawrence died, from a wound caused on the 2d by

a bursting shell. Three times in succession the little garrison, commanded on the first occasion by Major Banks, on the last two by Brigadier Inglis, beat back the assaults of the enemy. On 22d September Havelock (q.v.) and Outram, with a relieving force, captured the Alum-bagh (q.v.), and on the 26th reached the Residency. Again the siege was formed by the rebels, both of the Residency and the Alum-bagh. The latter was succoured by Sir Colin Campbell on 10th November. Then, after driving the mutineers out of their two principal strongholds, Sir Colin reached the garrison in the city (16th November). Six days later the gallant Havelock died of dysentery. Sir Colin Campbell, leaving Outram with 3500 men to hold the Alum-bagh till his return, escorted the civilians, and the women and children, to Cawnpore. In the first week of March 1858 he returned to the attack upon the rebels at Lucknow, who had meanwhile entrenched themselves in the city. A week's hard fighting subdued them (9-15th March) and ended the Mutiny.

Luçon, an episcopal town of 7000 inhabitants in the south of La Vendée, on the railway from Nantes to Bordeaux, and on the canal of Luçon. Richelieu was Bishop of Luçon; and many battles were fought here in 1792-97.

Lucretia, the wife of L. Tarquinius Collatinus, famous for her heroic virtue. She was shamefully outraged by Sextus Tarquinius, whereupon she summoned her husband and a group of friends, and, after making them take a solemn oath to drive out the hated race of Tarquins from the city, plunged a knife into her heart. Of the poetic elaborations of the story the most famous is the long *Rape of Lucrece* of Shakespeare's youth. See BRUTUS.

Lucretius, TITUS CARUS, Roman poet, lived in the first half of the 1st century B.C., but of the particulars of his life we really know nothing. A story was current some time after his death that he died raving mad from the effects of a love-potion administered to him by his wife Lucilia, and on this story Tennyson has founded a very striking and powerful poem; but it would seem to have been a malicious invention, started by some hostile critic, or possibly by an early Christian writer who took delight in assuring that a champion of unbelief and materialism must have come to a bad end. The great—indeed, the only—work of Lucretius is an essay in hexameter verse, 'On the Nature of Things' (*De Rerum Natura*), in six books, containing upwards of 7400 lines. The work was said, but on no good authority, to have been revised by Cicero. All we know is that Cicero once briefly alludes to it (*Epist. ad Quintum Fratrem*, ii. 9), observing that there are several flashes of genius in the poem, and that much skill is shown in the composition. This is a very fair criticism, and it has commended itself to general acceptance. The poem, we take it, was on the whole coldly received by Roman readers, and with the moderns Lucretius has never been a popular classic. The subject-matter of his work is not generally attractive, nor is the versification for the most part pleasing or harmonious. Lucretius aspired to popularise the philosophical theories of Democritus and Epicurus on the origin of the universe, with the special purpose of eradicating anything like religious belief, which he is always savagely denouncing as the one great source of man's wickedness and misery. In this he is terribly in earnest, and he is never so eloquent as when he is striking at this hated enemy. The often-quoted verse, 'Tantum religio potuit suadere malorum,' expresses his innermost conviction, and out of this springs his finest and most vigorous poetry. A calm and tranquil mind was his.

summum bonum, and the only way to it lay through a materialistic philosophy which teaches that immortality is an empty dream. To Lucretius this was a positively delightful thought; he hailed it as a sure deliverance from the worst terrors which haunt men's minds. The universe, as it exists, was, he held, evolved out of ultimate elementary atoms, infinite in number, streaming downwards in void space, like a huge snowstorm; this, or something like it, was the theory of Democritus. Creation, as we understand it, is impossible; nothing can come out of nothing, neither can anything be destroyed; destruction is only a name for a change of substance. Life, mind, soul, &c. are simply parts of the man in the same sense as his limbs, and being in their nature corporeal, being, as we should say, functions of the body, they perish finally with the body, or at least so perish as to leave no survival of consciousness. All knowledge is derived from the senses, which are in fact our only test and criterion of truth. All phenomena can be explained by natural causes, and thus the door is closed against any belief in the divine or supernatural. Lucretius, in fact, is substantially in accord with modern materialism, and he often reminds us of some of the newest theories of modern science. For instance, he explains contagious diseases by the perpetual flying about in the air of minute particles, germs as we call them, injurious to life; and again, in his account of the various types of animal life as they successively appeared on the earth, we have something like anticipations of the 'survival of the fittest,' and of the Darwinian theory of evolution. Every now and then, indeed, there is quite a modern flavour about the doctrines of Lucretius. Still, it is as a poet that he has his chief interest for us, though the man himself, in his intense earnestness, no doubt put his philosophy before his poetry. A very readable book might be made up with the title 'The Beauties of Lucretius.' His poem abounds in strikingly picturesque phrases, such as only a great poet could have originated; scattered up and down in it are episodes of exquisite pathos and vivid description, perhaps hardly to be equalled in the whole range of Latin poetry. Now and then he allegorises some of the popular myths and legends, showing how they foreshadow moral truths, and in such passages he is one of the sublimest and most impressive of poets.

For Lucretius and his poetry, see Sellar, *Roman Poets of the Republic* (1863); Veitch, *Lucretius and the Atomic Theory* (1875); Dr John Masson, *The Atomic Theory of Lucretius* (1884), and *Lucretius, Epicurean and Poet* (1907-9); Thomson, *The Greek Tradition* (1915). An edition of Lucretius was printed about 1473 at Brescia, followed in 1500 by the Aldine, and in 1563 by the edition of Lambinus, which from that time held its place for upwards of three centuries as the standard text. In 1850 appeared the edition of the great German scholar Lachmann, in which the text was thoroughly revised, and on this in 1860 Munro greatly improved, adding in 1864 a most valuable commentary and a close and vigorous prose translation (new ed. 1914). A critical edition by Diels was completed by Mewaldt (1923). Creech's translation into English verse (1682) was the work of an enthusiastic admirer of the poet and his philosophy. Cyril Bailey's prose translation (1910) is an admirable piece of work.

Lucullus, LUCIUS LICINIUS, a distinguished Roman general, born about 110 B.C. In the first Mithradatic war he commanded the fleet as legate of Sulla. In 74 B.C., as consul with Cilicia for his province, he defeated Mithradates (q.v.), and almost annihilated his army on its retreat. In 71 B.C. Pontus became subject to the Romans. The measures which Lucullus now introduced in the government of the province of Asia show that he was a just, wise, and humane administrator; but

his troops grew disaffected on account of the strictness of his discipline. In the spring of 69 B.C. he marched into Armenia, and gained a complete victory over Tigranes. In the following year he gained another great victory at the river Arsianias over a new army led against him by Tigranes and Mithradates; but the mutinous spirit of the legions daily increased, and soon he could do nothing. At last he was superseded by Pompey, and left Asia in 66 B.C. In conjunction with the aristocratic party he attempted to check the increasing power of Pompey, and the attempt caused the coalition known as the first triumvirate. But he was ill fitted to act as leader against such unscrupulous men, and soon withdrew altogether from political affairs. During his public career he had acquired (but not unfairly) prodigious wealth; and he spent the remainder of his life surrounded by artists, poets, and philosophers, and exhibiting in his villas at Tusculum and Neapolis, and in his house and gardens at Rome, a luxury and splendour which became proverbial. He died about 57 B.C.

Lucy, Sr., a virgin who was martyred under Diocletian at Syracuse. She is the patron of the blind, and is commemorated on 13th December.

Luddites, bands of workmen who went about the midland counties of England between 1812 and 1818 destroying machinery, whose introduction had resulted in a displacement of labour, aggravated by a simultaneous commercial depression. They took this name from one Ned Ludd, a Leicestershire idiot, who had in a passion destroyed some stocking-frames thirty years before, and their outrages commenced at Nottingham in November 1811, and extended during the following spring and summer through Cheshire, Lancashire, and Yorkshire. In July 1816 they broke out with greater vigour, and destroyed every lace machine in Loughborough, while their leader openly declared his readiness to march 100 miles to destroy any machinery working under price. In October of the same year another party broke thirty machines in Leicester; but soon after the riots of the Luddites are lost sight of in the wider and more formidable political riots which marked this period, and made the social history of 1816 little more than a long catalogue of disturbances.

Ludendorff, ERICH VON, German general, born a merchant's son in Posen, had been a staff officer in 1904-13, and on the outbreak of the Great War took part (as Bülow's quartermaster-general) in the taking of Liège. In August he was sent as chief of staff to East Prussia, where, drawing off most of the troops opposed to Rennenkampf, and concentrating against Samsonoff, he won for Hindenburg the victory of Tannenberg. When Hindenburg succeeded Falkenhayn in 1916, Ludendorff, as his 'first quartermaster,' seems to have taken the real direction of the war. His sending of Mackensen to the Dobruđa was a brilliant tactical success; but thenceforward he had to play a losing game against military and political difficulties. In November 1923 he was joint leader in an abortive monarchist rising in Bavaria, and, being captured, was tried for high treason but acquitted (1st April 1924). In 1925, as a candidate for the presidency of the Reich, he gained little support in the cause of a fascist dictatorship.

Lüdenscheid, a town of Westphalia, 19 miles ESE. from Elberfeld-Barmen, is the seat of numerous hardware manufactures (as metal buttons, buckles, teaspoons, teapots, mountings for umbrellas and sticks, musical instruments) besides iron-foundries and machine-shops; pop. 31,000.

Lüderitzbucht, **Lüderitzland**, names sometimes given to Angra-Pequena (q.v.) and the

adjoining territory, which became part of German Namaqualand.

Ludhiana, capital of a district in the Punjab (with an area of 1452 sq. m. and a population of 568,000), stands 8 miles from the south bank of the Sutlej, and on the Sind, Punjab, and Delhi Railway. It was founded in 1480 by the princes of Delhi, and is now a thriving corn-mart, and has manufactures of Kashmir shawls, scarves, cottons, turbans, furniture, and carriages. Pop. 52,000. The shrine of a Mohammedan saint here attracts a large concourse of pilgrims every year.

Ludlow, a market-town and municipal borough of Shropshire, at the Corve's influx to the Teme, 28 miles S. of Shrewsbury. It is a very old and interesting place, with two noble monuments of antiquity. First, there is the massive Norman keep, 110 feet high, of the castle, where Prince Arthur wedded Catharine of Aragon; where, in the banquetting-hall, Milton produced his *Comus*; and where, too, Butler wrote *Hudibras*. Captured by King Stephen, the Lancastrians, and the Round-heads, it was finally dismantled in 1689. Secondly, there is the cruciform collegiate church (restored 1863-91), Perpendicular in style, with a tower 130 feet high. The grammar-school, founded in 1282, and refounded in 1552, is almost the oldest in the kingdom; and one of seven gates still remains. From Edward IV.'s reign till 1867 Ludlow returned two members, then one till 1885. Pop. 6000. See, for Ludlow formation, SILURIAN.

Ludlow, EDMUND, a sturdy English republican and regicide, was born of a good old family at Maiden Bradley, Wiltshire, in 1617; studied at Trinity College, Oxford; and at the outbreak of the Civil War was a student in the Temple. He volunteered into Essex's lifeguards, saw service under Waller and Fairfax, was returned in his father's room to parliament for Wiltshire in 1646, sat among the king's judges, and had a place in the council of state of the Commonwealth. In 1651 he was sent to Ireland as lieutenant-general of horse, and held the chief command for six months between the death of Ireton and the arrival of Fleetwood. He refused to recognise Cromwell's protectorate, and until his death took no further part in public affairs. Returned to parliament for Hindon in 1659, he urged the restoration of the Rump, held command again for a few months in Ireland, was nominated by Lambert to the committee of safety, and strove in vain to reunite the broken ranks of the old republican party. Four months after the Restoration he fled to France and Vevey in Switzerland. After the Revolution he returned to England, but, the House of Commons having craved his arrest, he returned to Vevey, and died there in 1692. His *Memoirs*, one of the best contemporary sources of knowledge, cover the period 1640 to 1688; new ed. by Firth (1894).

Ludlow, JOHN MALCOLM FORBES, C.B. (1821-1911), called to the bar in 1843, was in 1875-91 chief registrar of friendly societies, but was better known as a fellow-labourer with J. F. D. Maurice in founding the Christian-Socialist movement and a Working Men's College, and as promoter of co-operation, co-partnership, and social reform.

Ludwigsburg, in Württemberg, 8 miles N. of Stuttgart, grew up round a hunting castle of Duke Eberhard Ludwig, and became the second royal residence, and one of the principal garrison towns, of the kingdom. It has a (once royal) castle, with picture-gallery and splendid gardens. Pop. 23,000.

Ludwigshafen, a town of the Bavarian Palatinate, stands on the left bank of the Rhine, opposite Mannheim. It has grown rapidly owing to its manufactures (soda, aniline dyes, acids, fertilisers,

wagons, &c.) and its trade in iron, timber, coal, and agricultural products. Pop. 90,000.

Luffa. See LOOFAH.

Luga'no, a town in the Swiss canton of Ticino, stands on the north-west shore of the lake of the same name, 49 miles by rail N. by W. from Milan. In appearance the place is thoroughly Italian; villas stud the lower slopes of the hills embosomed in vineyards and chestnut woods. The church of Santa Maria degli Angioli has interesting works of art by Luini. An important cattle fair is held here in October. Mazzini and the Italian patriots made Lugano their headquarters for some time after 1848. From Monte Salvatore (2982 feet), in the vicinity, a magnificent view may be obtained. Pop. 14,000.—The LAKE OF LUGANO, also called CERESIO, lies at the southern foot of the Alps, 889 feet above sea-level. Its length is 14½ miles, its average breadth 1½ mile; area, 18½ sq. m. The depth varies very greatly, the maximum being 945 feet, whilst the average is only about 246 feet.

Lugdunum. See LYONS, LEYDEN.

Lugo (*Lucus Augusti* of the Romans), capital of a province in the north-west of Spain, is situated on the Minho, 72 miles by rail S.E. of Coruña, and is still surrounded with old walls, high and thick, with towers. It has a cathedral built in 1129-77, and manufactures of linen and leather. It was celebrated as early as the time of the Romans for its warm sulphur baths. Pop. 28,000.—The province is a mountainous but agricultural region, drained by the Minho and its tributary the Sil, and rich in minerals that are but little extracted. Area, 3800 sq. m.; pop. 470,000.

Lugo, a town of Italy, 18 miles by rail W. of Ravenna, has a trade in corn, hemp, wine, and a celebrated fair (all September); pop. 30,000.

Lugsail. See SAIL.

Lugworm. See LOBWORM.

Luik. See LIÈGE.

Luini, or LOVINO, BERNARDINO, a painter of the Lombard school, was born about 1470 at Luino, on the Lago Maggiore. He developed his skill in the school of Leonardo da Vinci; indeed many of his works used to be attributed to Leonardo. Luini's principal charms are a certain poetic grace and beauty. He died some time after 1530. He painted frescoes in the Ambrosian Library, in the Brera Gallery, and in the church of St Maurizio, all at Milan. Other works hang in the church at Lugano. His best-known easel-works include 'The Virgin Enthroned' (Brera), 'The Daughter of Herodias' (Louvre), 'Christ disputing with the Doctors' and 'Vanity and Modesty' (London), &c. Luini is one of the five great painters whose 'supremacy' Ruskin affirmed. See G. C. Williamson's *Bernardino Luini* (1899).

Luke. The name Luke (Loukas) is probably a shortened Greek form of the Latin Lucanus. Luke was the companion of St Paul, and the authorship of the third Gospel and the Acts is generally attributed to him. He is mentioned three times by St Paul in the Epistles (Col. iv. 14; Philemon, ver. 24; 2 Tim. iv. 11). From these references we learn (a) that Luke was a Gentile, since in the Colossian passage a distinction is drawn between 'those of the circumcision' and Epaphras and Luke; (b) that he was a 'beloved physician' (c) and a fellow-worker with the apostle; (d) that he was Paul's constant companion during his imprisonment in Rome, remaining with him when all his other friends had deserted him. Luke has sometimes been identified with the Lucius mentioned in Romans, xvi. 21, who is associated with Paul and others in sending greetings, but this suggestion is extremely improbable, as the name

is spelt differently, and the Lucius of Romans was a Jew, since he is described as a kinsman of the apostle. A Lucius of Cyrene is also mentioned in Acts, xiii. 1, but we have no grounds for supposing that he was our Luke, except the bare fact that both of them seem to have been associated with the city of Antioch. Luke was credited with the authorship of the third Gospel and Acts in comparatively early times. The Muratorian Fragment (180 A.D.) is the first authority to ascribe these books to him, and about the same time the evidence of Irenæus is quite explicit upon the point. Tradition has this in its favour, that it is unlikely that two such important books would have been fathered upon Luke, who was one of the secondary figures of the Apostolic Age, unless he had actually been associated with their composition. Modern opinion, however, is divided upon the question whether this tradition should be accepted. The radical school of critics, headed by Schmiedel, deny altogether that Luke had any hand in the production of either the Gospel or Acts. An intermediate school hold that he was author of the 'We-sections' of Acts, and perhaps of some of the sources of the Gospel, but this material was worked over and very largely expanded by a later editor. The conservative circle of scholars still maintain the traditional view, and their position has been immensely strengthened in recent times by the support of Harnack. Harnack, after a minute examination of the linguistic data, has reached the decided conclusion that the We-sections of Acts cannot be separated from the rest of the book, and that all the evidence points to the fact that Luke was the author of the whole. If this result is sound—and Harnack's adhesion has certainly given a new lease of life to the conservative position (see also ACTS)—the following fresh facts about the personality of Luke can be gleaned from these writings. (1) We know from the preface of Luke that its author was not one of 'the original eye-witnesses' of the events which he recorded. This statement disposed of the supposition that Luke was the unnamed disciple who shared with Cleopas the walk to Emmaus, or that he was one of the seventy commissioned by Jesus to preach. (2) He was the companion of St Paul during some of his missionary journeys. When this association commenced we cannot tell. The We-sections commence when Paul reaches Philippi. But there is a western reading preserved in Codex Bezae in Acts, xi. 28, which suggests that the companionship began during the year which Paul and Barnabas spent at Antioch, the capital of Syria. We can be certain that Luke was with Paul during his work at Philippi (xvi. 10-17), during his stay at Troas (xx. 5-15), during the journey from Miletus to Jerusalem (xxi. 1-18), and finally during the voyage from Caesarea to Rome (xxvii. 1-xxviii. 16). Very little reliable information can be obtained from later writers. There is strong probability that Eusebius is right in his statement that Luke was originally connected with Antioch, though Sir W. Ramsay prefers to think that he lived at Philippi. Eusebius is supported by a statement in the *Præfatio Lucae*: 'Luke . . . by nation a Syrian of Antioch, a disciple of the Apostles . . . died in Bithynia at the age of 74.' Another tradition places the sphere of his later labours in Alexandria. Tradition—very late tradition, however—also suggests that he was an artist, and that he painted a portrait of the mother of Jesus, but little importance can be attached to the suggestion.

See Harnack, *Luke the Physician and The Date of Acts*; commentaries of Plummer and Godet; articles in Biblical dictionaries.

Lukuga, an intermittent outflow from Lake Tanganyika (q.v.) into the Congo.

Luleå, the capital of the Swedish county of Norbotten, is situated at the mouth of the river Luleå, on the north-west coast of the Gulf of Bothnia. It exports timber, tar, salmon, reindeer-hides, and the produce of the Gellivara iron-mines (situated 126 miles NW. from Luleå). The railway (304 miles long) from Luleå north-westwards across the north of Sweden and Norway to Narvik on Ofoten Fjord in the north of the latter country, begun in 1888, was long the northernmost in Europe. Pop. 11,000.

Lull, RAMÓN. See LULLY (RAYMOND).

Lully, GIOVANNI BATTISTA, musical composer, was a Florentine by birth, born about 1633. Taken to Paris whilst still a boy, he attracted the attention of Louis XIV. by his violin-playing. The king made him director of the royal orchestra, and eventually (1672) director of operatic affairs in Paris. In collaboration with Quinault, Lully composed a great number of operas, some of which kept the stage until the time of Gluck (circa 1778). It was by making the ballet an essential part of the opera that Lully achieved this success. The favourites amongst his operas were *Thésée*, *Armide*, *Phaëton*, *Atys*, *Isis*, and *Acis et Galatée*. He died at Paris on 22d March 1687. A friend of Molière, he composed music for some of his comedies. See OPERA; and Radet's great monograph (1891).

Lully, RAYMOND, 'the enlightened doctor,' was born at Palma, in Majorca, in 1234. In his youth he led a dissolute life, and served for some time as a common soldier; but, a complete revulsion of feeling taking place, he withdrew to solitude, and gave himself up to ecstatic meditations and the study of the occult sciences. This sudden change of life produced in Lully a fervid and enthusiastic state of mind, under the influence of which he formed the project of a spiritual crusade for the conversion of the Mussulmans, an idea he never afterwards abandoned. In pursuance of this project he commenced an earnest study of theology, philosophy, and the Arabic language, and after some years published his great work, *Ars Generalis sive Magna*, which has so severely tested the sagacity of commentators. This work is the development of the method of teaching known subsequently as the 'Lullian method'; a mechanical aid to the mind in the acquisition of knowledge and the solution of all possible problems by a systematic manipulation of certain fundamental notions (the Aristotelian categories, &c.). He even invented a machine (of tin or pasteboard) to assist in this great task. Yet in this departure from scholastic logic, and his zeal for a true interpretation of nature, he was really a precursor of Bacon.

Lully subsequently published another remarkable work, *Libri XII. Principiorum Philosoph. contra Averroistas*, and, full of the principles which he had developed in this book, he went to Tunis in 1292 to argue with his Mohammedan opponents. Ere long he was thrown into prison and condemned to banishment. After lecturing at Naples for several years he proceeded to Rome, thence to his native island of Majorca, thence to Cyprus and Armenia. In 1306 he again sailed for Africa, entered the city of Bugia, now Bougie (q.v.), in Algeria, was again thrown into prison, and again banished. At Paris he lectured against the principles of Averroes. But his missionary zeal could only be satisfied by martyrdom. Sailing once more for Africa, at Bugia he was stoned and ill-treated so that he expired a few days afterwards on board a Genoese vessel (1315). The Lullists combined a religious mysticism with a belief in alchemy.

See books by Helfferich (1858), Canalezas (1870), Zevemer (New York, 1902), Frost (1903), Barber (1904),

Waite (1922); editions by Salzinger (1742) and Rossello (1886); and the histories of philosophy and logic.

Lumbago is a rheumatic affection of the muscles or fibrous tissues in the lumbar region, or small of the back. It is often first recognised by the occurrence of a sharp stabbing pain in the loins upon attempting to rise from the recumbent or sitting position. It is sometimes so severe as to confine the patient to bed and in one position, from which he cannot move without intense suffering; but in milder cases he can walk, although stiffly and with pain, and usually with the body bent more or less forward. It may be distinguished from inflammation of the kidneys by the absence of the peculiar direction of the pain towards the groin, as also by the absence of the nausea and vomiting and other constitutional symptoms which usually accompany the disease of the kidney.

The causes of lumbago are the same as those of sub-acute rheumatism generally. The complaint may arise from partial exposure to cold, especially when the body is heated, and violent straining will sometimes induce it. In persons with a strong constitutional tendency to rheumatism the slightest exciting cause will bring on an attack of lumbago.

The treatment must vary with the intensity of the affection. In most cases a warm bath at bedtime, followed by ten grains of Dover's powder, or full doses of alkaline remedies, as citrate of potassium, will speedily remove it; and, as local remedies, a mustard poultice, a mixture of chloroform and soap-liniment, or the application of the button canterbury made for the purpose will be found serviceable. (See also the treatment for RHEUMATISM.) The disorder has been known to disappear completely after one application of the cauterium, which should be heated in a spirit-lamp to somewhere about 200° F., and then be rapidly brought in contact with points of the skin over the painful parts at intervals of about half an inch. Each application leaves a red spot, but blisters seldom occur if the operation is properly performed. The application of a hot iron, used just as in ironing clothes, with two or three folds of blanket between it and the skin, frequently gives great relief.

Luminosity. See LIGHT, PHOSPHORESCENCE, PHOTOMETRY.

Luminous Paint, a phosphorescent powder, such as sulphide or oxysulphide of calcium, ground up with a colourless varnish or other medium, and used as a paint. Even after daylight is over the Phosphorescence (q.v.) continues, and the object painted (e.g. a match-box) remains visible in the dark. It was invented by Dr W. H. Balmain in 1877, and improved by W. C. Horne.

Lumpsucker (*Cyclopterus*), a genus of Teleostean fishes in the family Cyclopteridae (or Discoboli), nearly related to Bullheads, characterised

skin, the elevated anterior ridge which grows over the first dorsal fin, the weakly ossified skeleton, and the fusion of the pelvic fins to form an anterior circular adhesive disc by which the fishes can fix themselves very firmly. The same disc is seen in the closely related tadpole-like 'sea-snails' in the genus *Cyclogaster* or *Liparis*. The common Lump-sucker (*Cyclopterus lumpus*) is a northern fish, common on British coasts. The quaint body is finely coloured, especially in the breeding males, and may attain a length of two feet, though half that is nearer the average. The creature occurs on rocky bottoms at considerable depths (100 fathoms), and thence to the shore in the narrow sense; it is sluggish and may attach itself to floating objects, but it can swim vigorously. It feeds largely on crustaceans and worms. It spawns in spring near shore, and the large masses of reddish eggs adhere between stones in pits which the male excavates. Over these he mounts guard, driving off crabs and other enemies, and every now and then violently splashing in the water with his pectoral fins so that the eggs are aerated and kept clean. The fry are tadpole-like and smooth; they often fasten themselves to the paternal body. The flesh is not greatly esteemed, but varies with the seasons. The Scots name *Cock-paddle* refers to the cock's comb-like crest; the female is often distinguished as *hen-paddle*.

Lumsden, SIR HARRY BURNETT (1821-96), son of a Scottish colonel in the Bengal Artillery, served in the Sutlej campaign (1845), became assistant to Sir Henry Lawrence in the Punjab, raised in 1846 the famous cavalry force called the 'Guides' (whom he clothed in khaki, being the first to introduce this uniform into the Indian army), and during the Mutiny was in Afghanistan on a delicate mission. He fought against the Waziris, commanded the Hyderabad contingent, and in 1875 retired from the army as lieutenant-general. See *Lumsden of the Guides*, by Lumsden and Elmslie (1899), and *Pearse's History of Lumsden's Horse* (1903).

Lunacy. See INSANITY.

Lunardi, VINCENZO (1759-1806), born at Lucca, was a famous aeronaut; see BALLOONS, &c.

Lunawara (or *Lunavada*), a protected state of India, in the Rewa Kantha Agency, Gujarat, with an area of 388 sq. m. and a pop. of 83,000.

Lund (*Londinum Gothorum*), a city of Gothland, in the extreme south of Sweden, by rail 374 miles SW. of Stockholm and 10 NE. of Malmö. In the 10th century it was a large and powerful city, was made a bishopric in 1048, and an archbishopric in 1104. The archbishop claimed ecclesiastical supremacy over the whole of Scandinavia. At the same period Lund was the chief seat of the Danish power in the Scandinavian peninsula, and for a long period the capital of the Danish kingdom; at the epoch of its greatest prosperity it is said to have had 200,000 inhabitants. But after the introduction of the Reformation by Christian III. in 1536 the city began to decay, and had sunk down to a mere village before the end of the 17th century. The principal building is the fine Romanesque cathedral, dating from the 11th century; it has an imposing crypt. Lund owes its revival to the founding there of a university in 1668 by Charles XI. It has a large library, an excellent zoological museum, and a botanic garden. Tegnér was a professor from 1813 to 1826, and here he composed his masterpiece, *Frithjof*. Pop. 23,600.

Lundy (Scand. 'grove island'), a granitic island of Devonshire, in the mouth of the Bristol Channel, 11½ miles NNW. of Hartland Point, 17 NW. of Clovelly, 24 W. of Ilfracombe, and 30 SSE. of St Gowan's Head in Wales. It measures 3½ miles by 1;

Lumpsucker (*Cyclopterus lumpus*).

by the deep, thick, short shape of the adult body, the rough spines and tubercles on the otherwise naked

has rocky and precipitous shores, with only one landing place on the south side; and attains an altitude of 525 feet. The cliffs are the resort of multitudes of sea-fowl. The antiquities include prehistoric kists, remains of round towers and a chapel, and the ruined castle of the Mariscoes (11th to 14th centuries), from whose time on into the 17th century Lundy was a stronghold of pirates, buccaneers, privateers, and smugglers. It figures in Kingsley's *Westward Ho!*; was the death-place of 'Judas' Stucley; was garrisoned till 1647 for Charles I. See a book by Loyd (1925).

Lüneburg, a town of Hanover, situated on the river Ilmenau, 31 miles by rail S.E. of Hamburg. Its streets are narrow and its houses mediæval, but its suburbs are modern. The 15th-century church of St Michael contains the tombs of the Lüneburg princes. The five-aisled church of St John dates from the 14th century, is pure Gothic in style, and has a tower 371 feet high. The mediæval town-house is adorned with old pictures and stained glass. A salt mine, discovered in 906, still yields large quantities of salt. There are also a gypsum mine, iron works, chemical manufactories, &c. Lüneburg lampreys are well known in Germany. Population, 28,000. Although existent in 795, the place only began to acquire importance after the founding of the Benedictine monastery in 904; it was greatly increased by the settlement here of large numbers of the people of Bardowiek, destroyed in 1189. Lüneburg afterwards joined the Hanseatic League, and was the capital of an independent duchy. But it lost the greater part of its privileges in the 16th century, and in the 17th suffered much from the Swedes and their enemies. It began to revive again in the 19th century. Near by the Allies defeated the French on 2d April 1813.

The principality of Lüneburg, or rather Brunswick Lüneburg, existed from 1235 to 1369, from 1373 to 1532, and from 1546 onwards. From the princes of this house is descended the reigning house in Great Britain (see BRUNSWICK).—South of Lüneburg stretches for 50 miles on end the Lüneburg Moor (*Heide*), a grazing-ground for sheep. It produces also honey, buckwheat, and numerous wild berries, and is largely clothed with fine heather.

Lunel, a French town of Hérault, 14 miles N.E. of Montpellier, with a trade in muscatel wine and brandy; pop. 8000.

Lunette. See FORTIFICATION.

Lunéville, a town in the French department of Meurthe-et-Moselle, at the confluence of the Meurthe and the Vezouse, and 20 miles by rail S.E. of Nancy. It was formerly a residence of the Dukes of Lorraine; their palace, built by Duke Leopold, in which the Emperor Francis I. was born, is now used as a cavalry barrack, this town being one of the largest cavalry stations in France. Here was signed the peace of Lunéville, on 9th February 1801, between Germany and France, on the basis of the peace of Campo-Formio (q.v.); and during the Great War the place was occupied by the Germans (24th August to 11th September 1914). The industry embraces gloves, hosiery, and cottons, and there is a trade in wine. Pop. 24,000.

Lungs. See RESPIRATION; for diseases of the lungs, PNEUMONIA, PLEURISY, TUBERCULOSIS, &c.; for lung-fishes, MUDFISHES.

Lungwort, or OAK-LUNGS (*Sticta Pulmonaria*), a lichen with a foliaceous, leathery, spreading thallus, of an olive green colour, pale brown when dry, pitted with numerous little cavities and netted, much lacerated; the shields (*apothecia*) marginal, reddish-brown with a thick border. It grows on trunks of trees in mountainous regions

in Britain and other European countries, sometimes almost entirely covering them with its shaggy thallus. It has been used as a remedy for pulmonary diseases. It is nutritious, and, when properly prepared, affords a light diet, capable of being used as a substitute for Iceland moss; yet it is bitter enough to be used as a substitute for hops. It yields a good brown dye.—The name lungwort is also given to a genus of flowering plants (*Pulmonaria*) of the natural order Boraginæ. The common lungwort (*P. officinalis*) is rare and hardly naturalised in Britain, although common in some parts of Europe. It has ovate leaves and purple flowers, and was formerly employed in diseases of the lungs, but seems to have been recommended chiefly by a fancied resemblance to the lungs in its spotted leaves. It is mucilaginous, and contains nitre. It has been used as a pot-herb. *P. angustifolia* is British.

Lunkah, better LANKA (Sansk. 'island'), is specially used of Ceylon, and also of a great tobacco-growing district in the delta of the Godavari.

Lunularia, a genus of Liverworts (q.v.).

Lupercalia, a festival among the ancient Romans, held on the 15th of February, in honour of Lupercus, the god of fertility. When Rome began to seek a Grecian origin for its religious ceremonies Lupercus was identified with Lycæan Pan, and his worship was said to have been introduced by Evander, the Arcadian. Modern scholars place no value on such statements. Lupercus is believed by them to have been one of the oldest pastoral deities of Italy, and everything that is known regarding him and his rites favours this view. These rites were of the rudest and most primitive character, and indicate a high antiquity. Goats and dogs were sacrificed; afterwards the priests (called *Luperci*) cut up the skins of the victims and twisted them into thongs, with which they ran through the city striking every one they met, especially women, who put themselves in their way hoping that the god of fertility would be propitious towards them. As the festival is believed to have been at first a shepherd one, this running about with thongs is understood to have been intended as a symbolical purification of the land. The place where the festival was held was called the Lupercal, and was situated on the Palatine Hill. It contained an image of Lupercus, covered with a goat's skin. Lupercalia were also held in other cities of Italy.

Lupine (*Lupinus*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, mostly annuals, but some of them perennial herbaceous plants, some half-shrubby; and generally having digitate leaves, with rather long stalks. The flowers are in racemes or spikes, the calyx two-lipped, the keel beaked, the filaments all united at the base. The species of lupine are numerous, and are chiefly natives of the countries near the Mediterranean Sea, and of the temperate parts of North and South America. The White Lupine (*L. albus*), a species with white flowers, has been cultivated from time immemorial in the south of Europe and in some parts of Asia, for the sake of the seeds, which are farinaceous and are used as food, although when raw they have a strong, disagreeable, bitter taste, which is removed by steeping in water and boiling. They were a favourite kind of pulse amongst the ancient Greeks and Romans, and still are so in some parts of the south of Europe, although generally disliked by those who have not been accustomed to them. The Yellow Lupine (*L. luteus*), so called from its yellow flowers, and the Egyptian White Lupine (*L. Termis*), which has white flowers tipped with blue,

are also cultivated in the south of Europe, Egypt, &c., for their seeds, which are similar in their qualities to those of the white lupine. In many countries lupines, and particularly the white lupine, are cultivated to yield green food for cattle, and also to be ploughed down for manure. They grow well on poor and dry sandy soils, which by this process of *green-manuring* are fitted for other crops. Many species of lupine are cultivated in our flower-gardens, having beautiful white, yellow, pink, or blue flowers. The flowers of some species are fragrant. No lupine is a native of Britain. *L. perennis* adorns sandy places from Canada to Florida with its fine blue flowers.

Lupton, THOMAS G. (1791-1873). See ENGRAVING.

Lupuline. See HOPS.

Lupus is a chronic disease of the skin, in which dull or livid tubercles are developed, having a tendency to destroy or so seriously to affect the adjacent tissues, with or without ulceration, as always to lead to indelible cicatrices. It was formerly known as *noli me tangere*. The disease usually attacks the face, especially the alæ of the nose and the lips, but may occur on almost any part of the body. It usually begins in childhood or early adult life, but may recur at a later period. It more often affects the female sex, and is not contagious, nor usually hereditary. It is, in its severer forms, a terrible disease, but is happily of somewhat rare occurrence. It derives its name from the Latin *lupus*, 'wolf,' in consequence of its destructive nature. See TUBERCLE.

Lupus usually commences with the appearance of one or two circular or oval, dull-red, somewhat translucent tubercles, about two lines in diameter. After a time these tubercles increase in number and size, and take on new characters. They may ulcerate, constituting the variety known as *Lupus exedens*, in which case the ulceration may pursue a superficial or a deep course. Scabs are formed over the ulcers; and as these scabs are thrown off the ulcer beneath is found to have increased in extent, till great destruction of the soft parts and (in the case of the nose) of the cartilages is effected. The ulcer of lupus has thick red edges, and exudes a fetid, ichorous matter in considerable quantity. When they do not ulcerate, the tubercles are softer than in the previous variety, and form patches of considerable extent, the intervening skin and cellular tissue also swelling and exhibiting here and there dull-red points, which are the summits of the imbedded tubercles. The lips become much enlarged, the nostrils closed with the swelling, the eyelids everted, and the whole face hideous. This variety is known as *Lupus non exedens*.

The progress of lupus is usually slow, and the sufferings of the patient less than might be expected, in consequence of the sensibility of the parts being diminished from the first. The complaint may continue for years, or even for life, but is seldom fatal. Its causes are not well known; it is due to the presence of the tubercle bacillus in the affected skin; but many of those affected by lupus enjoy otherwise excellent health, and there is no special tendency to invasion of the lungs or other organs, commonly the seat of tuberculosis.

Treatment.—It is of course desirable that the patient's general health be brought into as vigorous a condition as possible; and for this purpose cod-liver oil, iodide of iron, and other tonics are often useful. But no internal remedy seems to have any reliable effect upon the disease. The local treatment has passed through many variations: the application of strong escharotics, repeated incisions, or scraping away of the diseased tissues, were often successful in modifying or arresting the disease.

Unna of Hamburg recommended in 1886 the constant application to the diseased parts of plasters containing salicylic acid and creasote. Some favourable results were obtained from the use of Koch's tuberculin. But much more successful has been the method of phototherapy, or persistent treatment by light-rays (the chemical rays, not the heat ones), devised about 1896 by Dr Niels R. Finsen of Copenhagen. The Röntgen (q.v.) rays and radium seem to reach even deeper layers than those affected by sunlight or electric light.

Luray Cavern, a cave, not large, but remarkable for the vast number and extraordinary shapes of its stalactites, is close to Luray village, Virginia (90 miles NW. of Richmond). Many of these wonderful columns exceed 50 feet in length; numbers of them are hollow, giving out bell-like notes when struck; and the colours range from waxy white to yellow, brown, or rosy red. The cavern, which is lit with electric light, attracts thousands of visitors every year.

Lurcher, a name applied to any dog with a distinct *cross of greyhound*. The commonest form of the lurcher is the first cross between the collie and the greyhound, though in some instances they have been bred for many generations without a fresh cross. As the lurcher combines to a great extent the speed of the greyhound and the sagacity of the collie, no hare is able to escape him. The owner of such an animal is an object of suspicion to every gamekeeper.

Lurgan, a thriving town of Ireland, in County Armagh, 20 miles SW. of Belfast by rail. It is but 1 mile south of the shores of Lough Neagh, and the country around is populous and fertile. It has thriving manufactures of cambrics, lawns, damasks, and diapers. Pop. 13,000.

Luristan, a mountainous province in the west of Persia; corresponds roughly to the ancient Susiana, was the seat of the ancient Elamite empire, and is now occupied by numerous minor tribes.

Lurlei. See LORELEI.

Lusatia (*Lausitz*), a district now belonging in part to Saxony and in part to Prussia. It was formerly divided into Upper and Lower Lusatia, which constituted two independent margraviates, including an area of about 4400 sq. m. Many of the inhabitants are Wends. Given in 1319 to Bohemia, and obtained by Matthias Corvinus in 1478, Lusatia was transferred to Saxony in 1635; but, by the Congress of Vienna, the whole of Lower Lusatia and the half of Upper Lusatia was ceded to Prussia. The portion left to Saxony now forms the circle of Bautzen.

Lushais, a warlike race occupying the little-known Lushai Hills in Cachar (Assam), Chittagong (Bengal), and the adjoining parts of Burma. To check their raids on British territory expeditions were required—in 1871-72, and again in 1889-90 and 1892. Their country is now British.

Lusiads. See CAMOENS.

Lusignan, a picturesque town in the French department of Vienne, 17 miles SW. of Poitiers. It has a very fine church dating from the 11th century, but its castle, associated by legend with the fairy Melusine (q.v.), was razed by the Catholics in 1574. The House of Lusignan gave two titular kings to Jerusalem, and four kings to Cyprus. Pop. 2000.

Lusitania. See PORTUGAL.

Lustre, the characteristic appearance of a bright metallic surface, or of air within glass under water as seen under certain angles of total reflection (see REFLECTION). It is supposed to be

due to the conflict between the images in the two eyes, which do not coincide in respect of brightness all over the field. A similar result may be obtained by looking with one eye at a white-and-black and with the other at a black-and-white object, the form, sizes, and positions of the objects being such as would otherwise have enabled the observer to blend them into a single stereoscopic image (see STEREOSCOPE); the opposition of brightness makes the stereoscopic binocular image assume a lustrous appearance.

Lustrum (from *luere*, 'to purify' or 'expiate'), the solemn offering made for expiation and purification by one of the censors in name of the Roman people at the conclusion of the census. The animals offered in sacrifice were a boar (*sus*), sheep (*ovis*), and bull (*taurus*), whence the offering was called *Suovetaurilia*. As the census was quinquennial, the word *lustrum* came to mean a period of five years.

Lute (Arab. *al'ud*), a stringed instrument, which three hundred years ago was as popular as is the piano to-day. It was introduced into Europe by the Arabians, from whose language it derives its name. The Arabian lute was made of twenty-one pieces of maple-wood, with a flat face, a round back, and three rosettes in the face. The strings were eight in number, and were tuned in pairs. The date of its introduction and dissemination through Europe is shortly after the conquest of Spain by the Arabians. The European lute possessed originally eight strings. This number was not increased for many centuries. Three new strings were then added, bringing up the number to eleven: of these two were tuned alike, and the odd one, which was also the highest, was called chanterelle. The need of accommodating the lute to the chromatic scale procured the addition of thirteen new strings, until in the 17th century the total of twenty-four was reached, beyond which number the augmentation did not continue. At that date the lute commonly in use in Europe consisted of a table of fir or pine; a body or belly, composed of convex ribs of pine; a neck, or finger-board, of hard wood, on which were frets, consisting of catgut strings fastened tightly round the neck; a head, on which were placed the pegs or screws that tightened or relaxed the strings in tuning; and a bridge, to which the strings were attached at one end, the other end being fastened to a piece of ivory, between the head and neck. Of the twenty-four strings twelve ran over the finger-board and twelve by the side of it. The performer used his left hand to press the frets, and struck the strings with his right. There were many varieties of the lute; the treble lute was the smallest, the bass lute the largest. The theorbo was a double-necked lute, of which the archlute and the chitarrone were two subordinate varieties. A peculiar description of notation, called *tablature*, was employed in music written for the lute. The strings were represented by parallel lines, on which were placed letters of the alphabet, referring to the frets: thus, A marked that the string was to be struck open; B, that the first fret was to be pressed; C, the second, and so on. Over the lines were placed crotchets, quavers, &c., which denoted the lengths of the various notes. The Arabian lute is still extant in the East, of a form nearly identical with that described. The European lute survives only in the guitar and similar instruments. The lute is represented on the sculptures of the Egyptian tombs, so that the antiquity of the instrument is immense. For the European lute, see Becker's *Hausmusik in Deutschland* (1840); for the Arabian lute, Rowbotham's *History of Music*, vol. iii. (1887).

Lute (Lat. *lutum*, 'clay'), in Chemistry, denotes a substance employed for effectually closing the joints of apparatus, so as to prevent the escape of vapour or gases, or for coating glass vessels so as to render them more capable of sustaining a high temperature, or for repairing fractures.

Lutetia. See PARIS.

Luthardt, CHRISTOPH ERNST (1823-1902), Lutheran theologian, was born at Maroldsweisach in Lower Franconia, studied at Erlangen, and became professor of Theology at Marburg in 1854, and in 1856 at Leipzig. His Commentary on John's Gospel (1852; 2d ed. 1875) has been translated into English, as has also *St John the Author of the Fourth Gospel*, and works on the saving, the fundamental, and the moral truths of Christianity (*Apologetische Vorträge*). He was also author of a *Compendium der Dogmatik* (1865; 9th ed. 1893), *Die Ethik Luthers* (1867), and *Die Antike Ethik* (1887), besides collections of lectures and sermons. See his *Reminiscences* (2d ed., 1891).

Luther, MARTIN, the greatest of the Protestant Reformers of the 16th century, was born at Eisleben on the 10th November 1483. His father was a miner in humble circumstances; his mother, as Melancthon records, was a woman of exemplary virtue (*exemplar virtutum*), and peculiarly esteemed in her walk of life. Shortly after Martin's birth his parents removed to Mansfeld, where their circumstances ere long improved by industry and perseverance. Their son was sent to school; and both at home and in school his training was severe. His father sometimes whipped him, he says, 'for a mere trifle till the blood came,' and he was subjected to the scholastic rod fifteen times in one day! Luther's schooling was completed at Magdeburg and Eisenach, and at the latter place he attracted by his singing the notice of a good lady of the name of Cotta, who provided him with a comfortable home during his stay there. Here under Trebonius he made good progress in Latin. In 1501, when he had reached his eighteenth year, he entered the university of Erfurt, with the view of qualifying himself for the legal profession. He went through the usual studies in the classics and the schoolmen, and took his degree of Doctor of Philosophy, or Master of Arts, in 1505, when he was twenty-one years of age. Ere this, however, the death of a friend, and the terror of a thunderstorm, had deeply impressed him; and he was led to the study of the Scriptures. Not content with the gospels and epistles in the lectionaries, and failing to find elsewhere a complete Bible (though the whole Vulgate had been translated into German before his time; see BIBLE, Vol. II. p. 127), he had recourse to the Vulgate in the university library. His heart was touched, and he resolved to devote himself to a spiritual life. He separated himself from his friends and fellow-students, and withdrew into the Augustinian convent at Erfurt. Here he spent the next three years of his life—years of peculiar interest and significance; for it was during this time that he laid, in the study of the Bible and of Augustine, and with the assistance of his life-long friend Staupitz, the foundation of those doctrinal convictions which were afterwards to rouse and strengthen him in his struggle against the papacy. He describes very vividly the spiritual crisis through which he passed, the burden of sin which so long lay upon him, 'too heavy to be borne,' and the relief that he at length found in the clear apprehension of the doctrine of the 'forgiveness of sins' through the grace of Christ.

In the year 1507 Luther was ordained a priest, and in the following year he removed to Wittenberg, destined to derive its chief celebrity from his name. He became a teacher in the new university founded there by the Elector Frederick of Saxony.

At first he lectured on dialectics and physics, but his heart was already given to theology, and in 1509 he became a Bachelor of Theology, and commenced lecturing on the Holy Scriptures. His lectures made a great impression, and the novelty of his views already began to excite attention. 'This monk,' said the rector of the university, 'will puzzle our doctors, and bring in a new doctrine.' Besides lecturing, he began to preach, and his sermons reached a wider audience, and produced a still more powerful influence. They were printed and widely circulated in Germany, France, and England, so that the doctrines of salvation by free grace were diffused throughout Europe. His words, as Melancthon said, were 'born not on his lips, but in his soul,' and they moved profoundly the souls of all who heard them. In 1511 he was sent on a mission to Rome, and he has described very vividly what he saw and heard there. His devout and unquestioning reverence—for he was yet in his own subsequent view 'a most insane papist'—appears in strange conflict with his awakened thoughtfulness and the moral indignation at the abuses of the papacy beginning to stir in him. It was when climbing on his knees the steps of the so-called judgment-seat of Pilate that the words, 'the just shall live by faith,' flashed upon his soul and drove him to his feet.

On Luther's return from Rome he was made a Doctor of the Holy Scriptures, and his career as a Reformer may be said to have commenced. The system of indulgences had reached a scandalous height. The idea that it was in the power of the church to forgive sin had gradually grown into the notion that the pope could issue pardons of his own free will, which, being dispensed to the faithful, exonerated them from the consequences of their transgressions (see INDULGENCE). The sale of these pardons had become an organised part of the papal system. Money was largely needed at Rome to feed the extravagances of the papal court; and its numerous emissaries sought everywhere to raise funds by the sale of 'indulgences': the principal of these was John Tetzel, a Dominican friar, who had established himself at Jüterbog (1517). Luther's indignation at the shameless traffic which this man carried on finally became irrepressible: 'God willing,' he exclaimed, 'I will beat a hole in his drum.' He drew out ninety-five theses on the doctrine of indulgences, which on 31st October he nailed up on the door of the church at Wittenberg, and which he offered to maintain in the university against all impugnors. The general purport of these theses was to deny to the pope all right to forgive sins. This sudden and bold step of Luther was all that was necessary to awaken a widespread excitement. Tetzel was forced to retreat from the borders of Saxony to Frankfort-on-the-Oder, where he drew out and published a set of counter-theses, and publicly committed those of Luther to the flames. The students at Wittenberg retaliated by burning Tetzel's theses. The elector refused to interfere, and the excitement increased as new combatants—Hochstratten, Prierias, and Eck—entered the field. Eck was an able man, and an old friend of Luther's, and the argument between him and the Reformer was especially vehement. In 1518 the latter was joined by Melancthon, who became one of his dearest and most trusted friends.

At first the pope, Leo X., took little heed of the disturbance; he is reported even to have said when he heard of it that 'Friar Martin was a man of genius, and that he did not wish to have him molested.' Some of the cardinals, however, saw the real character of the movement, which gradually assumed a seriousness evident even to the

pope; and Luther received a summons to appear at Rome, and answer for his theses (1518). Once again in Rome it is unlikely he would ever have been allowed to return. His university and the elector interfered, and a legate was sent to Germany to hear and determine the case. Cardinal Cajetan was the legate, and he was but little fitted to deal with Luther. He would enter into no argument with him, but merely called upon him to retract. Luther refused, and fled from Augsburg, whither he had gone to meet the papal representative. The task of negotiation was then undertaken by Miltitz, a German, who was envoy of the pope to the Saxon court, and by his greater address a temporary peace was obtained. This did not last long. The Reformer was too deeply moved to keep silent. 'God hurries and drives me,' he said; 'I am not master of myself: I wish to be quiet, and am hurried into the midst of tumults.' Dr Eck and he held a memorable disputation at Leipzig (1519), in which the subject of argument was no longer merely the question of indulgences, but the general power of the pope. The disputation, of course, came to no practical result; each controversialist claimed the victory, and Luther in the meantime made progress in freedom of opinion, and attacked the papal system as a whole more boldly. Erasmus and Hutten joined in the conflict, which waxed more loud and threatening.

In 1520 the Reformer published his famous address to the 'Christian Nobles of Germany.' This was followed in the same year by a treatise *On the Babylonish Captivity of the Church*. In these works, both of which circulated widely, and powerfully influenced many minds, Luther took firmer and broader ground; he attacked not only the abuses of the papacy and its pretensions to supremacy, but also the doctrinal system of the Church of Rome. 'These works,' Ranke says, 'contain the kernel of the whole Reformation.' The papal bull containing forty-one theses was issued against him; the dread document, with other papal books, was burned before an assembled multitude of doctors, students, and citizens at the Elster Gate of Wittenberg. Germany was convulsed with excitement. Eck (who had been the chief agent in obtaining the bull) fled from place to place, glad to escape with his life, and Luther was everywhere the hero of the hour. Charles V. had at this time succeeded to the empire, and he convened his first diet of the sovereigns and states at Worms. The diet met in the beginning of 1521; an order was issued for the destruction of Luther's books, and he himself was summoned to appear before the diet. This was above all what he desired—to confess the truth before the assembled powers of Germany. He resolved—having received a safe conduct—to obey the summons, come what would. All Germany was moved by his heroism; his journey resembled a triumph; the threats of enemies and the anxieties of friends alike failed to move him. 'I am resolved to enter Worms,' he said, 'although as many devils should set at me as there are tiles on the house-tops.' His appearance and demeanour before the diet, and the firmness with which he held his ground and refused to retract, all make a striking picture. He was not allowed to defend his opinions. 'Unless I be convinced,' he said, 'by Scripture and reason, I neither can nor dare retract anything, for my conscience is a captive to God's word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me God. Amen.'

On his return from Worms he was seized, at the instigation of his friend, the Elector of Saxony, and safely lodged in the old castle of the Wartburg. The affair was made to assume an aspect of

violence, but in reality it was designed to secure him from the destruction which his conduct at Worms would certainly have provoked, he having been placed under the ban of the empire. He remained in this shelter for about a year, concealed in the guise of a knight. His chief employment was his translation of the Scriptures into his native language. He composed various treatises besides, and injured his health by sedentary habits and hard study. His imagination became morbidly excited, and he thought he saw and heard the Evil One mocking him while engaged in his literary tasks: the blot from the inkstand that he hurled at him is still shown on the wall of his chamber. The subject of the personality and presence of Satan was a familiar one with Luther, and he has many things about it in his *Table-talk*.

The disorders which sprang up in the progress of the Reformation recalled Luther to Wittenberg. He felt that his presence was necessary to restrain Carlstadt and others, and, defying any danger to which he might still be exposed, he returned in 1522 to the old scene of his labours, rebuked the unruly spirits who had acquired power in his absence, and resumed with renewed energy his interrupted work. He strove to arrest the excesses of the Zwickau fanatics, and counselled peace and order to the inflamed peasants, while he warned the princes and nobles of the unchristian cruelty of many of their doings, which had driven the people to exasperation and frenzy. At no period of his life is he greater than now in the stand which he made against lawlessness on the one hand and tyranny on the other. He vindicated his claim to be a Reformer in the highest sense by the wise and manly part which he acted in this great social crisis in the history of Germany. In this year also he published his acrimonious reply to Henry VIII. on the seven sacraments. Although he had been at first united in a common cause with Erasmus, estrangement had gradually sprung up between the scholar of Rotterdam and the enthusiastic Reformer of Wittenberg. This estrangement came to an open breach in the year 1525, when Erasmus published his treatise *De Libero Arbitrio*. Luther immediately followed with his counter-treatise, *De Servo Arbitrio*. The controversy raged loudly between them; and in the vehemence of his hostility to the doctrine of Erasmus Luther was led into various assertions of a very questionable kind, besides indulging in wild abuse of his opponent's character. The quarrel was an unhappy one on both sides; and it must be confessed there is especially a want of generosity in the manner in which Luther continued to cherish the dislike which sprang out of it. In the course of the same year Luther married Katharina von Bora, one of nine nuns who, under the influence of his teaching, had emancipated themselves from their religious vows. The step rejoiced his enemies, and even alarmed some of his friends like Melancthon. But it greatly contributed to his happiness, while it served to enrich and strengthen his character. All the most interesting and touching glimpses we get of him henceforth are in connection with his wife and children.

Two years after his marriage he fell into a dangerous sickness and depression of spirits, from which he was only aroused by the dangers besetting Christendom from the advance of the Turks. Two years later, in 1529, he engaged in his famous conference at Marburg with Zwingli and other Swiss divines. In this conference he obstinately maintained his peculiar views as to the sacrament of the Lord's Supper (q.v.), and, as in the controversy with Erasmus, distinguished himself more by the inflexible dogmatism of his opinions than by the candour and comprehensiveness of his arguments,

or the fairness and generosity of his temper. Aggressive and reforming in the first stage of his life, and while he was dealing with practical abuses, he was yet in many respects essentially conservative in his intellectual character, and he shut his mind pertinaciously after middle life to any advance in doctrinal opinion. The following year finds him at Coburg, while the diet sat at Augsburg. It was deemed prudent to entrust the interests of the Protestant cause to Melancthon, who attended the diet, but Luther removed to Coburg, to be at hand for consultation. The Augsburg Confession (q.v.) marks the culmination of the German Reformation (1530). In 1540 Luther and Melancthon sanctioned as friends—not as doctors of theology—the second marriage of Philip of Hesse, while his invalid first wife was still alive. (She assented, and lived till 1549.) Luther died at Eisleben on 18th February 1546, and was buried at Wittenberg.

Luther's character presents an imposing combination of great qualities. Endowed with broad human sympathies, massive energy, manly and affectionate simplicity, and rich, if sometimes coarse humour, he is at the same time a spiritual genius. His intuitions of divine truth were bold, vivid, and penetrating, if not comprehensive; and he possessed the art which God alone gives to the finer and abler spirits that He calls to do special work in this world, of kindling other souls with the fire of his own convictions, and awakening them to a higher consciousness of religion and duty. He was a leader of men, therefore, and a Reformer in the highest sense. His powers were fitted to his appointed task: it was a task of Titanic magnitude, and he was a Titan in intellectual robustness and moral strength and courage. It was only the divine energy which swayed him, and of which he recognised himself the organ, that could have accomplished what he did.

View him as a mere theologian, and there are others who take higher rank. There is a lack of patient thoughtfulness and philosophical temper in his doctrinal discussions; but the absence of these very qualities gave vigour to his bold, if sometimes crude conceptions, and enabled him to triumph in the struggle for life or death in which he was engaged. To initiate the religious movement which was destined to renew the face of Europe, and give a nobler and more enduring life to the Teutonic nations, required a gigantic will, which, instead of being crushed by opposition, or frightened by hatred, should only gather strength from the fierceness of the conflict before it. To clear the air thoroughly, as he himself said, thunder and lightning are necessary. Upon the whole, it may be said that history presents few greater characters—few that excite at once more love and admiration, and in which we see tenderness, humour, and a certain picturesque grace and poetic sensibility more happily combined with a lofty and magnanimous, if sometimes rugged sublimity.

Luther's works are very voluminous, partly in Latin, and partly in German. Among those of more general interest are his *Table-talk*, his *Letters*, and *Sermons*. His Commentaries on Galatians and the Psalms are still read; and he was one of the great leaders of sacred song, his hymns, rugged, but intense and expressive, having an enduring power.

The most important complete editions of Luther's works are those of Wittenberg (12 vols. German; 8 vols. Latin, 1539–58); Halle, ed. by Walch (German, 24 vols. 1740–53); and Erlangen and Frankfurt (67 vols. German; 33 vols. Latin, 1826–73). A splendid new and complete edition was commenced at Weimar in the year of the fourth centenary of his birth (1883).

His *Briefe, Sendschreiben und Bedenken* were edited by De Wette and Seidemann (6 vols. 1825-56); the *Briefwechsel*, by Burckhardt (1866), and by Enders (1884-93); his *Politische Schriften*, by Mundt (1844); his *Kirchenpostille*, by Francke (1844); his *Tischreden*, by Förstemann and Bindseil (1846-48); his *Geistliche Lieder*, by Wackernagel (1856), Gödeke (1883), and A. Fischer (1883). A good selection of the lesser writings is that entitled *Martin Luther als Deutscher Klassiker* (3 vols. Frank. 1871-83).

Of the many Lives the most important are those of Meurer (3d ed. 1870), Jürgens (3 vols. 1846-47), Köstlin (2 vols. 1875; 3d ed. 1883; also a popular ed. 1883), Plitt and Petersen (2d ed. 1883), Kolde (1884-93), Bayne (1887), Beard (1889), Preserved Smith (1911), Professor Grisar, S.J. (trans. 1913-17), and Mackinnon (1925 *et seq.*). See the *Cambridge Modern History* (ii. 'The Reformation,' 1904), Lindsay's *History of the Reformation* (i. 1906), Armstrong's *Charles V.* (1902), and Creighton's *History of the Papacy* (v. 1894).

On Luther's theology there are works by Th. Harnack (1862-86), Köstlin (1863), and Lommatsch (1879). The Catholic view is fairly given by Döllinger, and in Janssen's *Geschichte des Deutschen Volkes*.

Lutherans, a designation originally applied by their adversaries to the Reformers of the 16th century, and afterwards distinctively appropriated among Protestants themselves to those who took part with Martin Luther against the Swiss Reformers, particularly in the controversies regarding the Lord's Supper. It is so employed to this day as the designation of one of the two great sections into which the Protestant Church was soon unhappily divided, the other being known as the Reformed Church (q.v.). To the end of Luther's life perfect harmony subsisted between him and his friend Melancthon; but already there were some who stood forth as more Lutheran than Luther, and by whom Melancthon was denounced as a 'crypto-Calvinist' and a traitor to evangelical truth. After Luther's death this party became more confident, and, holding by Luther's words, without having imbibed his spirit, changed his evangelical doctrine into a dry scholasticism and lifeless orthodoxy, whilst extreme heat and violence against their opponents were substituted in the pulpit itself for the zealous preaching of the gospel. The principal seat of their strength was in the university of Jena, which was founded in 1557 for this very object, and maintained their cause against Wittenberg. Great intolerance was manifested by this party; and no controversy was ever conducted more bitterly than the Sacramentarian Controversy. See SYNCRETISM, SYNERGISM.

Towards the end of the 17th century the Lutherans of Germany found a new object of hostility in the Pietists (q.v.); and in the 18th century they came into conflict with Rationalism (q.v.). When, after the wars of the French Revolution were over, the Prussian government formed and carried into execution a scheme for the union of the Lutheran and Reformed churches into one national church, leaving them free to use either the Lutheran or Heidelberg confession, an active opposition arose on the part of those who now began to be known as *Old Lutherans*. Separate congregations were formed, and an attitude of open hostility to the government was assumed by some; whilst others, more moderate, but holding the same theological opinions, continued to maintain these opinions within the *United Evangelical Church*. The separatists were for some time severely dealt with by the government, and about 1837 many left their native country to found Old Lutheran communities in America. After that time greater toleration was practised, and in 1841 the Old Lutherans became a legally-recognised ecclesiastical body in Prussia. A freer *New Lutheranism*, claiming to represent Luther's spirit rather than the dogmas of the

old Lutheran systematists, has since 1848 become practically dominant in most parts of Protestant Germany, in Prussia as well as elsewhere, under the leadership of such men as Hengstenberg, Hofmann, Harless, Luthardt, Thomasius, and Kalnis.

Lutheranism is the prevailing form of Protestantism in Germany; it is the national religion of Denmark, Iceland, Sweden, and Norway; and there are Lutheran churches in the Baltic republics, in Holland, France, Poland, Hungary, and the United States, besides strong missions in Asia, Africa, America, and the South Seas. There are some sixty millions of Lutherans in the world, nearly two and a half millions of them in the United States. Amongst the Lutheran symbolical books the Augsburg Confession (q.v.), Luther's Shorter Catechism, and the *Formula Concordiae* (see CONFESSIONS), hold the principal place. The chief difference between the Lutherans and the Reformed is as to the *real presence* of Christ in the sacrament of the Supper; the Lutherans holding the doctrine of *consubstantiation*—Christ's body present 'in, with, and under the unchanged bread and wine'—although rejecting *transubstantiation* (see LORD'S SUPPER, TRANSUBSTANTIATION, and ZWINGLI); whilst some of their more extreme theologians have asserted not only the presence of the human nature of Christ in the Lord's Supper, as Luther did, but the absolute omnipresence or ubiquity of his human nature. Other points of difference relate to the allowance in Christian worship of things *indifferent* (*adiaphora*); and many of those things at first retained as merely tolerable by Luther and his fellow-reformers have become favourite characteristics of some of the Lutheran churches—as crucifixes and pictures in places of worship, &c. In its constitution the Lutheran Church is generally unepiscopal, but is consistorial (not presbyterian; see CONSISTORY); the clerical 'superintendents' over the clergy and churches of districts have neither episcopal rank nor jurisdiction. In Denmark, Iceland, Sweden, and Norway there are bishops, and in Sweden an archbishop (of Uppsala), but their powers are very limited.

See the works of the old systematists Chemnitz, Johann Gerhard, Hutter, Quenstedt; Hase's *Hutlerus Redivivus* (1828; 12th ed. 1883); the dogmatic works of Twisten, Nitzsch, and Martensen; and the church histories.

Luton, a market-town of Bedfordshire, on the river Lea, among the Chiltern Hills, 31 miles by rail NNW. of London. St Mary's Church, mixed Decorated and Perpendicular in style, is a noble structure, with a flint-work tower 90 feet high, a baptistery chapel, and many interesting monuments. It has been restored since 1865. Luton is the chief seat in England of the straw-hat industry, which dates from the reign of James I. The Plaithall (1869) was made a market in 1925. The town-hall was burned to four walls in a riot (1919). There are also a corn-exchange, parks, &c. Luton was reincorporated as a municipal borough in 1876. Pop. (1851) 10,648; (1891) 30,006; (1921) 57,075.

Lutterworth, a small town of Leicestershire, on the Swift, 8 miles NNE. of Rugby. The fine old church, restored by Gilbert Scott in 1867-69, contains the pulpit and other relics of Wyclif, who was rector from 1374 till his death on 28th December 1384. He was buried here, but in 1428 his remains were dug up and burned, and the ashes cast into the Swift. 'This brook conveyed his ashes into Avon, Avon into Severn, Severn into the narrow seas, they into the main ocean; and thus the ashes of Wicliffe are the emblem of his doctrine, which now is dispersed all the world over.'

Lüttich. See LIÈGE.

Luttringhausen, a manufacturing town of Rheinland, 5 miles SE. of Elberfeld. Cloth, calico, and silk, hardware, and brandy manufactures are carried on. Pop. 14,000.

Lützen, a small town of Prussian Saxony, famous for two great battles fought in its vicinity. The first, a brilliant victory of the Swedes in the Thirty Years' War, took place on 16th November 1632 (see GUSTAVUS ADOLPHUS). The battle on 2d May 1813 was fought somewhat farther to the south, at the village of Groszorschen. It was the first great conflict of the united Russian and Prussian army with the army of Napoleon in that decisive campaign; and the French were left in possession of the field.

Lützow, LUDWIG ADOLF WILHELM, FREIHERR VON, born in Brandenburg on 18th May 1782, died at Berlin on 6th December 1834, gave his name to a celebrated corps of volunteers, raised in Silesia during the war of liberation in 1813. It included several celebrated men, as Jahn, Theodor Körner, &c., and was renowned for its ardent patriotism and magnificent courage. The men uniformed themselves, and are often spoken and sung of as the 'Black Rifles' (*Jäger*). Lützow's wife was the Countess of Ahlefeldt, the friend of Immermann.

Luxembourg, DUC DE. François Henri de Montmorency-Bouteville, one of Louis XIV.'s celebrated marshals, was born at Paris on 8th January 1628. A posthumous son, he was trained by his aunt, mother of the Great Condé, to whom he stuck faithfully all through the wars of the Fronde. After 1659 he was pardoned by Louis XIV., who created him Duc de Luxembourg (1661)—he had just married the heiress of the House of Luxembourg-Piney. He again took the field in 1667, serving under Condé in the invasion of Franche-Comté; but, receiving an independent command against the Netherlands in 1672, he successfully invaded the enemy's country, and when compelled to retreat in the winter of 1673 led back his men in such a masterly way as to win the reputation of being one of the greatest generals of the age. His chief exploits during the continuance of the war were to storm Valenciennes and to defeat the Prince of Orange at Mont-Cassel and St Denis. He had been made marshal in 1675. Soon after the conclusion of peace (1678) he quarrelled with the all-powerful minister Louvois, and was not employed again on active duty for twelve years. The story that Louvois implicated him in the affair of the poisoners of Paris is probably a myth, though Luxembourg seems certainly to have spent some part of 1680 in the Bastille. In 1690 he was sent to take command in Flanders, and defeated the allies at Fleurus, and in the following year he twice more routed his old opponent, William III. (formerly Prince of Orange) at Steinkirk and near Neerwinden. He died at Paris on 4th January 1695. Luxembourg had an unfailing instinct of the right thing to do on the field of battle, and when to do it. In action he was prompt and bold; but often failed to reap the full advantages of victory owing to his indolence. He was a little man and hump-backed, and addicted to self-indulgence.

Luxembourg, an independent grand-duchy of Europe, wedged in between France, Prussia, and Belgium. It consists of a plateau, furrowed with valleys, and connecting together the uplands of Lorraine, the Forest of Ardennes, and the Eifel; nearly all its streams flow to the Moselle, which for some 20 miles forms its eastern border. The country is well wooded, yields wheat, flax, hemp, and rapeseed, grows wine, and is rich in iron ore. The extraction and smelting of this mineral is, next to agriculture, the principal occupation. But leather, gloves, pottery, cloth, paper, sugar, beer, and spirits

are manufactured. Area, 998 sq. m.; pop. (1871) 197,528; (1922) 260,767, nearly all Catholics, and of Low German stock, though French is the language of the educated classes. The dignity of grand-duke belongs to the head of the House of Orange-Nassau, and as such was held by the kings of Holland from 1815 to 1890, when, on the death of William III. without male issue, it passed to Adolf, Duke of Nassau; and on his death in 1912 (the law of succession having been changed) to his daughter. The head of the government is the minister of state, and there is a Chamber of Deputies of 48 members.—The *Belgian province* of Luxembourg, which down to 1839 formed part of the grand-duchy, lies contiguous to this last on the west; it constitutes the south-eastern extremity of the kingdom of Belgium. In its physical features and its main product it differs little from the grand-duchy. Area, 1706 sq. m.; pop. (1920) 223,739. Chief town, Ailon.—The *history* of the grand-duchy of Luxembourg begins with the history of the city. On the site of this there stood in the 8th century a castle, which in 738 was given by Charles Martel to the abbey of Treves. The founder of the first line of counts was Siegfried, who in 963 acquired the castle of Lucilinburch or Lützelburg (i.e. Luxembourg). In 1136 the countship passed to the Counts of Namur. The fourth Count Henry was elected emperor as Henry VII. in 1308, and his son John became king of Bohemia. In 1354 the title was raised from count to duke. In 1444 the duchy was united with Burgundy, and shared the history of that state down to 1659, but it was reckoned a member of the German empire. From 1659 to 1713 Luxembourg was held by the French king. It was again annexed by the French in 1795, and two years later made the department of Forêts. But in 1815 the Vienna Congress created it a separate state, a member of the German Confederation, but gave it to William I. of Holland. And this position was again declared definitive of the eastern section in 1839. By the London treaty of 1867 it was made a completely independent state, and the Prussian garrison withdrew from the fortress of Luxembourg. It was occupied, contrary to treaty, by the Germans during the Great War. Thereafter a referendum (28th September 1919) decided for the existing as against a republican constitution. Detached from German Zollverein by the treaty of Versailles, Luxembourg in 1922 entered into economic union with Belgium.—**LUXEMBURG**, the capital of the grand-duchy, by rail is 42 miles N. of Metz and 32 SW. of Trier. It stands on a rocky platform, connected with the neighbouring country only on the west, and elsewhere engirt by a steep valley, 200 feet deep, in which nestle the industrial suburbs of Klausen, Pfaffenthal, and Grund. The intermediate gorges are crossed by fine viaducts. The Spaniards, Austrians, French, and Dutch, who successively held possession of the town, so increased and strengthened its fortifications, hewn, like those of Gibraltar, in great part out of the solid rock, that in the beginning of the 19th century the place was considered to be, with the exception of Gibraltar, the strongest fortress in Europe. But the fortifications were demolished in accordance with the treaty of London of 1867, and the site of the walls has been laid out as beautiful gardens. There are in the town the ruins of Count Mansfeld's palace and the cathedral (built in 1613). Pop. 48,000.

See German works by Coster (1869), Schötter, Werke, Eyschen, and Phips (1894); French, by Gläserer (1885); English, by Passmore (1906), and Renwick (1913).

Luxeuil, a French town in Haute-Saône (pop. 5000), 15 miles NW. of Belfort, with remains of the monastery founded by St Columbanus in 590.

Luxor. See THEBES.

Luynes, DUC DE (1578-1621), the unworthy favourite of Louis XIII. of France, was a page at the court of Henry IV., and became ultimately peer of France and chancellor.

Luzern. See LUCERNE.

Luzon', the largest of the Philippines (q.v.).

Luzula, a genus of plants of the natural order Juncaceæ, differing from rushes in having a 3-seeded instead of a many-seeded capsule, and in having soft plane leaves, which are generally covered with thinly-scattered longish hairs. They do not grow in wet places, like rushes, but in woods, pastures, and elevated mountainous situations (see RUSH). Perhaps there is no more common British plant than the Field-rush (*L. campestris*), a plant of very humble growth; its flowering spikes congregated into a close head, their dark colour relieved by the whitish yellow of the anthers, profusely adorn dry pastures in spring. It is of no agricultural value. The species which grow under trees preserve their verdure in winter,

Field-rush
(*Luzula campestris*).

improving the cover for game.

Lwiv, Lwów, Ruthenian and Polish names of Lemberg (q.v.).

Lyall, SIR ALFRED COMYN, was born, the son of a clergyman, at Oulston in Surrey in 1835, and was educated at Eton and Haileybury for an Indian career. K.C.B. (1881) and lieutenant-governor of the North-west Provinces in 1882-87, he was in 1888 appointed a member of the Council of India. His *Verses written in India* proved him to be not merely a keen critic of the life about him but a poet. His *Asiatic Studies* (1882-99) showed a rarely sympathetic insight into the actual beliefs of the Indian people, and was accepted as a standard authority. He wrote a book on Warren Hastings, and one on the rise of the British dominion in India (1893); a critical study of Tennyson (1902); the Life of Lord Dufferin (1905); and *Studies in Literature and History* (1915). He died 10th April 1911. See Life by Durand (1913).

Lycanthropy. See WERWOLF.

Lycaonia, in ancient geography, a country in Asia Minor, bounded E. by Cappadocia, N. by Galatia, W. by Pisidia, and S. by Isauria and Cilicia. Its capital was Iconium (q.v.).

Lyceum (Gr. *Lukeion*), originally the name of a place in the immediate neighbourhood of Athens, consecrated to *Apollo Lyceus*, and noted for its shady wood and beautiful gardens, but particularly for its gymnasium, in which Aristotle and the Peripatetics taught, and from which the Romans borrowed the same name for similar institutions. In more modern times the name lyceum was given in honour of Aristotle to the higher Latin schools in which the Aristotelian philosophy formed a principal branch of education; and at the present day the name is variously applied to educational and literary institutions, especially to the French schools called Lycées (see FRANCE); and in America to societies or academies.

Lychnis, a genus of plants of the natural order Caryophyllaceæ. They are herbaceous plants, generally perennial, and natives of temperate countries. Several are found in Britain. The Ragged Robin (*L. Flos-cuculi*) is one of the most frequent ornaments of meadows and moist pastures; the German Catchfly (*L. Viscaria*) is very rare, and generally found growing on almost inaccessible precipices; the Red Campion (*L. diurna*) and the White Campion (*L. vespertina*) abound in fields, hedges, and the borders of woods. The last two are dioecious, and, strangely enough, the female of the first and the male of the second are very common, while the male of the first and female of the second are rather rare. The flowers of *L. vespertina* are usually fragrant in the evening. The Scarlet Lychnis (*L. chalcedonica*), a native of Asia Minor, is a frequent and brilliant ornament of flower-borders. Some of the species have saponaceous properties. Some botanists break up the genus, making the German Catchfly *Viscaria vulgaris*, and the White and Red Campions *Melandryum album* and *M. dioicum*.

Lycia, a country on the south coast of Asia Minor, bounded on the W. by Caria, on the N. by Phrygia and Pisidia, and on the E. by Pamphylia. It is a mountainous region, formed by lofty spurs of the Taurus, which reach 10,000 feet in height; the valleys are very fertile. The most ancient inhabitants are said to have been two races called Solymi and Termilæ. The Lycians are prominent in the Homeric legend of the Trojan war. Lycia maintained its independence against Croesus, king of Lydia, but was afterwards made subject to the Persians and Syrians, and then to Rome. During the time of its independence it consisted of twenty-three confederate cities, of which the principal were Xanthus (the capital), Patara, Pinara, Olympus, Myra, and Tlos; and at the head of the whole confederation was a president or governor called the Lyciarch. Many monuments and ruined buildings (temples, tombs, theatres, &c.) and other antiquities testify to the attainments of the Lycians in civilisation and the arts, which they seem to have derived in large measure from Greek sources. Sir Charles Fellows, about 1840, was the first to discover and point out the interesting character of these Lycian remains. The language was apparently not Indo-Germanic.

Lycopodiaceæ form a class of isosporous pteridophytes, containing two genera. The Lycopodiales, to which they belong, are thus classified: I. Eligulatæ (without ligules): (a) Lycopodiaceæ. II. Ligulatæ (with ligules): (a) Sigillariaceæ (fossil); (b) Selaginellaceæ (living); (c) Bothrodendraceæ (fossil); (d) Lepidodendraceæ (fossil); (e) Pleuromiaceæ (fossil); (f) Isoëtaceæ (living). Lycopodiaceæ include the genus *Lycopodium*, with about 100 species which are universally distributed; and the genus *Phylloglossum* with only one species (*P. Drummondii*), found in Australia and New Zealand.

Lycopodium is best known under the name of 'Club-moss' or 'Stag's-horn moss,' but there is no more than a superficial resemblance between it and the true mosses (Muscinæ). The stem may be creeping as in *L. clavatum*, the common club-moss of the British Isles, erect as in *L. Selago*, which is also a British species, or shrubby and stout as in some tropical species.

The Lycopodiaceæ have mostly a dichotomous form of branching. The stems, except in the shrubby forms, are slender, and never reach more than a few feet in length. The leaves are small and undivided, usually overlapping and completely protecting the stem. Special branches are spore-bearing, and one sporangium is borne in the axil

of each leaf. In some related forms, living and fossil, there are two kinds of spores. The spore develops a green prothallus, which sends root-hairs into the soil, or a colourless, tuberous subterranean prothallus; but both forms produce on the same

Club-moss (*Lycopodium clavatum*):

a, roots; b, creeping stem; c, upright stem; d, vegetative branches; e, stalk bearing the sporangiferous branches; f, f', g, spore-bearing leaf; h, same in section; h', sporangium; i, vein of spiral vessels.

individual antheridia and archegonia; the former produce spermatozooids, and the latter oospheres. Fertilisation occurs as in the Fern (q.v.). The sporophyte plant which results from the fertilisation of an oosphere by a spermatozoid is the conspicuous generation, while the oophyte or prothallus is the inconspicuous generation. The roots are simple, and may arise at any point of the stem near the ground. A number of flattened vascular bundles unite at intervals longitudinally in the centre of the stem to form a single axile cylinder, which is surrounded by a sheath, while the rest of the stem around this is made up of thick or thin walled cells. The elements of the bundle resemble those of ferns. A simple strand passes from the axile cylinder to the midrib of each leaf. Alternation of generations is very strongly marked in *Lycopodium*, but vegetative reproduction of the sporophyte may occur by means of bulbils in the axils of the leaves or on the

roots, or by means of adventitious buds on the stems.

The spores of *Lycopodium* are used for coating pills, and the hands rubbed over with the spores may be dipped in water without being wetted; they have been used for flash-lights in pyrotechnic displays, owing to copious inflammable oil. Many species possess medical properties, but these are too violent for modern use. *L. clavatum* is emetic, and *L. Selago*, cathartic. The spores of many form a powder which is beneficial in ulcerations, &c., and *L. alpinum* is used as a dye. The Lycopodiaceæ may be regarded as the dwarfed survivors of tree-like forms that were very plentiful in the forests of the Carboniferous period. See Clute, *The Fern Allies* (N.Y. 1905); and for fossil forms Seward, *Fossil Plants*, vol. ii. (1910).

Lycurgus, the lawgiver of Sparta, is usually dated about 820 B.C. He was uncle of the young king Charilaos, and governed the state wisely during his nephew's infancy, then travelled over Crete, Ionia, and Egypt, and on his return, finding his country in complete anarchy, made a new division of property, and remodelled the whole constitution, military and civil. Next he bound the citizens by oath not to change his laws until he came back, and then left Sparta to be no more seen. His memory was honoured as that of a god with a temple and yearly sacrifices.

Lycurgus, an Attic orator, born about 396 B.C., was a pupil of Plato and Isocrates, and warmly supported Demosthenes' policy. He was thrice appointed manager of the revenue. He died in 328. Of his fifteen speeches but one is extant.

Lyddite, a powerful explosive (like melinite), made from picrate of potash. It was tested at Lydd, near New Romney, in Kent. See PICRIC ACID.

Lydenburg. See LEYDENBURG.

Lydgate, JOHN, an admirer and imitator of Chaucer, was born at Lydgate, near Newmarket, in Suffolk, about 1370, and became a monk in the Benedictine monastery of Bury St Edmunds. He may have studied at Oxford, and travelled into France and perhaps Italy. In the monastery he appears to have taught the rhetoric and philosophy of his time, and he wrote poetry with equal ease upon the most widely different themes. He was prior of Hatfield Broadoak in 1423-34. His death probably occurred about 1450, and we have his own evidence that his last years were harassed by poverty. Ritson enumerated in his *Bibliographia Poetica* no fewer than 251 pieces as written by Lydgate; his attributions are reconsidered by H. N. McCracken in his *Lydgate Canon* (1908). A selection from the minor poems was edited by Halliwell (-Phillips) for the Percy Society in 1840. Many poems (edited by Schick and others) have been printed by the Early English Text Society; and some have appeared in facsimile at Cambridge. Lydgate's longer works are the *Storie of Thebes*, the *Troy Book*, and the *Falls of Princes*. The *Storie of Thebes* is represented as a new Canterbury tale, told by the author after joining the company of pilgrims at Canterbury. It is written in rhyming ten-syllable couplets, and contains about 4780 lines. Its sources are the *Thebaid* of Statius and the *Teseide* of Boccaccio. The versification is rough, the poem dull and prolix to a degree, the prologue alone accepted. The *Troy Book* (E.E.T.S. 1906-10) was undertaken about 1412, at the request of Prince Henry, afterwards Henry V., and was finished in 1420. It is written also in the ten-syllable couplet, and is divided into five books, and founded on Guido di Colonna's Latin prose, *Historia Trojana*. Its best-known passage is the long panegyric on his 'Maister Chaucer' in the third book. The *Falls of Princes* (edited by Dr Henry Bergen, 1924), divided into nine books, is written in Chaucer's seven-line stanza, and contains upwards of 7000 stanzas. It was written in 1430 by desire of Humphrey, Duke of Gloucester, and is founded on a French paraphrase by Lawrence de Premierfait of Boccaccio's Latin work, *De Casibus Virorum Illustrium*. Other works that may merely be mentioned here are the *Dauunce of Machabre*, or Dance of Death, translated from the French; the *Court of Sapience*; the *Temple of Glass*, a copy of Chaucer's *House of Fame*; and his only prose work, *The Serpent of Division* (edited by McCracken, 1911).

Lydia, anciently a country of Asia Minor, surrounded by Ionia, Caria, Phrygia, and Mysia, was originally inhabited by the Mæonians, though the Lydians, an allied tribe, probably occupied the plain of Sardis. The country was celebrated for its fruitful soil—except the barren *Katakekavmene* (burned up) volcanic region in the east—and its mineral wealth, particularly for the gold of the river Pactolus and of the neighbouring mines of Tmolus, but was in later ages infamous for the corruption of morals which prevailed amongst its inhabitants, and especially in Sardis (q.v.), its capital. The Lydians, shut out from the *Ægean* Sea by the Ionian Greeks, developed great commercial activity inland. They likewise distinguished themselves in the textile arts. They were believed to have been the inventors of coined money, and of dice and other games. Many elements of their civilisation seem to have been derived from the Hittites; Hittite governors ruled for some time at Sardis. The sun-god Atlys, and Cybele, the mother of the gods, the Hittite-Babylonian Tammuz and Istar, were the deities principally worshipped. Three dynasties are recorded to have ruled over ancient Lydia: the first, wholly mythical, was founded by Atlys; the second,

usually called the Heracled, from its founder being a reputed son of Herakles by Omphale, has been identified with the Hittites; the third was founded by Gyges about 690 B.C. This king created a powerful Lydian empire, which attained its greatest period of splendour under his descendant Cræsus (q.v.) the rich, who was taken by Cyrus the Persian in 546. Sardis thereafter became the western capital of the Persian empire. Lydia was subsequently subject in turn to Athens, Macedonia, and Rome. Fragments remain of the language, which was apparently not Indo-European. Affinity with Etruscan or Hittite is possible. Inscriptions from Sardis include a bilingual (Aramaic and Lydian). For the Lydian mode, see HARMONY, MODE, PLAIN-SONG; and for Lydian stone, TOUCHSTONE.

Lye, a term sometimes used to denote all solutions of salts, but more generally appropriated to solutions of the fixed alkalies, potash and soda, in water. The solutions of caustic potash and soda are called caustic lyes; those of their carbonates, mild lyes. The fluid which remains after a substance has been separated from its solution by crystallisation is called the *mother lye*.

Lyell, SIR CHARLES, geologist, was the eldest son of Charles Lyell, Esq., of Kinnordy, Forfarshire, where he was born 14th November 1797. After receiving his early education at Midhurst, in Sussex, he entered Exeter College, Oxford, and graduated as B.A. in 1819. At Oxford he attended the lectures of Buckland, and thus acquired a taste for the science he afterwards did so much to promote. After leaving the university he studied law, and in due time was called to the bar; but his circumstances not rendering a profession necessary for a livelihood, he devoted himself to geology, and made tours in 1824, and again in 1828-30, over various parts of Europe, and published the results of his investigations in the *Transactions of the Geological Society* and elsewhere. His great work, *The Principles of Geology* (3 vols. 1830-33), may be ranked next after Darwin's *Origin of Species* among the books which exercised the most powerful influence on the direction of scientific thought in the 19th century. It broke down the belief in the necessity of stupendous convulsions in past times; and taught, as had long before been maintained by Hutton and Playfair, that the greatest geological changes might be produced by the forces still at work on the earth. It was subsequently divided into two parts, published as two distinct works—viz. *The Principles of Geology; or the Modern Changes of the Earth and its Inhabitants* (many editions); and *The Elements of Geology; or the Ancient Changes of the Earth and its Inhabitants*. The *Geological Evidences of the Antiquity of Man* (1863) startled the public by its unbiassed attitude towards Darwin's *Origin of Species*. Lyell also published *Travels in North America* (1845) and *A Second Visit to the United States* (1849). During the second sojourn, when he also visited Nova Scotia, he estimated the recession of the rock at Niagara, and the amount of deposition of alluvium at the delta of the Mississippi. On the opening of King's College, London, in 1832 Lyell was appointed professor of Geology, an office which he soon resigned. In 1836, and again in 1850, he was elected president of the Geological Society, and in 1864 president of the British Association. He was knighted in 1848, and created a baronet in 1864. He died 22d February 1875, and was buried in Westminster Abbey. See his *Life, Letters, and Journals* (2 vols. 1881); and the article GEOLOGY.

Lykewake. See WAKE.

Lyly, JOHN, romance-writer and dramatist, was born in the Weald of Kent about 1553. He became

a student of Magdalen College, Oxford, in 1569; B.A., 27th April 1573; M.A., 1st June 1575. In Lansdowne MS. 19 is preserved a Latin letter (written in 1574) in which he begs Lord Burghley to help him towards procuring a fellowship at Magdalen College; but the application does not appear to have been successful. He afterwards studied at Cambridge, where he was incorporated M.A. in 1579. Failing to gain preferment at the universities, he followed the court. Among the Harleian MSS. are two undated petitions to Queen Elizabeth, begging that he might be appointed Master of the Revels. In the first he writes: 'I was enternteyned yor Ma^{ty} s'vant by yor owne gracious fauour, strengthened with condicions, that I should ayme all my courses at the Reuells (I dare not say with a promise, but a hopeful Item to the rev'con) for wch these 10 yeres I have attended with an unwearyed patience, and nowe I knowe not what Crabb took me for an Oyster, that in the midst of yor sunshine of your most gracious aspect, hath thrust a stone betwene the shells to eate me alive that only lye on dead hopes.' The tone of the second letter is even more desponding: 'Thirteene yeres your highnes seruant, but yet nothing. . . . A thousand hopes, but all nothing: a hundred promises, but yet nothing.' He found a patron in Lord Burghley, who gave him some post of trust in his household. In 1589 he took part in the Martin Marprelate controversy, and incurred the enmity of Gabriel Harvey, who described him in *Pierce's Supererogation* (1593) as 'a mad lad as ever twanged, never troubled with any substance of witt or circumstance of honestie, sometime the fiddle-sticke of Oxford, now the very bable (bauble) of London.' The authors of *Athenæ Cantabrigienses* (ii. 326) state that he was returned for Aylesbury to the parliament of 19th February 1592-93; for Appleby, 24th October 1597; and again for Aylesbury, 7th October 1601. In December 1597 he addressed to Secretary Cecil a letter expressing disappointment at not obtaining advancement. From the register of St Bartholomew the Less, London, it appears that he was buried 30th November 1606. He was married, and had children, was short of stature, and very fond of tobacco.

Lyly's most famous work is his *Euphues*, a romance in two parts. The first part, *Euphues, the Anatomy of Wit* (4to), was published in the spring of 1579; the second part, *Euphues and his England*, followed in 1580. In court circles the romance was received with great applause. Edward Blount, the publisher, who collected Lyly's plays in 1632, declared: 'Our Nation are in his debt for a new English which hee taught them. . . . All our Ladies were then his Schollers; And that Beautie in Court which could not Parley Euphueisme was as little regarded as shee which now there speakes not French.' In the *Monastery* Scott drew, in the person of Sir Piercy Shafton, the character of a euphuistic gallant; but the portrait is barely recognisable. One peculiarity of this 'new English' is the constant employment of similes drawn from fabulous stories (of classical and medieval writers) concerning the properties of animals, plants, and minerals. Another is the excessive indulgence in antithesis. Lyly cannot relate the simplest incident without introducing antithetical flourishes and fetching illustrations from bestiaries and herbals. This unnatural style of writing was not Lyly's invention, but was to a large extent modelled (as Professor Landmann showed) on the example of the Spanish writer Guevara (q.v.). Lord Berners and others had translated works of Guevara; but the Spaniard's claims were forgotten, and Lyly was regarded as the pattern of refinement. Greene, Lodge, and others set themselves to imitate *Euphues*, but their affectations were seldom so

deliberately extravagant as Lyly's. Later the enphuistic style was held up to derision. Drayton speaks scornfully of

Lyly's writing then in use;
Talking of stones, stars, plants, of fishes, flies,
Playing with words and idle similies.

The matter of *Euphues* is more commendable than the manner. Sound advice is offered on the subject of friendship, love, travel, the nature and education of children, morality, and religion.

Lyly's comedies (which were performed before the queen by children's companies) are more readable than his romance. The earliest, as we learn from the prologue, was *The Woman in the Moone*, first printed in 1597, but produced in or before 1583. *Campaspe* and *Sapho and Phao* were published in 1584; *Endimion* in 1591; *Gallathea* and *Midas* in 1592; *Mother Bombe* in 1594; and *Love's Metamorphosis* in 1601. With the exception of *The Woman in the Moone*, these comedies (on pastoral and mythological subjects) were written in prose. Though they display little dramatic power, they are fanciful and attractive entertainments. Frequently the dialogue is sparkling. The delightful songs were first printed in the edition of 1632.

Lyly's plays were (badly) edited by Fairholt in 1858, and the whole works by R. W. Bond in 1903; *Euphues* by Arber (1868), Landmann (1887), Croll and Clemons (1916); the *Endymion* by Baker (1895). See C. G. Child's *Lyly and Euphuism* (1894), J. D. Wilson's *John Lyly* (1905), and A. Feuilleter's *John Lyly* (1910).

Lyme Regis, a seaport and watering-place of Dorsetshire, at the mouth of the Lym rivulet, 5 miles SE. of Axminster and 23 W. of Dorchester. The Cobb breakwater, dating from the 14th century, was reconstructed by government in 1825-26. Chartered by Edward I., and incorporated by Elizabeth, Lyme returned two members till 1832, and then one till 1868. It beat off Prince Maurice (1644), and was Monmouth's landing-place (1685). Natives have been Sir George Somers, Captain Coram, and Mary Anning, the discoverer of the Ichthyosaurus and Plesiosaurus in the Lias rocks here, which are largely quarried. Population, 2900. See Roberts's *History of Lyme Regis* (1834), and works by Cameron (1912), and Wanklyn (1922).

Lymington, a municipal borough of Hampshire, at the mouth of the Lymington River in the Solent, 18 miles SW. of Southampton. The salt-works belong to the past, and yacht-building is now the principal industry. Lymington is also of some importance as a summer resort. It commands fine prospects of the Isle of Wight, and its vicinity abounds in charming scenery. Till 1867 it returned two members to parliament, till 1885 one. Pop. 4600.

Lymph (Gr. *lympa*, 'water') is the term applied by physiologists to the fluid contained in the Lymphatics (q.v.). It is a colourless or faintly-yellowish fluid, of a rather saltish taste, and with an alkaline reaction. It coagulates shortly after its removal from the living body, and forms a jelly-like, semi-solid mass, which continues for some time to contract, so that at last the clot is very small in proportion to the expressed serum. On microscopic examination the lymph is seen to contain corpuscles which do not in any respect differ from the colourless blood-cells, molecular granules, fat-globules, and occasionally blood-corpuscles.

Lymphatics arise in the form of a network of lymph capillaries which lie in the minute inter-cellular spaces of the body, and in addition form large lymph cavities, such as the peritoneal, pleural, &c. The lymph is then conveyed by larger and larger vessels to the venous system, on entering which it mixes with the blood. The lymph of the

left side of the trunk, of both legs, of the left arm, and the whole of the chyle is conveyed into the blood by the thoracic duct; while the lymph of the right side of the head, neck, and trunk, and of the right arm, enters the circulation at the junction of the axillary and internal jugular veins on the right side by a short trunk, guarded at its opening by valves. On its way the lymph passes through small glands of the size of a pea or bean called lymphatic glands. Thus, those of the arm pass through the lymphatic glands of the axilla, those of the leg through the glands of the groin, and those of the head and face through the glands of the neck.

Diagram of Lymphatic System:

a, small artery or capillary from which lymph (blood-plasma) exudes; b, cell bathed by lymph; c, small lymphatic into which lymph collects; d, lymphatic gland; e, vein into which the lymph is returned.

The lymph arises primarily from the fluid part of the blood which exudes from the capillaries, bathes the cells and tissues of the body, and then, after supplying them with food and receiving their excretions, passes on once more to enter the circulation, being carried there by the lymphatic vessels. The corpuscular elements are chiefly the products of the lymphatic glands. See CHYLE, CIRCULATION.

Lymphne. See HYTHE.

Lynchburg, a city of Virginia, lies in a picturesque mountain region, on the James River, which is here spanned by several bridges, 144 miles by rail W. by S. of Richmond. It is one of the principal manufacturing cities of the state, and has large flour-mills, iron-works, tanneries, and manufacturing of shoes, furniture, &c., besides tobacco, which is the staple of the town's trade. The place figures in the history of the Civil War. Pop. 30,000.

Lynch Law, the summary trial and punishment of offenders by private and unauthorised persons. This mode of administering justice has been necessarily employed in countries newly settled, where the power of the civil government is not yet sufficiently established. The frequency with which it has been resorted to in the southern and western states of the American Union, however, as a punishment for serious criminal offences, is to be referred rather to a doubt on the part of the mob as to the adequacy of the ordinary legal machinery. In 1885-1922 there were 4152 lynchings in the Union, about 80 per cent. in the southern states, and some 75 per cent. on negroes. In most cases the crime is great and the guilt indisputable. Any punishment without legal trial constitutes lynch law (see VIGILANCE SOCIETIES), but the simple term 'lynching' usually implies capital punishment. The phrase has been variously traced to a Virginia soldier and to a Virginia farmer of that name, to one Lynch who was sent out from England about 1687 to suppress piracy, and to a mayor of Galway (q.v.) in Ireland; while yet another tradition refers it to Lynch Creek, in North Carolina, where the forms of a court-martial and execution were gone through over the lifeless body of a Tory, who had already been precipitately hanged to prevent a rescue. See works by Cutler (1905), and Bancroft, *Popular Tribunals* (vols. xxxi. and xxxii. of his 'History of the Pacific States of North America,' 1882-90).

Lyndhurst, a Hampshire village, the capital of the New Forest, 9 miles S.W. of Southampton. Its Early English church (1863) has a monument by Flaxman, and a fresco by Leighton. Near it is the Verderers' Hall, with Rufus's stirrup.

Lyndhurst, JOHN SINGLETON COPLEY, BARON, thrice Lord Chancellor, was the son of J. S. Copley, R. A. (q. v.), and was born at Boston, Massachusetts, 21st May 1772. At three, with his mother, he followed the painter to London, where, from 1780 till his death, his home was at 25 George Street, Hanover Square. After a private education at Chiswick, in 1790 he entered Trinity College, Cambridge. In 1794 he came out second wrangler and second Smith's prizeman, next year got a fellowship, and in 1796 paid a six months' visit to the United States, travelling with Volney. On his return to England he began to study for the bar, to which, however, he was not called till 1804, when he joined the Midland circuit. He worked assiduously, but success was 'very, very slow' till 1807, and not assured till 1812, when he made a real hit by his ingenious defence of a Luddite rioter. In 1817 he obtained the acquittal of Thistlewood and Dr Watson on their trial for high-treason; but for the next state prosecution, four months afterwards, the government secured him on their side, and in 1818 he entered parliament for a government borough. Henceforward, whatever his former politics, he continued a fairly consistent Tory, and as such his promotion was rapid. In 1819, as Sir John Copley, he became Solicitor-general, in 1824 Attorney-general, and in 1826 Master of the Rolls. When Canning was charged to form a ministry he offered the Great Seal to Copley, who was raised to the Upper House as Baron Lyndhurst; he remained Lord Chancellor under three administrations from 1827 to 1830. At the close of the latter year his Whig opponents made him Chief-baron of the Exchequer, which office he exchanged for the woolsack during Peel's brief administration (1834-35). He next led the opposition in the Upper House to the Melbourne ministry, his annual reviews of the session doing much to reanimate his party and pave the way for its return to power in 1841. He then for the third time became Lord Chancellor, and held the Great Seal till the defeat of the Peel government in 1846. After that time he took little part in home politics, but his voice was often heard on matters of foreign policy. Threatened with blindness for the last fourteen years of his life, he died 12th October 1863, at the great age of ninety-one. Lyndhurst's attainments as a clear-headed lawyer have never been questioned; his judgments—that, for instance, in the great case of *Small v. Atwood* (1832)—have never been excelled for lucidity, method, and legal acumen. In the House of Peers he had not his equal as a debater. Still, he was not a great statesman, lawgiver, or orator, mainly perhaps through lack of earnestness. His character has been blackened by Lord Campbell (*Lives of the Chancellors*, vol. viii. 1869), and eulogised by Sir Theodore Martin (*Life of Lord Lyndhurst*, 1883). See Atlay, *Victorian Chancellors* (i. 1906); and for the act that goes by his name, DECEASED WIFE'S SISTER.

Lyndsay, LYNDSEY, or LINDSAY, SIR DAVID, OF THE MOUNT, long the most popular of the older Scottish poets, was the last of the greater makars in whom the Chaucerian tradition prevailed. His writings, however, including the lengthy miracle-play, *Ane Pleasant Satyre of the Thrie Estaitis*, are far from Chaucerian in spirit, and are mainly didactic, satirical, and prosaic. He was the son

of David Lyndsay of Garmylton (now Garleton), in East Lothian, whose grandfather was a son of Sir William Lyndsay of the Byres. He may have been born about 1490, either at Garleton or at his father's other house, The Mount, in Fife. The name of 'Da. Lindesay' occurs in the list of 'incorporated' students in St Salvator's College, St Andrews, for the year 1508 or 1509. It may be that of the poet. We cannot tell when he entered the royal service, but in October 1511 he is found taking part in a play acted before the court of James IV. In the following spring he was appointed 'keeper' or 'usher' of the prince who, when little more than a twelvemonth old, became James V.; and his verses preserve some pleasing traces of the care and affection with which he tended the king's infant years. His wife, Janet Douglas, had long the charge of the royal apparel. In 1524 the court fell under the power of the queen-mother and the Douglasses, and Lyndsay lost his place; but in 1538, a few years after the Douglasses had been overthrown, Lyndsay was made Lyon King-of-arms, having some time before received the honour of knighthood. In this capacity he accompanied embassies to the Low Countries, England, France, and Denmark. He appears to have represented Cupar in the parliaments of 1542 and 1543; and he was present at St Andrews in 1547 when the followers of the reformed faith called Knox to take upon himself the office of a public preacher. He died childless before the summer of 1555.

Separate poems had already been printed in London (1538, 1546) and 'Copmanhoun' (1552), when two collected editions appeared in France in 1558. Some thirty recorded Scottish editions (to 1777), apart from single poems, indicate the great popularity which Lyndsay long enjoyed. For fully two centuries, indeed, he was what Burns has since become—the poet of the Scottish people. His works were in almost every house, his verses on almost every tongue. Like Burns, he owed part of his popularity no doubt to his complete mastery of the popular speech. But Lyndsay was read also in Southron English (1566, 1575, 1581), and in Danish (1591). Two Latin translations (one unfinished) are lost. His verses show few marks of the highest poetical power, but their merits otherwise are great. They are full of satirical humour, good sense, varied learning, and knowledge of the world. They are valuable now, if for nothing else than their vivid pictures of manners and feelings. In the poet's own day they served a political purpose, by preparing the way for the great revolution of the 16th century. It has been said that the verses of Lyndsay did more for the Reformation in Scotland than all the sermons of Knox. Like Burns, Lyndsay shot some of his sharpest shafts at the clergy. The licentiousness that characterises his verse must be attributed in part to the age in which he lived. The earliest and most poetical of his writings is *The Dreime*; the most ambitious, *The Monarchie*; the most remarkable in his own day, perhaps, was *The Satyre of the Thrie Estaitis*; but that which is now read with most pleasure, both for its subject and for its freedom from the allegorical fashion of the time, is *The Historie of Squyer Meldrum*. There is an edition of Lyndsay's works by Chalmers (3 vols. Lond. 1806); but in points of detail it is less accurate than that of David Laing (3 vols. 1879). His poems have been edited by J. Small, F. Hall, and Sir J. Murray, for the Early English Text Society (5 parts, 1865-71). His *Register of Scottish Arms*, a heraldic work, was printed in 1878.

Lyndsay of Pitcottie. See LINDSAY (ROBERT).

Lynedoch, THOMAS GRAHAM, LORD, British general, was the son of the laird of Balgowan in Perthshire, and was born on 19th October 1748. He raised in 1793 the 90th regiment of foot, and with it served at Quiberon and Île d'Yeu. He distinguished himself at the capture of Minorca (1798), conducted the siege of Valetta (Malta), which capitulated (1800) just after he was superseded in the command, took part in the retreat to Coruña and in the Walcheren expedition (1809), at Barrosa, near Cadiz, gained a splendid victory over the French (1811), and then under Wellington distinguished himself at the siege of Ciudad Rodrigo (1812), was present at Badajoz and Salamanca, commanded the left wing at Vitoria (1813), captured Tolosa and San Sebastián, and, lastly, commanded a body of troops in Holland, with which he defeated the enemy at Merxem, but failed in an ill-advised attempt to storm Bergen-op-Zoom (1814). Three months later he was created Baron Lynedoch of Balgowan, and in 1821 was promoted to the rank of general. He was the founder of the Senior United Service Club in 1817. He died in London, 18th December 1843. See *Lives* by J. M. Graham (2d ed. 1877) and A. M. Delavoye (1880).

Lynn, LYNN REGIS or KING'S LYNN, a seaport and borough (till 1918 parliamentary) of Norfolk, at the mouth of the Great Ouse, 48 miles WNW. from Norwich and 99 N. by E. from London. It still retains traces of the ramparts and a fosse, which once guarded it on the landward side, and abounds in picturesque old timbered houses, ornamented with carved work. Of its four churches the principal are cruciform St Margaret's, varying in style from Norman to Perpendicular, with two towers, one of which was surmounted by a spire 258 feet high, blown down in 1741—and St Nicholas (1146-74), with a modern spire (1869). Other features of interest include the Red Mount Chapel, octagonal, noticeable for its richly-ornamented roof; the hexagonal tower of the Grey Friars; a grammar-school, founded in or before the reign of Henry VIII., at which Eugene Aram was once usher; a guildhall (1410), in which is preserved the Red Register of Lynn, one of the earliest paper books in existence; the South Gate (circa 1437); custom-house (1683); hospital (1834-47); museum (1854), with a good collection of British birds; public library (1899, new building 1905); two extensive docks (1869-84), admitting vessels drawing 21 feet at spring-tides; technical institute (1893); and Greenland Fishery Museum (1912), a timbered house bearing the date 1605. A considerable trade is carried on in corn, oil-cake, coals, timber, and the mussel, shrimp, and whelk fisheries are important; but the imports of port wine, for which Lynn was formerly noted, have declined. In Edward I.'s reign it was one of the principal ports of the kingdom; in 1397 it ranked fifth amongst the towns contributing 'loans' to meet the royal necessities; in 1474 the Hanse merchants had a factory or 'steelyard' here; and in the first half of the 16th century it was a flourishing seat of cloth manufacture. In 1643, during the Civil War, the town capitulated to the parliamentary force after three weeks' resistance. King John (who in 1204 granted the town its first charter), the dowager queen Isabel (a resident for twenty-eight years at Castle Rising, a few miles distant), Edward III., Henry VI., Edward IV., Henry VII., and Oliver Cromwell all visited Lynn, which was the birthplace of John Capgrave, the chronicler, and of Fanny Burney. 'Pop. (1801) 10,096; (1901) 20,288; (1921) 19,968.

Lynn, a city and port of Massachusetts, on Massachusetts Bay, 10 miles NNE. of Boston, was

founded in 1629. Most of the houses are built of wood; among them are many handsome villas belonging to Boston merchants. The manufacture (established 1636) of ladies' and children's shoes is the most extensive in the United States. There are also large tanneries. Here in 1643 the first smelting works in New England were established. Pop. 100,000.

Lynton and Lynmouth, two villages of North Devon, on the Bristol Channel, 18 miles NE. of Barnstaple. Lynmouth stands close to the sea, and Lynton, half-way up the cliff, 428 feet above. They were 'discovered' in 1883, and have since been developed as summer resorts. There is a cliff-railway 1000 feet in vertical ascent. Shelley stayed at Lynmouth in 1812; and Southey called it 'the finest spot, except Cintra and Arrabida [near Lisbon], that I ever saw.' Near by is the Doone Valley, celebrated in Blackmore's *Lorna Doone*. Population of Lynton urban district, 2600.

Lynx, a genus of Felidae, having a less elongated form than many others of that family, the body elevated at the haunches, long fur, a short tail, and the ears tipped with tufts or pencils of hairs. They are less courageous than other Felidae of similar size, and prey on small quadrupeds and birds. It has been said that they kill and devour the skunk. In pursuit of birds they climb trees. They are generally of a sullen and suspicious

The European Lynx.

temper, and not easily tamed. The species are not numerous, but widely distributed; the distinctions of species and varieties are somewhat uncertain. The European Lynx (*L. lynx*) is common in many parts of Europe and Asia, chiefly in mountainous and wooded districts. Its colour is variable, but generally of a dark reddish gray, spotted with reddish brown, the belly whitish. It is about three feet long, and proverbial for acuteness of sight. It is hunted in winter for its fur, which is always in demand in the market; but many of the lynx skins imported from the north of Asia possibly belong to other species. Those of North America, and probably also many of those of the north of Europe and of Asia, are the skins of the Canada Lynx (*L. canadensis* or *L. borealis*), which is generally of a hoary gray colour, a broad space along the back being blackish brown. It is rather larger than the European Lynx, and more clumsy in form. The Bay Lynx (*L. rufus*) is found in more southern parts of North America, both in mountainous and in swampy districts, and often makes great havoc among poultry; it is commonly called in America the wild-cat. But as all these forms graduate into one another they should probably be referred to a single species. Another Asiatic species is the Tibet Lynx.

Lyon Court, the court in Scotland which has jurisdiction in questions regarding coat-armour and precedence. It is presided over by the Lyon King-of-arms. See HERALD.

Lyonnesse. See CORNWALL.

Lyonnais, a former province of France, was bounded on the W. by Auvergne and on the S. by Languedoc. Its territory coincides nearly with the present departments of Rhône, Loire, Haute-Loire, and Puy-de-Dôme.

Lyons (Fr. *Lyon*), the third city of France and capital of the department of the Rhône, stands at the confluence of the Rhone and the Saône, by rail 315 miles SSE. of Paris and 218 N. by W. of Marseilles. The commercial and fashionable quarters of the city lie on the long narrow tongue of land between the rivers, and are connected with the suburbs beyond by numerous bridges. This central part of Lyons contains many narrow streets, with tall gloomy houses; but much has been done to lighten it since 1852 by the making of long straight, wide streets, and the opening up of squares. In this district stand the museum (1667), with valuable Roman antiquities, a library, pictures by the great masters, and other art collections; the church of St Martin d'Ainay, the oldest in Lyons, rebuilt in the 10th and 11th centuries, but portions dating from the 6th; St Nizier Church, at first the cathedral, a fine 15th-century Flamboyant building, with the crypt in which St Pothinus is said to have officiated; the graceful town-house, built in 1646 and restored in 1702; the unique museum of tissues; the Bourse; the hospital, founded in the 6th century, and—like the Hospice de la Charité (1531), the Chamber of Commerce, and the Veterinary College—the oldest of its kind in France; and the arsenal. To the north lies the populous industrial suburb of La Croix Rousse, formerly the great abode of the silk hand-loom weavers. Across the Saône, and on its right bank, is the steep, high suburb of Fourvières, the ancient *Forum Vetus* of Trajan, whose summit (410 feet) is now crowned by the church of Notre Dame (the new church begun in 1872). Here is the miracle-working image of our Lady of Fourvières that is believed to have preserved the city from the cholera in 1832, 1835, and 1850; it is visited by thousands of pilgrims annually, whose offerings cover the walls of the church. From its tower, which is surmounted by a gilded statue of the Virgin, 18 feet high, a view can be had of the distant Alps. On this elevated site, too, stands the church of St Irenæus, in the crypt of which are preserved what purport to be the bones of 19,000 Christian martyrs who perished in the persecution by Severus. At the foot of the hill next the Saône are the archiepiscopal cathedral of St John, of the 12th to 14th century, with magnificent stained-glass windows of the same date and a celebrated clock of 1598; the palace of the archbishop, who ranks as 'primate of the Gauls'; and the law-courts. On the left bank of the Rhone, which is so low that it has to be protected with embankments to prevent it from overflowing and flooding the city, is the handsome new suburb of Les Brotteaux, terminated on the north by the park of the Tête-d'Or and the permanent buildings of the great Lyons Fair (revived in 1916); while more to the south is the suburb of La Guillotière, with a venerable 12th-century bridge. Lyons possesses also a university with four faculties and over 3000 students; Catholic faculties, constituting in reality a Catholic university; a military (medical) school; schools of art (of great value for the silk manufactures), of music, and of commerce; and a municipal library. Commanding both the Rhone and the Saône the place is of great strategic importance, and the city is a fortress of the

first rank, being defended by a double ring of forts. Pop. (1872) 301,868; (1891) 398,027; (1901) 459,099; (1921) 561,592. Among the towns of France, Lyons ranks second only to Paris in commercial and industrial importance. Of trade, silk is the great staple, and here the silk industry of France and of the world has its commercial centre. Formerly the town was equally important as a manufacturing centre of the industry, but with the coming of the power-loom the weaving branches in the later 19th century moved out to the surrounding districts. In augmentation of native supplies raw silk in large quantities is yearly imported from China, Japan, Italy, and the Levant, and manufactured goods to the value of many millions of pounds are annually distributed within the country itself; but also largely to Great Britain, the United States, and other countries. The specialty of the Lyons manufacture used to be heavy figured stuffs, such as velvets, satins, watered silks, plushes, moirés, and so forth; but, owing to a change in taste or fashion, a growing demand has arisen for lighter stuffs dyed in the piece. Of the industries of Lyons silk-dyeing and printing are important, while many find employment in the various chemical industries (dyes, starch, candles, soap), machinery-making establishments, foundries, brass-works, factories for fancy-ware, gold and silver goods, hats, paper, mathematical instruments, and numerous minor branches. The admirable position of Lyons makes it a great emporium of trade between central and southern Europe, and, apart from its activities in silk, cotton is imported from America and Egypt, and a large amount of business done in cloth and linen, chestnuts, coal, charcoal, cheese, and wine and spirits. The place is also one of the principal railroad centres of France, and as a financial centre—here is the home of the *Crédit Lyonnais*—it follows only Paris in importance. The list of notable persons born in Lyons includes Germanicus and the Roman emperors Claudius and Caracalla, Jules Favre, Say, Suchet, the De Jussieus, Ampère, Mme Récamier, Delorme, the Coustons, Flandrin, Meissonier, Puvion de Chavannes, and Jacquard.

The Romans settled a colony here in 43 B.C. and made it the starting-point for their great network of highways through Gaul. It soon became the ecclesiastical metropolis of that great province and its first commercial and manufacturing town, under the name of Lugdunum. But ill fortune attended it: it was burned to the ground in 59 A.D., and again in 197; it suffered severely during the barbarian invasions; and was conquered by the Saracens in 736. Yet it was visited by gleams of glory: in 478 it was made capital of the Burgundian kingdom, and, passing to the empire in 1032, was invested with self-government and the privileges of a free imperial town. But after the condemnation of the Emperor Frederick II. at the Council of Lyons in 1245 the city reverted to the French crown. The introduction of the silk industry must be set down to the credit of Francis I. The Reformation, entering from Geneva, had a short but violent reign; the emigration of the Huguenots struck a blow at the industrial prosperity of the town from which it did not recover for some time. In 1789 the city embraced the cause of the Revolution, though royalist feeling was also strong here. In 1792 it refused obedience to the National Convention; in revenge it was besieged, captured, its buildings destroyed, its name changed (till 1794) to *Ville-Affranchie*, and 6000 of its citizens slain under the direction of Collot d'Herbois, Couthon and Fouché. The 19th century was chiefly memorable for trade riots, which sometimes, as in 1831, 1834, and 1849, assumed very formidable dimensions. After the war of 1870 it became known as a focus of red republicanism. President

Carnot was assassinated in Lyons in 1894. During the Great War the city, far from the fighting line, distinguished itself by its industrial and charitable activities. As a port and manufacturing centre Lyons is deeply interested in the harnessing and rendering navigable of the Rhone (q.v.). M. Herriot, mayor of Lyons from 1905, and prime minister of France 1924-25, provided many civic improvements.

See *Histories* by Olerjon (4 vols. 1829-35), Beaulieu (1833), Monfalcon (8 vols. 1866-70), Metzger (9 vols. 1881-85), Charléty (1903), the topographical account by Joanne, and works by Josse (1892), Steyert (1895), and Hennezel (1914).

Lyra, NICOLAUS DE, mediæval commentator, born at Lyre, in Normandy, became a Franciscan, wrote *Postille Perpetue in Universa Biblia* and other works, insisting on the literal meaning against extravagant allegories. 'Si Lyra non lyrasset,' it was said, 'Lutherus non saltasset.' He died in 1340.

Lyre, one of the oldest forms of stringed instrument. It was introduced into Egypt from Palestine during the 18th dynasty, and was common among the Greeks even in the heroic times. Most of the barbarians who invaded the Roman empire were acquainted with the lyre, and must have independently attained the knowledge of it. The common Greek lyre was made of a tortoise-shell, with blocks inside, similar to those used in a violin, to modify the strain of the strings. The shell was covered with bull's hide, and two horns were fastened to one side of it, one horn at each extremity of the side. A piece of wood served as a crosspiece, and was fastened from the tip of one horn to the tip of the other. Seven strings of gut were tied to the crosspiece, the other ends being secured at the bottom of the shell. Pegs for the strings were added to the crosspiece by the later Greeks, likewise a bridge to prevent the strings touching the shell, and two sound-holes cut in the shell in order to increase its resonance. The lyre, unlike the lute, cannot be stopped by

the fingers and its sounds thereby multiplied. Its sounds can be no more in number than its strings. Consequently, since the rise of the modern scale, the lyre, whose strings were never more than about seven in number, has been unable to cope with the growing exigencies of an intricate music, and has fallen into complete desuetude.

Lyre-bird (*Menura*), a genus of remarkable Passerine birds, of which the best known is *M. superba* of New South Wales, where it is often called the Lyre Pheasant. By far the largest of

Lyre-bird (*Menura superba*).

singing birds (with 'the apparent bulk of a hen pheasant, but really much smaller'), it is excessively shy, keeping to rocky and thick brush, mostly on

the ground, feeding on insects, worms, and snails. The females and immature males have a long, broad, normal tail; that of the cock at the breeding season is a splendid piece of decoration, one of the features being the lyre-like form of the two exterior feathers. This he displays on a chosen walk or dancing-place, and sings at intervals as he struts. Lyre-birds have highly-developed mimetic gifts, imitating even a cock's crow or a dog's bark. The nest is a loosely-built domed structure on a rocky ledge not far from the ground, the low fork of a tree, or the like; and there is one large egg. There are two other species, *M. victorior* and *M. alberti*. All, unfortunately, are becoming rare.

Lyric, the name given to a certain species of poetry because originally accompanied by the music of the lyre. It is rapid in movement, as befitting the expression of the mind in its emotional and impassioned moments, and naturally its principal themes are love, devotion, patriotism, friendship, and the Bacchanalian spirit. It was a favourite form among the ancient Greeks and Romans, and here it may be enough to mention the lyrics of such masters as Sappho, Pindar, Tyrtaeus, Simonides, of many unknown writers in the *Greek Anthology*, and of Catullus and Horace. The most important form of the modern lyric is the *song*, with its religious sister, the *hymn*, neither of which, as we might expect, extends usually to any great number of lines. Lyric poetry obviously concerns itself with the thoughts and emotions of the writer's own mind, and is thus *subjective* as opposed to the epic, for example, which is essentially *objective* in character; while from beginning to end it should express but one incident, situation, or spasm of emotion. Modern English literature is remarkably rich in poetry in lyric forms, although it would be difficult to bring together any three of their contemporaries to outweigh Goethe, Schiller, and Heine.

Lys, or LEYE, a river of France and Belgium, rises near Lysbourg, Pas-de-Calais, flows in a north-easterly direction, forms, roughly between Armentières and Menin, the boundary between France and Belgium, and passing Courtrai joins the Scheldt at Ghent after a course of 130 miles. Throughout the Great War the river ran across the battle area, and its name is given to a battle (April 1918), when, in a German thrust for the sea, allied troops were repulsed on a front from Mont Kemmel to La Bassée, and on the Lys, driven upstream to a point beyond Merville from a line which, crossing the river near Frelinghien below Armentières, had, from October 1914, been much contested.

Lysander, a famous Spartan warrior and naval commander, of extraordinary energy and military skill, but not less remarkable for the cunning, revenge, and ambition by which he was characterised. He spent part of his youth at the court of Cyrus the Younger, and in 407 B.C. was appointed to the command of the Spartan fleet, from which time he constantly prosecuted the design of overthrowing the Athenian power, in order to exalt that of Sparta. He defeated the Athenian fleet at the promontory of Notium; and, being again entrusted with the management of the fleet after the defeat of his successor, Callieratidas (405 B.C.), he was again victorious. He swept the southern part of the Ægean, and made descents upon both the Greek and the Asiatic coasts. He then sailed north to the Hellespont, and anchored at Lampsacus. An immense Athenian fleet soon made its appearance at Ægospotami, on the opposite side of the straits, amounting to 180 ships. Of these, 171 were captured by Lysander a few

days after. The blow to Athens was tremendous. Everywhere her colonial garrisons had to surrender, and Spartan influence predominated. Finally, in 404 B.C., he took Athens itself. His popularity now became so great, especially in the cities of Asia Minor, that the Spartan ephors dreaded the consequences, especially as they knew how ambitious he was. Every means was taken to thwart his designs, until finally it would appear that he had resolved to attempt the overthrow of the Spartan constitution; but this scheme was prevented by his death at the battle of Haliartus in the Boeotian war (395 B.C.). His Life was written by Plutarch and by Cornelius Nepos.

Lysias, the first Greek orator who attained perfection in his own line, was the son of Cephalus, who, foreigner though he was—he came from Syracuse—succeeded in making his house one of the centres of intellectual life in Athens. Lysias himself was born in Athens, probably about 432 B.C. (the date is very uncertain), was educated along with children of the best Athenian families, and at fifteen years of age joined the colony planted by Athens at Thurii, where his early manhood was spent. The failure of the Athenian expedition against Sicily made it advisable for Lysias, like other friends of Athens, to leave Thurii, and in 412 he returned to Athens and continued his rhetorical studies, not for professional purposes, for he and his brother Polemarchus were wealthy, but from choice. The choice proved in the event a wise one, for the Thirty Tyrants, in 404 B.C., stripped the brothers of all their wealth, killed Polemarchus, and only failed to kill Lysias because he fled to Megara. The first practical use to which Lysias put his eloquence was, on the fall of the Thirty (403), to avenge his brother's death by prosecuting Erasthenes, the tyrant on whom the principal responsibility for the legal murder of Polemarchus rested. He then practised, until his death at the age of eighty, with singular success as a writer of speeches for persons engaged in litigation. According to Dionysius of Halicarnassus, he composed 233 such speeches, and only failed in two instances to secure a favourable verdict. From an examination of the surviving speeches, we can see that Lysias is at all times and in all matters surprisingly and delightfully lucid in both thought and expression: he rarely indulges in a metaphor, he is always direct, and uses simple, commonplace language for his simple narrative and common-sense arguments. But though simple his narrative is never monotonous: it is lively, graceful, and entertaining. Another quality, which both contributed to his practical success and helps to place his speeches amongst the most entertaining of Greek literature, is his power of character drawing.

See Jebb, *Attic Orators*; and Blass, *Die Attische Beredsamkeit*.

Lysimachia, a genus of erect or creeping plants of the natural order Primulaceae, with opposite, alternate, or whorled leaves, and white, yellow, or red flowers, either solitary or in racemes. They are perennials, and are mostly natives of the northern temperate regions, but a few species are tropical. Over 60 species are known: *L. nemorum* is the wood loosestrife, or yellow pimpernel, and *L. nummularia* is the herb-twopence, creeping jenny, or moneywort which frequents damp shady places, and is often cultivated in hanging baskets, and used for covering rocks.

Lyte, HENRY FRANCIS, hymn-writer, born at Ednam, near Kelso, 1st June 1793; in 1812 entered Trinity College, Dublin; took orders in 1815; and, his health having failed three years earlier, died at Nice, 20th November 1847. His *Poems*, chiefly

Religious (1833; reprinted as *Miscellaneous Poems*, 1868), *Memoir of Henry Vaughan* (1847), &c., are almost forgotten; but 'Abide with me,' 'Pleasant are thy courts,' and other hymns keep his memory green. See Life prefixed to his *Remains* (1850).

Lytham, a watering-place of Lancashire, on the north shore of the Ribble estuary, 14 miles W. of Preston, and 7 SSE. of Blackpool; pop. 11,000.

Lythraceae, a natural order of dicotyledons, chiefly herbs, and rarely shrubs or trees. The order contains about 20 genera and upwards of 450 species, chiefly natives of the tropics; but a few are found in Europe and in North America. Astringent qualities are ascribed to some of the species. The order is well represented in Britain by the well-known Purple Loosestrife (*Lythrum Salicaria*), which grows abundantly on the margins of ponds and streams and in moist meadows, in some parts of the country imparting character to the landscape by its broad masses of purple flowers. The Henna (q.v.) of Egypt is produced by *Lawsonia inermis*, a plant of this order. The leaves of another (*Pemphis acidula*) are said to be a common pot-herb on the coasts of the tropical parts of Asia. The leaves of *Ammania vesicatoria*, an East Indian aquatic plant, are very acrid, and are sometimes used as blisters. *Lagerstroemia indica* has become a favourite tree in the south of Europe, and flowers even in the canton of Ticino.

Lyttelton, the port of Christchurch (q.v.), 6 miles SE. of it, on an inlet north of Banks Peninsula, has a good harbour sheltered by breakwaters, and a graving-dock; pop. 4000.

Lyttelton, GEORGE, LORD, son of Sir Thomas Lyttelton of Hagley, in Worcestershire, was born in 1709, and educated at Eton and Christ Church, Oxford. He entered parliament in 1730, where he soon acquired eminence as a speaker, held several high political offices, was raised to the peerage in 1759, and died 22d August 1773. Lyttelton had once a considerable reputation as an author, and his poetry gained him a place in Johnson's *Lives of the Poets*. His best-known prose works are *Observations on the Conversion and Apostleship of St Paul* (1747), *Dialogues of the Dead* (1760), and *History of Henry II.* (1764). See his *Memoirs and Correspondence* (2 vols. 1845).—His son, THOMAS, LORD LYTTELTON (1744–79), who was as conspicuous for profligacy as his father for virtue, died three days after a nocturnal warning by a dove and a white lady. The *Poems by a Young Nobleman* (1780) may partly have been his, but the *Letters* were probably by 'Dr Syntax.' See Andrew Lang, *The Valet's Tragedy* (1903).

Lyttleton, SIR THOMAS. See LITTLETON.

Lytton, EDWARD BULWER, LORD, writer and politician, born in London 25th May 1803, was third and youngest son of General Earle Bulwer (1776–1807) of Heydon and Dalling in Norfolk, by Elizabeth Barbara Lytton (1773–1843), the heiress of Knebworth in Hertfordshire. As a child a devourer of books, his favourites *Amadis de Gaul* and the *Faerie Queen*, he took early to rhyming, and went to school at nine, though not; it may be unluckily, to a public one, but to six private tutors in succession (1812–21). In 1820 he published *Ismael and other Poems*, and about the same time was 'changed for life' by a hopeless, tragic first love. At Trinity Hall, Cambridge (1822–25), he read English history, political economy, metaphysics, and early English literature; spoke much at the Union; carried off the Chancellor's gold medal for a poem upon 'Sculpture,' but took only a pass degree. Meanwhile, in a long-vacation walking-tour (1824), he had visited the grave of his lost love in the Lake Country; and there, in Scotland, and in the north of England, had strange

adventures with cut-throats and most impossible Gypsies. Now, his college life ended, he alternated awhile between Paris and London; and in London, in December 1825, he met Rosina Wheeler (1802-82), a beautiful Irish girl, whom in August 1827, despite his mother, he married. It was a most unhappy marriage. She bore him a daughter, Emily (1828-48), and a son, the future Earl of Lytton; in 1836 they separated. But his marriage did this for him: it called forth a marvellous literary activity, for the temporary estrangement from his mother threw him almost wholly on his own resources. He had only £200 a year, and he lived at the rate of £3000; the deficiency was supplied 'out of his well-stored portfolio, his teeming brain, and his indefatigable industry.' During the next ten years he produced twelve novels, two poems, one political pamphlet, one play, the whole of *England and the English*, three volumes of *Athens, its Rise and Fall*, of which only two ever were published, and all the essays and tales collected in the *Student*, to which must be added his untold contributions to the *Edinburgh*, the *Westminster*, the *New Monthly* (of which he became editor in 1831), the *Examiner*, &c. His Wertherian *Falkland*, published anonymously in 1827, gave little promise of the brilliant success, both at home and abroad, of *Pelham* (1828), the clever persiflage of whose dandy hero is still delightful. No two readers agree on the relative merit of his books, but indeed this very divergency of opinion as to which is really his masterpiece only illustrates his amazing versatility. Certainly *Pelham* is better than *Paul Clifford* (1830), a marvellous idealisation of the highwayman, as *Eugene Aram* (1832) is of the murderer; but most will rank it as inferior to the exquisitely fanciful *Pilgrims of the Rhine* (1834) or to one or another of his four splendid historical novels—*The Last Days of Pompeii* (1834), *Rienzi* (1835), *The Last of the Barons* (1843), and *Harold* (1843). Then, there is his domestic trilogy, *The Caxtons* (1850), *My Novel* (1853), and *What will he do with it?* (1859), Sterne-like, yet strangely un-Sterne-like, surpassing Thackeray for peasants and Dickens for gentlemen, and both in knowledge of the world of politics. Or there are *Zanoni* (1842), *A Strange Story* (1862), and, shorter but stronger than either, *The Haunted and the Haunters* (*Blackwood's Magazine*, 1859). No English story of the supernatural comes near to this, and why?—because he wrote here as a believer, as a serious student of astrology, chiromancy, occult lore generally. These books are triumphs in the art of fiction in its most widely differing divisions, and taken together, display an unexampled range of powers. Here the reader finds at once vast knowledge, rich suggestiveness wedded to profundity of thought, fresh insight into perplexing psychological and social problems, breadth of view, wit in richer measure than humour, together with an unusual power of handling vivid incident and a rare mastery of plot-construction.

Of his plays it must suffice to say that the *Lady of Lyons* (1838), *Richelieu* (1838), and *Money* (1840), all three of which owed something to hints from Macready, long and firmly held the stage; of his poems that *King Arthur* (1848), and even *St Stephens* (1860), and the *Lost Tales of Miletus* (1866), will all be forgotten when the *New Timon* (1846) is still kept in remembrance by the savage answer it provoked from Tennyson.

In 1831, at the age of twenty-eight, he had entered parliament as member for St Ives, and attached himself to the Reform party; but Lincoln

next year returned him as a Protectionist Liberal, and that seat he held till 1841. In 1838 the Melbourne administration conferred on him a baronetcy for his brilliant services as a pamphleteer; in Dec. 1843 he succeeded, by his mother's death, to the Knebworth estate, and assumed the additional surname of Lytton. He now sought to re-enter parliament, in 1847 contesting Lincoln unsuccessfully; and in 1852 he was returned as Conservative member for Hertfordshire. Deafness hindered him from shining as a debater, but he made himself a successful orator. In the Derby government (1858-59) he was Colonial Secretary, and signalised his brief tenure of office by calling into existence the two vast colonies of British Columbia and Queensland. In 1866 he was raised to the peerage as Baron Lytton. He died at Torquay on 18th January 1873, and was buried in Westminster Abbey.

Lord Lytton's works in all exceed sixty, and fill more than 110 volumes. To those already mentioned may be added *The Disowned* (1829), *Devereux* (1829), *Godolphin* (1833), *Ernest Maltravers* (1837), *Alice* (1837), *Leila and Calderon* (1838), *Night and Morning* (1841), *Poems and Ballads, chiefly from Schiller* (1844), *Lucretia* (1846), *Caxtoniana* (1863), *The Coming Race* (anonymously, 1870), *Kenelm Chillingly* (1873), *The Parisians* (1874), and *Pausanias the Spartan* (unfinished, 1876). The *Life, Letters, and Literary Remains of Lord Lytton* (vols. i.-ii. 1883), by his son, comes down only to 1832, so must be supplemented by the political Memoir, also by the Earl of Lytton, prefixed to the *Speeches of Lord Lytton* (2 vols. 1874), and by the *Life in 2 vols.* (1913) by his grandson, Lord Lytton, who makes free use of his father's work. A *Life* by T. H. S. Escott appeared in 1910.

LYTTON, EDWARD ROBERT, EARL OF, poet, diplomatist, and statesman, son of the preceding, was born, in Hertford Street, London, 8th November 1831, and was educated at Harrow and at Bonn. In 1849 he went to Washington as an attaché and private secretary to his uncle, Sir Henry Bulwer (q.v.); and subsequently he was appointed attaché, secretary of legation, consul or *chargé d'affaires* at Florence (1852), Paris (1854), The Hague (1856), St Petersburg and Constantinople (1858), Vienna (1859), Belgrade (1860), Constantinople again (1863), Athens (1864), Lisbon (1865), Madrid (1868), Vienna again (1869), and Paris (1873). In that last year he succeeded his father as second Lord Lytton, and in 1874 became minister at Lisbon, in 1876 Viceroy of India, at the same time receiving the Grand Cross of the Bath. The chief events of his viceroyalty were the proclamation of the Queen as Empress of India at the grand Delhi durbar on 1st January 1877, and the outbreak in 1879 of the tedious and unpopular Afghan war. In 1880, on the fall of the Beaconsfield government, he resigned, and was made Earl of Lytton; in 1887 he was sent by Lord Salisbury as ambassador to Paris, and there he died 24th November 1891. His works, published mostly under the pseudonym of 'Owen Meredith,' include *Clytemnestra* (1855), a dramatic poem; *The Wanderer* (1859); *Lucile* (1860), a novel in verse; *Serbalski pesme* (1861), translations from the Serbian; *The King of Amasis* (1863), a prose romance; *Orval, or the Fool of Time* (1869); *Fables in Song* (1874); *Glenavereil* (2 vols. 1885), an epic of modern life; *After Paradise, or Legends of Exile* (1887); *Marah* (1892); and *King Poppy* (1892). See his *Personal and Literary Letters*, edited by his daughter, Lady Betty Balfour (1906).

M

the thirteenth letter of our alphabet, descends from the thirteenth letter of the ancient Semitic alphabet. The Semitic name of the letter, in Hebrew *mēm*, in Syriac and Arabic *mīm*, is probably, though not quite certainly, the Phœnician equivalent of the Hebrew *māyīm*, 'water.' Some slight support for this explanation may be found in the fact that the following letter is named *nūn*, 'fish'; in one or two other instances the sequence of letters in the alphabet seems to have been due to association of ideas connected with their names. It is supposed by some scholars that the zigzag line in the earliest form, , was intended to represent waves. The late Hebrew  (at the end of a word ) still retains some resemblance to the original type.

In early Greek inscriptions the letter appears as , and when written from left to right as . Subsequently this was modified into M.

The Greek name of the letter, *mū*, was not adopted from Semitic, but formed in imitation of the name of the succeeding letter *nū*.

The Romans adopted the letter in the later Greek form M, which survives in our ordinary printed capital. Our minuscule M, and the black-letter capital, descend from the Roman cursive form, in which the upper angles were rounded.

In mediæval handwriting a medial or final *m* was often represented by a stroke over the preceding letter, as in *exēplū* for *exemplum*. This practice survived into the 17th century, and is found in many early printed books.

The letter has from the beginning been the symbol of the voiced labial nasal consonant. The corresponding voiceless sound exists in modern Welsh, where it is written *mh*. In early Irish M was used not only for its original sound, but also for a kind of *v* sound into which this had in certain positions become changed. This secondary value of the letter was afterwards distinguished by the dotted form *m̃*, which is still used in books printed in the Irish character; in transliterated Irish and in Scottish Gaelic *mh* is substituted for it.

In French and Portuguese, *m* in combination with a preceding vowel-letter or vowel-digraph forms a complex symbol representing a simple nasal vowel. In French this occurs only in words that had originally a consonant *m*, the normal sign of a nasal vowel being *n*. In Portuguese nasality is expressed by *m* without regard to etymology, as in *ben* from the Latin *benē*.

The Roman name of the letter, *el* (for the origin of which see the article F), is preserved in the modern languages, but has become disyllabic in Italian (*emme*) and in Spanish (*eme*).

Maartens, MAARTEN (1858-1915), the pen-name of Jost Marius Willem van der Poorten Schwarz, a Hollander, who, having spent part of his boyhood in England and been at school in Germany, studied law at Utrecht, and became a

lecturer there in 1883. He wrote powerful novels in nervous English.

Maastricht. See MAESTRICHT.

Mab, 'the fairies' midwife,' who delivers men of dreams. Shakespeare, Shelley, and others make her queen of the fairies—a dignity really belonging to Titania, the wife of Oberon (q.v.). Mab's praises have been sung by Shakespeare, Ben Jonson, Herrick, Drayton, and other English poets.

Mabillon, JEAN, a learned Benedictine, born 23d November 1632 at St Pierremont, in Champagne. He studied at St Remy, in 1653 entered the Benedictine order, was placed in 1658 in the monastery at Corbie, in 1663 became keeper of the monuments at St Denis, and from 1664 worked, with stupendous erudition, in the abbey of St Germain-des-Prés at Paris. Here he died, 27th December 1707. He made many journeys into Germany and Italy for purposes of research. He aided D'Achery in the preparation of his vast historical collection, the *Spicilegium*; undertook an edition of the works of St Bernard (1667); and constructed a general history of his order, *Acta Sanctorum ordinis S. Benedicti* (9 vols. folio, 1668-1701). His classical work *De Re Diplomatica* (Paris, 1681) practically created the science of Latin palæography. Other works are *Vetera Analecta* (1675-85), *Musæum Italicum* (1687-89), and *Annales ordinis S. Benedicti* (6 vols. folio, 1703-39). His posthumous works, including many letters, appeared at Paris (3 vols. 1724).

See Ruinart, *Vie de Jean Mabillon* (1709); Chavin de Malan, *Histoire de Dom Mabillon et de la Congrégation de Saint-Maur* (1843); Jadart, *Dom Jean Mabillon* (1879); and E. de Broglie, *Mabillon, 1664-1707* (1888).

Mabinogion. See HERGEST, and WALES.

Mably, GABRIEL BONNOT DE, elder brother of Condillac (q.v.), born at Grenoble on 14th May 1709, studied at the Jesuit College in Lyons, and became secretary to the minister Cardinal Tencin, his uncle. But before many years had passed the two had quarrelled, and Mably gave himself up to a studious life. He died at Paris on 23d April 1785. He entertained a great admiration for the ancients, especially for the institutions of Sparta, and constantly illustrated his writings by the acts and lives of Solon, Phocion, Lycurgus, and Cato. In this department his chief books were *Entretiens de Phocion* (1763); *Parallèle des Romains et des François* (1740); and *Observations sur l'Histoire de la Grèce* (1766). His political theories were those of communism. His *De la Manière d'Écrire l'Histoire* (1783) contains severe strictures on Hume, Robertson, Gibbon, Voltaire, and other historians. *Le Droit Public de l'Europe* (1748) was the outcome of his official life. See Guerrier, *L'Abbé de Mably* (1886).

Mabuse, JAN, whose real name was GOSSART, a Flemish painter, was born at Maubeuge (Mabuse) about 1470, and entered the painters' guild of St Luke at Antwerp in 1503. His life and work are divisible into two well-marked sections. In the earlier portion, during which he dwelt mostly at Antwerp, his paintings—principally altarpieces—

show that he studied Memlinc, Van der Weyden, and Quentin Matsys; their influence is especially apparent in an 'Adoration,' now at Castle Howard in Yorkshire, and in altarpieces at Scawby in England, and Tongerlo in Belgium. The most celebrated of his early pictures, a 'Descent from the Cross,' painted for the church of Middelburg in Holland, was burned in 1568. In 1508 Mabuse accompanied Philip of Burgundy to Italy when he went to arrange the treaty of Cambrai. This set the fashion to subsequent Flemish painters of spending some time in the sunny, art-loving south. Mabuse returned home with his style greatly modified by the study of Leonardo, Michelangelo, and Raphael; but the modification was one that too often tended towards mannerisms, and to the introduction of contemporary portraits and details into religious pictures. After his return he resided chiefly at Wyck, Middelburg, and Antwerp, and died at the last-named place on 1st October 1532. His later works embrace three classes—subjects from Greek mythology, as Neptune and Amphitrite, and Danaë, characterised by strong traits of coarse realism; portraits, as of the children of King Christian II. of Denmark (about 1528), of a princess of Portugal, and of Jean Carondelet (1517); and religious subjects, including 'St Luke painting the Madonna,' 'Christ in Agony,' 'Adam and Eve,' and several Madonnas. Mabuse was a painstaking workman. Nearly all his pictures have rich architectural backgrounds, but the figures are stiff and stony; the colours are bright, sometimes gaudy.

Mac (contracted M'), a Gaelic prefix occurring frequently in Scottish names, as Macdonald, McLennan, and the like, meaning 'son.' It corresponds to Welsh *Map*, shortened into *Ap* or *P*, as *Ap Richard*, *Prichard*.

Macadam, JOHN LOUDON, inventor of the system of road-making known as 'macadamising,' the son of James MacAdam of Waterhead of Dunch, Kirkcudbright, was born at Ayr, 21st September 1756. He went to New York in 1770, entered his uncle's counting-house, became a successful merchant, and on his return to Scotland in 1783 bought the estate of Sauchie, Ayrshire. He began in 1810 to make experiments in the construction of roads, which became a passion with him, and in gaining experience he travelled 30,000 miles, and spent £5000. In 1816 he was appointed surveyor to the Bristol Turnpike Trust, and re-made the roads there cheaply and well. His advice and assistance were now sought in all directions, and his methods formed the subject of a select committee of the House of Commons in 1819. Instead of going deep for a 'bottoming,' he worked on the top; the road-metal, from 1 to 2 ounces in size, was scattered to a depth of from 6 to 10 inches, and when shaken and pressed together, made a top-covering as close as a wall (see *ROAD*). Macadam, impoverished through his labours, petitioned parliament in 1820 for his expenses and some reward. His petition was repeated in 1823, and he was voted £10,000 and appointed Surveyor-general of Metropolitan Roads in 1827. He declined a knighthood. He died at Moffat, Dumfriesshire, 26th November 1836. He published several books on roads. See *Smiles, Lives of the Engineers* (1861).

McAll Mission, the largest Protestant mission in France, was founded in 1871 by the Rev. Robert Whitaker McAll (1821-1892; see the *Life* published in 1896) and his wife.

Macao, a Portuguese settlement on the south coast of China, on the west side of the estuary of the Canton River, Hong-kong being about 40 miles distant on the opposite side of the same estuary. The settlement occupies a small peninsula project-

ing from the south-eastern extremity of the island of Hiang-shang, and is defended by forts built on the high ground overlooking Macao town. Potentially it is a place of great strategic importance. The islands Colowan and Taipa also belong to the settlement, whose total area is $4\frac{1}{2}$ sq. m. and pop. close upon 75,000, of whom only some 3000 are Portuguese, the rest being mostly Chinese; the Macaists or Nhons are a people of mixed European and Asiatic descent. The population of the town is about 64,000. The public buildings are handsome, and the city is clean and brightly coloured. Macao is one of the healthiest ports in China, though heat and rainfall are excessive during the south-west monsoon (April to October). The greater part of the revenue of the settlement is derived from licensed gambling-houses and from lotteries. The Portuguese obtained permission from the Chinese authorities to settle in Macao in 1557. The Chinese, however, continued to regard the place as Chinese territory, and not until 1887 was Portugal accorded sovereign rights. The importance of Macao is as a port, but since the rise of Hong-kong its commerce has suffered severely; at the same time its harbour, in spite of dredging, is being continually silted up, and its anchorage is in consequence defective. As a long-cherished possession, however, the Portuguese attach to the place a sentimental value far in excess of its real commercial worth. Shortly after it was declared a free port (1845) it became the headquarters of the coolie trade, especially with Peru and Cuba; but in consequence of fearful abuses the British and the Chinese constrained the Portuguese government to abolish the traffic in 1874 (see *COOLIES*). The trade of Macao (the name of which was for long a synonym for decay) is almost exclusively a transit trade, and is mainly in the hands of Chinese. Macao is the seat of a Roman Catholic bishop, and the headquarters of French missions in China. A grotto is shown here in which the exiled Camoens (q.v.) is said to have written part of his *Lusiads*. See works by Montalto de Jesus (1902) and J. D. Ball (1905).

Macaque. See *BARBARY APE*.

Macaroni (Ital. *maccaroni*, an early form of *maccheroni*), a preparation of wheat which for a long time was confined to Italy, and, in fact, almost to Genoa; it is now, however, all over Italy and at Marseilles and other places in the south of France. Strictly speaking, the name macaroni applies only to wheaten paste in the form of pipes, varying in diameter from an ordinary quill up to those now made of the diameter of an inch; but there is no real difference between it and the fine threadlike vermicelli, and the infinite variety of curious and elegant little forms which, under the name of *Italian pastes*, are used for soups. Only certain kinds of wheat are applicable to this manufacture, and these are the hard sorts which contain a large percentage of gluten. The wheat is first ground into a coarse meal, from which the bran is removed. This 'semola' is worked up into a dough with water; and for macaroni and vermicelli it is forced through gauges, with or without mandrels, as in wire and pipe drawing; or for *pastes* it is rolled out into very thin sheets, from which are stamped out the various forms of stars, rings, &c. Macaroni forms a large article of home consumption, and is exported to all parts of the world.

Macaronic Verse is properly a kind of humorous poetry, in which, along with Latin, words of other languages are introduced with Latin inflections and construction; though the name is sometimes applied to verses which are merely a mixture of Latin and the unadulterated vernacular of the author. Thus 'lassas kissare bonæas' ('to

kiss the bonnie lassies'), and 'burnantem extinguere thurstum,' are parts of macaronic hexameters. Teofilo Folengo, called Merlinus Coccaius (1491-1554), a witty and graceless Benedictine, has been erroneously regarded as the inventor of macaronic poetry; but he was the first to employ the term in this sense. His *Macaronea* (1517) is a long satiric poem, in which Latin and Italian are mingled. A predecessor of his by half a century was Odassi or Odaxius of Padua. Good specimens are found in the *Malade Imaginaire*, and in the *Epistolæ Obscurorum Virorum*. The *Polemologia* (1683), possibly by Drummond of Hawthornden, is probably the best-known British example. Fortunately macaronic poetry has not been very extensively cultivated, although specimens of it may be found in the literature of almost all European countries.

See Genthe, *Geschichte der Macaronischen Poesie* (1829); Octave Delepiere's *Macaronéana* (1852), and his *De la Littérature Macaronique* (1852-62); Morgan's *Macaronic Poetry* (New York, 1872); Brunet's *Littérature Macaronique* (1879); and Portioli's *Opere Macaroniche di Merlino Coccaio* (3 vols. Mantua, 1882-89).

Macaroon (from the same root as Macaroni), a kind of biscuit made with the meal of sweet almonds instead of wheat or other flour.

Macarthur, MARY, labour organiser, was born at Ayr 13th August 1880, and, educated in Glasgow and in Germany, became a pioneer in the organisation of women workers. To her the foundation of the Women's Trade Union League was mainly due, and in 1906 she formed the National Federation of Women Workers, while it was largely through her that, in the Trades Board Act of 1909, recognition was accorded to the principle of the minimum wage. In 1911 she married William C. Anderson (d. 1919), a Labour politician. She died in London 1st January 1921. See *Life* by Mrs Hamilton (1926).

Macartney, GEORGE MACARTNEY, EARL, administrator and diplomatist, was born of Scottish descent at Lissanoure, near Belfast, 14th May 1737. On leaving Trinity College, Dublin, he entered (1759) the Inner Temple, London. He was knighted in 1764, and, as envoy-extraordinary to Russia, concluded (1767) a commercial treaty; from 1769 to 1772 he was Chief-secretary for Ireland; and from 1775 to 1779 he was governor of Grenada, but was compelled, after an honourable defence, to give up the island to Comte d'Estaing, and was himself carried prisoner of war to France, though he soon contrived his exchange. In 1776 he had been made a baron of Ireland. The East India Company in December 1780 appointed him governor of Madras, and six years later promoted him to be governor-general; but ill-health prevented his acceptance. The first diplomatic mission to China from Great Britain was headed by Macartney, now an Irish viscount, in 1792; before his return home he was made an Irish earl (1794). After a confidential mission to Italy (1795-96), made Baron Macartney in the British peerage, he went out as governor of the new colony of the Cape of Good Hope (1796); but ill-health compelled his return (November 1798), and three years later prevented his acceptance of a place in the Addington ministry. He died at Chiswick 31st March 1806.

See memoir prefixed to Barrow's edition of his works (1807) and the fuller *Life* by Mrs H. H. Robbins (1908).

Macassar, the southern portion of Celebes (q.v.), contains the chief town and port, Macassar, on the west coast of the southern peninsula; pop. 20,000.

Macaulay, THOMAS BABINGTON, LORD, one of the most popular and brilliant of British essayists and historians, was born at Rothley Temple,

Leicestershire, 25th October 1800. He came of a Scottish Celtic family, several of whose representatives were ministers of the Church of Scotland. Two of them—Macaulay's grandfather, John Macaulay, who died minister of Cardross, and Kenneth, author of a history of St Kilda—came into contact and collision with Samuel Johnson, when touring in the Hebrides in the company of Boswell. Zachary Macaulay (1768-1835), the father of the future historian and politician, had a somewhat chequered career as an estate manager in Jamaica, but in the later years of his life was best known as an energetic and single-hearted member of the 'Clapham Sect' of philanthropists of which Wilberforce was the acknowledged head. He was married in Bristol in 1799 to Selina Mills, the daughter of a Bristol Quaker, and the pupil and friend of Hannah More. Macaulay was the first offspring of this union, and was named after his father's brother-in-law. His earliest years were spent with his family in London. From infancy he showed that insatiable thirst for knowledge, that prodigious tenacity of memory, and that talent for phrase-making, which were subsequently to be the delight and the envy of his contemporaries. At the age of seven he wrote a compendium of Universal History and three cantos of the 'Battle of Cheviot' in imitation of Sir Walter Scott. His parents while noting 'marks of uncommon genius' in their son, and encouraging him in every way, never flattered him or paraded him before others as a prodigy. Thus he grew up a simple child delighting in, but unconscious of his faculty, 'playful as a kitten,' and devoted to his brothers and sisters. In 1812 he was sent to a private school kept by the Rev. Mr Preston, a Low Church clergyman, at Little Shelford, near Cambridge. There, and at Aspenden Hall in Hertfordshire, to which Mr Preston removed in 1814, he remained till his time came to go to college. He studied hard and read omnivorously; the taste for novels and light literature generally which he now acquired and never lost, brought him more than one rebuke from his father.

In October 1818 Macaulay went into residence at Trinity College, Cambridge; but he detested mathematics, and cannot be said to have distinguished himself as a student. Yet he twice won the Chancellor's medal for English verse, and obtained a prize for Latin declamation. In 1821 he carried off a Craven university scholarship; took the degree of B.A. the following year; and in 1824 was elected to a Fellowship. He was one of the most brilliant disputants in the Union Debating Society, and made the friendship of the ablest of his contemporaries, including Praed, Romilly, Charles Villiers, Moultrie, and above all Charles Austin.

In 1826 Macaulay was called to the bar and joined the Northern Circuit. But he had no liking for his nominal profession, and made no attempt to secure a practice. Already, indeed, literature had irresistible attractions for him. In 1823 he became a contributor to *Knight's Quarterly Magazine*, along with Praed and others of his Cambridge friends. In it there first appeared some of his best verses—in particular *Ivry*, *The Spanish Armada*, and *Naseby*. Certain of his prose articles, such as *The Fragments of a Roman Tale*, and *Scenes from the Athenian Revels*, 'show,' says Cotter Morison, 'such a natural turn for a dialogue and dramatic *mise en scène*, that it says a great deal for Macaulay's good sense and literary conscientiousness that he remained content with this first success, and did not continue to work a vein which would have brought him prompt, if ephemeral popularity.' In 1825—the year in which he took his degree of M.A.—he was discovered by Jeffrey, then on the

outlook for 'some clever young man' to write for the *Edinburgh Review*. The famous article on Milton appeared in the August number, and the unequivocal success which it met with not only secured him a position in literature, but was the means of opening to him the doors of society and politics. But Macaulay's first thoughts were for his family. It was now in straitened circumstances, owing chiefly to his father being too much absorbed by the agitation for the abolition of the slave-trade to attend to his business. Macaulay ungrudgingly took upon himself the task of supporting his brothers and sisters by his pen. Fortunately it was now in great demand. For nearly twenty years he was one of the most prolific of the writers to the *Edinburgh Review*, and out of sight the most popular. Macaulay was, however, claimed by politics. Certain of his articles had attracted the attention of the chiefs of the Whig party to which he had attached himself. In 1830 he entered parliament, having been presented by Lord Lansdowne with the pocket-borough of Calne. He threw himself with his usual intensity into the work of the House of Commons, and in his first session made a speech in favour of the bill for the removal of Jewish disabilities. But it was in the debates that preceded the passing of the Reform Bill that his great powers as an orator were in reality first manifested. While devoting himself to parliament, 'rivaling Stanley in debate and Hume in the regularity of his attendance,' he discharged the duties first of Commissioner, and then of Secretary, to the Board of Control. At the same time he wrote steadily for the *Edinburgh Review*, and made almost as great a reputation as a conversationalist in society as he had already acquired as a parliamentary debater.

On the passing of the Reform Bill of 1832, Macaulay had exchanged Calne for Leeds. Mainly for the sake of his family he accepted the office of legal adviser to the Supreme Council of India, with a salary of £10,000 a year attached to it. Accompanied by his favourite sister Hannah, who in Dec. 1834 married Mr (afterwards Sir) C. Trevelyan, he sailed for Calcutta (by Madras), Feb. 15, 1834. In India he worked as hard as he had done in England. Besides discharging his duties as member of the Supreme Council, he acted as chairman of two committees—the committee of Public Instruction, and the committee appointed to prepare a Penal Code and a Code of Criminal Procedure. In the former capacity he drew up an elaborate minute, in which he successfully counselled the teaching of European literature and science to the natives of India. To Macaulay also must be assigned the lion's share of the great work performed in connection with the Indian Penal Code, of which Sir James Fitzjames Stephen has said: 'It is to the French Code Pénal, and I may add the North German Code of 1871, what a finished picture is to a sketch. It is far simpler and better expressed than Livingstone's Code of Louisiana, and its practical success has been complete.' For a time Macaulay was extremely unpopular with a section of the British population of Calcutta, owing to the active part he took in bringing about a judicial reform known as the Black Act, which withdrew from British subjects resident in the provinces of India the privilege of bringing civil appeals before the Supreme Court of Calcutta. During his stay in India he read enormously, and wrote for the *Edinburgh Review* his essays on Mackintosh and Bacon. In the beginning of 1838 he returned to England with the competence he had saved from his official salary.

After a pleasant tour in Italy, Macaulay returned to political life, though not without reluctance, as he was already laying the foundations of his great

historical work. In 1839 he was elected member for Edinburgh, and a few months later entered Lord Melbourne's cabinet as Secretary at War. His most important work at this time was the writing of *The Lays of Ancient Rome*, which had been partially inspired by his visit to Italy. Never has purely civic patriotism received a more spirited poetic rendering than in this volume. It appeared in 1842, and won an immense popularity. Next year he published his collected *Essays* in three volumes. While his party were in opposition, he delivered a number of weighty speeches in the House of Commons on subjects which interested him. By one of these he converted Sir Robert Peel, and indeed the majority of the House, to his views of copyright; in another he declared, 'Of all the institutions of the civilised world, the Established Church of Ireland seems to me the most absurd.' His connection with the *Edinburgh Review* ceased in 1845; he had now commenced his *History of England from the Accession of James II.* When Sir Robert Peel's administration fell in 1846, Macaulay took the office of Paymaster-general of the Forces, and was re-elected triumphantly for Edinburgh. A variety of circumstances, however, of which probably the support he had given in parliament to the Maynooth Grant, was the chief—led to his defeat at the general election of the following year.

Macaulay regarded this defeat as a signal for his retirement into private life. In 1852 he was again returned for Edinburgh without any exertion on his own part; but he made few speeches after his reappearance in parliament, and gave himself up almost entirely to his *History*. The first two volumes appeared in 1848, and at once attained a greater amount of popularity than had ever before fallen to the lot of a purely historical work (see LONGMAN). Next year he was elected Lord Rector of the university of Glasgow. He had a severe illness in 1852, and from this he never completely recovered. In 1855 the third and fourth volumes of his great work were given to the public, and were as cordially received as their predecessors. The following year he retired from the representation of Edinburgh. In 1856, also, he left the bachelor chambers he had occupied for fifteen years in the Albany, and took up his residence in Holly Lodge, Campden Hill, Kensington, where he lived till his death. In 1857 he was raised to the peerage under the title of Baron Macaulay of Rothley. In the same year he was elected a foreign associate of the French Academy of Moral and Political Sciences. Among other honours which came to him in his last years, and which he especially prized, was his nomination to the Prussian Order of Merit, and his election to the High Stewardship of the borough of Cambridge. While working steadily at his *History*, he found time to write for the *Encyclopædia Britannica* articles on Atterbury, Bunyan, Goldsmith, Samuel Johnson, and William Pitt. Though conscious that the ailment from which he suffered—weakness of the heart, complicated with asthma—would prove fatal, he took as keen an interest as before in the well-being of his relatives and in the fortunes of his country. The end came on the 28th December 1859; 'he died as he had always wished to die—without pain, without any formal farewell; preceding to the grave all whom he loved, and leaving behind him a great and honourable name, and the memory of a life, every action of which was as clear and transparent as one of his own sentences.' He was buried in Poet's Corner, Westminster Abbey, on 9th January 1860. The fragmentary fifth volume of his *History* which he left behind him was published in 1861.

The reputation of Macaulay is certainly not what

it was during his lifetime or immediately after his death. He has been convicted of historical inaccuracy, of sacrificing truth for the sake of epigram, of allowing personal dislike and party bias to distort his views of men and incidents. He looks too much at the mere material side of life. As a thinker he is deficient in balance, repose, inwardness, and modesty. In his writing there is far too much light and far too little shade; he not infrequently confounds the foaming hurry of his own words with the march of events; the splendour of his style sometimes degenerates into garishness; occasionally when he plays the censor, he almost sinks into insolent brutality. It must be admitted also that he was too declamatory to be accorded a place in the front rank either of poets or of historians. But as a narrator of events he has no rival, and hardly even a second; he is lucidity itself. The intellectual solidity and energy of Macaulay, the breadth and variety of his knowledge, the fervour and dignity of his patriotism—these remain untouched by posthumous criticism. And in his nephew's biography he stands revealed as the most affectionate and unselfish of relatives, loyal in his friendships, pure-minded as a child, generous, upright, and courageous. Of no public man, of no man of letters, can the nation be more whole-heartedly proud than of Macaulay.

The authoritative work on the life of Lord Macaulay is the *Life and Letters*—a most admirable biography—by his nephew, Sir George Otto Trevelyan, the first edition of which was published in 1876. A *Life* of his father by Viscountess Knutsford appeared in 1900. Of the innumerable estimates of Macaulay which have appeared since his death, Cotter Morison's Monograph in the 'English Men of Letters' series (1882), an essay by Lord Morley (*Critical Miscellanies*, 1886), and an elaborate study by Taine (*History of English Literature*, vol. ii. 1871) may be mentioned.

Macaw. See PARROT.

Macaw-tree, GREAT (*Acrocomia sclerocarpa*), a palm of the same tribe as the coconut, a native of the West Indies and of the warm parts of America. It is called *Macoya* in Guiana and *Macahuba* in Brazil. It is from 20 to 30 feet high, with pinnated leaves from 10 to 15 feet long. The fruit yields an oil of a yellow colour, of the consistence of butter, with a sweetish taste, and an odour of violets, used in the native regions of the tree as an emollient in painful affections of the joints, and extensively imported into Britain, where it is sometimes sold as *Palm Oil*, to be used in the manufacture of toilet-soaps.

Macbeth, hereditary *mormaer* or ruler of Moray, married Gruoch, granddaughter of Kenneth mac Dubh, king of Alban. In 1040 he slew Duncan, king of Scotia, near Elgin, and succeeded him on the throne, though to Thorfinn, the Norwegian earl of Orkney, he had to yield the region north and east of the Tay, and Cumbria and Lothian seem to have remained faithful to Duncan's infant sons. His seventeen years' reign is commemorated in the chronicles as a time of plenty. He granted lands to the Culdees of Lochleven 'with the utmost veneration and devotion'; and, alone of Scottish kings, he made a pilgrimage to Rome (1050), and there gave large alms to the poor. Malcolm Canmore, King Duncan's eldest son, had fled to England on his father's death; and in 1054 his uncle Siward, Earl of Northumbria, led an army into Scotland against Macbeth. A bloody but indecisive battle was fought near Scone; and it was not till three years later that Malcolm, making a fresh independent attempt, drove Macbeth into Aberdeenshire, and killed him at Lumphanan, 15th August 1057. Such practically is all that is known for certain of the 'liberal king,' as St Berchan styles Macbeth. The fables immortalised by Shake-

speare's genius have for pedigree Raphael Holinshed, out of Hector Boece, out of Boece's fertile fancy and Wyntoun. See Skene's *Celtic Scotland* (1876).

Maccabees, a word of uncertain meaning and origin, but the name Makkabi, originally given to Judas Maccabæus, is possibly connected with *Magqab*, 'hammer.' The founder of the Maccabean dynasty, Matithjahu, or Mattathias, a priest (not, as generally supposed, a high-priest, nor even of the family of high-priests), was the first who made a stand against the persecutions of the Jewish nation and creed by Antiochus Epiphanes. He and his family were called Hasmoneans (Gr. *Asamonaioi*). At the beginning of the troubles he had retired, together with his five sons, Jochanan, Simon, Jehudah (Makkabi), Eleazar, and Jonathan, to Modiin, a small place between Jerusalem and Joppa, to mourn in solitude over the desolation of the holy city and the desecration of the Temple. But the Syrians pursued him thither. He being a person of importance, Apelles, a Syrian captain, endeavoured to induce him, by tempting promises, to relinquish his faith, and to embrace the Greek religion. He answered by slaying with his own hand the first renegade Jew who approached the altar of idolatry. This gave the sign for a sudden outbreak. His sons, together with a handful of faithful men, rose against the national foe, destroyed all traces of heathen worship, and fled into the wilderness of Judah. Their number soon increased; and not long after, they were able to make descents into the adjacent villages and cities, where they circumcised the children, and restored everywhere the ancient religion of Jehovah. At the death of Mattathias (166 B.C.), which took place a few years after, Judas Makkabi (166-161 B.C.) took the command of the patriots, and repulsed the enemy, notwithstanding his superior force, at Mizpah, Bethsur, and other places, reconquered Jerusalem, purified the Temple, and inaugurated the holy service (164 B.C.). Having further concluded an alliance with the Romans, he fell in battle against Bacchides (161 B.C.). His brother Jonathan, who succeeded him in the leadership, renewed the Roman alliance, and taking advantage of certain disputes about the Syrian throne, rendered vacant by the death of Antiochus, acquired the dignity of high-priest. But Tryphon, the guardian of the young Prince Antiochus Theos, fearing his influence, invited him to Ptolemais, and had him there treacherously executed. Simon, the second brother, was elected by the Jewish commonwealth to assume the reins of the national government, and was formally recognised both by Demetrius, Tryphon's antagonist, and by the Romans as 'chief and ruler of the Jews.' He completely re-established the independence of the nation, and the year after his succession (141 B.C.) was made the starting-point of a new era. The almost absolute power in his hands he used with wise moderation; justice and righteousness flourished in his days, and 'Judah prospered as of old.' But not long (seven years) after his accession to the supremacy, he was foully murdered (136 B.C.) by his own son-in-law, Ptolemy, who vainly hoped to succeed him. For the subsequent history of this family, see JEWS, HYRCANUS, and HEROD. The Feast of the Maccabees—i.e. both of the sons of Mattathias, and of the seven martyr children (2 Macc. vii.)—is found in the Roman martyrology under the date of the first of August. See De Sauloy, *Histoire des Machabées* (1880); Ewald, and Schürer.

Maccabees, BOOKS OF. Two books of this name are recognised as canonical by the Church of Rome, and enumerated in the articles of the Church of England among those apocrypha which

'the church doth read for example of life and instruction of manners, yet doth not apply to establish any doctrine.'

1 *Maccabees*, by far the more important of the two, after a rapid account of the conquests of Alexander the Great and the distribution of his dominions among his successors (i. 1-9), goes on to describe the Hellenising policy of Antiochus Epiphanes towards the Jews and its baneful effects (i. 10-64). Chapter ii. gives the genealogy of the Maccabean family and an account of the efforts of the aged Mattathias to rouse the spirit of active resistance among his countrymen (168 B.C.). The rest of the book falls into three main divisions, relating respectively to Judas (iii. 1-ix. 22), Jonathan (ix. 23-xii. 53), and Simon (xiii. 1-xvi. 18), the sons of Mattathias, and concludes with a brief mention of the accession of John Hyrcanus, referring for details to 'the chronicles of his priesthood' (xvi. 19-24). The work as we now possess it is the Greek translation of a Hebrew original, which was still extant in Jerome's time. According to Origen its Hebrew title was *Sarbeth Sabaniel* (meaning, perhaps, 'the prince of the house which God built up'). The date of its original composition cannot have been much (if at all) earlier than 106 B.C. (the last year of Hyrcanus), nor later than 64 B.C., at which time the relations of the Jews with the Romans changed so greatly for the worse. The author was plainly a Hebrew-speaking Jew, well acquainted with the topography of Palestine, who, if he had not actually witnessed or taken part in some of the transactions he describes, had at least conversed with those who had, and been at pains to make himself acquainted with the authentic oral traditions regarding them. He also had access to written documents, some of them of a public and official character. In spite of some inaccuracies and exaggerations he is entitled to high rank as a sober, painstaking, and trustworthy historian. The date of the Greek translation cannot be determined, but it was probably made very soon after the appearance of the original. 1 *Maccabees* was translated by Luther, who speaks of it as almost on a level with the canonical books, and hardly unworthy to be reckoned among them.

2 *Maccabees* opens with two letters (i. 1-10a and i. 10b-ii. 18), purporting to be addressed by the Jewish authorities in Jerusalem to their brethren in Egypt, urging them to the regular observance of the Feast of the Dedication. The second and longer of the two contains much legendary and fabulous matter about Jeremiah and Nehemiah, and on the internal evidence generally it seems certain that both must be regarded as spurious. The reference in these letters to the wars of liberation leads the author of the book to speak of Judas Maccabæus, and to introduce himself as the epitomist of the five books of Jason of Cyrene on this theme. Who Jason of Cyrene was, or at what date he lived, is not known; he wrote in Greek, at some distance, both in place and in time it would seem, from the events he describes. He does not appear to have been acquainted with 1 *Maccabees*. The date of his epitomist is also uncertain; all that can be said is that he most probably wrote somewhere about 100 B.C. In numerous instances the statements of 2 *Maccabees* do not admit of reconciliation with those of 1 *Maccabees*, and the result of critical examination is in every case in favour of the latter. It is evident that the epitomist, at least, if not also Jason himself, was comparatively indifferent to rigid accuracy in historical detail; he writes mainly with a didactic purpose, and seeks at every point to give prominence to supernatural interventions on behalf of the chosen nation.

Besides the above comparatively well-known

writings, there occur in certain MSS. of the Septuagint two other books known also by the name of *Maccabees*, though called so only in a loose sense.

3 *Maccabees*, in seven chapters, relates two occurrences in the reign (222-205 B.C.) of Ptolemy IV. Philopator—his attempt to desecrate the Temple, which was miraculously defeated through the prayers of Simon the high-priest, and the frustration of his vindictive scheme to destroy all his Jewish subjects, whom he had caused to be gathered together in the circus at Alexandria. The narrative is in many parts obviously fabulous, and at every point is without historical confirmation.

4 *Maccabees*, as its original title, 'On the Sovereignty of Reason' implies, is a discourse on the sovereignty of pious reason over the passions (i. 1-iii. 18); to this are appended numerous illustrations from the time of the *Maccabees* (iii. 19-xviii. 23). The second and larger portion may possibly have been based on the work of Jason of Cyrene (see above); the work as a whole is of a hortatory character, and the suggestion has been made that it was originally a synagogue sermon. Of the author nothing is known except that he was a sincere Jew, well read in Greek philosophy, and especially in that of the Stoics.

A fifth book of *Maccabees*, in Arabic, is printed in the Paris and London polyglots. It gives a summary of Jewish history from 180 B.C. to the close of the reign of Herod the Great, but has no independent value (See *Ency. Biblica*, col. 2868 [3]).

The most recent translation with introduction and commentary is that of books i.-iv. by Oesterley, Moffatt, Emmet, and Townshend respectively in *Apocrypha and Pseudepigrapha*, ed. by R. H. Charles (1913).

Maccaluba, a small mud volcano, 138 feet in height, situated 6 miles N. of Girgenti in Sicily. The sides are studded with numerous small cones, which usually emit hydrogen, and occasionally mud and stones, often sending them to a great height.

MacCarthy, DENIS FLORENCE, an Irish poet, was born in Dublin, 26th May 1817. He became known as one of the young poets of that famous newspaper, the *Nation*, founded by Charles Duffy in 1842, and his collected *Ballads, Poems, and Lyrics* appeared in 1850. His 'Bell-Founder,' 'Voyage of St Brendan,' 'Foray of Con O'Donnell,' and the 'Pillar Towers of Ireland,' quickly carried his fame over the land as well as to Irishmen beyond the sea. Shelley's translations from Calderon attracted him to Spanish, and in 1853 he published six of Calderon's dramas translated in the metres of the original, and further instalments followed in 1861, 1867, 1870, and 1873, earning the praises of Ticknor and Longfellow, and in 1881 a medal from the Royal Academy of Spain. In 1872 appeared *Shelley's Early Life*, and in 1879 he wrote the ode for the Moore centenary. For some years MacCarthy suffered from heart disease, and he died at Blackrock, near Dublin, April 7, 1882. A collected edition of his poems appeared in 1884.

MacCarthy, JUSTIN, a brilliant journalist and novelist, was born in Cork, 22d November 1830. He became attached to the staff of the *Northern Times*, Liverpool, in 1853, and in 1860 entered the reporters' gallery of the House of Commons for the *Morning Star*, becoming its foreign editor the following autumn and chief editor three years later. He resigned his post in 1868, and devoted the next three years to an unusually complete tour of the United States, in which he visited as many as thirty-five of the thirty-seven states. Soon after his return he became connected with the *Daily News*, but he also contributed among other magazines to the *London*, the *Westminster*, and the *Fortnightly Reviews*. He entered the House of Commons in 1879 as member for Longford, and

was leader of the main wing of the Irish Home-Rule party ('Anti-Parnellite') from the deposition of Mr Parnell (q.v.) till 1896, when he resigned the post. Of his novels the best known are *Paul Massie* (1886), *The Waterdale Neighbours* (1867), *My Enemy's Daughter* (1869), *Lady Judith* (1871), *A Fair Saxon* (1873), *Linley Rochford* (1874), *Dear Lady Disdain* (1875), *Miss Misanthrope* (1877), *Donna Quixote* (1879), *The Comet of a Season* (1881), *Maid of Athens* (1883), *Camisola* (1885), and *The Right Honourable*, with Mrs Campbell Praed (1886). Among his other works are *Modern Leaders* (1872); *A History of our Own Times, from the Accession of Queen Victoria* (7 vols. 1879-1905); *The Epoch of Reform* (1882); *History of the Four Georges and William IV.* (4 vols.); *The Reign of Queen Anne*; books on George Sand, Peel, Gladstone, and Pope Leo XIII.; and several volumes of autobiographical reminiscences (1899-1911). He died 24th April 1912.—His son, JUSTIN HUNTLY MCCARTHY, born in 1860, is also known as a dramatist, novelist, and historian.

M'Cheyne, ROBERT MURRAY, who has been called 'the George Whitefield of Scotland,' was born at Edinburgh on 21st May 1813, educated at the High School and university of his native town, and licensed as assistant preacher in Larbert and Dunipace in 1835. The scene of his life-work was, however, Dundee; he was elected minister of the new church of St Peter's there in 1836, and laboured in the same parish until his death, on 25th March 1843. In 1839 he visited Palestine as one of a mission of four ministers sent out by the Church of Scotland to inquire into the condition of the Jews, and on his return published, in conjunction with A. A. Bonar, *Narrative of a Mission of Enquiry to the Jews* (1839). He died on the very eve of the Disruption; had he lived he would certainly have thrown in his lot with the party of his former tutors, Dr Chalmers and Dr Welsh. Besides being an eloquent preacher, a man of saintly piety, and a most exemplary parish minister, M'Cheyne wrote hymns and published sermons, both of considerable merit. See his *Remains* (*Letters, Sermons, &c.*), with a Memoir by A. A. Bonar (1848), and his *Life* by J. C. Smith (1910). His *Complete Works* appeared at New York in 2 vols. in 1847.

Macchia, an Italian word adopted by botanists for what in Corsica is called *maquis*, in Spain *monte bajo*, in Portugal *mattos*, the bush-forest consisting of species that once formed the underwood in destroyed forests. Such macchie are composed of various rock-roses (*Cistus*), *laurustinus* (*Viburnum Tinus*), tree-heather (*Erica arborea*), strawberry trees (*Arbutus Unedo*), mastix bushes (*Pistacia Lentiscus*), wild olive trees (*Olea europæa*, var. *Oleaster*), myrtles (*Myrtus communis*), holm oaks (*Quercus Ilex*), and divers other plants, all so intertwined that only with the bush-knife can a path be cut through it. The macchie, which are in some respects like the Californian chaparral, cover in many parts immense districts and formed splendid hiding-places for banditti. *Andare nella macchia* was a euphemism for 'becoming a bandit.'

Macchiavelli. See MACHIAVELLI.

McClellan, GEORGE BRINTON, an American general, was born at Philadelphia, 3d December 1826, graduated at West Point with 'Stonewall' Jackson and others in 1846, and served with the engineers through the Mexican war, where repeated gallantry in action gained him a captain's brevet. He was afterwards employed as an instructor at West Point and on engineer duty in Texas, Oregon, and Washington, and in 1855 was one of three American officers sent to observe the campaign in

the Crimea. In 1857 he resigned his commission, and engaged in railroad business until the outbreak of the Civil War in 1861. In April he was appointed major-general of Ohio volunteers, and in May a major-general in the United States army. By the middle of July he had driven the enemy out of West Virginia, which entered the Union as a separate state the year after. McClellan was now called to Washington to reorganise the Army of the Potomac, which was made up of either raw recruits or regiments fresh from the defeat of Bull Run; of these he received the command in August, and in November he was made commander-in-chief. But the authorities at Washington were too nervous to rest content with so slow and careful an organiser as McClellan; and when, in April 1862, he landed at Old Point Comfort, for the invasion of Virginia by the peninsula of the James River, he had already been deprived of the command-in-chief. His peninsular campaign lasted till July, and ended disastrously, partly from want of support, and partly from over-caution. He advanced near to Richmond, but was compelled to retreat, fighting the 'seven days' battles' (June 25 to July 1) as he did so, and finally to evacuate the peninsula. After the disastrous second battle of Bull Run (August 29-30), which was followed by a Confederate invasion of Maryland, he was reinstated (informally it would seem) in the chief command, and, reorganising the army at Washington, marched rapidly north, met the forces of General Lee at Antietam (q.v.), and compelled him to recross the Potomac. This short campaign was McClellan's most brilliant achievement, but he undoubtedly failed to pursue his advantage as rapidly as he should. He followed the Confederates into Virginia, but with too great deliberation for the taste of the impatient cabinet, and in November he was superseded by General Burnside (q.v.). Here his share in the war ended. In 1864 he resigned his commission, and unsuccessfully opposed Lincoln (q.v.) for the presidency. He was then in Europe till 1868, and in 1877 was elected governor of New Jersey. He died at Orange, New Jersey, 29th October 1885. McClellan was the idol of his soldiers, and deserved their love by his care for them. See his *Report on the Organisation and Campaigns of the Army of the Potomac* (1864); *McClellan's Own Story*, edited by Prime (1886); and *Life* (1901) by Michie.

Macclesfield, a municipal borough and important manufacturing town of Cheshire, pleasantly situated on the river Bollin, and on the western declivity of a range of low hills, 15 miles SSE. of Manchester and 167 NW. of London. Among its buildings are a ruined castle (c. 1400), the fine old church of St Michael, founded by Queen Eleanor in 1278 and restored in 1901, the town-hall (1823-70), the infirmary (1872), and the grammar-school (1502), re-endowed by Edward VI., rebuilt in 1855, with a new school added in 1915. Macclesfield has three public parks, public baths, a free library, a museum, a technical and science school, a school of art, and a county girls' high school. The old button trade belongs to the past; and the silk manufacture, established in 1756, is now the staple, the place indeed being the centre of the English silk industry; knitting (silk, wool, cotton), slipper-making, dyeing, and brewing are also important. In the neighbourhood coal, slate, and stone are got. Macclesfield, which has nine (possibly ten) charters (the earliest extant by Prince Edward, Earl of Chester, in 1261), was besieged and captured by the Parliamentary forces during the Civil War, and was visited by Prince Charles during the 'Forty-five. It returned two members to parliament from 1832, was disfranchised for bribery in 1880, and in 1885 was merged in the county

division of Macclesfield. Pop. (1851) 39,048; (1901) 34,624; (1921) 33,846.

M'Clure, SIR ROBERT JOHN LE MESURIER, the discoverer of the North-west Passage, was born at Wexford, 28th January 1807, and entered the navy in 1824, served in Back's Arctic Expedition in 1836, and Ross's Franklin Expedition in 1848. As commander of another Franklin Expedition (1850-54) he passed in a sledge from Barrow Strait, where his ship, the *Investigator*, lay, to Melville Sound, connecting with the Arctic Ocean to the west. M'Clure was rescued by another expedition, made K.C.B., and after serving in Chinese waters, an admiral. He died 17th October 1873. See POLAR EXPLORATION and works there cited.

MacCossair, LIAM. See COSGRAVE.

M'Cosh, JAMES (1811-94), a voluminous defender of Scottish philosophy, was born at Carskeoch, Ayrshire, 1st April 1811. After studying at Glasgow and Edinburgh he became a minister of the Church of Scotland, and was settled at Arbroath in 1835. In 1839 he removed to Brechin, and at the Disruption cast in his lot with the Free Church. In 1851 he was appointed professor of Logic and Metaphysics in Queen's College, Belfast, a position which he held till 1868, when he was called to the presidency of Princeton, which he resigned in 1888 to devote the close of his life more exclusively to philosophical production. *The Method of the Divine Government* (1850) was followed in 1860 by *The Intuitions of the Mind inductively investigated*. His *Examination of Mr J. S. Mill's Philosophy* (1866) is entitled 'a defence of fundamental truth.' M'Cosh defended what he considered the Natural Realism of Reid against both the empirical school and the relativistic views of Kant, Hamilton, and Mansel; and maintained the older intuitionist view against the associationists and evolutionists on the one hand and the transcendentalists on the other. In 1875 he published a useful history of *The Scottish Philosophy*, and in 1890 *The Religious Aspect of Evolution*. A series of philosophical tracts was collected as *Realistic Philosophy* (2 vols. 1887). See Life edited by Sloane (1896).

M'Crie, THOMAS, a learned Scottish historian and divine, was born at Duns in November 1772, studied at the university of Edinburgh, and was ordained in 1795 pastor of an Anti-burgher congregation in that city. There he died, 5th August 1835. M'Crie's works are in the highest degree valuable to the student of Scottish ecclesiastical history. They exhibit research at once vast and minute, and though they are essentially apologetic, yet their author is never consciously unfair, and does not misstate facts. He shows, however, such admirable skill in finding palliation even for the less defensible acts of the Reformers, and so warm a zeal for Presbyterianism, that the impartial Hallam described his spirit as 'Presbyterian Hildebrandism.' He attacked Sir Walter Scott's account of the Covenanters in *Old Mortality* in three trenchant papers in the *Edinburgh Christian Instructor*, and most unprejudiced readers were compelled to admit that he had the best of the controversy. He is described in *My Schools and Schoolmasters*. His best-known works are *The Life of John Knox* (1812), which procured him the first degree of doctor of divinity to be conferred on a Scottish dissenting minister, *The Life of Andrew Melville* (1819), and the less satisfactory *History of the Progress and Suppression of the Reformation in Spain* (1829). His works were collected in 4 vols. (1855-56), and a Life was published in 1840 by his son, Thomas M'Crie.

M'ulloch, HORATIO, Scottish landscape-painter, was born in Glasgow in 1805. He ex-

hibited for the first time in 1829; in 1836 he was elected an A.R.S.A., and in 1838 an R.S.A., when he removed to Edinburgh. Here he lived till his death on 24th June 1867. He painted Highland landscapes with unrivalled truth, breadth, and imagination, among his principal pictures being 'Highland Loch,' 'Loch-an-Eilan,' 'View in Cadzow Forest,' 'Dream of the Forest,' 'Misty Corries,' 'Deer Forest, Isle of Skye,' 'Loch Achray,' 'Mist rising off the Mountains,' 'Kilchurn Castle,' and 'Bothwell Castle.'

MacCulloch, JOHN (1773-1835), geologist, born in Guernsey of a Scottish family, studied medicine at Edinburgh, was assistant-surgeon to an artillery regiment, was employed by government in geological researches in Scotland, in 1820 was appointed physician to Prince Leopold of Saxe-Coburg, and was ultimately professor of Chemistry and Geology at Addiscombe. His death was caused by a carriage accident. Among his works are a *Description of the Western Islands of Scotland* (1819), *A Geological Classification of Rocks* (1821), *A System of Geology* (1831), besides books on malaria and remittent fevers.

M'Culloch, JOHN RAMSAY (1789-1864), political economist, was born at Whithorn in Wigtownshire. At first a clerk in a lawyer's office, he became known in Edinburgh in connection with the *Scotsman* newspaper (of which he was editor in 1818-19), and by his economic articles in the *Edinburgh Review*. In 1828 he was appointed professor of Political Economy in University College, London, and in 1838 Comptroller of H.M. Stationery Office. His publications comprise *The Principles of Political Economy* (1820), *The Literature of Political Economy* (1845); besides books on wages, taxation, and partnership, a dictionary of commerce, a geographical and statistical dictionary, and a *Statistical Account of the British Empire* (1837). Peel gave him a pension of £200 a year. For Life see 1869 edition of the *Dictionary of Commerce*.

MacCunn, HAMISH (1868-1916), composer, was born in Greenock. After study under local teachers, in 1883 he won a scholarship at the Royal College of Music. In 1888-94 he was professor of Harmony at the Royal Academy of Music. He was afterwards conductor with various opera companies. His overture, *Land of the Mountain and the Flood*, founded on Scottish themes, was produced in 1887, and thereafter he was regarded as one of the most promising composers of the day. His works embrace other overtures, *Cior Mohr*, produced at Glasgow, 1887, and *The Dowie Dens of Yarrow*; choral works, including *The Lay of the Last Minstrel*; many songs; and the operas *Jeanie Deans* (1894) and *Diarmid* (1897; libretto by the ninth Duke of Argyll). Possessing fertility in melody and a remarkable mastery of the orchestra, he was a pronounced upholder of nationality in music, and his works are distinctly Scottish in character.

Macdonald, ÉTIENNE JACQUES JOSEPH ALEX-ANDRE, was born 17th November 1765 at Sedan, his father, a schoolmaster (born in South Uist, educated at Douai), who followed Prince Charlie to France, being of the stock to which Flora Macdonald also belonged. He entered the army in 1784 and, embracing the cause of the Revolution, rapidly rose to high rank; he distinguished himself at Jemappes, and by the capture of the Dutch fleet (1795) after crossing the ice. In 1798 he was made governor of the Roman States, and, having routed the army of the king of Naples at Otricoli, he completed the subjugation of that kingdom. In the following year he marched to North Italy, to check the inroad of Suwaroff, who, however, de-

feated him after a three days' bloody contest on the Trebbia. In 1800 and 1801 he commanded the army of reserve in Switzerland and marched across the Splügen. But in 1805 he lost the favour of Bonaparte by his support of Moreau. Four years later the emperor, hard pressed, summoned Macdonald to command the right wing of the army of Italy. He took Laibach, and distinguished himself at Wagram, and was created marshal and Duke of Taranto. He held a command in Spain in 1810, and in the Russian campaign; and in 1813 he contributed to the successes of Lützen and Bautzen, but was utterly routed by Blücher at the Katzbach. After the battle of Leipzig he helped to cover the retreat of the French army. In the subsequent struggles on French ground Macdonald made desperate efforts to face the enemies of Napoleon; but, seeing that further resistance was hopeless, he advised the emperor to abdicate. The Bourbons made him a peer, and gave him the command of a military division; but he refused to serve during the Hundred Days. From 1816 he was Chancellor of the Legion of Honour, and took an active part in the discussions of the Chamber of Peers. He died at Courcelles, Loire, 25th September 1840. See his *Souvenirs* (1892; trans. 1892).

Macdonald, FLORA, 'a name,' said Dr Johnson, 'that will be mentioned in history, and, if courage and fidelity are virtues, mentioned with honour.' Born in 1722 at Milton in South Uist, she lost her father, a tacksman, at two; and her mother four years later was abducted to Skye by Hugh Macdonald of Arnadale. Flora stayed behind in Uist with her only surviving brother, Angus, and at thirteen was practically adopted by Lady Clanranald, the wife of the chief of the clan. To this Flora owed her gentle upbringing, her three years' schooling at Edinburgh. She had not long returned to the Hebrides when the rebellion of the '45 broke out; and in June 1746, ten weeks after Culloden, she conducted Prince Charles Edward, disguised as 'Betty Burke, the Irish woman,' from Ormiclade in Benbecula to Monkstadt in Skye, and thence by way of Kingsburgh to Portree. That she was in love with the 'young hero' is absolutely false—she was not even a Jacobite; but those three short perilous days endeared her to more than Jacobites, and she was much fêted during her twelvemonth's captivity on the troopship in Leith Roads and at London. In 1750 she married the son of Macdonald of Kingsburgh, and at Kingsburgh in 1773 she entertained Dr Johnson, who describes her as 'of middle stature, soft features, gentle manners, and elegant presence.' In 1774 her husband emigrated to North Carolina, and in 1776, on the outbreak of the war of independence, he became a brigadier-general (his five sons, too, were all British officers). He himself was made prisoner; and Flora, returning to Scotland in 1779 with her younger daughter, got her arm broken during the voyage in a fight with a French privateer. After two years at Milton, she was rejoined by her husband, and they settled again at Kingsburgh; but it was at Peinduin, a neighbour's house, that she died on 5th March 1790. Shrouded in a sheet that had wrapped Prince Charles Edward, she was buried at Kilmuir, in a grave now marked by an Iona cross (1880) of Aberdeen granite, 28½ feet high.

The so-called *Autobiography of Flora Macdonald* (2 vols. 1869) is a silly forgery; but reference may be made to *Flora Macdonald and Prince Charles*, by the Rev. Alexander MacGregor (1882), and to *Flora Macdonald in Uist*, by W. Jolly (1886).

Macdonald, GEORGE, a Scottish poet and novelist, born at Huntly, Aberdeenshire, in 1824, educated at Aberdeen University and the theo-

logical college of the Congregationalists at High-bury. He became minister at Arundel in Sussex, and afterwards at Manchester, but was compelled by the state of his health to give up preaching. A short residence in Algiers restored him to comparative vigour, and, returning to London, he took to literature as a profession. His first book, *Within and Without*, a poem, appeared in 1856, and was followed by *Poems* (1857), and *Phantastes, a Faerie Romance* (1858), a poem as irregular as *Kilmeny*, and almost as full of beauty and power. A long series of novels followed, including *David Elginbrod* (1862); *The Portent* (1864); *Alec Forbes of Howglen* (1865); *Annals of a Quiet Neighbourhood* (1866); *Guild Court* (1867); *The Seaboard Parish* (1868); *Robert Falconer* (1868); *Wilfrid Cumbermede* (1871); *Malcolm* (1874); *St George and St Michael* (1875); *Thomas Wingfold, Curate* (1876); *The Marquis of Lossie* (1877); *Sir Gibbie* (1879); *What's Mine's Mine* (1886); *Lilith* (1895); and *Salted with Fire* (1897). Almost all these novels contain passages of singular beauty, and are lightened up by fine fancy and descriptive power, but they are badly constructed and defective in harmony as works of art. They reveal the deep spiritual instincts of their author in his reaction against Calvinism, as well as the nebulosity of his mental atmosphere and his inability for sustained thought. The dialect is that of Aberdeen and the north-eastern counties, and sounds feeble to the ear after the classic vigour of the language of Burns and Scott. He had also published books for the young: *Dealings with the Fairies* (1867), *Ranald Bannerman's Boyhood* (1869), *At the Back of the North Wind* (1870), and *The Princess and the Goblin* (1871); besides religious works: *Unspoken Sermons* (3 series, 1866-89), and *The Miracles of Our Lord* (1870). Familiar also as a famous lecturer, at home and in America, in 1877 he received a Civil List pension of £100. Long in ill-health, he died 18th September 1905. See *Life* by his son Dr Greville Macdonald (1924).

MacDonald, JAMES RAMSAY, the first Socialist prime-minister of Great Britain, was born at Lossiemouth, 12th October 1866, and educated at the board school there, becoming a pupil-teacher. In London, from the age of eighteen, he studied science, and was a clerk, a journalist, and secretary to a Radical candidate. Already a keen worker for socialism and trade-unionism when the Independent Labour Party was founded, he soon became one of its most brilliant members. From 1900 to 1911 he was secretary of the Labour Party; from 1901 to 1904 a member of London County Council. In this part of his career he had the help and inspiration of his wife, Margaret Ethel Gladstone (daughter of the chemist, Dr J. H. Gladstone, F.R.S.), whom he married in 1896. She died in 1911. In 1906 he entered parliament as Labour member for Leicester, and showed himself not merely a great speaker but a master of parliamentary business, and an expert in foreign affairs. Chairman of the Labour Party from 1911, he resigned on Britain's entry into the Great War, to which he was opposed. Pacifism brought him obloquy. The National Seamen's and Firemen's Union refused him shipping to Russia; the authorities refused him a passport to Stockholm. In 1918 he lost his seat. 1922 saw him member for Aberavon, chairman once more, and therefore, in the new distribution of party strength, leader of the opposition. In December 1923 the country declared against Mr Baldwin's protection policy, and Mr MacDonald thus naturally became prime-minister (January 1924), though the Unionists were still the strongest party. His government abolished the McKenna duties on imports (imposed first in 1915), and dealt with housing, unemployment insurance, old age pensions,

agricultural wages, &c., but a minority at the mercy of the Liberals could not carry any thoroughgoing Socialist measures. As Foreign Secretary Mr MacDonald enhanced the prestige of the League of Nations by attending its assembly at Geneva. He succeeded in improving relations with France and Germany; and he recognised the Soviet government in Russia. His treaty with Russia, however, was not ratified. Defeated in the House of Commons on a Liberal amendment in connection with the withdrawal of prosecution against a Communist editor, the government obtained a dissolution, and was defeated in the general election of October 1924, when Mr Baldwin returned to office. Besides a Life of his wife (1912), Mr MacDonald has written several books on socialism, and on India. He has travelled widely.

Macdonald, Sir John Alexander, Canadian statesman, was born in Glasgow, 11th January 1815, and with his parents emigrated five years later to Canada. He was educated at Kingston, called to the bar in 1836, and appointed a Q.C. in 1846. He represented Kingston in the Canada Assembly from 1844 till the union of the provinces in 1867, and in the Dominion parliament till 1878, when he was defeated; but he afterwards sat for Victoria, British Columbia, and for Carleton and Lennox, and was again returned by his old constituency in 1887. Before the union he had been Receiver-general in 1847, Commissioner of Crown-lands in 1847-48, Attorney-general for Upper Canada in 1854-58, succeeding Sir Allan Macnab as leader of the Conservatives and premier in 1856, and again Attorney-general in 1858-62 and 1864-67. On 1st July 1867, when the new constitution came into force, he was called upon to form the first government for the new Dominion, and was minister of Justice and Attorney-general of Canada until he and his cabinet resigned in 1873. He was again returned to power in 1878, and was successful in the elections of 1882 and 1887. In 1878 his success was owing to the adoption of a policy of protection for native industries, which discriminates against the productions of all other countries, not even excepting Great Britain. Sir John was mainly instrumental in bringing about the confederation of the British North American provinces, and in securing the construction of the Intercolonial and Pacific railways; and he was a pioneer of imperial unity. In 1871 he was appointed one of the British Commissioners for the settlement of the *Alabama* claims. He was made a privy-councillor in 1872, K.C.B. in 1867, and G.C.B. in 1884, and received honours from Oxford and the Canadian universities. He died 6th June 1891. His widow was made a peeress of the United Kingdom, and his bust was erected in Westminster Abbey in 1892. See *Lives* by Pope (1894) and Parkin (1909).

MacDowell, Edward Alexander (1861-1908), an American composer who, after an education in America and in Germany and France lasting till 1888, settled in Boston. In 1896 he became professor of Music at Columbia University, New York, a post which he held until 1904, when, largely owing to overwork, he was compelled to resign. Orchestral suites, such as *Indian Suites* (1896), and pianoforte pieces full of imaginative charm and delicacy place him in the forefront of American composers. His work shows how deeply he was influenced by his European training.

Macduff. See *BANFF*.

Mace, a thick, heavy club or staff, almost 5 feet long, surmounted by a metal head, frequently spiked, which was used by knights and warlike churchmen in the middle ages. The ornamental maces of parliament, the universities, and city

corporations, borne as an ensign of authority, may be traced to the 12th and 13th centuries, when princes armed their guards with spikeless maces as the handiest against the sudden attacks of the Assassins (q.v.). The need passed away, but the maces remained as symbols of rank. The House of Commons has possessed three maces. The first disappeared after the execution of Charles I. The second was the 'bauble' that Cromwell had removed: it has been claimed that a mace preserved in the museum at Kingston, Jamaica, is the same. The sergeant-at-arms at the close of the session hands over the mace to an official of the crown, getting a receipt for it; it is kept under lock and key till the House meets again. In the congress of the United States the sergeant-at-arms has a silver mace. The Lord Mayor's mace, of silver gilt, and weighing nearly a quarter of a hundred-weight, dates from 1735.

Mace, the Aril (q.v.) or inner covering of the Nutmeg (q.v.). It is a lacerated membrane, blood-red when fresh, varying in length according to the variety. There are two varieties of nutmeg cultivated, one named 'Royal,' the other 'Green.' The former bears the longer and finer quality of mace. The mace is removed from the nutmeg and dried in the sun a few days, when it quickly loses its fine red colour and becomes light brown. It is then sprinkled with sea-water to preserve it and render it flexible, and is pressed flat, in which condition it is exported, chiefly from Penang and Singapore. Mace is the most aromatic part of the fruit, and yields both fixed and essential oils. The former, obtained by expression, is highly fragrant, of buttery consistence, and brown colour. It is powerfully stimulant, and in India is employed as a liniment and embrocation in rheumatism. The essential oil is extracted by distillation. It possesses the fragrance of mace, and is yellow in colour. Mace is a native of the Moluccas and neighbouring islands, but is cultivated in Java, Penang, Sumatra, Mauritius, and other parts of the East, and in Cayenne, and some of the West India Islands. The aril of other species of *Myristica* (Nutmeg) of inferior quality occasionally appears in commerce.

Macedonia, a region, anciently a kingdom, lying NW. of the Ægean Sea. Originally of small extent, it stretched at the period of its greatest area from the Hæmus (mod. Balkan) range on the N. to Thessaly and the Ægean on the S., and from Epirus and Illyria on the W. to Thrace on the E. The country is on the whole mountainous, especially in the south and west, but there are several large plains of great fertility. The principal rivers were the Strymon, Axios, and Haliacmon. See map at GREECE. Macedonia was famous for its gold and silver mines, and its oil and wine. It contained a number of flourishing cities, of which the names are well known in ancient history, particularly *Ægæ* (Edessa) and Pella, the capitals, Pydna, Thessalonica, Potidæa, Olynthos, Philippi, and Amphipolis. Perdicas I. (circa 700 B.C.) is reputed to have been the first king and founder of the Macedonian monarchy. In 490 B.C. and again ten years later Macedonia was compelled to take part with the Persians in their invasions of Greece. Under the wise and vigorous reign of Archelaus (413-399 B.C.), an admirer of Greek art and civilisation, Macedonia greatly increased in prosperity and power. But a period of civil wars and anarchy then ensued, and was only terminated by the accession of Philip II. (359 B.C.), who, having seated himself firmly on the throne, developed the resources of his kingdom, and laid the foundation of its future greatness (see GREECE). His son, Alexander III., surnamed the Great, brought half the then known world

under his sway; but after his death the Macedonian empire was broken up, and, after twenty-two years of incessant warfare, was formed into four kingdoms under his principal generals (see PHILIP and ALEXANDER). Macedonia, with Greece, fell to Antipater's son Cassander. But in the wars against the Gauls, the civil strifes of the descendants of Alexander's generals, and in the ambitious designs of Pyrrhus, king of Epirus, Macedonia almost perished as a kingdom. It was, however, once more established securely by Antigonus Gonatas (277-239), the grandson of Alexander's general Antigonus. Conquered by the Romans in 168 B.C., Macedonia was twenty-five years later made a Roman province, in which Thessaly and part of Illyria were included. On the partition of the Roman world, it was incorporated in the eastern empire. In the end of the 6th century it was settled by Slavonic races, and subsequently formed part of the kingdoms of the Bulgarians (10th century), Salonica, Thessalonica (1224), the Serbians (14th century), and the Turks (16th century to 1912-13). The population of the coast districts are Greeks, whilst in the interior Christian Bulgarians greatly preponderate. The agitation in Macedonia for reforms in government, and the brutal oppression of the Christians in 1902-3 by Albanians, secretly supported by the Turkish authorities, led to open revolution. In its suppression terrible atrocities were perpetrated by Turkish soldiers, whole villages were massacred, and a bloody vendetta kept up on both sides. Russia and Austria-Hungary, backed by the other powers, drafted a scheme of partial reform, and a body of European officers was appointed to the gendarmerie, but without materially improving the state of things. After the Balkan wars of 1912-13 Macedonia was divided between Greece and Serbia, Bulgaria being disappointed in her hope of a share by her defeat at the hands of her late allies. Considerable transferences of population have followed.

Macció, a port of Brazil, capital of Alagoas state, lies on a peninsula between the Lagoa do Norte and the sea; pop. 40,000.

Macerata, a town of Central Italy, on a hill 44 miles S. of Ancona, with a cathedral, university, and some manufactures; pop. 24,000.

Macfarren, SIR GEORGE ALEXANDER, was born in London 2d March 1813, and educated at the Royal Academy of Music, at which institution he became a professor in 1834. In 1875 he was appointed Principal of the Academy, and also professor of Music at Cambridge University. He died, blind, 31st October 1887, having been knighted in 1883. His earliest dramatic work, *The Devil's Opera*, was produced in 1838; *Don Quixote* followed in 1846, *King Charles II.* in 1849, *Robin Hood* in 1860, *Jessy Lea* in 1863, and *She Swoops to Conquer*, *The Soldier's Legacy*, and *Helvellyn* in 1864. His best cantatas were *Lenore* (1852), *May-day* (1856), *Christmas* (1860), and *The Lady of the Lake* (1877). He did not produce his first oratorio, *John the Baptist*, until 1873; it had for successors, *The Resurrection* (1876), *Joseph* (1877), and *David* (1883). Macfarren's works comprise numerous other small dramatic pieces, as well as chamber music, vocal and instrumental, and several symphonies and overtures. He stands higher, however, as a writer on the theory of music than as a composer. He was an enthusiastic advocate of the views of Alfred Day (1810-49) as laid down in that writer's *Treatise on Harmony* (1845), and for many years stood almost alone in his advocacy of it. As a decided conservative in music, Macfarren manifested little sympathy for such modern schools as Wagner's. He wrote *Rudiments of*

Harmony (1860; 13th ed. 1885), *Lectures on Harmony* (1867; 3d ed. 1882), *Counterpoint* (6th ed. 1886), *A Musical History* (1885), and *Addresses and Lectures* (1888); besides editing *Old English Ditties* (1857-80), *Moore's Irish Melodies* (1859), *Scottish Ditties* (1861-80), and the second edition of Day's *Treatise* (1886). See the Life by H. C. Banister (1891).

McGill, JAMES, philanthropist, was born in Glasgow, 6th October 1744, and died in Montreal, Canada, 19th December 1813. He emigrated to Canada before the American revolution, engaged for some time in the North-west fur trade, and, subsequently settling in Montreal, became a successful merchant there. He was for many years a member of the Lower Canada Assembly, and subsequently a member of the legislative and executive councils. He was noted for philanthropy. He bequeathed to the college in Montreal that bears his name property valued at £30,000 and £10,000 in money; but, in consequence of the increased value of land, these figures convey a very inadequate idea of the present value of his gift.

Macgillicuddy Reeks, a group of rugged mountains in Ireland, in County Kerry, rise from the western shores of the Lakes of Killarney, and cover an area of 28 sq. m. Carran-Tual, the loftiest peak, not only of the Reeks but in all Ireland, is 3414 feet in height. Caher, the next in altitude, reaches 3200 feet, and there are several others which exceed 2500 feet.

M'Gregor, ROBERT. See ROB ROY.

Machair'odus, a gigantic sabre-toothed tiger of the Pleistocene period, with canine teeth 6 or 8 inches long, and jagged at their edges like a fine saw. Its remains were found in Kent's Cavern (q.v.).

Machar, JAN SVATOPLUK, Czech writer of prose and verse, born in 1864.

Machiavelli, NICCOLO DI BERNARDO DEI, born of an ancient burgher family at Florence, in 1469, and a pupil of the celebrated scholar, Marcello Virgilio, was employed in public affairs from a very early age, and may be regarded as the literary representative of the political life of the important period to which he belongs. The years of his early manhood were passed amid the political troubles occasioned by the French invasion under Charles VIII. (1493), when the Medici fled from Florence, and the republic was proclaimed, and a new constitution formed under the influence of the great reformer, Savonarola. Machiavelli's first appearance in public life was in the year of his famous contemporary's fall from power, and execution. He was elected in June 1498 to a subordinate secretaryship in the department of 'I veci di Balìa'—i.e. the Ten chosen to direct the military and diplomatic affairs of the republican government. He was promoted in July of the same year to the chief-secretaryship under this same commission. This position, which, though honourable, was subordinate, he occupied until the fall of the republic in 1512. His immediate superior in office was Marcello Virgilio Adriani, a celebrated humanist, whose companionship is supposed to have stimulated in Machiavelli the enthusiasm for the study of the classics. It seems proved, however, that Machiavelli did not know Greek, and cannot be classed among the erudite of that cultured age. Machiavelli's duties were almost entirely diplomatic; he was employed in a great variety of missions, the instructions and correspondence connected with which may almost be said to contain the secret political history of Italy during his time. The culminating point of his reputation as a diplomatist was his mission to the great master of treachery and dissimulation, Caesar Borgia, Duke of Valentinois, commonly called 'Il Valentino,' in

1502, of which an account is preserved in fifty-two letters written during the course of the negotiation, unsurpassed in dramatic interest by any series of state-papers. In the complicated external relations which Florence had now assumed, Machiavelli is found in communication with all the great foreign powers, as he had hitherto been with the Italian principalities. Between 1500-11 he formed part of important missions, once to the German emperor Maximilian, and four times to France. His despatches during these journeys, and his treatises on the 'Affairs of France and Germany,' are full of a far-reaching insight into the causes and effects of the various characteristics he had seen and studied. The most important part which Machiavelli took in public affairs was his spirited attempt to raise a trained body of citizens able, without the aid of treacherous mercenaries, to defend their liberty against foreign invasion.

The sincere patriotism which ennoble his writings and his life filled him with forebodings for the fate of his country, and especially of his beloved native town, and inspired him to teach with fervour the only mode of reviving her ancient dignity and independence. On the restoration of the Medici in 1512, Machiavelli was involved in the downfall of his patron, the Gonfaloniere Soderini. He was arrested on a charge of conspiracy in 1513. On being put to the torture, he disclaimed all knowledge of the alleged conspiracy; but, although pardoned, in virtue of the amnesty ordered by Leo X., he was obliged for several years to withdraw from public life, during which period he devoted himself to literature. It was not till the death of the young Lorenzo de' Medici, in 1519, that Machiavelli began to recover favour. He was commissioned in that year by Leo X. to draw up his report on a reform of the state of Florence; and in 1521 and the following years he was officially employed in various diplomatic services and as historiographer. After the disastrous defeat of the French at Pavia (1525), Italy lay helpless before the advancing forces of the Emperor Charles V., whose ferocious soldiery, though nominally allies, sacked the rich and defenceless Italian towns in their power. Machiavelli used his failing energies, undermined by chronic disease, to rouse his fellow-citizens in their own defence, and in negotiations to avert from Florence the invading army on its way to Rome. In May 1527, on receiving the news of the sack of Rome and imprisonment of Pope Clement VII. (Giulio de' Medici), the Florentines again drove out the Medici rulers and proclaimed the republic. But Machiavelli found that he was to be allowed no part in the popular movement for liberty and for defence against the foreigner; his patriotism was doubted, and he was suspected of favouring the Medici. This bitter disappointment, added to his already feeble health, brought on an illness, of which he died on the 20th June of the same year. His death was accompanied by the usual ministrations of the church, for, though he had written much against clerical corruption and tyranny, he had never impugned, nor indeed even discussed, religious doctrine. He was interred in his family's burying-place in Santa Croce, but all exact record of the spot is lost, the family having become extinct as early as 1597.

Through misrepresentation and misunderstanding of his writings, his name became after his death hated, and his teachings were spoken of as almost diabolical, his earliest and most violent assailants being the clergy, and especially the Jesuits. Although his writings were several times partially published in a more or less garbled form, the first great edition was not issued until 1782; it was dedicated to Earl Cowper, who had had a leading part in encouraging the publication, as also in

promoting a public subscription for a monument to Machiavelli in Santa Croce. From that period until our own day his fame has steadily increased, and his pre-eminent position as the founder of political science is now assured.

Machiavelli's writings fill 6 vols. 4to (Florence, 1782), or 10 vols. 8vo. Besides his letters and state-papers, his historical writings also comprise *Florentine Histories*, extending from 1215 to 1492, with a fragmentary continuation to 1499; *Discourses on the First Decade of Titus Livius*; a *Life of Castruccio Castracani* (unfinished); a *History of the Affairs of Lucca*. His literary works comprise an imitation of the *Golden Ass* of Apuleius, an essay on the Italian language, and several minor compositions. He also wrote *Seven Books on the Art of War*, which has been much admired by the learned in military science. But the great source of his reputation, for good or for evil, is the celebrated book *De Principatibus*, or, as it has since been called, *Il Principe*. The main question discussed in this world-famed book is: How principalities may be governed and maintained. In resolving this question, various cases are supposed, for each of which appropriate rules, principles, and suggestions are laid down, and all are illustrated both by contemporary examples and by a wealth of historical learning which it is difficult to overrate. The 7th chapter, in which he details with evident admiration the system of Caesar Borgia, and the 18th, in which he discusses 'the duty of princes as to the obligation of keeping faith,' are perhaps those which have most contributed to draw upon the author the odious reputation of which his very name has become the symbol; but, in truth, these chapters are only more precise and more formal than the rest, from their heaping together statements which are elsewhere insinuated or supposed. The broad scheme of the book is everywhere the same—viz. that for the establishment and maintenance of authority all means may be resorted to, and that the worst and most treacherous acts of the ruler, however unlawful in themselves, are justified by the wickedness and treachery of the governed. Such being the moral of the book, a question has arisen as to the intention of the writer, and a favourite theory for a time prevailed, that *The Prince* was but a satire upon absolutism, and was designed to serve the cause of liberty, of which Machiavelli was an ardent friend, by making arbitrary power odious and contemptible. This theory, however, besides being utterly irreconcilable with the tone of the work, is completely disproved by a letter of Machiavelli to his friend Vettori (1513), which was discovered only in 1810, and which shows that *The Prince* was written by Machiavelli in all seriousness, in order to recommend himself to the Medici (for whose private perusal it was designed, and not for publication) as a master in the art of government. In his ardour for the liberation of Italy from the rule of foreigners, Machiavelli had become convinced that strong native governments, even though absolute, must be endured; and, having accepted that of the Medici for Florence, he was content to use all means for its security and consolidation. *The Prince* was published, after Machiavelli's death, at Rome, in 1532; and, if any doubt should be entertained as to the seriousness of the author, the book need only be compared with the commentary which is furnished by every page of his *Legazioni*, or the reports of his diplomatic missions, which are also contained in his collected works. Of the many criticisms and rejoinders to which *The Prince* has given occasion, the most remarkable is that of Frederick the Great, *Antimachiavelli, ou Examen du Prince de Machiavelli* (1740); and *The Prince* was condemned by Pope Clement VIII.

The comedies of Machiavelli form an epoch in the history of the Italian theatre, as he and his great contemporary, Ariosto, were the first to represent actual life and dialogue in their plays. Machiavelli's famous comedy, *La Mandragola*, full of biting humour and shameless indecency, is a master piece of dramatic art.

Among the many noted historians who have discussed the work and morality of Machiavelli, we may note Macaulay's brilliant essay, and in the more modern style of historical criticism Leopold Ranke's study in *Zur Kritik neuerer Geschichtsschreiber*. The most complete and remarkable work on Machiavelli is that by P. Villari, *Niccolo Machiavelli e i suoi tempi* (1871-82; Eng. trans. 1892). Tommasini's *Vita e Scritti di Machiavelli* (1883-1911) is full of careful research. Lord Morley's Romanes Lecture on *Machiavelli* was published in 1897.

Machine-Gun is defined in the British services as a weapon, usually of rifle but occasionally of larger calibre, which is fired from a stable mounting provided with elevating and traversing gears, or if not with the latter, at least with a clamp by means of which its lateral traverse can be fixed as desired, and in which, by suitable mechanism, the operations of loading and firing are performed continuously, either by *hand-power* by the manipulation of a lever or winch-handle, or *automatically* by utilising the recoil of the barrel or a minute portion of the gases of explosion. In all cases the ammunition is carried in 'hoppers,' 'feed-strips,' or 'feed-belts,' from which it is fed into the gun by the mechanism. A gun which is loaded and fired automatically with its butt against the firer's shoulder, and supported under its muzzle by a simple rest, as is usually the case with the Lewis and Hotchkiss guns (see below), is not termed a 'machine' gun. The definition is not wholly satisfactory; for immediately a Lewis or Hotchkiss gun is mounted on a stable mounting of the kind described—as both have been for certain purposes—it would become a 'machine' gun according to the definition. The distinction which is sought to be drawn by the definition is between a weapon mounted and used to some extent like a piece of artillery and one which is used like a heavy rifle, especially in connection with the refinements of aiming possible with the former and practically impossible with the latter, whereby, for example, a gun can be aimed to hit some objective (possibly unseen from the gun itself, and aimed at by 'indirect laying'), and be left aimed, ready to be fired immediately occasion demands it, whether by day or night. The ability also to traverse the gun on its pivot steadily while it is firing without altering the elevation is of great importance in order to give lateral distribution of fire when necessary. Seeing that automatic guns fire normally about seven shots a second, it will be readily understood that rapid traversing is needed when the objective is a wide one without depth—as, for instance, infantry attacking in a single line abreast—unless there is to be great waste of ammunition.

The ambition to fire a number of rounds very rapidly is nearly as old as the inception of fire-arms, and bundles of barrels, fired simultaneously, were in use in the 15th century, and acquired later the name of 'organs.' The ability to fire rapidly was soon found to be of small use without the power of loading rapidly, but the latter does not appear to have been achieved until the 19th century. There is in the Rotunda Museum at Woolwich an improved form of 'organ' gun, which dates at least from 1830. It was termed a 'Requa,' and consists of thirty-one musket-barrels carried in a frame and capable of being discharged by the firing of a single cap.

Somewhat similar to the Requa, but a great improvement on it, was the 'canon à balles,' or 'mitrailleuse,' invented about 1866, and used by

the French in 1870 with very indifferent results, partly no doubt from the comparative inefficiency of the weapon itself, but largely from lack of training and appreciation of the proper rôle of machine-guns. Its thirty-seven rifle-barrels could

Fig. 1.

Medium-size Gatling, mounted on Field Carriage.

be loaded simultaneously at the breech in about five seconds by means of a frame containing cartridges of the modern type, and the barrels could be discharged one by one or simultaneously. This gun, however, was not a true machine-gun, as it was not self-loading, and the first true machine-gun, of the hand-power class, was the Gatling, invented by an American of that name about 1860, and first used at the end of the American Civil War of 1861-65, and in most of the wars which have taken place since up to as late a date as 1898. This gun (see fig. 1) usually has ten rifle-barrels, each with its own locking-bolt and striker (see RIFLE), which are revolved together round the central axis A by the winch-handle B. The cartridges lie in the hopper C with their bullets all towards the muzzle, and drop, one by one, into grooves just behind the breeches of the barrels, a groove to a barrel. Each locking-bolt gradually pushes a cartridge from the groove in front of it into its barrel during one half-revolution, fires it, and gradually extracts and ejects it, during the next half-revolution. Fire at a speed of about 200 rounds per minute is obtainable

Fig. 2.

Nordenfält-Palmerantz Gun, inside Bulwark Mounting.

easily. The gun was adopted by the British service in 1873, and was used in the Ashanti war of 1873-74, in Zululand in 1879, and in Egypt in 1882. It was superseded by the Nordenfält and Gardner guns, adopted respectively in 1880 and 1882.

The Nordenfält gun is shown in fig. 2. It had four or more barrels placed side by side,

with a hopper A for cartridges above them, and was loaded and the barrels fired successively by working a lever backwards and forwards.

Fig. 3.—Five-barrelled Gardner Gun on Tripod Stand.

The Gardner gun, shown in fig. 3, was generally of the rifle-calibre type, and sometimes, for lightness, had only one barrel, but more usually two. By turning the winch-handle A the barrels were loaded from the hopper B, and fired one after the other.

Both these guns fired from 100 to 150 rounds per minute, but could easily fire up to 300, and were reliable;

but all hand-worked guns are liable to be put out of action, with a chance of injury to the firer, if a cartridge 'hangs fire'—i.e. does not explode at once; for such a cartridge is extracted, and may explode in the mechanism. Hand-working also

tends to disturb the aim. Consequently they have been superseded by the automatic class, now to be described.

The Maxim automatic machine-gun was adopted in the British service in 1889. It depends upon the recoil of its barrel for its action, and has (see fig. 4) a single barrel A, surrounded by water in the jacket B. The cartridges are carried in belts C of 250 rounds, from which they are fed into the gun. A full description of the somewhat intricate action of this gun is beyond the scope of this article, but the following will give an outline of it. When the trigger D is pressed the gun fires, and the barrel, with the lock pressed firmly against it, recoils about one inch. *By this time the bullet has left the barrel.* The arm E now strikes the buffer-stop F and causes the axle G attached to it to rotate, withdraw the lock from the breech, and place a cartridge (withdrawn from the belt during recoil) ready to be pushed into the breech. As G rotates the knob H of the buffer-handle, attached to G, swings over, and when the lock is full open strikes the buffer-spring I. The rotation of G also winds up the fusee chain J attached to the spring K (shown dotted), and extends the latter. When H strikes I, all recoil has been absorbed; the spring K contracts, pulls back J, rotates G in a contrary direction, and thereby causes the new cartridge, already referred to, to be pushed into the breech and the latter to be closed by the lock. Ejection of the fired cartridge is performed at the same time. If the trigger be kept pressed the firing continues automatically. When firing, the gun is held by one or both hands on the two handles L, between which lies the trigger D,

Fig. 4.

which is pressed down by the thumb of either hand.

The Maxim rifle-calibre gun as supplied up to 1912 weighed 60 lb., to which must be added about 10 lb. for the water in the barrel-casing. It has been superseded by a lighter gun, termed the 'Vickers Machine-gun,' which weighs 28½ lb. empty, and 38½ lb. filled with water. The principle of its action is exactly the same as that of the Maxim, but the details have been modified. Both patterns fire about 450 rounds per minute; but the speed of fire of the 'Vickers,' when used in air-craft, can be very greatly increased if desired. They are sighted up to 2900 yards, and are mounted on tripods (see fig. 5) designed for carriage either by a wheeled vehicle or by pack-transport. For guns required in fortresses at assigned points, and for the armament of ships or boats as may be required, fixed mountings are used; while for movable armaments in fortresses a special mobile mounting designed for firing over a parapet has been designed.

The Maxim gun has also been made to fire small common shell (see SHELL) fused with percussion-fuses, and the 1-pounder is the 'pom-pom' of which so much was heard in the South African war of 1899-1902.

Of automatic guns worked by the gases of explosion, the Hotchkiss rifle-calibre gun, adopted in 1915, may be selected as sufficiently typical of the principle. In this gun there is a small hole in the

underside of the barrel about twelve inches from the muzzle, by which a minute portion of the gases of explosion can pass into a tube lying under and parallel with the barrel. In this tube is a movable piston-rod which gears with the breech-block or

Fig. 5.

bolt (see RIFLE) and with the feed-piece by which the cartridges, held by clips on metal strips—each strip holding thirty cartridges—or in belts of fifty,

are fed to the gun. At the moment when the gun fires, the rod is in its most forward position, having been pushed there by a strong recoil-spring. As soon as the bullet passes the hole in the barrel, and until it is clear of the muzzle (i.e. for a period of about $\frac{1}{1000}$ th second), the gases pass into the tube and drive back the rod. The rod compresses the main-spring, causes the breech-block to unlock and to extract and eject the fired case, and the feed-piece to place a fresh cartridge in front of the breech-block ready to be pushed into the breech. If the trigger has not been pulled the piston-rod is now caught and held by the trigger-sear. The trigger mechanism can be set to fire single shots, when the trigger must be released and pulled for each shot fired; or for automatic firing, when, after the trigger has been pulled and is kept pulled, the gun continues to fire, at a rate of about 450 rounds per minute, as long as cartridges are fed to it. In either case, on pulling the trigger the piston-rod is freed from the restraint of the sear, is driven forward by the compressed recoil-spring, and as it moves causes the breech-block to push the new cartridge into the breech and to lock itself, and the striker to fire the cartridge. The gun weighs about 27 lb., and is sighted up to 2000 yards. It is usually fired like a rifle with its butt against the firer's shoulder, and supported under the muzzle by a bipod rest. A rest is also supplied, for optional use, which can support the butt, so that elevation can be maintained independently of any effort by the firer. A tripod has also been supplied for it, but without elevating-gear. For cavalry service, in which it has mainly been employed, it is carried by pack-transport.

The Lewis gun, adopted in 1915, weighs 26 lb., and is sighted up to 1900 yards. Its ammunition is supplied from circular hoppers. It is a gas-actuated gun, working on exactly the same principles as the Hotchkiss, and capable of firing at the same speed. It is not, however, fitted with single-shot mechanism, and a very rapid pull and release of the trigger is the only means of firing a single shot. It is used in precisely the same way, but is not provided with the rest for the butt. It has also been supplied with a tripod. For infantry service, in which it has been principally employed, it is carried in wheeled vehicles.

There are several other recoil and gas-actuated machine-guns, showing great differences in detail, but the root principles are, and must be, the same as in the guns described. The following are the machine-guns which were used by the great powers during 1914-18: Austria, the Schwarzlose (recoil of cartridge-case); France, the Hotchkiss for the navy, and the Puteaux (gas) for the army; Germany, the Maxim; Italy, the Perino (recoil); Russia, the Maxim; United States, the Colt (gas), Browning (recoil), and Maxim. The Colt was used by the Canadian forces at first, but was replaced by the Vickers machine-gun.

It will be clear that automatic guns, depending as they do for their action on the correct firing of the cartridge, are free of the 'hang-fire' difficulty referred to above, and that they are much more rapid in their action than hand-operated guns; and although somewhat delicate in their mechanism, experience has shown that they are capable of considerable exposure and rough usage. Owing to their greater rapidity of fire and single barrels, they are even more affected by the great enemy of all machine-guns—viz. the immense heat set up by firing a number of rounds rapidly. The gallon of water in a Maxim water-jacket boils after about 600 rounds fired consecutively—approximately in $1\frac{1}{2}$ minute. To meet the difficulty often experienced on service in obtaining water for the jacket, and to avoid the betrayal of the position of the gun by a

cloud of steam, a condenser is supplied, which is a canvas bag connected by a flexible metal tube with the jacket. A good deal of water is recovered thereby. Guns without water-jackets, even if their barrels are fitted, as in the Lewis and Hotchkiss, with fins to act as radiators, cannot fire more than about 500 rounds consecutively without risk of damage.

Every British warship is provided with two or more rifle-calibre machine-guns for use with landing-parties or other similar purposes; and aircraft usually carry one as their regular armament. Prior to 1914 every British cavalry regiment and infantry battalion was equipped with a machine-gun section of two guns. The experiences of war, however, soon showed that the value of machine-guns in civilised warfare—no doubt also owing to the unexpectedly peculiar conditions of continued fighting at close quarters—had been greatly underestimated; and while every effort was made to increase the supply of guns, a machine-gun corps, organised in companies of four sections with four guns to each section, was established toward the close of 1916. This recognised that the service of machine-guns is a profession demanding special training, and that the telling-off of an officer in a regiment or battalion for a year or two as machine-gun officer does not fully meet requirements. Infantry battalions were supplied with Lewis guns retained permanently under battalion, and cavalry with Hotchkiss guns under regimental command. The regulations for the new companies, however, recognise that when machine-guns are detached from a company to work with a battalion they must obey orders given by the battalion commander (see *Infantry Machine-gun Company Training*, 1917).

As to the immense value of machine-guns (including Lewis and Hotchkiss guns), it is only necessary to point out that one gun can deliver a fire equal to that of about thirty riflemen, while occupying about one-fifteenth of the space needed for thirty men, and requiring only one-tenth of that number, or less, to handle it. When used on the defensive it is easily provided with all the ammunition it requires—its most exacting requirement—can be usually concealed easily until it opens fire, and even after it has done so is not easily located, owing to the use of smokeless powder. During 1914-18 its terrible powers were supplemented by the carefully prepared positions in which it was used, in which it was usually not only concealed, but well protected against hostile artillery fire, while the attacker had to pass through wire entanglements—often nearly intact in spite of preliminary bombardment—to get at it. As is fully admitted, the 'Tank' (q.v.) had to be invented to cope with it. When used in the attack, its best employment has not been determined quite so exactly, but enough is known to make it certain that it is an indispensable weapon. The Lewis guns will be in the attacking line, while the machine-guns will follow in support, ready to meet counter-attack and to consolidate a position when won, and, in the event of failure, to cover retreat. It is impossible in an article of this character to deal fully with the subject, and the reader is referred to the work already quoted. To sum up, the essentials of the successful use of machine-guns are, broadly: (1) an abundant supply of ammunition; (2) concealment, coupled, if possible, with protection, especially from artillery fire against which they are helpless, except at short ranges to which artillery would approach in quite unusual circumstances only; (3) reservation of fire until an objective of sufficient importance presents itself, and one upon which fire is likely to be effective; (4) accurate knowledge of all ranges in the area operated upon. It is obvious that these essentials

can be much more easily guaranteed in defence than in attack, especially the first.

As to the shell-firing guns of the 'pom-pom' class, the opinion is now very general that, while their moral effect on troops unfamiliar with them is at first considerable, it lessens rapidly, as the material effect of their small shell is so small; and since they cannot compete with good quick-firing artillery, and are less efficient, for equal effects, at short ranges than rifle-calibre guns, owing to their greater weight, both in themselves and their ammunition, their employment in the future on land or sea, except perhaps against aircraft, is doubtful. For the armament of aircraft for aerial warfare they have, however, distinct possibilities.

Machu Picchu, a well-preserved Inca city discovered by Professor Hiram Bingham in 1911 on the top of a ridge in the most inaccessible part of the Urubamba Cañon, NW. of Cuzco, and identified with Tampu Tocco ('the temporary abode with windows'), the traditional original home of the Incas. The city, apparently a city of refuge, protected by precipices over 1000 feet in height, was unknown to the Spanish chroniclers, and when found was overgrown with forest. It is remarkable for the number of stone stairways and of windows. Its two hundred houses exemplify all types of Inca architecture. The principal temple has three conspicuous windows, thought to be those through which the three chief Inca groups are said to have emigrated. See the reports of the Yale expeditions.

Macintosh, CHARLES (1766-1843), a Glasgow manufacturing chemist. See INDIA-RUBBER.

M'Intyre, DUNCAN BAN (1724-1812), the Gaelic poet-gamekeeper of Beinnndrain, was born in Glenorchy, fought on the government side at Falkirk, and in 1799-1806 was one of the Edinburgh City Guard. His complete works were edited with a translation by Professor George Calder in 1912.

Mack, KARL, FREIHERR VON, Austrian general, was born at Nennslingen, in Franconia, on 24th August 1752, entered the military service of Austria in 1770, and, after fighting in the Turkish war and against the French republican armies, was in 1797 created field-marshal. Having, after the peace of Campo Formio, been appointed by the king of Naples to the command of his troops, he took the field against the French, and occupied Rome; but he was unable to retain his hold of the city. A riot in the city of Naples, caused by his having concluded an armistice with the French, compelled him to seek safety in the enemy's camp. He was thereupon carried prisoner to Paris, but escaped in 1800. Five years later the emperor put him at the head of 80,000 men, and sent him to check the French advance along the line of the Iller. But the enemy outmanoeuvred him, and shut him up in Ulm, and on 17th October Mack capitulated with his army. He was tried by court-martial and condemned to death, but the sentence was commuted by the emperor to expulsion from the army and twenty years' imprisonment. In 1808 Mack was liberated, and in 1819 fully pardoned. He died 22d October 1822. His defence was published in Raumer's *Historisches Taschenbuch* (1873).

Mackay, CHARLES, LL.D. (1814-89), poet and journalist, son of an artillery officer, was born in Perth. Two songs, 'There's a Good Time Coming' and 'Cheer, Boys, Cheer,' had an extraordinary vogue, 400,000 of the first having been sold, without putting anything into his pocket.—His son ERIC (1851-98) wrote *Love-letters of a Violinist*, *Arrows of Song*, *Nero and Actea*, &c.

Mackay, ROBERT (1714-78), the Reay country Gaelic poet 'Rob Donn' ('brown'), was a Sutherland herd. See the Life by Hew Morrison prefixed to his poems (1898).

M'Keesport, a borough of Pennsylvania, on the Monongahela River, at the mouth of the Youghiogheny, and on several railways, 15 miles SE. of Pittsburg. It has flour, saw, and rolling mills, large manufactories of tubes, steel and iron, &c. It is the centre of the natural gas and bituminous coal region of the state. Pop. (1920) 46,781.

Mackensen, AUGUST VON, German field-marshal, born 6th December 1849 in the province of Saxony, entered the army in 1870, and served in the Franco-Prussian war. Fourteen years a staff officer, he made a reputation as an organiser. In the great European war he distinguished himself in the conduct of the campaign of 1915, in which he drove the Russians out of Galicia, and was made field-marshal. Forces under his command overran Serbia (1915) and Rumania (1916-17).

Mackenzie, ALEXANDER, Canadian statesman, was born in Logierait, Perthshire, 28th January 1822, removed to Canada in 1842, and worked for some time as a mason, subsequently becoming a builder and contractor. In 1852 he became editor of a Reform newspaper. He represented Lambton in parliament from 1861 to 1867, and in the Dominion parliament till 1882; he was then elected for East York, and was re-elected in 1887. From 1867 he led the Reform opposition in parliament, and in 1873-80 was leader of the Liberal party in Canada. In 1873 he succeeded Macdonald, becoming the first Liberal premier, and remained at the head of the government till 1878. He thrice declined a knighthood, wrote the Life of his friend and ally, the Hon. George Brown (1882), and died 17th April 1892.

Mackenzie, SIR ALEXANDER CAMPBELL, composer, knighted in 1895, was born in Edinburgh in 1847. He studied music in Germany and at the Royal Academy, London. From 1865 to 1879 he was engaged in Edinburgh as teacher, violinist, conductor, and composer. Afterwards he resided in Italy, devoting his energy mainly to composition. From 1887 to 1924 he was Principal of the Royal Academy of Music in London. His works embrace almost every form of music. His celebrity dates from the production of his opera *Colomba* in April 1883 at Drury Lane by the Carl Rosa Company. His subsequent opera *The Troubadour*, had not the same success. His oratorio, *The Rose of Sharon*, was produced at Norwich in 1884. Another, *The Lord of Life*, was composed for production in 1891 at Birmingham. Besides these, he has written other operas; several important cantatas; overtures, a number of Scottish rhapsodies, and other orchestral works; a concerto and a *pibroch* for violin; chamber music, songs, piano-forte and organ pieces, &c. His compositions are distinguished by a manly solidity of workmanship, the result of a thorough mastery of all branches of his art, combined in many instances with a happy poetic inspiration. He is also eminent as a conductor.

Mackenzie, COMPTON, novelist, son of Edward Compton the actor, was born at West Hartlepool, 17th January 1833. He was educated at St Paul's School and Oxford. His novels, enthusiastically admired by almost all who do not abhor them, include *The Passionate Elopement* (1911), *Sinister Street* (1913-14), *Guy and Pauline* (1915), *Sylvia Scarlet* (1918), *Sylvia and Michael* (1919), *The Seven Ages of Woman* (1922), *The Old Men of the Sea* (1924). The high spirits of *Poor Relations* (1919) won over many who had been indifferent or hostile.

Mackenzie, SIR GEORGE, a Scottish lawyer and statesman, nephew to the Earl of Seaforth, was born at Dundee in 1636. He studied at St Andrews, Aberdeen, and Bourges in France ('the Athens of Scottish lawyers'); in 1656 was called

to the bar at Edinburgh; and in 1661 boldly defended the Marquis of Argyll on his trial for high-treason. About the same time he was made a justice-depute, and as such had to repair 'once a week at least to Musselburgh and Dalkeith, and to try and judge such persons as are there delated of witchcraft.' He was soon after knighted, entered parliament as member for Ross-shire in 1669, and in 1677 was named king's advocate. Up to this point his career had been marked by a decidedly patriotic spirit, and he was even one of the most popular men in the country. In the midst of his professional labours he diligently cultivated literature, and was one of the first Scotsmen to write English with purity. 'That noble wit of Scotland,' Dryden terms him. Unhappily in the popular mind he is better known as criminal prosecutor in the days of the persecution, in which capacity he earned the title of 'Bluidy Mackenzie;' nor can it be disproved, in spite of his liberal antecedents, that he became a willing instrument of despotism. In 1682 he founded the Advocates' Library (q.v.); at the Revolution, six years afterwards, he retired to Oxford. He died in London, 8th May 1691, and was buried at Edinburgh in Greyfriars Churchyard.

His works, published between 1663 and 1686, and collected by Ruddiman (2 vols. folio, 1716-22), include *Religio Stoici*, *Moral Essay upon Solitude*, *Moral Gallantry*, *Vindication of the Government of Charles II.*, three treatises on the law of Scotland, and *Jus Regium*. See his *Memoirs of the Affairs of Scotland* (ed. 1821); and Andrew Lang, *Sir George Mackenzie of Rosehaugh* (1908).

Mackenzie, HENRY, the 'Man of Feeling,' was born in Edinburgh, 26th August 1745. A physician's son, he passed from the High School to the university, in 1765 went up to London to pursue his law studies, and, returning to Scotland, became crown attorney in the Court of Exchequer, and in 1804 comptroller of taxes. For upwards of half a century his was 'one of the most illustrious names connected with polite literature in Edinburgh,' where he died at the great age of eighty-five, on 14th January 1831. His *Man of Feeling* was published anonymously in 1771; *The Man of the World* followed in 1773, and *Julia de Roubigné* in 1777. All three have something of Richardson, and more of Sterne, but nothing of their genius. The first, which alone is not wholly forgotten (reprinted by Henry Morley in 1886), is perhaps the most namby-pamby effusion that ever 'attained classical celebrity.' His other writings include some Tory pamphlets, lives of Blacklock and Home, ninety-nine papers in the *Mirror* and *Lounger*, and four very weak plays. At least, he deserves recognition for his own recognition of Burns, and as an early admirer of Lessing and of Schiller.

Mackenzie, WILLIAM LYON, Canadian agitator and journalist, was born in Dundee, 12th March 1795, emigrated to Canada in 1820, and in 1824 established the *Colonial Advocate*, first at Queenstown, then at Toronto. There his denunciations of the officials resulted in the partial destruction of his printing-office in 1826. In 1828 he was elected to the provincial parliament for York, but was expelled for libel on the Assembly, and was successively expelled and re-elected until finally the government refused to issue the writ. In 1832 he went to London with a petition of grievances from the Reformers of Canada, and while there secured the dismissal from office of the Attorney-general and Solicitor-general of Upper Canada. In 1834 he was elected the first mayor of Toronto, and in 1836 he started the *Constitution*, in which he attacked Sir Francis Head, the lieutenant-governor, for interference with the elections. In 1837 he published a virtual declaration of independence in his paper, headed a band of armed insur-

gents, and demanded of the lieutenant-governor a settlement of all provincial difficulties by a convention. This demand not having been granted, Mackenzie determined to arrest the lieutenant-governor and capture the military stores in Toronto; but being met by a superior force at Montgomery's Hill, 4 miles from the city, the insurgents were put to flight after a brief skirmish in which several were killed. Mackenzie and others effected their escape, and took possession of Navy Island in the Niagara River, where he established a provincial government. He was soon, however, compelled to break up his camp, and was afterwards sentenced by the United States authorities to twelve months' imprisonment in Rochester jail. On the proclamation of amnesty in 1849 he returned to Canada, and was a member of parliament from 1850 till 1853. Reforms more radical than those he contended for have since been granted. He died in Toronto, 28th August 1861. See the *Life* by his son-in-law, Charles Lindsey (2 vols. 1862).

Mackenzie River, in North America, has its origin, as the Athabasca (q.v.), in a Rocky Mountain lake in British Columbia, flows over 600 miles to Lake Athabasca, and 240 as the Slave River to Great Slave Lake (q.v.). It now assumes the name of Mackenzie River, and conveys the waters of the Great Slave Lake to the Arctic Ocean at Mackenzie Bay, after a final course which is reckoned at 1045 miles, making a total river-system of nearly 2500 miles. It drains an area of little less than 600,000 sq. m. The mouth of the river is closed from October to June by ice. The Mackenzie district itself is desolate and unfit for colonisation; but its great tributaries, the Liard and Peace Rivers and the Athabasca, drain an immense fertile country, with abundance of petroleum (the fields have been reported the largest in the world) and some coal and lignite. The Mackenzie received its name from Sir Alexander Mackenzie (c. 1755-1820), by whom it was discovered in 1789. Sir John Franklin (q.v.) descended it in 1825. The former territory of Mackenzie is a provisional district of the Northwest Territories. There is, however, also a Mackenzie district in Saskatchewan.

Mackerel (*Scomber scombrus*), a North Atlantic representative of the genus *Scomber*, gregarious and migratory in its habits, swift in its movements, and brilliant in its coloration. The spindle-shaped body, usually a little over a foot in length, is covered with very small scales. Its colour may be described in a general way as bluish-green above, with a dash of brassy-yellow and with numerous wavy, black, transverse bands, and silvery below. The English Channel is about the centre of the mackerel's range in the eastern part of the Atlantic, but its range extends to the Canaries, the Mediterranean, and the Black Sea. On the other side of the Atlantic the mackerel extends from Greenland to Cape Cod. The shoals, or schools, keep to the surface, swimming against wind and tide, and causing a disturbance which can be seen from some distance. The moving light which the fishermen allege as a sign of the mackerel's nocturnal migration is due to the luminescence of minute animals which the fishes disturb. In winter the mackerel lives in deep water near the bottom. The spawning is in early summer, and the eggs float. The growth of the fry is rapid. At least in spring and summer the mackerel is a dainty feeder, depending largely on minute crustaceans, such as copepods. As these feed on diatoms and peridinid infusorians, which multiply in direct proportion to the amount of sunlight, there is a direct correlation between the sunshine record in spring and the abundance of mackerel on the market. The fishing is mainly by means of drift-nets and seine-nets, and is of great importance both in Europe and America. The flesh

is delicious, whether eaten fresh or preserved, salted or in oil, smoked or dried, but it cannot be kept for more than a short time. On this account an old enactment (1698) allowed them to be sold in London either before or after divine service on Sundays. Next to the families of herring, cod, and salmon,

Common Mackerel (*Scomber scombrus*).

the mackerel family (*Scombridae*) is the most important economically. It includes, for instance, the bonitos and the tunny. The Spanish or Coly Mackerel (*Scomber colias*), a rarity on the south coast of England, occurs in the Mediterranean and in the Western Atlantic from Nova Scotia to Cape Hatteras. It has a swim-bladder, absent in the common mackerel. The name Horse Mackerel is applied to various fishes—the Scad (q.v.), the Tunny (q.v.), and the American Blue Fish (*Pomatomus*).

Mackerel-guide. See GAR-PIKE.

Mackerel-midge is a small Rockling (q.v.).

Mackinaw. See MICHIGAN (LAKE).

McKinley, MOUNT, or DENALI, the highest mountain in North America, is in Alaska, in lat. 63° 4' N. and long. 151° W., and is 20,464 feet high. It was first scaled, not by Cook (1906), but by Archdeacon Stuck and Mr H. P. Karstens (1913).

McKinley, WILLIAM, twenty-fourth president of the United States, was born 29th Jan. 1843, at Niles in Ohio, and served in the Civil War, retiring in 1867 as major to Canton, where, after a period of study, he practised law. He was elected to congress in 1877, and repeatedly re-elected. In 1891 he was made governor of Ohio, his name having ere this been identified with the high protective tariff carried in the McKinley Bill of 1890, though subsequently modified by the Democrats in 1894. Chosen Republican candidate for the presidency in 1896, he conducted an exciting contest with W. J. Bryan, who advocated the cause of free silver, payment of debts in silver dollars, the repression of monopolies, and was understood to favour labour at the expense of capital. A large section of the Democrats—spite of their dislike to his protective policy—supported him as against Bryan; and as representative of a gold standard and the interests of capital, he secured then, and again in 1900, a large majority. Shot at Buffalo by an anarchist bullet on 6th September 1901, he died on the 14th. —For the war with Spain, see CUBA.

Mackintosh. See INDIA-RUBBER.

Mackintosh, SIR JAMES, philosopher, was born at Aldourie in Inverness-shire, October 24, 1765. Having studied at King's College, Aberdeen, and then medicine at Edinburgh, he settled in London, for some time supporting himself and his young wife by writing for the newspapers. The first work that brought him into notice was his *Vindiciae Gallicae* (1791), in reply to Burke's *Reflections on the French Revolution*. Fox, Sheridan, and other leading Whigs sought the author's acquaintance; and when the association of the 'Friends of the People' (q.v.) was formed he was

appointed secretary. He was called to the bar in 1795, and ere long attained high eminence as a forensic lawyer. In 1799 he delivered a brilliant series of lectures on the law of nature and of nations before the benchers of Lincoln's Inn; and his defence of Peltier (1803), charged with a libel on Bonaparte, was a splendid triumph. In 1804 he was knighted, and appointed recorder of Bombay, and in 1806 judge of the Admiralty Court; here he spent seven years, entering parliament on his return as Whig member for Nairn (1813). He was professor of Law in the college of Haileybury from 1818 to 1824, and in 1830 became a member of the Board of Control under the Grey ministry, and spoke in favour of the Reform Bill. He died not long after, on the 22d May 1832. His *Dissertation on the Progress of Ethical Philosophy* (1831), written for the *Encyclopædia Britannica*, although very incomplete, shows the admirable powers of the author. For Lardner's *Cyclopædia* he wrote a brief but excellent survey of the History of England. A mere fragment of a great projected work, entitled *A History of the Revolution in England in 1688*, appeared after his death.

A collection of Mackintosh's miscellaneous works was published in 3 vols. in 1854. See the *Memoirs* by his son (2 vols. 1835), and the essays of Macaulay and De Quincey.

Macklin, CHARLES, actor, was born 1st May 1690, according to his biographer (Macklin used to say in 1699), the son of an Irish gentleman named M'Laughlin, who commanded a troop of horse for King James at the Boyne two months later, and lost his estates in consequence. After a wild, unsettled youth, in which he was by turns potboy, college servant, and stroller, he played for a number of years in Bristol and Bath, till his brogue was worn down, and in 1733 was engaged for small parts at Drury Lane. He steadily rose in the public favour, till in 1741 he appeared in his great character, Shylock: Pope said of it, 'Thus is the Jew that Shakespeare drew.' From this time he was accounted one of the best actors, appearing with nearly equal success in tragedy or comedy, in passion or buffoonery, for nearly half a century. His last performance was at Covent Garden in May 1789, when he broke down; but he survived, with an annuity of £200, till 11th July 1797. He was generous, high-spirited, and honourable, but somewhat irascible: in 1735 he killed a brother-actor in a quarrel over a wig, and was tried for murder; and frequently afterwards he was engaged in disputes and actions at law. He wrote a tragedy, and several farces and comedies; of these *Love à-la-Mode* (1759) and *The Man of the World* (1781) have been printed; in the latter his own part was Sir Pertinax MacSycophant. See *Lives* by Francis Asprey Congreve (1798) and by Edward Abbot Parry (1891).

Macknight, Dr JAMES, an eminent divine of the Church of Scotland, was born at Irvine, in Ayrshire, 17th September 1721; studied at Glasgow University, and afterwards at Leyden, in Holland; and in 1753 was ordained minister of the parish of Maybole. In 1769 he was translated to Jedburgh, and thence to Edinburgh in 1772, where he died, 13th January 1800. Macknight was a superior scholar, a liberal, wise, and prudent ecclesiastic, and a respectable writer on Scripture subjects. His principal works are *Harmony of the Four Gospels* (1756); *The Truth of the Gospel History* (1763); and *A New Translation of the Apostolical Epistles, with Commentary and Notes* (1795).

Mackonochie, ALEXANDER HERIOT, priest, was born at Fareham in Hampshire, 11th August 1825, the son of a Scots East Indian colonel. He studied a while at Edinburgh University, took a second class in classics at Oxford, and was or-

claimed to a curacy at Westbury, removing in 1852 to Wantage, and in 1858 to St-George's-in-the-East. In 1862 he became the first vicar of St Alban's, Holborn. His prosecution by the Church Association for ritualistic practices began in 1867; and in 1882, in accordance with the dying wish of Archbishop Tait, he sought to withdraw from the conflict by resignation. The charge of St Peter's, London Docks, he held but a twelvemonth, for on 15th December 1887 he lost his way in Mamore deer-forest, Ballachulish, and two days later was found dead in the snow. See his *Life* by Mrs Towle (1890).

McLaren, ALEXANDER (1826-1910), 'of Manchester,' born at Glasgow, studied there, and became a Baptist minister in Stepney, Southampton, and (from 1858) Manchester. He was one of the most eminent and revered Nonconformist preachers of his time, and published many volumes of sermons and commentaries. See *Life* by E. T. McLaren (1911).

Maclaren, CHARLES (1782-1866), born at Ormiston, East Lothian, was first editor of the *Scotsman*, editor of the *Encyclopædia Britannica* (6th edition), and a geologist.

Maclaurin, COLIN, mathematician, born at Kilmodan, Argyllshire, in 1698, graduated at Glasgow, and became professor of Mathematics in Marischal College, Aberdeen. In 1719 he visited London, and was admitted to the Royal Society. There he published his *Geometria Organica* (1719), an elaborate treatise on the description of curves. He afterwards visited France as tutor to Lord Polwarth's son, and while there wrote a dissertation on the percussion of bodies, which gained the prize of the Academy of Sciences in 1724; while sixteen years later he divided with Euler and Bernouilli its prize for an essay on the flux and reflux of the sea. The following year he was appointed, on the recommendation of Newton, assistant to James Gregory, professor of Mathematics in the university of Edinburgh, and soon after succeeded him in the chair. In the labour of preparing trenches and barricades to defend Edinburgh against Prince Charlie's army he took too active a share for his health, and died of dropsy June 14, 1746. Maclaurin's writings gave a strong impetus to the study of mathematical science in Scotland. His *Treatise on Fluxions* (1742), written in defence of Newton's discoveries against the attack of Berkeley, was the first work in which the principles of fluxions were logically arranged, and formed a contribution of the greatest importance to the theory of the tides and the figure of the earth. The *Treatise on Algebra* (1748) was left incomplete, as was also the *Account of Sir Isaac Newton's Philosophical Discoveries* (1748), containing explanations of all Newton's discoveries, the optical ones excepted. Many papers appeared in the *Philosophical Transactions*.

Macie, a term employed in mineralogy to designate what are also called *twin crystals*, which are crystals united according to some precise law, yet not having their faces and axes parallel, so as to render the one a mere continuation of the other. In some macies the axes are parallel; in some, they are inclined at an angle. Crystallisation in macies is very characteristic of some minerals.—*Macie* is also the name of the variety of Andalusite (q.v.) called Chiasolite, a silicate of alumina, containing a little magnesia and oxide of iron. Macie has been much used for making beads for rosaries, &c.

McLennan, JOHN FERGUSON, a strikingly original and suggestive writer on primitive civilisation, was born at Inverness, 14th October 1827. He graduated at King's College, Aberdeen, in 1849, and then proceeded to Trinity College, Cambridge, which he left in 1853 to join the

Scottish bar in 1857. But he cut short the practice of his profession in his zeal for the study of the usages and customs of early civilisation. The chief fruit of his labours appeared in *Primitive Marriage* (1865), in which he emphasises the importance of the matriarchal theory of marriage amongst savage peoples, and in papers in the *Fortnightly Review* (1869-70) on totemism. His book, after being enlarged and the argument strengthened by new evidence, was issued under the new title of *Studies in Ancient History* in 1876. McLennan further defended his views as against the patriarchal theory of Sir Henry Maine in *The Patriarchal Theory*, left incomplete at the author's death, but finished and edited by his brother Donald in 1885. He also wrote a *Life of Thomas Drummond* (1867) and papers on 'The Levirate and Polyandry' (1877). Draftsman of parliamentary bills for Scotland in 1872-75, he died 16th June 1881. A second series of *Studies in Ancient History*, edited by his widow and A. Platt, appeared in 1896.

MacLeod, FIONA. See SHARP (WILLIAM).

MacLeod, NORMAN, a divine of the Church of Scotland eminent for his pulpit oratory, his writings, and his liberal Christianity, the son of a parish minister, was born at Campbeltown, Argyllshire, 3d June 1812. He was educated at Campbeltown and Campsie, to which his father had been translated, attended Glasgow University, and entering the church, became minister of London, in Ayrshire (1838-43); of Dalkeith (1843-45); and of the important Barony Church, Glasgow, from July 1851 till his death, June 16, 1872. He received the degree of D.D. in 1858, and was appointed one of the Queen's Chaplains in Scotland. An utterance of his on the Sabbath question in 1865 startled his brethren and the public, and he was threatened with prosecution; but wiser counsels prevailed. In 1869 he was moderator of the General Assembly, and was designated Dean of the Chapel Royal and Chaplain of the Order of the Thistle. In 1845 he visited Canada as a church deputy; he was in Palestine in 1864-65, and in India in 1867, on mission business for the Church of Scotland. One of the most eloquent and powerful addresses he ever delivered was that on missions before the General Assembly, after his return. From 1850 to 1859 MacLeod edited the *Edinburgh Christian Magazine*, for a year the *Christian Guest* (1860), and from 1860 till 1872 *Good Words*, to which he contributed tales, essays, verses, sermons, most of which were reprinted in book-form. Full of healthy life and human sympathy himself, his writings show shrewd observation, lively description, and good-humour; his tales are lacking on the constructive side. He possessed a large, simple, childlike nature, full of tenderness, and was broad and catholic in his sympathies, which bound him to humanity at many points. He published *The Earnest Student* (1854), *Deborah* (1857), *Daily Meditations* (1861), *The Gold Thread* (1861), *The Old Lieutenant* (1862), *Parish Papers* (1862), *Wee Davie* (1864), *Simple Truth* (1866), *Eastward* (1866), *Reminiscences of a Highland Parish* (his grandfather's parish of Morven, 1867), *The Starling* (1867), *Peeps at the Far East* (1871). See *Memoir* (1876) by the Rev. Donald MacLeod, and articles by Strahan (*Contemporary Review*, July 1872) and Dean Stanley (*Good Words*, 1872).

MacLise, DANIEL, painter, the son of a Highland soldier named M'Leish, was born at Cork in January 1806 (not 1811) and baptised 2d February, entered the school of the Royal Academy, London, in 1828, soon exhibited at the Academy, and in 1833 made himself famous by his 'All-Hallow Eve.' His later pictures are many of them familiar by engraving—such as 'The Banquet Scene in Mac-

beth' and 'Scene from Twelfth Night' (1840), 'Play Scene in Hamlet' (1842), and his design of 'Shakespeare's Seven Ages' (1848), 'The Gross of Green Spectacles' (1850), 'Caxton's Printing-office' (1851). The frescoes—each 45 feet long and 12 feet high—in the Royal Gallery of the House of Lords, depicting 'The Meeting of Wellington and Blücher on the Evening of the Battle of Waterloo' and 'The Death of Nelson at Trafalgar,' were admitted to be the finest mural paintings hitherto executed in Britain. Numerous good engravings of them are current. The most noteworthy pictures exhibited by MacIsaac, after the completion of these great works, were 'Othello,' 'Desdemona,' and 'Ophelia' (1867), 'The Sleep of Duncan' and 'Madeline after Prayer' (1868), 'King Cophetua and the Beggar Maid' (1869), 'The Earls of Desmond and Ormond,' posthumously exhibited in 1870, in which year he died on 1st April. The sketches by him of his contemporaries, published in *Fraser's Magazine* during 1830-38, were republished in 1874 and 1883. See the Memoir by O'Driscoll (1871).

Macmahon, MARIE EDMÉ PATRICE MAURICE DE, Duke of Magenta, marshal of France, descended from an Irish Jacobite family, was born at Sully, near Autun, 13th June 1808. Entering the army, he saw much active service in Algeria, especially distinguishing himself at the storming of Constantine (1837), commanded the division that stormed the Malakoff at Sebastopol in 1855, and took a conspicuous part in the war against the Kabyles in Algeria (1857-58) and in the Italian campaign of 1859, winning a marshal's baton and the dignity of Duke of Magenta for the decisive part he took in the battle of that name. He was nominated governor-general of Algeria in 1864. In the Franco-German war of 1870-71 he had command of the first army corps, but was defeated at Wörth, and wounded and captured at Sedan. On the close of the war he was made commander of the army of Versailles, with which he suppressed the Commune. In 1873 he was elected president of the republic for a period of seven years, with some hope that the restoration through him of the Bourbons might be secured. For his sympathies were, and continued to be, conservative, and at times reactionary, and, although he pursued no aggressive policy, he gradually became estranged from the Republicans. Rather than dismiss some of his old comrades in arms he preferred to resign, 30th January 1879. He afterwards lived in retirement, and died 17th October 1893.

Macmillan, DANIEL, was the son of a small farmer, and was born at Upper Corrie, Arran, 13th September 1813. His brother ALEXANDER was born at Irvine, 3d October 1818, survived Daniel for nearly forty years, and died 25th January 1896. After serving a seven years' apprenticeship (1824-31) under a bookseller at Irvine, Daniel went to Glasgow in 1831; was engaged with Johnson, Cambridge (1833-37), and with Seeley, London (1837-43). He was joined by his younger brother Alexander, who had been keeping a school at Nithill, near Paisley, and a small shop in Aldersgate Street in London was opened under his charge in 1843. Partly through the kindly interest of Archdeacon Hare the business of Mr Newby, Cambridge, was taken over by the brothers in the same year, and Mr Stevenson's business there was acquired for £3000 in 1845, with the assistance of fresh partners. As the brothers showed insight and knowledge of books their business grew rapidly, and by 1856 success was secured. The books that helped the young firm most largely were the works of Kingsley, Maurice, and the educational and university volumes. Daniel died 27th June 1857. He had a

high ideal of the bookselling business: 'As truly as God is, we are his ministers and help to minister to the well-being of the souls of men.' Alexander Macmillan (1818-96) was appointed publisher to Oxford University in 1863, and in the same year the business was removed to London. *Macmillan's Magazine* appeared in 1859-1907. See the *Life of Daniel Macmillan* by T. Hughes (1882), and the *Life and Letters of Alexander Macmillan* by C. L. Graves (1910).

Macmillanites. See CAMERONIANS.

Mâcon (*Matisco* of Cæsar), the capital of the French department of Saône-et-Loire, on the right bank of the Saône, 41 miles by rail N. of Lyons. A dull, modernised place, it has a twelve-arch bridge, with a view of Mont Blanc; a fragment of an old cathedral, demolished at the Revolution; the fine Romanesque church of St Pierre (rebuilt 1866); and a statue of Lamartine, who was born here. It carries on an extensive trade in wines known as Mâcon, like but lighter than Burgundy, as well as in corn, cattle, &c., and has manufactures of watches, brass, faience, &c., and distilling. Pop. 18,000.

Macon, capital of Bibb county, Georgia, on the Ocmulgee, stands among forest-clad hills, at the head of navigation, 78 miles SSE. of Atlanta, on six lines of railway. It is the seat of Mercer University (Baptist), a Roman Catholic college, a Wesleyan girls' school, and an academy for the blind; has iron and brass foundries, cotton-factories, &c., and ships large quantities of cotton and peaches. Pop. (1880) 12,749; (1920) 52,995.

Macpherson, JAMES, notorious as the 'translator' of the Ossianic poems, was born in 1736 at Ruthven, in Inverness-shire. After finishing his studies at King's College, Aberdeen, he became a schoolmaster in his native village, published a poem entitled the *Highlander* in 1758, contributed about the same time verses to the *Scots Magazine*, and in the following year, having met with 'Jupiter' Carlyle and John Home, the author of *Douglas*, he showed them some fragments of Gaelic verse, with 'translations' of the same. These (sixteen in number) appeared in 1760, and excited so much interest that the Faculty of Advocates in Edinburgh subscribed money to send Macpherson on a tour through the Highlands for the purpose of collecting more of the same. The quest was successful, but the unsatisfactory statements of Macpherson about his originals and the place where he made his discoveries excited grave and well-grounded suspicions. Some MSS. undoubtedly he found, but what he published as their contents was something very different from these. The result of his labours was the appearance at London, in 1762, of the so-called poems of Ossian (q.v.), under the title of *Fingal, an Epic Poem, in Six Books*; and in 1763, of *Temora, an Epic Poem, in Eight Books*. A storm of controversy soon arose in regard to their genuineness, which can hardly yet be said to have entirely subsided, although the general verdict is not so unfavourable as that of Dr Johnson, who denounced them as mere imposture. He probably found some poems, but very unlike the epic he published. This had, however, a great vogue in Europe, influenced Goethe, Schiller, and the Romantics (as well as Napoleon), and was the making of Macpherson in a worldly point of view. He was appointed in 1764 surveyor-general of the Floridas with a salary for life, and in 1779 agent to the Nabob of Arcot—a very lucrative office; sat ten years in parliament as member for Camelford; and died 17th February 1796 on the estate of Bellville (Balavil) which he had purchased in Inverness-

shire. His body was actually interred at his own request and expense in Westminster Abbey. He published also a wretched prose translation of the *Iliad*, and a number of political pamphlets. See books on him by Bailey Saunders (1894) and J. S. Smart (1905).

Macquarie, a tributary of the Darling (q.v.); a river and a harbour of Tasmania; a lake and a port in New South Wales; and a group of islets in the Southern Pacific, all discovered during the governorship of General Lachlan Macquarie, one of the ablest governors of New South Wales (1810-21) and a great fosterer of exploration.

Macqueen, ROBERT. See BRAXFIELD (LORD).

Macrauchenia (Gr., 'long-necked'), a genus of South American fossil herbivorous animals, forming a connecting-link between the Palæotherium (q.v.) and the camel family. In form they nearly resembled the llama, and the best-known species was as large as a camel.

Macready, WILLIAM CHARLES, actor, was the son of William McCready (so he spelt his name), actor and provincial manager. His mother, whose maiden name was Birch, was an actress. While the elder Macready was fulfilling an engagement at Covent Garden, William Charles was born in Mary Street, Euston Road, on 3d March 1793. In 1795 his father became manager of the Birmingham Theatre, and Macready was sent to Rugby, where he entered in 1803. He was intended for the bar; but his father's managerial speculations proving unsuccessful, he was forced to adopt the stage as his profession. He made his first appearance at Birmingham on 7th June 1810, playing Romeo, and for six years remained in the provinces. On 16th September 1816 he made his London début, playing Orestes (*Distrest Mother*) at Covent Garden. His reception by the critics and public was friendly; but he was for a long time very unfortunate in being cast for unsympathetic parts, one of the few exceptions being Rob Roy, in which he made a great hit, and of which he was the original actor in London. For many years he fought a fairly equal fight against Kean, Young, and Charles Kemble; but it was not till 1837 that he really took his position as leading English actor. On 30th September 1837 he inaugurated his famous Covent Garden management, during which he did much good service to the English stage. Surrounded by such players as Miss Faucit, Samuel Phelps, James Anderson, Mr and Miss Vandenhoff, Miss Priscilla Horton, and Mrs Warner, he produced Shakespeare's plays in worthy fashion, and did much to elevate and reform the theatre. For two seasons he managed Covent Garden, but abruptly gave it up; then, after two years' interval, took Drury Lane, which he managed from December 1841 to June 1843. After this time he never settled in London, but played in the provinces, in Paris, and in America. His last visit to the United States was marked by the terrible riots which arose out of the ill-feeling borne by the American actor Forrest to Macready. A riotous mob trying to break into the Astor Place Theatre for the purpose of maltreating Macready was fired upon by the military, and some twenty lives were lost (10th May 1849). On 26th February 1851 Macready took his farewell of the stage, at Drury Lane, in his great part of Macbeth, and passed his remaining years in placid retirement at Sherborne, Dorsetshire, and at Cheltenham, where he died on 27th April 1873. As an actor Macready endeavoured to combine the dignity of the Kembles with the naturalness of Kean. If not of the first rank, he was yet an actor of great power, and specially distinguished himself in Macbeth, Lear, Iago, King John, Cassius, and Henry IV. In

Virginus, Werner, Richelieu, and Claude Melnotte he was also greatly successful.

See Macready's *Reminiscences and Diaries* (1875); Lady Pollock's *Macready as I knew Him* (2d ed. 1885); a memoir by William Archer ('Eminent Actors' series, 1890); the *Diaries* as edited by Toynbee (1912).

Macrobius, AMBROSIIUS THEODOSIUS, a Latin grammarian who flourished about the beginning of the 5th century. He appears to have been by birth a Greek, but literally nothing whatever is known of his life, not even whether he was a Christian or a pagan. Two of his works are extant—a commentary on Cicero's *Somnium Scipionis*, and *Saturnaliorum Convivialium Libri Septem*, a series of historical, mythological, antiquarian, and critical dialogues at third hand. See studies by Linke (1880), Wissowa (1880), and Whittaker (1923).

Macrocosm. See MICROCOSM, PARACELSUS.

Macroon, a market-town of Ireland, on the Sullane, 24 miles by rail W. of Cork; pop. 2700. Near Macroon is a seat of the Earl of Bantry, constructed out of an old castle of King John's time.

McTaggart, WILLIAM, artist, was born at Aros, Kintyre, a crofter's son, 25th October 1835. He studied painting under Daniel Macnee in Glasgow and Robert Scott Lauder in Edinburgh, became R.S.A. in 1870, but was more closely associated with the Royal Scottish Water-colour Society and the Society of Scottish Artists. He lived in Edinburgh, and afterwards at Broomieknowe, near by, where he died 2d April 1910. He painted genre and landscape, especially fisher-folk and sea-scenes, with imaginative insight. Latterly his manner was akin to impressionism. See *Life* by Caw (1917).

Mactra, a genus of bivalve molluscs, with somewhat triangular equal-valved shells. They are active animals, ploughing their way through the sand either on the shore or at slight depths, and are able like cockles to take considerable leaps.

Mactra.

Two common North American species, *M. solida* and *M. ovalis*, known as hen-clams, surf-clams, &c., are sometimes eaten; while some small British species—e.g. *M. subtruncata*—are said to be gathered for feeding pigs.

MacWhirter, JOHN (1839-1911), artist, was born at Slateford, near Edinburgh. Apprenticed early to a bookseller and publisher, he soon left, and commenced his artist life. His early studies of wild-flowers at home and abroad were selected by Ruskin as examples for his Oxford class. In 1864 he was elected Associate of the Scottish Academy, in 1879 A.R.A., and in 1893 R.A. He excelled in depicting Highland scenery, but one of his most admired works is a view of Constantinople and the Golden Horn (1889). As favourites among his numerous pictures may be mentioned 'The Vanguard,' 'The Lady of the Woods,' 'The Three Graces,' and 'Out in the Cold.'

Madagascar, the third largest island in the world, is situated to the SE. of Africa, and is about four times as large as England and Wales; length, 995 miles; greatest breadth, 360 miles; area, 228,000 sq. m. Madagascar was frequently visited

by Europeans since the beginning of the 16th century, and the coasts were carefully surveyed by Captain Owen, R.N., in 1823-25; but for long there was no accurate knowledge of the interior. But between 1865 and 1870 Grandidier explored the island and crossed it in several directions. Numerous journeys were made by members of the London Missionary Society and other missions; and since the French conquest in 1895 the greater part of the island has been carefully mapped by French officers, and maps issued in various scales.

Madagascar consists of an elevated interior region, from 3000 to 5000 feet above the sea, and a comparatively level country surrounding the high land, not much exceeding 600 feet in altitude, and most extensive on the west and south, although there are lofty mountains extending to the south-eastern extremity of the island. The first of these great divisions is composed chiefly of Primary (gneiss and other crystalline) rocks, with enormous quantities of red clay-like earth, consisting of decomposed gneiss. It is a mountainous region, there being very little level ground except in the river-valleys, and some extensive and fertile rice-plains, the dried-up beds of ancient lakes. This interior highland comprises nearly half the total area of the island, and, although central, lies more to the north and east, the watershed running down the eastern side of the island at no great distance from the coast. From this upper region rises the mountain-mass of Ankaratra (nearly 9000 feet above sea-level), probably an ancient volcano. The lower regions of Madagascar are fertile and well wooded, especially on the eastern side of the island, though a large district in the south-west is barren. The western side consists of Secondary strata of the Cretaceous and Jurassic periods, and here the extensive plains are broken up by three prominent lines of mountain running north and south. From the south-east to the north-west and north several extensive groups of extinct volcanic craters have been traced. These are very numerous near Lake Itasy, and also in the Bêtafo district, 50 miles farther south. There are hot springs in many parts of the island. The chief rivers flow west and north-west, and there are many fine bays and harbours on the north-west coast. The largest lake is the Alaotra, in the Antsihanaka province, and a chain of lagoons extends for about 300 miles along the east coast, south of Tamatave, needing only about 30 miles of canal to connect them all into a continuous waterway; this has been partly done since the French conquest. A motor-car service is maintained on several of the main routes, and there is postal and telegraphic communication throughout the island.

All round the island is a nearly unbroken belt of forest, from 10 to 40 miles across, largely developed in the north-east, but more thin and scattered on the western side of the island. The flora of Madagascar is very rich and varied, and contains many trees producing valuable timber. Amongst the most characteristic forms of vegetation are the Traveller's Tree (*Ravenala madagascariensis*), the Rafia Palm (*Raphia pedunculata*), the Lace-leaf (*Aponogeton fenestratis*), the Beef-wood Tree (*Casuarina equisetifolia*), several species of pandanus and bamboo, and numerous peculiar orchids and ferns. Three-fourths of the species and one-sixth of the genera of the plants are endemic to Madagascar, showing (besides other facts to the same effect) that the island is of very great antiquity. About 4100 indigenous species are now known in Madagascar, and there is one natural order, Chlœnaceæ, with twenty-four species, confined to the island.

The fauna of Madagascar contains several exceptional and ancient forms of life, comprising many species and even genera known nowhere else; but,

considering its proximity to Africa, the country is markedly deficient in the larger carnivora and in ungulate animals. It is specially the home of the lemurs, there being about 40 species and well-marked varieties, as well as the allied and very curious Aye-aye (q.v., *Cheiromys madagascariensis*). Madagascar is also the chief habitat of the chameleons, and especially of those species with curious processes on the head, about half of all the known species in the world (50) being found in the island. About 260 species of birds are found in Madagascar, and of the 150 land-birds 35 genera and 129 species are peculiar to it, many of them being unlike any other living forms and of remote affinities. The remains, in a sub-fossil state, of large struthious birds, belonging to 7 or 8 species and 2 genera, *Aepyornis* and *Mullerornis*, have been found in the interior and in several places all round the southern coast. Of these, the largest, *Æ. ingens*, was about 10 feet high, and its egg is the largest known (14 in. x 11 in.). Fossil remains of gigantic tortoises have also been discovered, as well as those of two, if not three, species of extinct hippopotami, but smaller than those now living in South Africa; also relics of great rails, geese, and other waterfowl; of ape-like lemurs, connecting the lemurs and the monkeys; of slender-legged zebu oxen; of large, slender-snouted gavials; and of huge lizards, 60 to 70 feet long, of the genus *Bothriospondylus*, also of the genera *Titanosaurus* and *Megalosaurus*.

The Malagasy people appear to be mainly derived from the Malayo-Polynesian stock, with which they have numerous affinities; but they have many points of connection with the Melanesian tribes, from which the darker element in the inhabitants of Madagascar is probably derived. There is also an Arab element both on the north-west and south-east coasts. An earlier race called Vazimba was driven out of the central provinces by the Hova, and their descendants are still found in one part of the west coast. The Hova, the most advanced, civilised, and intelligent Malagasy tribe, inhabiting the central province of Imérina, and, since the beginning of the 19th century, the dominant race, are probably the latest immigrants and the purest Malayan in origin. Other important tribes are the Betsileo (southern central), Bira (farther south-west), Tanala (south-east forest), Betsimisaraka (east coast), Sihanaka (north-east central), and Sakalava (along the entire west coast). All the coast peoples appear to be closely connected with each other in language; but although there are many dialectic differences, the language of the whole country is substantially one, and is evidently nearly allied to those of the Malayan and Melanesian islands. The population of Madagascar is about 3,500,000.

The Malagasy, not having had their language reduced to a written form until the early part of the 19th century, have no ancient literature; but their numerous proverbs, songs, fables, and folk-tales, and their oratorical abilities, as well as the copiousness of their language, give ample proof of their intellectual acuteness. In their heathen state they were very immoral and untruthful, and cruel in war; but they are also courageous, affectionate, and firm in friendship, kind to their children and their aged and sick relatives, obedient to the law and loyal, very courteous and polite, and most hospitable. While retaining some traditions of a Supreme Being, they practised (and, except in the more enlightened parts of the central provinces, still practise) a kind of fetishism, together with divination, curious ordeals, and ancestor-worship.

The capital, Antananarivo, is situated centrally in the island, but nearer the eastern side. It has a population of about 70,000, and contains many large and handsome buildings, including the royal palaces,

the French Residency, government offices, seven stone churches, including the Anglican and Roman Catholic cathedrals, as well as many others of brick belonging to the English and French Protestant, the Lutheran and R.C., missions, several colleges and high schools, hospitals and dispensaries, an observatory, court of justice, mission printing-presses, &c. The chief ports are Tamatave and Mananjara, on the east coast; Majunga, on the north-west; and Tuléar, on the south-west coast. Diégo-Suarez, at the extreme north, and Fianarantsoa in Betsileo, are also important places.

The principal exports (averaging in value before the Great War from £800,000 to £900,000 annually) of Madagascar are cattle, hides, wax, india-rubber, rafia bast, fibre hats, and graphite, also ebony and other valuable woods; coffee, sugar, and vanilla are cultivated by Europeans, and ostrich-farming has been commenced. The chief imports, greatly varying in amount of late years, are cotton goods, metal-ware, crockery, coal, and rum. The principal trade is from the eastern ports to Mauritius and Réunion, and there is also now an increasing trade from the western side of the island with South Africa. The soil of the coast plains, especially of the eastern side, is fertile, and could supply large quantities of all tropical productions. Iron is abundant, especially as magnetite, also as hæmatite and bog-iron ore; the Malagasy are skilful in the smelting and working of this as well as other metals. Copper exists in some quantity in certain districts, and there also tin is said to be found. Galena is found abundantly near Mount Ankaratra, and from this lead is obtained, and silver has been extracted from it. Gold of excellent quality has been found in many parts of the interior, and forms about a third in value of the total exports. In the south-west of the island mineral oil and coal have also been lately discovered, and are now being worked. Other mineral products are sulphur, antimony, zinc, graphite, kaolin clay, slate, lignite, and garnets. Since the French conquest in 1895 carriage roads have been constructed in numerous directions in the interior, so as to connect together the chief towns and ports; and a railway connects Tamatave with Antananarivo. This is now being extended north and south of the capital. There is no lack of manual skill among the people, who excel in weaving, in straw-work, and in carpentry, as well as in the working of gold and silver and other metals.

Madagascar was known to the early Greek geographers Ptolemy and Arrian under the name of *Menuthias*; and the island was certainly known to and visited by Arab merchants at least a thousand years ago, and settlements were formed by them, as well as by Indian traders, in very early times; indeed, the Arabs have left indelible traces of their influence upon the language, civilisation, and superstitions of the Malagasy. Madagascar was first mentioned by Marco Polo as *Madeigascar* or *Magastiar*; but the first European to discover the island was the Portuguese Diogo Diaz in 1500. To the Portuguese was owing the name by which Madagascar was long known in European maps, *São Lourenço*, but they made no permanent colony there. The Dutch formed settlements for a short time; and the French made persistent efforts for nearly two centuries to maintain posts on the east coast, but without any permanent success. But they retained the little island of Ste Marie (east coast); in 1840 they obtained the island of Nosibé (north-west coast); and in 1883 they went to war with the Malagasy, hostilities being carried on in a desultory fashion for about two and a half years. Eventually a treaty was concluded by which the Bay of Diégo-Suarez, at the extreme north of Madagascar, was ceded to France, together with

the right to place a Resident and officers at the capital, and other officials at various ports and other places. In 1894 further demands were made by the French government upon that of Madagascar, but as these were not acceded to, an expeditionary force was sent to enforce the claims of France. This force landed on the N.W. coast early in 1895; but owing to the necessity for constructing a road, it was not until the 30th of September that the flying column reached the capital, bombarded it, and entered the city. The queen was allowed to retain somewhat of her dignity under the protectorate; but the rebellion of the following year led to the country becoming a colony of France. Queen Rānavàlona III. (born 1862, succeeded in 1883, died 1917) was in 1897 sent to live in Algeria. The whole island was gradually brought under French authority by General Gallieni, governor-general and commander-in-chief (1896-1905).

Up to the middle of the 17th century Madagascar was divided into a number of independent chieftaincies; about that time, however, the war-like Sakalava made themselves masters of the western half of the island, as well as of several interior provinces. But in the early part of the 19th century the Hova, led by two energetic chiefs, Andrianimpoinimerina and his son Radama I., threw off the Sakalava yoke, and, with the aid of English arms and discipline, made themselves virtually kings of Madagascar. They conquered the eastern, north-western, and central provinces; but the Hova authority was only nominal in many parts of the island. Radama abolished the export slave-trade, and encouraged English missionaries. From 1820 they reduced the language to writing, gave the people the beginnings of a literature, opened schools, founded churches, and introduced many of the arts of civilised life. But the accession of Queen Rānavàlona I. in 1828 gradually led to repressive measures; the missionaries were obliged to leave in 1835 and 1836, and in a severe persecution numbers of the native Christians perished; and Europeans were excluded from the island. The queen's decease in 1861 put an end to this period of terror, and Madagascar was reopened to Europeans at the accession of her son Radama II. Owing to the young king's follies and to intrigues with foreigners, he was put to death in 1863, and his wife Rāsoherina placed on the throne. During her reign (1863-68) steady advances were made, and treaties of commerce concluded with England, France, and America. Queen Rānavàlona II., who succeeded Queen Rāsoherina, her husband the prime-minister, and many of the nobles were baptised; and after the burning of the royal idols in 1869 almost the whole population of the central provinces of Imerina and Betsileo put themselves under instruction. In 1879 all the African slaves in the country were set free. Since 1896 the French Protestants have taken part in mission work. There are 2700 Protestant Christian congregations and some 400 schools, with 24,000 scholars and 360,000 adherents. Of the Roman Catholic mission, the numbers probably amount to about a fourth of the Protestants, of whom above three-fourths belong to the London Missionary and the Paris Societies, the others to the Friends, the Norwegian Lutheran, two American Lutheran, and the English Anglican missions. Several colleges and training institutions, as well as hospitals and dispensaries and leper asylums, have long been established in the country; and the mission presses issue 200,000 copies annually of various publications.

Sibree; Grandidier's *Histoire physique, naturelle, et politique de Madagascar* (forty 4to vols., 1876 et seq.); *Guide de l'Immigrant à Madagascar* (4 vols. 1900); other French books by Blanchard (1875), Routier (1895), and Catat (1896); and in English by Mullens (1875), Shaw (1886), Griffith (1920), and Ridgwell (1921), Oliver (1886), and Cousins (1895).

Mad-apple, a name sometimes given to the Apple of Sodom (q.v.), to the produce of the Egg-plant (q.v.), and to a kind of Galls (q.v.).

Maddalena, LA, a strongly fortified island, with a town of the same name, north of Sardinia. With the neighbouring islands of Caprera, &c., it forms an Italian naval station.

Maddaloni, a city of Italy, 17 miles by rail NNE. of Naples; pop. 23,000.

Madden, SIR FREDERICK, an eminent English antiquary, born in Portsmouth in 1801, employed in the British Museum first as assistant-keeper, from 1837 as keeper, in the department of MSS. He was knighted in 1832, and gazetted as one of the gentlemen of the privy chamber. In 1866 he retired from his office in the British Museum, and he died in London, 8th March 1873. Madden edited many works of literary or historical interest. As an editor he shows a rare combination of profound scholarship and temperate caution. His original writings are found in the pages of the *Archæologia* and *Collectanea Topographica*.

Madder (*Rubia*), a genus of plants of the natural order Rubiaceæ. The species are found in the tropical and warmer temperate parts of both the Old and New Worlds, and from early times till recently were important for the colouring matter of their roots, especially for dyeing Turkey-red. The most important is the Common Madder or Dyer's Madder (*R. tinctorum*), a native probably of the south of Europe as well as of Asia. It is a perennial, with weak stems and whorls of four to six elliptic or lanceolate glossy leaves, the stem and leaves rough with sharp prickles, small greenish-yellow flowers, and black fruit. Munjeet, or Indian Madder (*R. cordifolia*), ranks next to it in importance. *R. peregrina*, found in the south-west of England, and called Wild Madder, is very similar to *R. tinctorum*. Since the discovery of artificial Alizarin (q.v.) the commercial importance of madder has rapidly decreased (see DYEING).

Madeira, the largest of a small group of islands in the North Atlantic Ocean, off the north-west coast of Africa, from the nearest point of which it is 390 miles distant, in 32° 40' N. lat., 17° W. long. It lies 1164 miles SW. of the Lizard, and 535 miles SW. of Lisbon, and is within four days' sail of Plymouth, and six of Liverpool. The other islands of the group are Porto Santo, 23 miles to the NE., with a population of about 4000, where Columbus lived for a time before he touched at Funchal; and the Desertas, 11 miles SE., three uninhabited islands consisting of Deserta Grande, Bugio, and Ilheo Chao. Madeira (Portuguese 'timber,' the island having once been well wooded) was uninhabited when discovered in the 14th century, and was first settled in 1419. It is 38 miles long by 12 to 15 wide, and along with the other islands of the group is treated as an integral province of Portugal, entitled to send representatives to the Cortes at Lisbon. It was occupied by British troops in 1801 for a few months, and again from 1807 to 1814. It is traversed by a mountain-chain running east and west, with deep ravines between the lateral ridges, the most notable of which is the 'Grand Curial,' with a depth of more than 2000 feet. The islands are of volcanic origin,

and are the summits of lofty mountains, rising in Pico Ruivo to 6059 feet, in Torres Peaks to 6000, Pico Arrieiro to 5895, and in many others to 4000 and 5000 feet. Slight earthquakes occasionally occur. In the south the brooks are dry in summer, and the country is treeless and arid; the north side is more luxuriant and fertile, with wider areas of cultivated ground; in the north-west are undulating grassy plains. The coasts are steep and precipitous, the only harbour being that of Funchal (q.v.). Pop. of province (1920) 179,002.

The clouds, which are attracted by the mountains, yield plenty of moisture, and the climate is remarkable for its constancy, though probably too relaxing for those in perfect health and accustomed to a temperate climate. The thermometer at Funchal shows a mean temperature of 61° F. At the coldest season the thermometer occasionally registers a minimum of 50° F. In the hottest days of summer it seldom rises above 80°, while 90° is exceptional. The prevailing wind during nine months of the year is north-east. The average rainfall is 29 inches, and the average number of days on which rain falls in heavy showers is 70, but there are few really wet days. The temperate and constant warmth of its climate has made it a favourite resort for invalids affected by pulmonary disease. The only land reptile is the lizard, and Madeira has no indigenous mammalia, though the ordinary domestic animals, together with rabbits, rats, and mice, have been introduced by the Portuguese. The fruits and grains of Europe are cultivated on the lower levels; the products include wheat, barley, Indian corn, the potato, oranges, lemons, guavas, mangos, figs, and bananas. Travellers praise the golden splendour of the wide expanses of gorse and broom in blossom, and of the marvellous masses of colour, pink, mauve, and brick-dust red of the flora of the island.

Wine is the chief export, several kinds being produced in the island. That known in Europe as Madeira, a wine of strong body and fine bouquet, is made of a mixture of black and white grapes. The vines were nearly exterminated in 1852 and succeeding years by oidium, but were soon replanted; and oidium and the phylloxera have since been kept in check, so that a bad vintage has been almost unknown from that time. Sugar-canes brought from Demerara and the Canary Islands are flourishing.

The inhabitants are of mixed Portuguese, Moorish, and Negro descent; they are of vigorous frame, lively, and industrious, economical and simple in their habits. There is much emigration, chiefly to the United States and Brazil. Madeira long suffered from the absence of roads, the only six miles of macadamised roadway being that between Funchal and Camara do Lobos, a fishing-village. Loads are carried on the head by natives, and hammocks and sledges drawn by bullocks are used for the tracks, while small sledges assist travellers down the mountains sometimes. But roads have been made and motor-cars are supplanting bullocks. The export of fruit and vegetables is on the increase; and as irrigation has been introduced with great advantage, Madeira becomes more and more the market-garden of London. The trade is chiefly with Great Britain.

See works by Brown, Biddle, Stanford (1909), Koebel (1909), and Lethbridge (1924).

Madeira, the great affluent of the Amazon, has its origin in the confluence of the Mamoré and Guaporé (q.v.), at about 12° S. lat., the Beni (q.v.) joining 110 miles lower down. The river then flows north-east to the Amazon, its drainage basin embracing some 425,000 sq. m. From its mouth to its first falls the distance is

578 miles; above this point navigation is broken by a series of twenty-two falls, rapids, and cataracts for a distance of 210 miles. In 1873-75 the attempt to construct a railway to pass these, and so provide an outlet by the Amazon for the products of Bolivia, was defeated by the appalling mortality amongst the workers caused by fever. When in 1905 a new attempt was made, the fever was gradually conquered by modern science, doctors, and hospitals, and a line now runs from the frontier to near São Antonio.

Madeleine, LA, gives its name to the Magdalenian (late Paleolithic) culture. See ANTHROPOLOGY.

Mādhava is an appellation of the Hindu god Vishnu (q.v.).—**MADHAVA ACHARYA** was a 14th-century Hindu author, who wrote on the more ancient Hindu learning. And see **SINDHIA**.

Madison, (1) the capital of Wisconsin, founded in 1836, is situated on an isthmus between Lakes Mendota and Monona, 82 miles W. of Milwaukee, at the junction of several railways. It contains the state capitol, university of Wisconsin (founded in 1849), and lunatic asylum, and has manufactures of farming implements, machinery, &c. Pop. (1885) 12,064; (1910) 25,531; (1920) 38,378.—(2) Capital of Jefferson county, Indiana, on the Ohio River, 86 miles by rail SSE. of Indianapolis. It has boiler and engine works, steamboat-yards, and manufactories of furniture. Pop. 7000.

Madison, JAMES, fourth president of the United States, was born at Port Conway, Virginia, March 16, 1751, graduated at Princeton in 1772, and studied law. In 1776 he was a member of the Virginia Convention, and took a useful part in drawing up the state constitution. His life from this time was devoted to politics, and he became one of the most eminent, accomplished, and respected of American statesmen. In 1780 he was elected to the Continental congress, and in 1784 to the legislature of Virginia, in which he was chiefly instrumental in securing the recognition of the right to religious liberty. But at this period anarchy was threatening the young republic, which hitherto had been but a loose confederation of states. Congress was a deliberative body merely; its members represented states only, and its powers were practically confined to that of giving advice. Madison was active in bringing about the Convention of 1787, which framed the Federal constitution. There he acted with Jay and Hamilton, and with them wrote the *Federalist*. He was the chief author of the 'Virginia plan,' which even went some way towards disregarding state rights. He also suggested the important compromise under which, whether in apportioning taxation or representation, slaves were to be regarded as population and not chattels, but five were reckoned as three persons—the so-called 'three-fifths rule,' which secured the adoption of the constitution by South Carolina and the other slave-holding states. A month's discussion and all Madison's arguments were necessary before the Virginia Convention was brought to ratify the constitution, and that only by 89 votes to 79. Madison was elected to the first national congress. He had done as much as any man, perhaps, to secure the adoption of the constitution, but he now showed himself anxious to limit the powers of the central government to the strict letter of their commission therein contained. He opposed the financial policy of Hamilton, and became a leader of the Republican or Jeffersonian party. In 1801, Jefferson having been elected president, Madison was made secretary of state, which post he held during the eight years of Jefferson's administration. In 1809 he was elected president. The European wars of that period, with their

blockades and orders in council, were destructive of American commerce, and ultimately brought on a war with England, which was declared in 1812, and continued for two years, at an enormous cost of life and treasure. In 1817, at the close of his second term, Madison retired to his seat at Montpelier, Virginia, where he died, 28th June 1836. Modest and reserved, courteous and kindly, he is a pleasant as well as an important figure in American history. He was not a brilliant man, but he was a statesman of eminent ability and purity of character. See the *Lives by Rives* (Boston, 3 vols. 1859-68) and Gay ('American Statesmen' series, 1884).

Madison University, now Colgate University, is at Hamilton, N.Y.

Madness. See **INSANITY**.

Madoc, son of Owen Gwynnedd, a Welsh prince, is believed by his countrymen to have discovered America about 300 years before Columbus. Compelled, it is said, by civil strife, to abandon his native land, he sailed westward in 1170 with a small fleet, and, after a voyage of several weeks, reached a country whose productions and inhabitants were quite unlike those of Europe. Here he lived for a long time; then, returning to Wales, he gave an account of the new land that he had discovered, equipped another fleet, set sail again, and was never more heard of. The story will be found in Lloyd and Powell's *Historie of Cambria* (1584); but see the essay by Thomas Stephens written in 1858 for the *Eisteddfod*, and published in 1893. There is no foundation for this Welsh tradition; even if there were, the Northmen have a prior claim to the discovery of America, for it is beyond doubt that Greenland and the American mainland were visited by them at a much earlier period (see **VINLAND**). Catlin in his *Letters on the North American Indians* (1841) hazardingly describes the *Tuscaroras* as a mixed race, descended from Madoc's Welshmen and the aborigines. Southey chose the story of Madoc as the subject of one of his epics.

Madonna, an Italian word meaning 'My Lady,' used as the generic title for works of art, generally paintings, representing the Virgin, or the Virgin with the Infant Christ. Legend credits St Luke with having painted the first Madonna, a portrait put on the canvas from life, and with having carved the image of the Virgin in the Santa Casa at Loreto. After the Council of Ephesus (431), images of the Virgin with the Saviour in her arms became the recognised symbols of the orthodox faith. But the iconoclastic fury fomented by Leo III., the Isaurian, entailed the destruction of many of those early Madonnas. The oldest representations of the Virgin that survive are those which have been found in the catacombs, accompanying the tombs of the early Christians. Cimabue was the first to put natural life into the dead and angular designs of the Byzantine artists, and with him began that wonderfully productive and brilliant period of Italian art the all-dominant theme of which was the Madonna, that culminated in the glorious works of Raphael—the Sistine Madonna, the Madonna della Sedia, &c. These Italian artists handed on the cult to the German masters, who not only executed more realistic, more human pictures of the Virgin, but carved her effigy in wood. Amongst so many artists it is not surprising to find the subject treated in diverse styles and manners. To quote Mrs Jameson (*Legends of the Madonna*, new ed. 1890): 'Thus we have the stern, awful quietude of the old mosaics; the hard lifelessness of the degenerate Greek; the pensive sentiment of the Siena and the stately elegance of the Florentine Madonnas; the intellectual Milanese, with their large foreheads and thoughtful eyes; the tender, refined mysticism of the Umbrian; the sumptuous loveliness of the Venetian; the

quaint characteristic of the early German, so stamped with their nationality . . . the intense lifelike feeling of the Spanish; the prosaic, portrait-like nature of the Flemish schools; and so on.' The title *Madonna* is not used with rigid consistency: it is also applied to representations of the Annunciation, Nativity, Adoration of the Magi, Flight into Egypt, Holy Family, and all the several scenes and incidents in which the Virgin Mary personally figures. She is often represented too in certain specific characters with appropriate epithets, as *La Vergine Gloriosa* (with Jesus), *Our Lady of Sorrow*, *Queen of Heaven*, &c. Entire series exist depicting the events of her life, painted by painters like Giotto, Orcagna, Albert Dürer, and Luini. Two common series are the *Seven Joys* and the *Seven Sorrows* of the Virgin.

Besides Mrs Jameson's book, see works by Rohault de Fleury (1878), A. Schultz (1879), Erkl (1883), Von Schreiberhofen (1886), for the middle ages (1879); Fähr, for the older German schools (1884); and Liell, for the catacomb pictures (1890).

Madras City (called by the natives *Chennapatnam*) is situated on the Coromandel Coast in 13° 4' N. lat. and 80° 17' E. long., and is the capital of the presidency of the same name. Originally it consisted of a number of separate villages, which are now united into a single municipality. The roadstead, in which till quite recently all ships had to lie, is very much exposed, and on the approach of a cyclone all vessels put out to sea. A pier was erected in 1859-62. A harbour begun in 1876 was seriously damaged in 1881, and improvements continued to be made in the 20th century, but it is questionable whether it will ever be safe for ships to remain in it during a heavy storm. It already, however, greatly facilitates the landing of cargo during rough weather, and passengers have no longer to cross the surf in going to or coming from steamers. A marked feature of this part of the coast is the heavy surf which rolls in, even in comparatively calm weather. In ordinary weather the surf breaks about 300 feet from the shore, and the wave is of no great height; but in stormy weather there are two lines of surf, the outer one being some 1000 feet from the shore with a wave of 12 to 14 feet high. The ordinary surf can be crossed with safety by the native *massulah* boats, which are formed of planks sewn together with string, but no boat can live through the surf in a cyclone. The port is liable to be visited by these storms at two seasons—towards the end of May and beginning of June, when the south-west monsoon sets in, and in October, November, and the early part of December, during the prevalence of the north-east monsoon. Cyclones are rare at other times. The climate of Madras may be described as hot and moderately dry. The annual rainfall averages 49 inches, falling on ninety-five days, but during the seventy-four years ending with 1889 it varied from 8½ inches in 1827 to 18½ inches in 1832. The mean temperature for the year is 83° F., varying from 76° in December and January to 88° in June. During the hot months the temperature frequently rises above 100°, but the *mean maximum* in no month exceeds 99°. The mean annual range is 48°. The highest temperature recorded in the twenty-seven years ending with 1889 was 112·9° and the lowest 57·6°. The heat of the hot season is greatly modified by a sea-breeze, which often sets in soon after noon and blows till sunset. On the whole the climate is a healthy one.

On the shore, midway between the north and south extremities of the town, is Fort St George, the original settlement. This fort (built 1750) still contains the council chamber, a number of government offices, and barracks for the European troops. North of the fort lies Black Town,

or George Town, with most of the business offices and a crowded native population; south of it lies Triplicane, the chief Mohammedan centre. Inland and to the extreme south lie the houses chiefly occupied by Europeans, most of which stand in large 'compounds' or parks, surrounded by trees. Though Madras cannot compete with either Calcutta or Bombay in the magnificence of its public buildings, it contains some that are worthy of note. Amongst these may be mentioned Government House, the Chepauk Palace, the Senate House, St Andrew's Kirk, St George's Cathedral (containing a monument by Chantrey to Bishop Heber), the Madras Club, the post and telegraph office, and the High Court buildings. Many of the buildings are rendered specially striking by the free use of polished *chunam* made from shell lime. Madras University, founded in 1857, was originally an examining body, the teaching being done by affiliated colleges throughout the presidency. An act was passed in 1923 reorganising the university, so that a teaching and residential university might be established at Madras. In addition to colleges for the study of arts, medicine, and engineering, there are, in or near the city, a School of Art, a College of Agriculture, a branch of the Royal Asiatic Society, and a large museum, containing, amongst other things, very valuable collections of Indian coins and of sculptured marbles from the Buddhist 'tope' at Amravati. Madras is the seat of the government and of the supreme court. Pop. (1881) 405,843; (1921) 526,911, of whom 2944 were Europeans, 9000 Anglo-Indians (Eurasians), and 53,000 Mohammedans, the rest being Hindus. The chief articles of export are coffee, tea, cotton, grain, hides, indigo, oil-seeds, dye-stuffs, sugar, and horns. The average value of exports and imports for five years previous to 1922 was about £6,675,000 and £8,200,000 respectively. For the railway connection, see under the presidency below. The Buckingham Canal gives a waterway to the north and south parallel to the coast.

Madras Presidency, one of the administrative divisions of India, occupies the southern part of the peninsula; it is also known as the Presidency of Fort St George. It extends from N. lat. 20° 18' on the east coast and lat. 14° on the west coast to Cape Comorin in lat. 8° 4'. The total area, excluding the Madras states, is 142,260 sq. m.; pop. (1881) 30,868,504; (1921) 42,318,925. Of these some 37½ millions are Hindus, about 2,840,000 Mohammedans, and over 1,360,000 Christians. (The Madras states—Travancore, Cochin, Pudukkottai, and a few small states—have an area of 10,696 sq. m., and a population of 5,460,000.) For revenue purposes the presidency is divided into twenty-seven districts. The chief government officer in each district is the collector, who controls all departments except the judicial. The principal mountains belong to the two chains of the Eastern and Western Ghâts. The former have an average height of 1500 feet, but rise in parts to 3000 or 4000 feet; the latter have a considerably greater average height, with a number of peaks rising from 5000 to 8000 feet, and a few even higher. A considerable part of the presidency forms a tableland, together with the state of Mysore, rising to a height of from 1000 to 3000 feet. A very notable geographical feature is the Palghât Gap in the Western Ghâts, 25 miles wide, and only 1000 feet above sea-level. Through it passed the old trade-route between the west and east coast, now superseded by a railway, and through it the south-west monsoon blows strongly, bringing rain to a considerable area lying east of it. The Nilgiri Hills, on which at Ootacamund is the summer seat of the government, may be looked on as the junction of the

Eastern and Western Gháts. There are also several important outlying spurs, of which the Shevaroyis in Salem, the Anamalais in Coimbatore, and the Palnis in Madura are the most noteworthy. The chief rivers are the Godavari, the Kistna, and the Kaveri, all rising in the Western Gháts, and crossing the peninsula in a south-easterly direction to the Bay of Bengal. Very extensive irrigation-works have been carried out in connection with each of these rivers, while minor irrigation-works are to be found in almost all parts of the presidency. There are about 4000 miles of railways. The Madras Railway (5 ft. 6 in. gauge), with its terminus at Madras, crosses the country in two lines. The one passes in a south-westerly direction to Calicut and Mangalore, with branches to Bangalore, where it connects with the Mysore Railway, and to Mettapolliem, the station for the Nilgiris. The other crosses in a north-westerly direction to Raichor, where it connects with the Great Indian Peninsular Railway. At Guntakal it makes connection with the extensive system of the South Mahratta Railway. The South Indian Railway (metre gauge) runs south from Madras to Tinneveli, with branches to Pondicherry, Negapatam, and Tuticorin; a line from Trichinopoly connects it with the Madras Railway at Erode, and another branch from Chengalpat connects it with the same railway at Arcunum. There are good roads in most parts of the presidency.

The climate differs greatly in different parts. In the Carnatic the dry season lasts from the middle of December till the end of June, there being often three or four months without any rain. From June to October there are heavy showers, and from October to the middle of December the north-east monsoon brings copious rain. Over a great part of the east coast strip the annual rainfall exceeds 40 inches; but in some parts inland it does not exceed 20 inches, and in many parts it falls below 30 inches. The mean annual temperature is about 82°, and in many stations a maximum temperature of upwards of 110° is not uncommon. On the Malabar coast the rainfall is much heavier, and comes with the south-west monsoon. The moisture-laden winds, being driven upwards by the lofty mountains, cool as they ascend, and pour down their surplus moisture on the strip of land between the hills and the sea. Thus, the fall from June to October is 119 inches at Mangalore, and 132 inches at Honawar. The annual rainfall at Mangalore is 131 inches, and at Cochin 115 inches; at the latter place 227 inches fell in 1882. This abundant rainfall leads to a most luxuriant vegetation in Travancore and on the west coast. The mean temperature varies from 79° to 80°, and there are no great extremes. The climate of the hill-stations is not unlike that of England at its best. Frosts are not unknown, but are slight, and in summer the temperature never rises very high. The climate of the Nilgiris has been described as 'that of the English spring and summer without Atlantic storms or the bitter east winds of March.' Save when the monsoon is at its height, it would be difficult to imagine a finer climate. Rice is the chief crop grown throughout the presidency, but several other cereals are largely cultivated. Pulse, ground-nut and other oil-seeds, indigo, and sugarcane are of great importance in certain parts. Cotton is grown over a wide area in the drier parts, and tobacco of excellent quality is produced in large quantities on islands in the Godavari, and in parts of the Coimbatore and Madura districts. Trichinopoly cigars and cheroots are increasingly exported. On the hills tea, coffee, and cinchona are successfully cultivated over wide areas. The manufacturing industry is represented by cotton, sugar, gunny bags, paper, ice, and tiles. Madras

is not rich in minerals. Gold is found in many parts, but the Dharwar Rocks do not yield the productive results obtained in Mysore. Iron of excellent quality abounds, but the want of fuel prevents any large development of the iron industry. Other minerals are magnesite, manganese, mica, and monazite. Diamonds have been found, chiefly in the Karnul district. The forests are now carefully protected by the state, and are of great value, especially the teak forests.

The first English settlement was made at Masulipatam in 1611. In 1616 factories were established on the west coast at Calicut and Cranganore. In 1628 the Masulipatam factory was transferred to Armagaon, 40 miles north of Pulicat, and this was the first place fortified by the English in India. In 1639 a settlement was obtained at Madras. Christian missions have made more progress in Madras than in any other part of India. Of a total of 4,750,000 Christians in India in 1921, 2,800,000 were in Madras (including the Indian states of Travancore, Cochin, and Pudukkottai); and of those about one-half were Roman Catholics. In the Madras states the Christians numbered more than 25 per cent. of the population in 1921.

Madras System. See BELL (ANDREW).

Madrepore. See CORAL.

Madrid, the capital of Spain, is situated in the province of the same name, in the ancient division of New Castile, on the left bank of the Manzanares, in 40° 24' N. lat. and 3° 25' W. long., 880 miles by rail from Paris. It is built on a treeless, ill-watered plateau, 2410 feet above sea-level, and was created capital by the arbitrary will of a sovereign. The Manzanares is merely a mountain-torrent falling into the Jarama, a tributary of the Tagus, useless for communication, and not even to be depended upon to supply the city with water, which is brought from the Guadarrama Mountains by an aqueduct 42 miles in length. The sole recommendation of Madrid as capital is its central position in the Peninsula; it is nearly equidistant from the Atlantic and Mediterranean coasts and from the Pyrenean frontier. Swept, during the winter months, by the icy winds from the snow-capped mountains on the north, and exposed in summer to a burning sun, it has a climate which, though dry and bright, shows extreme variations of temperature (104° to 14° F.). At the beginning of the 19th century the population was about 160,000; in 1860 it was 298,000; in 1870, 332,000; in 1910, 571,540; and in 1920, 750,896. The town is being rapidly extended; built on high ground, its streets slope down to the Manzanares on one side, and on the other to a deep furrow, now the Prado and the Castellana.

Through the Latin and Arabic chroniclers Madrid can trace its existence as far back as the 10th century, when it was known as *Medina Magerit*, a fortified post of some importance on the frontier of the Moorish kingdom of Toledo. First retaken by the Christians under Ramiro II. of Castile (939), it was not finally conquered till the reign of Alfonso VI. (1085). A list of its inhabitants, Castilian and Mozarab, appears in a charter of Toledo granted by Alfonso VIII. in 1117. After this time the mention of it in documents is frequent. The part first inhabited was the high ground where the royal palace now stands on the west of the city: here was the stronghold that first gave the place celebrity. As the Christian frontier was pushed farther southward, Madrid would probably have again sunk into obscurity had it not been a favourite place of meeting for expeditions against the Moors, and temporary residence of the kings, who were attracted by the game sheltered in the

extensive forests, long since destroyed, to the great detriment of the climate. The city received its first charter in 1202, and the Cortes were first held in it by Ferdinand VI. (1309), and subsequently by Alfonso XI. and Henry III., the former of whom altered the constitution of the city, giving it twelve *regidores* and two *alcaldes* in place of the *Señor de Madrid*, who had formerly been elected by nobles and commons. John II. and Henry IV. granted additional privileges to the city. Isabel the Catholic acquired the city after a sharp struggle with the partisans of her rival Doña Juana, and it now became a place of some importance owing to the more frequent presence of the court. After the death of the Catholic kings, the regent, Cardinal Cisneros, ruled Spain from Madrid, and, though the city embraced the popular cause in the war of the Comuneros, it received such privileges from the Emperor Charles V. that its population rose rapidly from 3000 to 6000 households; during this reign it furnished a prison for Francis I., king of France. When in 1561 Madrid was declared capital of Spain by Philip II. it contained about 30,000 inhabitants. With the court came the great nobles, who built palaces, and innumerable friars, who established convents; nevertheless till the middle of the 17th century the city presented a mean appearance, and most of the houses were only one story high, thus avoiding the obligation of lodging the numerous retinue of the kings. Philip IV. made some improvements, especially the laying out of the park of the Buen Retiro, and in his time Madrid, though still unpaved, filthy, and roamed over at will by the privileged pigs of St Anthony, was the seat of one of the most brilliant courts of Europe. The greatest benefactor of the city was King Charles III., many of whose splendid works still exist. Madrid took an active part in the revolution that wrested the power from Godoy, the Prince of the Peace, and during the domination of Napoleon (2d May 1808) made a gallant attempt to shake off the foreign yoke. Though taken by the allied force under the command of the Duke of Wellington in 1812, Madrid was not finally rid of the French till 1813. The next year marked the return of the Bourbon king. Although the scene of several of the revolutions that form so large a part of modern Spanish history, Madrid, aided by the suppression (1836) of the convents, the introduction of railways (1850), and an abundant supply of good water (1858), has been continually and rapidly advancing in importance and prosperity.

The general aspect of the city is clean and gay, whilst the older parts, the Calle de Toledo, Plaza Mayor, and district of Lavapiés are picturesque; no trace of the mediæval city now remains. Madrid is administered by a military and a civil governor, aided by the mayors of the various districts into which it is divided. The police is good, and Madrid is as safe as any European capital. The new streets are generally fine, broad, and planted with trees; the houses well built, lofty, stuccoed and painted, and inhabited by several families living in flats, guarded at night by watchmen (*serenos*), to whom the key of the street door is entrusted. A great feature is the magnificent open spaces, chief of which is the Prado, running north and south through the eastern part of the city, and, with its continuations, three miles long: it contains four handsome fountains with groups of statuary, a fine obelisk to commemorate the gallant struggle of the citizens with the French (2d May 1808), monuments to Columbus, the Marqués del Duero, and Isabel the Catholic. The picture-gallery, founded by Charles III., and situated in the Prado, is one of the finest in Europe, and contains the principal works of Velázquez and Murillo, besides many of

the masterpieces of Raphael, El Greco, Tintoretto, Rubens, Teniers, Goya, and Van Dyck. Two other parks are the Buen Retiro, with the large monument to Alfonso XII., the fashionable promenade on the east of the city, and the Casa de Campo on the west. Midway between its extremities the Prado is crossed at right angles by the Calle de Alcalá, the finest street in the city, about a mile in length, and leading from outside the fine triumphal arch rebuilt by Charles III. to the Puerta del Sol, a handsome though not very large square, with broad pavements, and a fountain in the centre. This square is the heart of Madrid; here converge the principal tramway lines which have so greatly aided the extension of the city, and in it and the streets branching off from it are situated the principal shops and places of business. The finest square is the Plaza Mayor, formerly the scene of bull-fights and *autos da fé*, and said to have held 50,000 spectators; it contains a gigantic equestrian statue of Philip III., its founder, and was formerly the centre of Madrid, but is now somewhat decayed as the city has moved farther eastward. On the west of the city is situated the royal palace; commenced in 1738 to replace the ancient Alcázar, which had been burned down, it was finished in 1764. It is a fine stone building in the Tuscan style, designed by Filippo Jabara an Italian architect, and his successor Sachetti. Dependencies of the palace are the royal armoury, containing the finest collection in the world, and the royal stables, remarkable for their extent. Other fine buildings are the palace of justice, formerly a convent; the houses of parliament, Palacio de los Consejos; Buena Vista Palace, now the ministry of war; the national bank; and the town-hall. There is a flourishing university, founded by Cardinal Cisneros. Madrid is well provided with newspapers and public libraries, the chief being the National Library, housed in the National Museum, and the library of the university; those of the palace and of the Academy of History contain many treasures. Amongst the many learned societies the principal are the Academies of History and the Spanish Language; the Ateneo is a flourishing literary club with a good collection of books. The opera-house is one of the finest in the world, and there are many other fine theatres. The bull-ring, situated outside the gates on the east, is a solid structure seating 14,000, and owned by the provincial council. The church of Santa María de la Almudena, near the Royal Palace, is to take the place of plain San Isidro as the cathedral. There are two Gothic churches of note, the Capilla del Obispo, and the church of San Jerónimo el Real, which is interesting historically. San Francisco el Grande contains a notable altar-piece by Goya. The manufacture of tobacco, the monopoly of which is farmed by the government to a company, employs many hands, chiefly women. Leather and fancy goods are made. The publishing trade is important, and books are well printed and cheap. The old tapestry-factory still turns out beautiful work, and the potteries at Moncloa are now producing good imitations of many of the artistic kinds of earthenware for which Spain was formerly celebrated. Madrid is the principal railway centre in the country. The exchange and money-market, largely carried on by foreigners, is the most important in Spain.

See Ayala y Sastre, *Madrid, Biblioteca de la Provincia* (1889); Mesonero Romanos, *El Antiguo Madrid* (1881); Mrs Steuart Erskine, *Madrid* (1922). For Madrid (Province), see SPAIN.

Madrígal, a word of uncertain etymology, denotes a short lyrical poem, generally on the subject of love, and characterised by some epigrammatic terseness or quaintness. It was written,

as a rule, in iambic metre, contained not less than six or more than thirteen lines, and ran chiefly upon three rhymes. Among the Italians the best writers of madrigals are Petrarch and Tasso; among the French, Montreuil and Monerif; among the Germans, Hagedorn, Voss, Goethe, and A. W. Schlegel; and among the English, Lodge, Wither, Carew, and Suckling.—The name is also applied to the music for a simple song sung in a rich artistic style, but without musical accompaniment. The original composers wrote for three, four, or more voices; but madrigals are now usually sung by a small but well-trained choir. These compositions originated with the Flemings, and before the middle of the 15th century. From them and by them it was carried to Rome and Venice, and to England, where a famous school of madrigal composers flourished from about 1530 to about 1630. The chief composers of the English school were Byrd, Weelkes, Kirkby, Wilbye, Morley, Dowland, Benet, Este, Bateson, and Orlando Gibbons. Madrigal-singing ceased to be popular in the 18th century; its place is now taken by glee-singing (see GLEE). The Madrigal Society of London, founded in 1741 by John Immyns, claims to be the oldest musical association in Europe.

See E. N. Fellowes (ed.) *The English Madrigal School* (1913 et seq.), *English Madrigal Verse, 1588–1631* (1920), and *English Madrigal Composers* (1921).

Madura, a maritime district of India, in the south of the Presidency of Madras, is bounded on the E. by the Gulf of Manaar; it has an area of 4907 sq. m., and a pop. (1921) of 2,007,082. Chief town, Madura, second largest in the presidency; pop. (1881) 73,807; (1921) 138,894. For nearly 2800 years Madura was the political and religious capital of the southernmost part of India. Its Pandyan kings are mentioned by the ancient Greek geographers. In the 17th century the Nayak rulers, chiefly Tirumala (1623–59), built here a magnificent pagoda to Sundareswara (Siva), with a hall having one thousand (997) pillars, a fine palace, now ruined, a summer palace for the god, and a great tank. The Jesuits have long been active here; there are over 100,000 Roman Catholics in the districts of Madura and Ramanad (formerly part of Madura.) For Madura foot, see MYCETOMA.

Madura, an island of the Dutch East Indies, separated by a narrow strait from the north-east of Java, to which it is subject for governance, with an area of 1764 sq. m. It is mostly barren, but cattle-raising is carried on, and it possesses numerous forests and salt marshes. Along with some eighty smaller islands, lying mostly to the east, it forms a Dutch residency; area 2000 sq. m.; population 1,700,000. The people, of Malay descent, resemble the Javanese, but are stronger, more enduring, and more enterprising; they make the best native soldiers in the Dutch colonial army.

Madvig, JOHAN NICOLAI, Danish classical scholar, was born at Svaneke, in Bornholm, on 7th August 1804, educated at Frederiksborg and Copenhagen, began to teach at the university in 1826, and in 1829 became professor of Latin Language and Literature, and in 1848 inspector of higher schools. He took a keen interest also in politics, was one of the chief speakers of the national Liberal party, sat in parliament, held the portfolio of religion and education from 1848 to 1851, and after 1855 was repeatedly elected president of the Danish parliament. He died blind on 13th December 1886. For more than half a century Madvig enjoyed the highest reputation, not in Denmark only, but throughout Europe, as a shrewd, clever critic of the Latin and Greek prose-writers. It was in criticising and emending the

text of Cicero and Livy that he won his greatest laurels, his *Emendationes in Ciceronis Libros Philosophicos* (1828), editions of *Cicero's De Finibus* (1839; 3d ed., greatly improved, 1876), *Cato Major et Laelius* (1835; 2d ed. 1869), *Emendationes Livianae* (1860; 2d ed. 1876), and the edition of *Livy* (4 vols. 1861–66) being all productions of first-rate scholarship. He provided for students very valuable information on Cicero's works in *Opuscula Academica* (2 vols. 1834–42; 2d ed. 1887); worked out a systematic account of his critical principles in *Adversaria Critica* (3 vols. 1871–84); published in 1841 his well-known *Latin Grammar* (7th ed. 1881), and in 1846 his still better known *Greek Syntax* (Eng. trans. 1853), both excellent works, but now being superseded by the results of newer philological study. The last books from Madvig's pen were a dissertation on the *Constitution and Administration of the Roman State* (2 vols. 1881–82), intended in some sort as supplementary and corrective to Mommsen's great history, and an *Autobiography* (1887).

Mæander (now *Bojuk Mender*), the ancient name of a river of Asia Minor, rising near Celæna, in Phrygia, and flowing 240 miles west-south-westward to the Aegean at Miletus. Its windings, proverbial since Cicero's day, are after all nothing remarkable.

Mæandrina, a genus of massive reef-building corals of the family *Astræidae*. The individual animals which compose the colony are arranged in long winding rows; those of one row are not separated from one another by the usual round walls, and thus elongated continuous furrows are formed not unlike mammalian brain-convolutions; at the same time the entire shape is roughly hemispherical; hence the popular names brain-coral and brainstone coral. The rate of growth is slow; the total size often large. About twenty species (*M. cerebriformis*, *M. sinuosissima*, &c.) are known, some living, others occurring from the Chalk on to Tertiary strata. They are abundant in the West Indian Ocean.

Mæcenās, C. CILNIUS, a Roman statesman of Etruscan origin, whose name has become a synonym for a patron of letters. He first appears in history in 40 B.C. engaged in arranging a marriage between Octavian and Scribonia. Later we find him negotiating the peace of Brundisium, and acting with vigour in the city during the campaign of Actium. When Octavian assumed the supremacy and the title of Augustus, Mæcenās took a chief place in his counsels. The nature and extent of his official power are not very precisely understood, but they were undoubtedly great, though the influence and authority he enjoyed are to be estimated rather from his intimacy with the emperor than his mere position as a public servant. During his later years the friendship was interrupted from reasons that cannot now be exactly ascertained, but mutual esteem survived and no open rupture took place. Mæcenās was a thoroughly sincere imperialist. He had a belief in the value of an established government; and when he found that he no longer retained the confidence of his sovereign he did not lapse into a conspirator; but, as a modern minister might do, retired into the obscurity of private life. He had ever been given to luxury and sensual delights, but his complex nature craved the solace also of higher pleasures. He now gave all his time to literature and the society of literary men. He was immensely rich, and kept an open table for men of parts at his fine house on the Esquiline Hill; above them all he loved the genial Horace. He died in the year 8 B.C., leaving the emperor his wealth.

Mælar. See MÅLAR.

Mældun. See MAILDUN.

Maelström ('grinding stream'), or MOSKENSTROM, a famous whirlpool, or more correctly current, between Moskenäs and Mosken, two of the Lofoten (q.v.) Islands. The strait is habitually navigated by vessels at high tide and low tide, though in one place the water is always rough and churned into angry foam. When the wind blows directly against the current it becomes extremely dangerous, especially with spring-tides or during a north-west wind. The stories of ships, whales, &c. being swallowed up in the vortex are simply fables; at the same time, a ship once fairly under the influence of the current, would probably founder or be dashed upon the rocks, and whales have often been found stranded on the Flagstad coast from the same cause. The current takes twelve hours to make a circular revolution. Edgar Allen Poe's imaginative description of the horrors of being sucked down by the Maelström is well known. A like dangerous current is the Saltström, at the entrance of the Salten Fjord, where a vast mass of water is poured through a narrow opening at a terrific rate. Yet steamboats pass through the Saltström, though only at high or low tide.

Maenads. See DIONYSUS.

Maes, or MAAS, NICOLAS (1632-93), a Dutch genre and portrait painter, born at Dordrecht, who, after studying under Rembrandt, settled at Antwerp, and produced many genre paintings of merit. 'Girl at a Window,' 'The Idle Servant,' and 'Bishop Reading,' are among the finest examples of his art, and show his power of amusing observation, although they do not equal the works of Dow or Vermeer. He died at Antwerp.

Maeshowe, a chambered mound in the Mainland of Orkney, 9 miles WNW. of Kirkwall and 1 mile E. of the great stone circle of Stennis. A grassy truncated cone, 36 feet high and 92 feet in diameter, it is surrounded, at a distance of 90 feet from its base, by a trench 40 feet wide, and still in places 8 feet deep. On the west side is a passage, 54 feet long, $2\frac{1}{2}$ to $3\frac{1}{2}$ feet wide, and $3\frac{1}{2}$ to $4\frac{1}{2}$ feet high, with (about midway) a unique doorway. This passage leads to a central chamber, measuring $15\frac{1}{2}$ by $14\frac{1}{2}$ feet; converging to a vaulted roof, originally 20 feet high; and built, like the passage,

Maeshowe, ground-plan.

of undressed slabs and blocks of native stone. On each of the other three sides of the chamber, at a height of 3 feet from the floor, there is a square opening to a cell or 'sepulchral loculus,' 3 feet high, $4\frac{1}{2}$ feet wide, and $5\frac{1}{2}$ to 7 feet long. Maeshowe was explored in 1861 by Mr James Farrer, M.P., when it was found to have been 'ransacked' at least once before—in the winter probably of 1152-53 by Norwegians, followers of Earl Rognvald, and pilgrims to Jerusalem. Their Runic

inscriptions, comprising upwards of 900 letters, thickly cover the walls of the central chamber, and consist mainly of such inscriptions as 'Her-mund Hardaxe carved these runes.' There are carvings besides of eight crosses, 'a worm-knot,' and a nondescript animal.

Maestricht (Dutch *Maastricht*), the capital of the Dutch province of Limburg, 19 miles NNE. of Liège by rail, 19 WNW. of Aachen, and 152 SSE. of Amsterdam. It lies on the left bank of the Meuse or Maas, a stone bridge (1683), 133 yards long, connecting it with the suburb of Wijk. It was formerly an important fortress; but the fortifications were dismantled in 1871-78. The town-hall, with spire and carillon (1662), contains many paintings and a library; and in the three-towered church of St Servatius (12th-14th century), the cathedral once, is a 'Descent from the Cross,' by Van Dyck. But Maestricht's great sight is the subterranean quarries of the Pietersberg, formerly called *Mons Hunnorum* (330 feet). Their labyrinthine passages, 12 feet wide, and 20 to 50 feet high, number 16,000, and extend over an area of 15 by 9 miles. They are supposed to have been worked first by the Romans, and, amongst other fossils, have yielded two heads of the huge *Mosasaurus* (q.v.). The manufactures include glass, earthenware, beer, and carpets. Pop. (1876) 29,083; (1922) 56,392. Maestricht, the Roman *Trajectum ad Mosam*, was no less than six times besieged between 1579 and 1814, and in 1830 withstood the insurgent Belgians.

Maestricht Beds, a section of the Danian or uppermost division of the Cretaceous System (q.v.).

Maeterlinck, MAURICE, a Belgian writer, who, born at Ghent in 1862, has attained a world-wide popularity in several branches of literature. After an education at the Jesuit College of St Barbe, he was enrolled as a barrister, but the life did not suit him, and in 1889 he published his first book, *Serres Chaudes*, a volume of poems, and his first play, *La Princesse Maleine*. In 1891 he produced *Les Aveugles* and *Les Sept Princesses*, while in 1893 appeared *Pelléas et Mélisande*, a play with a strangeness, wherein the symbols used by Maeterlinck are exaggerated but never out of harmony. 1894 saw the publication of *La Mort de Tintagiles*, followed by *Le Trésor des Humbles* (1896), a volume of essays, *La Sagesse* (1898), and *Agla-vaine et Sélysette*. *La vie des Abeilles* (1901), an exquisite piece of work in which is told the life story of the bees without any of the mysticism so apparent in his other works, is entirely different from any of its forerunners; here all is sunny and happy and redolent of the garden and the open country. In juxtaposition *Monna Vanna* (1902) appears very intense and worldly, while *Joyzelle* (1902) is a romantic allegory more after the form of his earlier work. *L'Oiseau Bleu* (1909) is the story of the search for truth (often to be found in the inmost self and not outside), without which happiness is impossible. Here Maeterlinck's mysticism (always so moral) and matter-of-fact worldliness are strangely blended. *Marie Magdeleine*, a continuation of *Monna Vanna*, was a work of 1910. *Les Fiancelles* (1918), a sequel to *L'Oiseau Bleu* and *Le Bourgmestre de Stilmonte* (1918), a lurid picture of the German advance into Belgium, *Les Sentiers dans la Montagne* (1919) and *Le Grand Secret* (1922)—the great secret, the only secret being that all things are secret—in their varying form ably continue his work. With

absolute agnosticism Maeterlinck combines a happy belief in 'emanations' of all sorts. He is intensely symbolistic, and his characters are often more the stuff that dreams are made of, ghostly creations wandering through the work in human guise, than living creatures imbued with will and passion. He is pre-eminently the representative of modern Belgian literature at its best—in fact, he is Belgian literature. He married Georgette Le Blanc, who has both acted in his plays and assisted him in his literary work.

See Henry Rose, *Maeterlinck's Symbolism* (1910); Edward Thomas, *Maurice Maeterlinck* (1911); Jethro Bithehl, *Life and Writings of Maurice Maeterlinck* (1913), and Macdonald Clark, *Maurice Maeterlinck* (1915).

Mafeking, a town in the north-east corner of the Cape Province, connected in 1894 with the railway system from Capetown. Hence in 1896 Jameson (q.v.) started on his disastrous raid into the Transvaal. On the outbreak of the Transvaal war in 1899 Mafeking was invested by the Boer forces, but was heroically defended by Colonel Baden-Powell with a small garrison, and after a siege of seven months, was relieved on 17th May 1900. It is a junction for the Rand and Johannesburg. Pop. about 3200, some 1700 whites.

Maffei, FRANCESCO SCIPIONE, MARCHESE DI, playwright and antiquary, was born at Verona, 1st June 1675, and studied in the Jesuit College at Parma. He spent the years 1703-4 in military service, under his brother Alessandro, a distinguished soldier and field-marshal, but ultimately devoted himself to literary pursuits. His tragedy of *Merope* (1714) was so well received that it went through seventy editions in his own lifetime. His comedy of *Le Ceremonie* (1728) was also successful. *Verona Illustrata* (1731-32; new ed. 1827) is a work of much brilliancy and learning. After four years in France (1732-36) he visited England, Holland, and Germany, then settled in his birthplace, where he died 11th February 1755. A collective edition of his works was published at Venice in 1790, in 21 vols.

Mafia, or MAFFIA, a secret society in Sicily, more powerful than the Camorra (q.v.) of Naples, which has organised lawlessness, and made itself more feared than the law. Its code of honour (the *omertà*) binds the members to seek no redress from the courts, nor ever to give evidence before them; its object is to override the law, and to rule the island. In an organised form, however, the Mafia survives only in isolated localities; as it exists in the island as a whole, it rather expresses an idea than indicates a society with regular chiefs and councillors. It represents the survival among the people of a preference for owing the securing of their persons and property rather to their own strength and influence than to those of the law and its officers. Therefore a distinction is drawn between the high and the low Mafia, the latter embracing the great mass of members who, themselves not active in the matter, are afraid to set themselves against the Mafia, and are content to accept the protection of this shadowy league, which in them inspires more awe than do the courts of justice. Indeed, much of the Mafia's strength and vitality is directly due to the looseness of organisation, and to the fact that it is an ingrained mode of thought, an idea, and not an organised society, that the government has to root out. Direct robbery and violence are resorted to only for vengeance; for practical purposes the employment of isolation—in fact, the system of boycotting carried to the extreme point—is sufficiently efficacious. From the landholders blackmail is levied in return for protection, and the *vendetta* follows those

who denounce a member of the fraternity. The Mafia has controlled elections, protected its members against the officers of justice, assisted smugglers, directed strikes, and even fixed the hire of workmen. The government's efforts failed to stamp out the society; but many of its members driven abroad swelled the criminal classes of New York and New Orleans (as 'The Black Hand,' &c.).

See books by Alongi (Turin, 1887), Le Faure (Paris, 1892), Cutrera (Palermo, 1900); R. Bagot, *My Italian Year* (1911); and books named at SECRET SOCIETIES and SICILY.

Mafra, a town of Portugal, 20 miles NW. of Lisbon; pop. 5000. The palace was built by John V. in 1717-31 as a rival to the Escorial, but now serves as a barrack and military academy.

Magadoxo, MOGADISHU, or MUKDISHU, capital of Italian Somaliland, is a port 250 miles NE. of the mouth of the Juba River; pop. 10,000.

Magazine. See PERIODICALS. For Magazine Rifle, see RIFLE.

Magdala, a hill-fortress and small town of Abyssinia (q.v.), 300 miles S. of Annesley Bay, on the Red Sea, stood perched on a plateau 9110 feet above sea-level. It was the place of captivity of the British prisoners for whose rescue an expedition was sent out under Sir Robert Napier (Lord Napier of Magdala); and on 13th April 1868 the town was burned and its defences destroyed.

Magdalena, the principal river of Colombia, rises in the Central Cordillera, about 2° N. lat., and only 8 miles from the source of the Cauca. These streams flow north on either side of the Cordillera, uniting about 130 miles from the sea. The Magdalena, which ends in a large delta, is the principal means whereby merchandise is taken to the interior of Colombia. The river is navigable to Honda, 500 miles, where the rapids begin; above these it has been navigated to Neiva since 1875, and a railway (20 miles) alongside the rapids connects the upper and lower sections. The Magdalena's drainage area is calculated at 92,900 sq. m.

Magdalen College. See OXFORD.

Magdalene, MARY, or MARY OF MAGDALA, so named from a town near Tiberias, a woman 'out of whom Jesus cast seven devils,' and who believed in Him and followed Him. She was one of the women who stood by the cross, and one of those who went with sweet spices to the sepulchre. To her He first appeared after His resurrection. In consequence of an unfounded notion identifying her with the woman who had been a sinner, described in Luke, vii. 36-50, as having anointed our Lord's feet with ointment, and wiped them with her hair, Mary Magdalene has been long and generally regarded as a woman whose early life had been very profligate, although of this there is no hint whatever in the narratives of the evangelists; and the Magdalenes, so frequent amongst works of art, represent her according to this prevalent opinion. Our word *maudlin* (lit. 'weeping-eyed') is due to the same notion, and indeed the very name Magdalene has come to be applied to women who have fallen from chastity, and institutions for the reception of repentant prostitutes are known as *Magdalene Asylums*.

The conclusion of most commentators is that there were two anointings, one in some city unnamed during our Lord's Galilean ministry (Luke vii.), the other at Bethany before the last entry into Jerusalem (Matt. xxvi., Mark xiv., John xii.). The one passage adduced to prove that in these two narratives we have but one woman is John, xi. 2, and it has been argued by some that this could not possibly refer by anticipation to the history that follows in chap. xii. Against this it

may be said that to impute a life of impurity to Mary of Bethany is to make an entirely gratuitous assumption. The evidence to identify Mary Magdalene with either actor in the two narratives is still less secure. The identity of Mary Magdalene with the sinner was first positively asserted by Gregory the Great in his *Homilies*, and the services of the feast of St Mary Magdalene were arranged on the assumption of its truth. But a great and growing consensus of opinion among the most competent scholars, and those not merely Protestant, is conclusive against it.

Magdalene College. See CAMBRIDGE.

Magdalenian, the latest Palæolithic subdivision, excluding transitional cultures (Azilian, Maglenosian, Tardenoisian). See ANTHROPOLOGY, STONE AGE.

Magdalen Islands, a small group near the centre of the Gulf of St Lawrence, 54 miles NW. of Cape Breton Island. The largest is Coffin Island. The people are supported by the lobster, cod, herring, and seal fisheries.

Magdeburg, the capital of Prussian Saxony, and one of the chief fortresses of Germany, is 90 miles by rail SW. of Berlin and 72 N. of Leipzig. It lies in a cheerless country, on the left bank mainly of the Elbe, which, here 280 yards wide, branches into three channels, and forms two islands. On the smaller of these still stands the Citadel (1683-1702); but otherwise the old fortifications have since 1866 been built over or converted into promenades, their place being taken by a cordon of thirteen forts. The cruciform Gothic cathedral, rebuilt between 1207 and 1550, is 400 feet long, and has two western towers 341 feet high. It contains the tombs of the Emperor Otho the Great, of his first wife, the English princess Editha, and of Archbishop Ernest, whose monument (1497) is a masterpiece of Peter Vischer of Nürnberg. In front of the town-hall (1691-1866) is the equestrian statue of Otho, dating, not from 973 as its inscription claims, but from the close of the 13th century; and of several other monuments the most noteworthy are the Soldiers' Memorial (1877) and a statue of Luther (1886). The industries are of high importance, comprising huge ironworks, distilleries, cotton-mills, &c.; and the trade is correspondingly great—for sugar it is the first market of Germany. Magdeburg is the junction of five railways; and the river-trade is also very large. Pop. (1875) 122,789; (1919) 285,856, of whom over 17,000 were Catholics, and 3000 Jews. Founded by Charlemagne in 805, and refounded by Editha after its destruction by the Wends in 924, Magdeburg was in 968 made the seat of an archbishopric, and had 40,000 inhabitants in 1524, when, embracing the Reformation, it incurred the combined wrath of emperor and primate. It weathered the storm then, successfully withstanding Maurice of Saxony (1550); but during the Thirty Years' War it suffered fearfully. In 1629 it was vainly besieged for twenty-eight weeks by Wallenstein; in May 1631, after an heroic defence (2000 against 25,000), it was taken by Tilly and burned to the ground, the cathedral (reconsecrated for Catholic worship) and a few poor fisher huts being almost all that remained after the three days' sack, in which nearly the whole population of 36,000 perished by fire or sword or drowning in the river. In 1648 the archbishopric was converted into a secular duchy, and conferred on the house of Brandenburg in compensation for the loss of Pomerania. In 1803 the French annexed it to the kingdom of Westphalia; but in 1814 it was finally restored to Prussia. See works by Hoffman (2d ed. 1885), Kaverau (1886), and Guericke (2d ed. 1887); and for the *Magdeburg Centuries*, see CHURCH HISTORY.

Magdeburg Hemispheres are two hollow hemispheres, generally made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When

Magdeburg Hemispheres.

the edges are rubbed over with grease, pressed tightly together, and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force. See GUERICKE.

Magee, WILLIAM CONNOR, D.D., born at Cork, 17th December 1821, at thirteen entered Trinity College, Dublin, took orders in 1844, laboured at Bath, in London, and at Enniskillen, and became Dean of Cork in 1864, Dean of the Chapel Royal, Dublin, in 1866, Bishop of Peterborough in 1868, and Archbishop of York in March 1891, but died on the following 5th May. He was a brilliant orator. See *Life* by Canon MacDonnell (2 vols. 1896).

Magellan, FERDINAND (Portuguese *Magalhães* or *Magalhaens*), born about 1470 near Villa Real in Traz os Montes, served with distinction in the East Indies, and was famed for life in Morocco. Finding his sufferings rewarded with contempt by King Manuel he formally renounced his nationality, and together with his countryman, Ruy Falero, a geographer and astronomer, offered his services to Spain. They laid before Charles V. a scheme for reaching the Moluccas by the west, which was well received; and Magellan sailed from Seville, 10th August 1519, with five ships of from 130 to 60 tons, and about two hundred and fifty men. Sailing to the mouth of the La Plata and along the shores of Patagonia, he threaded the strait which bears his name (21st October-28th November 1520), and entered on that vast ocean which he named the Pacific from the fine weather which he experienced there. He had already been troubled by mutiny, which he had crushed by swift vengeance upon the ringleaders, and after reaching the Philippine Isles he fell in an expedition against the natives of Matan (27th April 1521). His ship, the *Victoria*, was safely navigated by Sebastian del Cano home to Spain, and thus completed, on 6th September 1522, the first voyage ever made round the world.

The best contemporary account of Magellan's famous voyage is that by Antonio Pigafetta, a volunteer in the fleet, translated by Lord Stanley of Alderley (with five minor narratives, Hakluyt Society, 1874), and anew, with the text, by J. A. Robertson (1906). See Guillemand, *Magellan and the Pacific* (1891).

MAGELLAN, STRAIT OF, separates South America on the south from Tierra del Fuego. It is 375 miles in length, and its breadth varies for the most part between 12 and 17 miles. It was discovered by Magellan in 1520, and first thoroughly explored by King and Fitzroy in the *Adventure* and *Beagle* (1826-36). The wider eastern half is bordered by level, gently-rolling grassy plains. The narrower western half is shut in by steep, wooded mountains; the current runs strong through it, and the west winds are a great hindrance to sailing-vessels. There are several fine harbours along this part of the strait. See *Early Spanish Voyages*, trans. and ed. Markham (1911).

Magellanic Clouds, or NUBECULÆ MAJOR and MINOR, two cloudy masses of light seen at night in the sky of the southern hemisphere. The greater lies between R.A. 4h. 40m. and 6h., and N.P.D. 156° and 162°; the lesser between R.A. 0h. 28m. and 1h. 15m., and N.P.D. 162° and 165°. They are composed of complex masses of nebulae and stars, condensed so as to give the naked eye the impression of a cloudy mass. See NEBULÆ.

Magendie, FRANÇOIS, an eminent French physiologist and physician, was born at Bordeaux, 15th October 1783, studied at Paris, became successively professor in anatomy (1804), physician to the Hôtel-Dieu, member of the Academy of Sciences (1819), and professor of Anatomy in the Collège de France (1831). He made important additions to our knowledge of nerve-physiology, the veins, and the physiology of food, and wrote numerous works, including the *Elements of Physiology* (originally a précis, 1816, afterwards extended). He was likewise the founder, and for ten years the editor, of the *Journal de la Physiologie Expérimentale*, in which are recorded many of the experiments on living animals which gained for him, too deservedly, the character of an unscrupulous vivisectionist. He died 7th October 1855.

Magenta, an Italian town, 18 miles W. of Milan by rail. Pop. 7000. Here, on 4th June 1859, 55,000 French and Sardinians defeated 75,000 Austrians, the latter losing 10,000 (besides 7000 prisoners), and the allies only 4000. For this victory MacMahon received his dukedom.—For the coal-tar colour, see DYEING.

Magerö. See NORTH CAPE.

Maggiore, LAGO, one of the largest lakes in Italy, the *Lacus Verbanus* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 39 miles in length, and varies in breadth from $\frac{1}{2}$ mile to $5\frac{1}{2}$ miles. It lies 646 feet above the level of the sea, and has a maximum depth of 1158 feet. The river Ticino flows through it. In a south-western expansion of the lake are the Borromean Isles (q.v.). On the north and west it is surrounded by granitic mountains, 7000 feet high, on the south and east by vineyard-covered hills.

Maggot, the larva of most flies (Diptera), without limbs or distinct head. They feed on the animal material, often a corpse of some sort, in which they are laid. Some of the larger forms are used for bait or for feeding birds.

Magi. In Accadian, the language of the early Turanian inhabitants of Babylonia and Media, *imga*, signifying 'august,' 'reverend,' was the title of their learned and priestly caste. The Semitic nations afterwards dominant in Babylonia and Assyria adopted the learning and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made *magos*. Under the Persian empire the magi were not only the 'keepers of the sacred things, the learned of the people, the philosophers and servants of God,' but also diviners and mantics, augurs and astrologers. They called up the dead by awful formulas, or by means of cups, water, &c. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Of their religious system the articles PARSEES and ZOROASTER will give a fuller account. Zoroaster, in the course of his great religious reform, reorgan-

ised the body of the magi, chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by re-instituting the original distinction of the three classes of *herbeds* ('disciples'), *mobeds* ('masters'), and *destur mobeds* ('complete masters'). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground, and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies, and was preceded by purifications of several months' duration. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they fell to the rank of wandering jugglers, fortune-tellers, and quacks, and gave their name (Magic, q.v.) to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is evidenced by the New Testament narrative of the homage of the Magi to the Infant Christ.

According to the narrative (Matt. ii. 1-12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense, and myrrh. As the 'Three Kings' their names became celebrated in the middle ages, and Bede distinguishes them as Kaspar, Melchior, and Balthasar. The last was the Chaldean name for Daniel; Melchior signifies 'king of light'; Kaspar in some legends appears as Gathaspar, and in Syriac sources as Gudophorhem, in which we may perhaps recognise the name of the powerful Indo-Parthian king, Gondophares, said to have been baptised by the apostle Thomas. The bones of the three kings are claimed to be deposited in the cathedral at Cologne. In the calendar the three days after New-year's Day bear their names, and their memory is preserved in the feast of the three holy kings—the Epiphany. The youngest of the three is generally represented in works of art as a black man.

Magic. The word is derived from the Latin *magia* and Greek *μᾶγεια*, both of which words are in turn based on the name of a Median caste, the Magi, who were apparently the leaders of the subject population in the time of Aryan (Persian) domination of Persia. The Magi were intimately associated with practices, such as divination and astrology, which were not countenanced by the writers of the Avesta or by the Parsis.

Much speculation has taken place concerning the relations between magic and religion. Tylor defined magic as an 'occult science,' a 'pseudo-science,' based on the association of ideas (*Primitive Culture*, i. 115). Frazer contrasts magic and religion, and claims that magic preceded religion. According to him magic is a rudimentary science, based on a theory of natural causation. Wundt makes magic a rudimentary religion, and claims that it is based on the doctrine of the soul. Rivers defines as 'magical' a rite believed in itself to be able to produce the required result, thus distinguishing it from a religious act, in which the element of appeal is present. Hubert and Mauss, representing the French school founded by Durkheim, define as magical those rites which do not form part of an organised cult. Magical rites are, according to them, anti-social. Of late years a new turn has been given to the study of magic by Elliot Smith (see *Evolution of the Dragon*), who, by means of his great generalisation concerning 'Givers of Life,' has made it possible to group great masses of facts together which hitherto seemed

chaotic. He shows that the objects or materials used in magical practice are so used because they are credited, for some reason or other, with 'life-giving' powers; that is to say, they are able to defend, to give good luck, to restore health, to procure children, and in many ways to further the interests of the individual—in a word, to give him a fuller measure of life, hence the phrase 'Givers of Life.' This generalisation makes it possible to define magic objectively as 'the use of Givers of Life,' and thus to avoid the difficulties and contradictions involved in the attempt to define it from the subjective point of view.

There can be little doubt that magic and religion are both the outcome of the same process of development of early thought and action. The first signs of beliefs and practices which can be termed magical are found in the caves of the Upper Palaeolithic Age in Europe, in Aurignacian times, when the dead were buried, in a crouching position, packed round with red ochre, and provided with ornaments of shells, teeth and claws of animals, bits of bone and pebbles. All the substances mentioned were doubtless used as Givers of Life; they were intended to restore life and to protect. At the present day many peoples still use the same means of warding off evil and of mitigating the horrors of death. In the same caves we sometimes find small feminine figurines, which probably represent the first deity conceived of man, the Great Mother, who, in all her manifestations, was the dominating personality of the earliest known religious systems (see also article IMAGES). Evidently in those remote days men's minds were occupied with beliefs which were both religious and magical at the same time. This confusion between religion and magic was present in the religious systems of Egypt, Greece, Japan, and many other peoples. Indeed, Dr Alan H. Gardiner [*Hastings's Encyclopædia of Religion and Ethics*, art. 'Magic (Egyptian)'] goes so far as to say that 'From the Egyptian point of view we may say that there was no such thing as "religion"; there was only *hike*, the nearest English equivalent of which is "magical power." Egyptian gods were of like nature with men; they had to be fed, clothed, as men, and their temples were spoken of as houses. The gods and the dead could only be approached by means of ritual, and ritual was distinguished from ordinary acts by possessing *hike*,—i.e. magical power.' Thus it comes about that 'The formulæ of the *Book of the Dead* differ neither in form nor in substance from the incantations which the Egyptians used to heal their own maladies; and the same general similarity runs through the daily liturgies of the temples and the tombs.' The magical nature of ritual is also evident in the *norito* (ritual) of Shinto in Japan. These old rituals were simply magical formulæ and incantations, intended to bring about the desired result. Similarly with much of the Vedic ritual in ancient India, especially in rites connected with initiation, the coronation of kings, the horse-sacrifice, and so on. Not only were magic and religion inextricably intertwined in former times, but magic has in many places shown a power of survival greater than many religious cults. While religious thought has had its vicissitudes, magical practice has in all times and places steadily pursued its way, and, indeed, even in highly civilised countries of western Europe, it still has its hold, in some form or other, on many men and women. The use of amulets, the belief in mascots and magical remedies for disease, the magical calling-up of the dead, divination, the use of love potions, can all be witnessed in countries where Christianity is the official religion, and science is supposed to reign supreme.

Magical acts are usually divided into several

categories. They may be *defensive*. Such, for instance, would be those preventive rites, such as the avoidance of contact with impure persons, especially before performing a rite, religious or magical; fasting; abstinence from sexual intercourse or certain kinds of food; asceticism, and so forth. Counter-charms would also be used to ward off the effects of the magic of others; rites would be performed with a curative aim. Then there are *productive* rites, connected with birth, with the weather, and with love. Other rites may be classed in the category of *prognostic*. These rites include divination, soothsaying, and prophecy. The means whereby these rites are performed are endless. In most cases there are certain objects or substances which are especially suited for the purpose; also the rites must be performed at a certain time and at a certain place. The agent must himself be in a certain condition. Rules and regulations with regard to direction must be observed. The magical manipulation is often hedged round with many restrictions, especially where the feat required is difficult of accomplishment. Among magical acts may be included eating, drinking, anointing, looking at certain objects, circumambulation, burying objects, imitative processes, the use of fire, and so on. Magical places include cross-roads, cemeteries, and solitary places. Magical objects are innumerable, and may be derived from an immense variety of sources. Shells, plants, minerals, stones, weapons, blood and red-coloured substances, gold, pearls and pearl-shell, have, in addition to many others, played their part in magical practice. Magical objects are often worn as talismans or amulets—the first to transmit their qualities to other objects, the second to protect the wearer. The study of the history of magical objects is only just beginning under the inspiration of Elliot Smith, and it promises to reveal much concerning early thought. In some cases the reason for the adoption of a particular substance is obvious. For instance, red-coloured substances doubtless owe their supposed efficacy to their colour, which is that of blood, the life-fluid, the loss of which causes death. The bodies of the dead in the Palaeolithic caves of Europe were doubtless packed with red ochre, because that colour endowed the earth with life-giving powers, and thus benefited the dead. Throughout the ages red-coloured substances, precious stones, berries, fluids, and so on have been endowed with life-giving powers, and have been freely used in magic. Another very important 'Giver of Life' is the cowrie shell, which is so widely used by women with the aim of securing fertility. This shell first appears on the scene as a magical object in the Upper Palaeolithic caves of Europe, together with the use of red ochre. It doubtless derives its supposed potency from its shape, which is that of the portal of life, and thence it has come to be used as a fertility amulet. The wearing of the teeth and claws of dangerous animals likewise first appears in the Upper Palaeolithic Age. This practice still survives in many parts of the world. These objects are worn to afford protection, to endow their wearer with the qualities of the animals from which they were taken. When Givers of Life are studied, it is found that their potency is transferred to other objects similar to them in some way or other; and thus a whole chain of magical objects or substances can take its origin from some single source.

Magical rites consist of two parts—oral and manual. The recitation of a formula is in itself magical. Also Names have a magical power; for to know the name of any one is often thought to be equivalent to having power over him (see M. A. Canney, *Givers of Life*, 1923). This is, of course, bound up with the common practice of having two

names, one of them secret. Words are believed to be creative. This is well shown in the texts of Ancient Egypt and India, where the gods create by uttering the names of various objects. In magical practice words occur in the form of spells or invocations and charms. Thus the Babylonian priests used magical texts to enable them to control and exorcise demons.

The mythologies of many peoples contain references to wonderful men and women who were possessed of great magical powers. Such were the Tuatha de Danaan of the Irish texts, the Cyclops, the Dactyli of Mount Ida, either of Crete or Phrygia, the Telchines of Rhodes, the Curetes of Acarnania, Medea of Colchis, Helen, and Circe also were possessed of magic power. The Children of the Sun are said in Greek mythology to have been especially powerful in this respect, and this is typical of them in other parts of the world. In many parts of the world there are also magical fraternities, the members of which are taught in secret the knowledge of some particular branch of magical craft. There is good reason to believe that this knowledge has been transmitted far and wide throughout the earth, and that the magical practice of peoples of low culture is founded on knowledge and on 'Givers of Life' brought to them by people of a high degree of culture. There seems also to have been transmitted the belief in the existence of a magical power which can be communicated from one object to another. The Egyptians believed that the sun-god, Re, transmitted to the king a magical golden fluid, called *sa*, which the king could, in his turn, transfer to his statue, and thus to other statues. Similarly it is found, in Melanesia, for instance, that stone statues are supposed to possess this magical power; and these stone statues play an important part in the magical craft of this region. Presumably, as the result of a process of degradation, this belief has been transferred to stones of curious shape, especially in places where stone statues are no longer made; but even when a stone is believed to possess magical power, a dream is necessary to verify its potency. The magical power of Melanesia, called *mana*, can be shown to be associated with outside cultural influences which were responsible, among other things, for the stone statues that are found there.

See the articles RELIGION, SUN-CULT, TOTEMISM, WITCHCRAFT; also Tylor, *Primitive Culture*; Frazer, *Golden Bough*; Wundt, *Völkerpsychologie*; Marett, *The Threshold of Religion* (1914); Rivers, *Medicine, Magic, and Religion* (1924); Elliot Smith, *The Evolution of the Dragon* (1919); Perry, *The Origin of Magic and Religion* (1923); Evans, *Magical Jewels* (1922); Hubert and Mauss, 'Esquisse d'une théorie générale de la magie,' *L'Année Sociologique*, vii. (1904).

Magic Lantern, an optical instrument said to have been invented by Athanasius Kircher in 1646, by means of which magnified images of small pictures are thrown upon a wall or screen. The instrument consists of a lantern containing a powerful argand lamp or lime-light arrangement (see LIME-LIGHT); in the side of the lantern is inserted a horizontal tube, the axis of which is on a level with the centre of the flame, and the light is generally made to pass through the tube by reflection from a concave mirror placed on the opposite side of the lantern. The tube is furnished with two lenses, one at each end; the inner one, the condenser, is a large lens of short focus, to condense a strong light on the picture, which is inserted into the tube, between the lenses, through a transverse slit. The other end of the tube is fitted with a double convex lens, or, better, a corrected combination of lenses, which receives the rays after passing through the picture, and throws them upon the screen or wall. The pictures are formed on glass slides—generally 3½

inches square—with transparent coloured varnish or by means of photography on a collodion, gelatine, or carbon tissue film on the glass, and must be inserted into the tube in an inverted position, and with the film or painted side nearest the screen, in order that the images may appear erect and unreversed. If the screen on which the image is thrown be at too great a distance, the image will become indistinct from the lessened intensity of the light. This instrument is sometimes used as a toy, but is also frequently employed to produce enlarged representations of astronomical and other scientific diagrams, and enlargements of photographic views, so that they may be well seen by an audience. Phantasmagoria, dissolving views, &c. are produced by a particular manipulation of the same instrument.

Magic Squares are sets of different numbers, each column of which, whether horizontal, vertical, or diagonal, adds alike.

1	1872	10	8
12	6	3	1870
7	9	1873	2
1871	4	5*	11

Fig. 1.

420	508	458	510
523	440	471	457
479	441	539	432
469	502	428	492

Fig. 2.

The above are two examples of a magic square with the same summation (in either case 1891). Considering the difficulty with which a person without previous knowledge could make even one such square, it may surprise many to hear that there are more than 700,000,000,000,000 (seven hundred billion) magic squares of this root (4), with the summation of 1891, each composed of different numbers, or with a different arrangement of the same numbers. Fig. 1 is so constructed that a great variety of other squares may be made from it by altering the four highest numbers in it. Thus, if 13, 14, 15, and 16 be substituted for 1870, 1871, &c. respectively, we get the smallest 4-square possible, with the summation 34. It was at one time thought that magic squares could only be composed of arithmetical or other symmetrical series of numbers; but an examination of Fig. 2 shows that that idea was erroneous.

Within the compass of a short article it is impossible to describe adequately any of the many rules for making magic squares. The following figures will, however, give some idea of the most important method, that of superposition, invented by De la Hire. It is most readily applied to *odd* squares, more especially to those whose roots are prime numbers. We therefore take the 5-square for our example.

1	3	5	2	4
5	2	4	1	3
4	1	3	5	2
3	5	2	4	1
2	4	1	3	5

Fig. 3.

5	0	15	10	20
10	20	5	0	15
0	15	10	20	5
20	5	0	15	10
15	10	20	5	0

Fig. 4.

Each row of the above squares contains the same numbers and in the same order relatively to one another. But in fig. 3 the first number of each row is the same as the *third* of the row above, whilst in fig. 4 it is the *fourth*. If now these two squares be combined by adding together the numbers that are in corresponding cells, the resulting square will be magic. In this case it will have the summation of 65, and the top row will be 6, 3,

20, 12, 24. By altering the positions of the numbers in the top rows, and making corresponding alterations in the others, 3600 distinct varieties of this magic square may be obtained.

Many mathematicians at home and abroad have written on magic squares, among whom may be mentioned Leibniz, Frenicle, Bachet, Ozanam, Montucla, Violle (1837), Frost, Cram, Ball (1917), Lucas (1894), Schubert (1900), and Ahrens (1918). Bordered and Tessellated magic squares may briefly be described as magic squares within magic squares. *Nasik* magic squares (so named by Frost from his place of residence in India) are squares whose magicality is not destroyed by repeatedly removing the first column or row to the last place, or *vice versa*. All squares with prime roots, made by De la Hire's method of superposition, are *nasik*. Even squares can also be made *nasik*. Fig. 1, with the numbers 13, 14, 15, and 16 substituted for the four highest, makes a *nasik* square.

Magilp, or **MEGILP**, a composition used by artists in oil-colours as a medium and for glazes. It is made of linseed-oil and mastic varnish. Robertson's medium, which is similar but dries quicker, is now more used than magilp.

Magilus, a remarkable Gasteropod found on the coral reefs of warm eastern seas. The young animal settles on the growing coral at the obvious risk of being gradually surrounded and smothered. This is avoided, however, by an entire change in the form of the shell, which is diverted from its original spiral type and grows out into a long irregular tube. 'A neck-and-neck race is kept up until the mollusc or the coral dies.' As it lengthens its tube the animal shifts *pari passu* to the outer portion, and the region it abandons is filled up with lime.

Maginn, WILLIAM, one of the most brilliant writers of his day, born at Cork, 10th July 1793, educated at Trinity College, Dublin. At twenty-three he received his degree of LL.D. from his college, being the first who had ever received it so young. He taught in Cork for ten years, and in 1823 removed to London to pursue the life of letters. One of his first contributions to *Blackwood's Magazine*—a Latin translation of *Chevy Chase*—appeared in 1819, and from that date for nine years scarcely a number appeared without an article from his pen. In 1824 Murray started the short-lived *Representative*, a daily newspaper, and Maginn was sent to Paris to act as foreign correspondent. In 1828 he joined the staff of the *Standard*, and he was one of the originators of *Fraser's Magazine* in 1830. His contributions to *Fraser* were as 'lively, learned, and libellous' as those to *Blackwood*, and one led to a harmless duel between the author and the Hon. Grantley Berkeley. The remainder of Maginn's career was irregular and unhappy. His habits of intemperance gained the mastery over him, and he was often arrested and in jail for debt, without losing, however, in the least his brightness or good-humour. He wrote his *Shakespeare Papers* for *Blackwood* in 1837, and in 1840 he began his *Magazine Miscellanies*, by *Doctor Maginn*, which did not extend beyond ten numbers. In 1842 he was again imprisoned in the Fleet, and, having passed through the bankruptcy court, was reduced in fast failing health to a state of great poverty. Help came from Sir Robert Peel almost too late, for poor 'bright, broken Maginn' died at Walton-on-Thames, 21st August 1842. He wrote two forgotten romances, *Whitehall*, or *the Days of George IV.* (1827, a parody on the historical novel, and Horace Smith's *Brambetty House* in particular), and *John Manesty*. (1844), completed after his death by Charles Ollier.

His *Homeric Ballads* were published in 1849. A collection of his papers was edited by R. S. Mackenzie (5 vols. New York, 1855-57); and his *Miscellanies, Prose and Verse*, by R. W. Montagu (2 vols. Lond. 1885).

Magistrate. See BOROUGH, and JUSTICE OF THE PEACE.

Maglemosian, a prehistoric culture, transitional between Palæolithic and Neolithic. See LAKE-DWELLINGS.

Magliabechi, ANTONIO, bibliophile, was born at Florence in 1633, and till his fortieth year was a goldsmith. From youth upwards, however, he displayed an inordinate passion for the acquisition of book-knowledge; and, having mastered Greek, Latin, and Hebrew, he literally entombed himself among books, of which disorderly piles encumbered every portion of his dwelling. In his daily habits he grew regardless of the decencies of life; and such was his avidity of study that he finally denied himself even the requisite intervals of repose. His memory was prodigious, and enabled him not only minutely to retain the contents of his multitudinous books, but also to supply, on occasion, the most exact reference to any particular page or paragraph, the place of each book being indicated with precision in the midst of their seemingly inextricable masses. Magliabechi was regarded as the literary prodigy of his times. In 1673 he was appointed court-librarian by the Grand-duke of Tuscany; and the many tributes of respect tendered by royal and distinguished personages to his wonderful erudition fostered in an inordinate degree his love of fame and praise, which rendered him intolerant of literary merit in others, and involved him in several bitter literary squabbles. He died at Florence on 4th July 1714, leaving no written record of his immense encyclopædic knowledge. His valuable library of 30,000 vols. he bequeathed to the Grand-duke, who made it over to the city of Florence; it is now a free library, and bears the name of its collector. See John Hill Burton's *Book-Hunter* (1862).

Magna Carta, the Great Charter granted by King John of England to the barons, has since that time been viewed as the basis of the English constitution. The oppressions of a tyrannical sovereign compelled a confederacy of the barons or tenants-in-chief of the crown, who took up arms for the redress of their grievances. They demanded the restoration of the laws of Edward the Confessor and Henry I.; laws which combined Norman feudalism with Saxon and Danish institutions. A conference was held at Runnymede, on the Thames near Egham, where king and barons encamped opposite each other; and, after several days' debate, John agreed on the 15th June 1215, and sealed the charter with great solemnity on the 19th. The Great Charter provided against the abuse of the royal prerogative by protecting the rights and obligations of the feudal proprietor. It redressed a variety of grievances connected with feudal tenures, some of which are long since obsolete. Minute provisions were made regarding the ward, relief, and marriage of heirs, and rights of their widows. No scutage or aid was to be imposed without the authority of the common council of the kingdom, except on the three great feudal occasions of the king's captivity, the knighting of his eldest son, and the marriage of his eldest daughter. The liberties of the city of London and other towns, burghs, and ports were declared inviolable. Freedom of commerce was guaranteed to foreign merchants. Justice was no longer to be sold, denied, or delayed. The Court of Common Pleas, instead of, as formerly, following the king's person in all his progresses, was permanently fixed at Westminster,

assizes were appointed to be held in the several counties, annual circuits established, and regulations made for the efficiency of the inferior courts. Life, liberty, and property were protected from arbitrary spoliation, and none was to be condemned to forfeit these but by lawful judgment of his peers or by the law of the land. No one was to be condemned on rumours or suspicions, but only on evidence of witnesses. Fines imposed were in all cases to be proportioned to the magnitude of the offence, and even the villain or rustic was not to be deprived of his necessary chattels. The testamentary power of the subject was recognised over part of his personal estate, and the rest was to be divided between his widow and children. The independence of the church was also provided for.

These are the most important features of that Charter which occupies so conspicuous a place in history, and which establishes the supremacy of the law of England over the will of the monarch. A charter was at the same time granted to mitigate the oppressions of the Forest Laws (q.v.). The terms dictated by the barons to John included the surrender of London to their charge, and the Tower to the custody of the primate till the 15th of August following, or till the execution of the several articles of the Great Charter. Twenty-five barons, as conservators of the public liberties, were empowered to make war against the sovereign in case of his violation of the Charter. Several solemn ratifications were required by the barons both from John and from Henry III.; and a copy of the Great Charter was sent to every cathedral, and ordered to be read publicly twice a year. The copy preserved in Lincoln Cathedral, published in fac-simile by the Records Commissioners in 1865, is the most complete.

See Stubbs's *Select Charters* (1870); and McKechnie's *Magna Carta*, a scholarly monograph (1905; new ed. 1914).

Magna Græcia (Gr. *Megalē Hellas*), the name given in ancient times to the Greek colonies of Southern Italy. The appellation must have been current at an early period. Polybius says it was used in the time of Pythagoras. Some writers include under the term the Greek cities in Sicily, others restrict it to those situated on the Gulf of Tarentum; but in general it is used to denote all the Greek cities in the south of Italy, exclusive of those in Sicily. The oldest settlement is believed to have been Cumæ, though it is doubtful whether it and its colonies, Dicaearchia and Neapolis, were really embraced under the designation Magna Græcia. The period assigned to its foundation—soon after the Trojan war—is obviously fanciful. The other more important Greek settlements in Italy were Sybaris (founded by the Achæans, 720 B.C.), Croton (by the Achæans, 710 B.C.), Tarentum (by the Spartans, 707 B.C.), Locri (by the Locrians, 710 B.C.; according to others, thirty or forty years later), Rhegium (by the Chalcidians; date of origin not known, but believed to be earlier than Sybaris), Metapontum (by the Achæans, 700–650 B.C.), Siris (by Ionians; date unknown), and Velia (by the Phocæans, 540 B.C.). These cities became in their turn the parents of many others. Of the earlier history of Magna Græcia very little authentic information has survived. The settlements appear to have risen rapidly to power and wealth, partly by the brisk commerce which they carried on with the mother-country, and partly also, it is conjectured, by an amalgamation with the Pelasgic (or prehistoric) natives of the interior, as at Locri. About 530 B.C. Pythagoras, the philosopher, arrived at Crotona, and soon acquired supreme influence in Magna Græcia, though it did not last long. The quarrels between the different cities were often bitter and bloody; the most notable cases were the destruction of

Siris by the Achæan cities and of Sybaris by Croton (510). Besides this they were hotly pressed at times by the Lucanians and Bruttians; and finally, 272–271 B.C., the Romans conquered the whole of Lower Italy. Long before this several of the cities had disappeared. The longest to survive was Tarentum.

See the separate articles on the cities; also Lenormant, *La Grande-Grèce* (3 vols. 1881) and *À travers l'Apulie et la Lucanie* (2 vols. 1883), or the more popular *Land of Manfred*, by Mrs Janet Ross (1889).

Magnesia. See MAGNESIUM.

Magnesia, an ancient city of Ionia in Asia Minor, situated nearly 10 miles NE. of Miletus in the valley of the Mæander. It was a wealthy and prosperous city until after it fell into the hands of the Romans, in spite of its having been destroyed during the Cimmerian invasion about 660 B.C. Here stood a famous temple to Artemis, the remains of which have been excavated, as has the Roman theatre; and here Themistocles, the Athenian patriot and statesman, died (449 B.C.). It was called Magnesia ad Mæandrum, to distinguish it from MAGNESIA AD SIPYLUM, on the Hermus, near Mount Sipylus. Beside this town Scipio defeated Antiochus of Syria in 190 B.C. It is now called Manissa, and is a town of 40,000 inhabitants, 41 miles NE. of Smyrna by rail. On Mount Sipylus is the colossal rock-carving called Niobe, believed to be Hittite.—The easternmost division of ancient Thessaly in Greece also bore this name.—To one of the places called Magnesia, most probably that in Lydia, we owe the terms magnet, magnetism, magnesia, and apparently also manganese.

Magnesian Limestone. See DOLOMITE.

Magnesium (Mg; atom. number 12; atom. wt. 24.36) is a metal very widely distributed over the globe. It is present in magnesite—magnesium carbonate; dolomite—carbonate of lime and magnesia; asbestos—silicate of lime and magnesia; and meerschauum—silicate of magnesia. It exists in mineral waters and the sea as sulphate and as chloride, the sulphate being known as Epsom salts. It was from the Epsom spring, in 1695, that Drew extracted this well-known salt, and in the beginning of the 18th century *Magnesia alba*, so called to distinguish it from what was already known as *Magnesia nigra* (black oxide of manganese—so called from its resemblance in colour, weight, &c., to the magnet) was discovered. The metal was first prepared by Davy, and for long its manufacture was limited to a small scale. Now, however, it is made in quantity by electrolysis of the fused chloride. The crude metal is finally distilled and pressed in a semi-fluid state into ribbon or wire.

Magnesium has a silver-white colour, which is tarnished by moist air. It is a very light metal, its specific gravity being only 1.75. It is readily volatile, and, when lighted, burns in air with an intensely brilliant light rich in chemical rays. On this account it was, till superseded by electric light, much used in photography, while in signalling and pyrotechny it plays an important part.

When magnesium burns in air it forms a white ash consisting of the oxide, magnesia, MgO (which may be also prepared by heating the carbonate). This is a very infusible substance, and is much used in medicine under the name of calcined magnesia. The carbonate, MgCO₃, is found in nature, but for medical purposes it is prepared by precipitating a soluble magnesium salt with carbonate of soda. According as it is prepared in the hot or cold, the resulting carbonate forms the ponderous and dense or the light variety. Although insoluble in water, this substance readily dissolves in water containing carbonic acid, and

this solution is known as fluid magnesia. The sulphate, $MgSO_4 \cdot 7H_2O$, or Epsom salts, occurs in nature, and is well known as a domestic remedy. It is much employed in febrile affections, but it may be used in any case in which a mild but efficient laxative is required. Its dose varies from $\frac{1}{2}$ to 1 ounce, but in order to promote its full efficacy it should be taken along with copious draughts of water. In combination with infusion of senna it forms the ordinary black draught. Magnesia and the carbonate are employed in small doses as an antacid, but in larger quantity they have a distinct purgative action. Fluid magnesia (see above) is a valuable aperient for women and children. Citrate of magnesia is the popular name for a granular, effervescent aperient, now much in use. It consists of a mixture of bicarbonate of soda, tartaric and citric acids, sugar, and a small trace (1 to 5 per cent.) of Epsom salts.

Magnetic Belts. See ELECTRICITY (MEDICAL).

Magnetism (*magnēs* or *lithos magnētēs*, 'the loadstone,' probably first found at Magnesia in Lydia). Magnets are natural (Loadstone, q.v.) or artificial, permanent (steel masses magnetised by the action of other magnets or of an electric current) or temporary (soft iron masses magnetised by magnets, or the so-called electro-magnets, soft iron masses round which a current is passing).

Polarity of the Magnet.—When a small soft iron, nickel, or cobalt ball is suspended by a thread, and a magnet (fig. 1) is passed along in front of it from one end to the other, the ball is powerfully attracted towards the ends, but not at all by the middle of the magnet. The points of the magnet towards which the attractive power becomes greatest are called its poles. By causing a small magnetic needle moving horizontally to vibrate in front of the different parts of a magnet placed vertically, and counting the number of vibrations, the rate of variation of the attractive power may be exactly found. When the poles of one magnet are made to act on those of another a striking dissimilarity between the poles is brought to light. To show this, let us suspend a magnet, NS, fig. 2, by a band of paper, M, hanging from a cocoon thread (a thread without torsion); or let us pivot it, or lay it on a float on water. When the magnet is left to itself it takes up a fixed position, one end keeping north, and the other south. The north pole cannot, except in unstable equilibrium, be made to stand as a south pole, or *vice versa*; for, when the magnet is disturbed, both poles return to their original positions. Here, then, is a striking dissimilarity in the poles, by means of which we are enabled to distinguish them as *north pole* and *south pole*. When thus suspended, let us now try the effect of another magnet upon it, and we shall find that the pole of the suspended magnet which is attracted by one of the poles of the second magnet is repelled by the other, and *vice versa*; and where the one pole attracts, the other repels. If, now, the second magnet be hung like the first,

Fig. 1.

Fig. 2.

Fig. 3.

it will be found that the pole which attracted the north pole of the first magnet is a south pole, and that the pole which repelled it is a north pole. We thus learn that *each magnet has two poles, the one a north, and the other a south pole, alike in their power of attracting soft iron, but differing in their action on the poles of another magnet, like poles repelling, and unlike poles attracting each other.*

The attractions and repulsions are found in a bar-magnet to follow the same laws of distribution as would have been obeyed by the forces due to two equal isolated discs, the one attracting, the other repelling, and situated at points a little short of the extreme ends of the bar; and the places where these imaginary discs of imaginary magnetic matter would be are called the poles of the magnet. This conception of imaginary magnetic matter greatly facilitates many calculations, and is largely applied. It is as if the one kind of pole consisted of positive, the other of negative matter; and the north pole of a magnet is, in accordance with this order of ideas, conventionally termed the positive pole.

No Isolated Poles.—If we try to cut a bar-magnet so as to isolate the poles, we find that each half has developed a new pole at the broken end, and each half has become a separate magnet whose poles are equal to one another, and to the poles of the original magnet. *We can therefore never have one kind of magnetism without having it associated in the same magnet with an equal amount of the opposite magnetism.*

The Earth a Magnet.—The fact of the freely suspended magnet taking up a fixed position has led to the theory (Gilbert, q.v., in 1600) that the earth itself is a huge magnet, having its north and south magnetic poles in the neighbourhood of the poles of the axis of rotation, and that the magnetic needle or suspended magnet turns to these as it does to those of a neighbouring magnet. All the manifestations of terrestrial magnetism (see below) give decided confirmation of this theory. It is on this view that the French call the north-seeking pole of the magnet the south pole (*pôle austral*), and the south-seeking the north pole (*pôle boréal*); for, if the earth be taken as the standard, its north magnetic pole must attract the south pole of other magnets, and *vice versa*. In England and Germany the north pole of a magnet is the one which, when freely suspended, points to the north, and no reference is made to its relation to the magnetism of the earth.

Form of Magnets.—Artificial permanent magnets are either bar-magnets or horseshoe-magnets. When powerful permanent magnets are to be made, several thin magnetised bars are placed side by side with their poles lying in the same direction. Such a collection of magnets is called a *magnetic magazine or battery*, and is more powerful than a solid bar of the same weight and size, because thin bars can be more strongly and regularly magnetised than thick ones. Fig. 3 is a horseshoe magnetic magazine. The central lamina protrudes slightly beyond the others, and it is to it that the armature is attached, the whole action of the magnet being concentrated on the projection. The magnetic needle is a small single permanent magnet nicely balanced on a fine point. See COMPASS.

The Magnetic Field.—The region surrounding a magnet (even, to a diminishing extent, to an infinite distance) is in a peculiar condition. If a magnet be laid under a piece of glass and soft iron filings be sprinkled on the glass, each filing will

assume a particular direction; and the whole congeries will map out the lines of the directions in which small magnets will be made to point by the play of the magnetic forces existing around the magnet, in the 'magnetic field' of that magnet. These directions are the Lines of Force in the magnetic field filling all space; and an example of them is given in fig. 4, which shows the arrangement of the filings above a bar-magnet, laid parallel to the glass. In a horse-

Fig. 4.

shoe magnet the strongest part of the field external to the magnet is that lying between the poles; the lines of force are there crowded together.

Magnetic Induction.—These lines of force external to the magnet are also Lines of Induction. In the direction of the lines of induction a magnetic separation tends to be set up; the soft iron filings are severally converted, in the neighbourhood of the magnet, into temporary magnets, each with a north and a south pole; the one pole is repelled, the other attracted; on the whole each filing is swivelled round into the direction of the local line of force. Similarly, a bar of soft iron becomes, while in contact with a magnet, as in fig. 5, or to a

Fig. 5.

less extent when in its neighbourhood, itself a temporary magnet; and it may in its turn magnetise and support other bars, so that a chain of soft iron bars may, up to a limiting weight, be supported on a magnet. Steel bars are slower than soft iron in taking up a magnetic condition, and the harder their temper the slower they are in doing so; but, unlike soft iron, they do not readily lose what they have acquired; they become permanent magnets, while soft iron retains magnetism only precariously and easily loses it when mechanically disturbed. Specially soft iron may lose the whole when struck; ordinary wrought-iron will generally retain traces of residual magnetism, the amount of which depends on the previous magnetic history of the particular bar. The characteristically magnetic substances are iron, nickel, and cobalt; but many others, even liquids (such as solutions of salts of iron) and gases (such as ozone), are attracted by the magnet.

Diamagnetism.—Most substances are (in the form of spheres) feebly repelled by magnets, and bars of them lie across the lines of induction in a non-uniform magnetic field. These substances are said to be diamagnetic—e.g. bismuth.

Magnetisation by the Earth.—The inductive action of terrestrial magnetism is a striking proof of the truth of the theory already referred to, that the earth itself is a magnet. When a steel rod is held in a position parallel to the Dipping-needle (q.v.) it becomes in the course of time, and the sooner if struck with a hammer, permanently magnetic. A bar of soft iron held in the same position is more powerfully but only temporarily affected. We may understand from this how the tools in work-

shops are generally magnetic. Whenever large masses of iron are stationary for any length of time they are sure to give evidence of magnetisation, and it is to the inductive action of the earth's poles acting through ages that the magnetism of the loadstone is probably to be attributed.

Preservation and Power of Magnets.—Even steel magnets, freshly magnetised, sometimes gradually fall off in strength, till they reach a point at which their strength remains constant. This is called the *point of saturation*. If a magnet has not been raised to this point it may lose nothing after magnetisation. We may ascertain whether a magnet is at saturation by magnetising it with a more powerful magnet, and seeing whether it retains more magnetism than before. The saturation-point depends on the material of the magnet itself. When a magnet is above saturation it is soon reduced to it by repeatedly drawing away the armature from it. After reaching this point magnets will keep the same strength for years together, if not subjected to rough usage. It is favourable for the preservation of magnets that they be provided with an armature or keeper. The power of a horseshoe-magnet is usually tested by the weight its armature can bear without breaking away from the magnet. Small magnets are much stronger for their size than large ones. The reason of this may be thus explained. Two magnets of the same size and power, acting separately, support twice the weight that one of them does; but if the two be joined, so as to form one magnet, they do not sustain the double, for the two magnets, being in close proximity, act inductively on each other. The north pole of the one tends to repel the adjacent magnetism of the contiguous north pole of the other, and to form by induction a south pole in its place; the magnets thus weaken one another. Similarly, several magnets made up into a battery have not a force proportionate to their number. Large magnets, in the same way, may be considered as made up of several laminae, whose mutual interference renders the action of the whole very much less than the sum of the powers of each. The best method of ascertaining the strength of bar-magnets is to cause a magnetic needle to oscillate at a given distance from one of their poles, the axis of the needle and the pole of the magnet being in the magnetic meridian. These oscillations observe the law of pendulum motion, so that the force tending to bring the needle to rest is proportionate to the square of the number of oscillations in a stated time.

Action of Magnets on each other.—Coulomb discovered, by the oscillation of the magnetic needle in the presence of magnets in the way just described, that when two sufficiently long magnets are placed, e.g. in the same line, with a small gap between them, so that the two poles at the gap may act upon one another practically without the interference of the remote poles, *the attractive or repulsive force between two magnetic poles varies inversely as the square of the distance between them*. Gauss proved from this theoretically, and exhibited experimentally, that when the distance between the centres of two magnets is large compared with the size of the magnets—i.e. *when the action of both poles comes into play—the action of two magnets on each other varies inversely as the cube of the distance between them*. This variation in the strength of the field may be shown either by the oscillation experiments above referred to, or by direct observation of deflections produced at different distances. The action on a magnet in a uniform magnetic field is that of a couple, like that of the hands on a copying-press. There is rotation, but no translation, unless the field falls off in strength from the position of the one pole to that of the other.

Effect of Heat on Magnets.—When a magnet is heated to redness it loses permanently every trace of magnetism; iron, also, at a red heat, ceases to be attracted by the magnet. At temperatures below red heat the magnet parts with some of its power, the loss increasing with the temperature. The temperatures at which other substances affected by the magnet lose their magnetism differ from that of iron. Cobalt remains magnetic at the highest temperatures, and nickel loses this property at 662° F.

Electric Relations of Magnetism.—Every electric circuit is a closed loop of some form or other. Every such loop bearing a current has round it a magnetic field; and such a single loop is equivalent to a thin disc, or shell of any form, cut out of a large bar-magnet, and has a south and a north aspect. The lines of induction pass, say, from the north face outwards, filling all space, and return to the south face, threading the loop, so that each line

Fig. 6.

of induction is a closed curve. The lines of induction immediately surrounding the wire are, if the circuit be large enough, circular in form. If wire bearing a current be coiled into a helix or solenoid (left-handed, fig. 6; right-handed, fig. 7), the helix

Fig. 7.

acts in respect to bodies external to it exactly in all respects as a bar-magnet would do: the strength of the equivalent magnet being in proportion to the strength of the current passing. The magnetic field surrounding a current-bearing loop or helix is called an Electro-magnetic Field; and it is identical with the field which might be produced by a sufficiently magnetised mass of the same contour: the difference being that, since currents may be made very strong, 'electro-magnetic' fields can be made more intense than any magnetic fields obtainable from steel magnets.

Magnetic Induction inside a Helix.—The interior of a current-bearing helix is a very powerful magnetic field, the most powerful part of the whole electro-magnetic field of the helix, since all the lines of induction are concentrated within it. Soft iron there becomes, instantly on the passage of the current, a powerful temporary magnet, or 'electro-magnet,' as it is called, which falls off in power instantly on the current being stopped; steel becomes permanently magnetised. Fig. 8 shows how the wires may be arranged to magnetise a horseshoe bar. A convenient mnemonic is (Daniell)—Lay

Fig. 8.

the thumb of the right hand across the forefinger; then if the forefinger point in the direction of the inducing current, the thumb will represent the induced magnet with the thumb-nail at its north-seeking end. Turn over into various positions.

This applies equally to a long straight current-wire or to any small portion of a helix.

The strength of the magnet produced by induction within a helix is, for small currents, proportional to the current and to the number of turns of wire in the coil; but as the current is increased a condition of saturation is approached after which no further increase in the current produces any increase in the strength of the induced magnet. For the time being soft iron may form a much stronger magnet, or 'electro-magnet,' than any permanent steel magnet of the same size could be. A coil without a soft iron core has a magnetic field if it carry a current; but the field is far stronger when a soft iron core is present.

Magnetic Attractions and Repulsions of Currents.—The stresses in the magnetic field are such as to make all lines of induction from various sources coincide as far as possible in direction; and hence circuits tend to place themselves, as far as possible, coincident with one another in respect of form and parallelism of current. It is not difficult to show that this tendency results in movements the same as those which would be produced if linear currents in the same direction (parallel, convergent, or divergent) mutually attracted one another, and currents in opposite directions repelled one another. When a circuit is in part flexible, the flexible part being a wire or even merely a line of discharge through air, it tends either to expand or to contract in area, so that it may come, as near as may be, to meet these conditions; and the result is that similarly-directed currents or parts

of the same current move into the closest possible proximity to one another. This is illustrated by fig. 9, in which the course of the current is shown by arrows; the movable part of the circuit, poised on mercury cups, will rotate in a magnetic field so as to tend to make the direction of its own lines of induction coincide with the direction of the lines of induction of the magnetic or electro-magnetic field, and thus to make its own contour embrace as many as possible of the lines of induction of the field, if their general trend coincide with its own, or as few as possible if they be opposed; and, consequently, if a wire in which a current passes downwards be placed vertically near *cd*, the lines of induction round that wire and those round *cd* coincide in general direction, and *cd* appears to be attracted by the wire; while if the current pass upwards *cd* is repelled, and *ef* attracted. Place, now, the wire below and parallel to *de*. If the current passes in the direction *d* to *e* no change takes place, as the attraction cannot show itself; but if the current moves from *e* to *d* the whole turns round till *d* stands where *e* was, and both currents run the same way. If the wire be placed at right angles to *de*, the rectangle turns round and comes to rest when both currents are parallel and in the same direction.

Fig. 9.

According to Ampère's theory, the earth, being a magnet, has currents in it which are equivalent to currents circulating about it; these must be

from east to west, the north pole of the earth being, in our way of speaking, a south pole. A magnet, then, will not come to rest till its own lower currents place themselves parallel to and in the direction of the earth's currents. This is shown in fig. 10, where a section of a rectangular bar-magnet is represented in its position of rest with reference to the earth-current. The upper current, being farther away from the earth-current, is less affected by it, and it is the lower current that determines the position. A magnetic needle, therefore, turns towards the north to allow the currents moving below it to place themselves parallel to the earth's current. This also is shown by the current-bearing rectangle in fig. 9, which comes to rest in stable equilibrium, in the absence of any external current, when *d* and *e* lie east and west.

Fig. 10.

The Measurement of Magnetic Data.—This has largely had its terminology evolved with reference to the equivalence of magnetic forces and phenomena to those which would be evinced if 'magnetism' were a kind of matter, positively or negatively attracting and resident in the poles. A *pole of unit strength* is one which attracts or repels another equal pole, situated at a distance of one centimetre, with a force of one dyne. The *magnetic moment* of a magnet is the strength of either pole multiplied by the distance between the two poles. This can be measured directly. The *intensity of magnetisation* of a bar-magnet is the magnetic moment divided by its volume. A *magnetic field of unit strength or intensity* at any particular point is a field in which at that point a unit pole would be pulled upon or repelled with a force of one dyne; and conversely, the intensity of a uniform magnetic field may be measured by finding the mechanical couple acting on a magnetic needle, freely suspended in it. The intensity of induced magnetisation produced by putting a long bar of a magnetisable substance in a uniform magnetic field of unit strength measures the *magnetic susceptibility* of that substance. The force within the substance of an induced magnet, due both to the inducing field and to the surrounding magnetised substance, when the inducing field is unity, measures the coefficient of magnetic induction or the *magnetic permeability* of the substance. The *strength of a magnetic disc or shell* is its magnetic moment per unit of area, if this be uniform.

Magnetic Measurement of Electric Data.—Given a magnetic shell of given outline and strength, its action upon a magnetic needle placed within its field can be observed; and conversely, from its outline and its deflecting action its strength can be calculated. An electric current of the same contour can have its intensity so regulated as to produce the same magnetic effect as the magnetic shell did upon the needle in one position; and if in one, then in every position; and the intensity of that current is said to be, in magnetic measure, numerically the same as the magnetic strength of the equivalent magnetic shell. This is the basis of a system of electric units, called magnetic or electro-magnetic units of electric quantities; and convenient multiples and submultiples of these—arrived at by substituting for the centimetre, the gramme, and the second, as the units of length, mass, and time, 1,000,000,000 cm., the ~~100,000,000~~ part of a gramme and the second as these fundamental units—are in use as the practical units for electrical measurement. These are the *ampère*.

the unit of current-intensity; the *ohm*, that of resistance (=the resistance of 106.3 cm. pure mercury column, 1 sq. mm. in transverse section); the *volt*, that of potential difference or 'electromotive force' (=approximately that of a Daniell cell in which the liquids are a saturated solution of nitrate of copper and dilute sulphuric acid, 1 acid to 22 water); the *coulomb*, that of electric quantity; the *farad*, that of capacity; and the *quadrant*, that of self-induction.

Self-induction.—When a current is suddenly started in a coil of wire, the ultimate result is to set up a magnetic field. But, while this is being set up, energy is being absorbed by the field, and the current falls short of its full intensity. Similarly, when the current ceases this energy is restored, and the current seems piled up as if it had momentum of its own like water in a hydraulic ram. The stronger the magnetic field that will be produced—the more lines of induction will thread the coil—the more marked is this effect; and this exaggeration is brought about by multiplying the turns in the coil (keeping down the resistance, if necessary, by increasing the thickness of the wire used), or by inserting a core of soft iron, or both.

Induction of Currents in Magnetic Field.—Lay two circuits in one another's neighbourhood. The sudden production or increase of current in the one will produce a brief current in the other in such a sense that there is mechanical repulsion between the induced current and the originating one; the cessation or diminution of the primary current induces, in the opposite sense, a brief current in the secondary circuit. These are phenomena of the magnetic field of the primary circuit; and the primary circuit can be replaced by a magnet or electro-magnet, whose approach or strengthening induces brief currents in one sense, and whose recession or weakening induces brief currents in the opposite sense. No current passes in the secondary coil so long as the primary current or magnet remains constant or stationary. For the ways in which this production of a secondary current is utilised, see DYNAMO, INDUCTION. If we try to move a good conductor—a copper disc or a knife—in a strong magnetic field the motion is resisted or damped; the production of the induced currents generated by motion in the field absorbs energy.

Rotatory Features of Magnetism.—As a simple case, consider the field in the immediate neighbourhood of a linear current. The lines of magnetic force run in circles round the wire; a magnet pole tends to be driven in such a sense that, if it be positive or north-seeking, it will travel round an advancing current in the same sense in which the point of a corkscrew travels round the axis of the advancing corkscrew. If a magnet were flexible it would form a coil round the current; and conversely, a flexible current-bearing wire tends to coil round a strong bar-magnet, and currents parallel to bar-magnets tend to rotate round the magnetic axis of the magnet.

Magnetism in the Atom or Molecule.—All substances become more or less magnetic—either paramagnetic (analogous to soft iron) or diamagnetic—under the inducing action of a magnetic field. As to elements, the degree of paramagnetic or diamagnetic effect depends, in a general sense, upon the place of the element in Mendelejeff's Periodic Series. It is, however, not an atomic property (except approximately in certain diamagnetic phenomena), but rather seems to belong to molecules, or even to agglomerations of molecules. It has been found (Curie) that, as a general rule, a diamagnetic effect is independent of the temperature, while a paramagnetic effect tends to vary inversely as the absolute temperature.

The explanation of magnetism in the atom or molecule is still very tentative and obscure. Ampère, in the early part of the 19th century, considered that every particle of a magnet has closed

Fig. 11.

Fig. 12.

currents circulating about it in the same direction. A section of a magnet according to this theory is shown in fig. 11. All the separate currents in the various particles may, however, be considered to be equivalent to one strong current circulating round the whole (fig. 12). Before magnetisation the molecules lie in different directions, so that the effect of the currents is lost, and the effect of induction is to twist the molecules round so as to bring the currents to run in the same direction. The perfection of magnetisation would be to render all the various currents parallel to each other. Soft iron, in consequence of its offering less resistance to such a disposition, becomes more powerfully magnetic under induction than steel, in which considerable resistance to this displacement of the molecules exists, and which, when this deformation has once been produced, retains it to a considerable extent, this being the cause of permanent magnetism. This displacement of the molecules upon induction is often accompanied by a tick, or by a mechanical twist or an alteration in length and thickness.

With the advent of the Electron Theory (see ELECTRON) it seemed that a mechanism (the whirl of charged electrons in an atom) had been provided for Ampère's concept; but a mystery remained, why all elements are not as magnetic as iron. It became necessary to frame a series of hypotheses, e.g., that in diamagnetic elements the whirls of the electrons were so directed as to neutralise one another's magnetic field; that in paramagnetic substances the whirls tended to become directed in a magnetic field as in Ampère's theory, but that this tendency was countered in solids by the cohesive forces, and in liquids and gases (Langevin) by the thermal turmoil and agitation of the molecules; and so forth. On the whole, however, the electron theory has not yielded satisfactory results. Weiss has produced evidence in favour of each molecule containing one or more elementary magnets or *magnetons*, these magnetons being, like electrons, identical in all substances; and Bohr has deduced from Quantum (q.v.) considerations the existence of a magneton equal to five Weiss magnetons. Gerlach and Stern have (1922) confirmed the existence of Bohr's magneton by direct measurement in the case of silver. See Andrade, *The Structure of the Atom* (with bibliography, 1923), pp. 257-284.

Nature of the Magnetic Field.—All the phenomena of the magnetic field are explicable as due to whirlpool currents of electricity in closed vortex-rings, the axes of which are the magnetic lines of induction. The reaction of tendencies to the formation of these vortex-rings from different sources results in the production of local variations of stress in the ether which result in attractive and repellent movements between currents or magnets, or between currents and magnets, or in the production of currents, or of magnetic induction; and the resultant forces are along the axes of the whirls,

which tend to shorten themselves longitudinally and to spread out laterally. The electric displacements in the whirls are therefore at right angles to the lines of magnetic force. With other dispositions of the magnetic field we have other forms of the lines of induction; but they are always closed curves which mark the axes of vortex motions or shears, and which lie wholly in air, or partly in air and partly in metal or other substances.

Electro-magnetic Propagation.—When a disturbance is set up in one place which leads to the formation of a magnetic field, the change from the original condition of the ether to the complex condition which is known as 'magnetic field' is marked by a magnetic or *electro-magnetic propagation* of the disturbance; and the theoretical velocity of this propagation has been shown to be about 300,000 kilometres per second, which is practically exactly the same as the speed of the propagation of light. In a linear current the direction of the current is the direction of propagation; the disturbance is propagated in the ether, not in the conductor; and the magnetic and electric displacements are at right angles both to the direction of propagation and to one another. Without a linear conductor to guide the propagation the disturbance is propagated equally in all directions; and Clerk-Maxwell advanced the proposition that light is a phenomenon of this order, an electro-magnetic phenomenon involving vortical stresses, rather than the mere vibration of an elastic ether. This proposition was very strikingly confirmed by the researches of Hertz in 1888. He found that by producing waves of electro-magnetic propagation of periodic disturbances he could reproduce with long waves, which he found to travel at the predicted rate, the phenomena of reflection at the surface of a conductor, refraction, polarisation, interference, &c., which are manifested by those short and frequent ether-waves which give rise to the phenomena of light and radiant heat; and his results showed that the plane of magnetic disturbance, at right angles to that of electric disturbance, is the analogue of the plane of polarisation, which must be at right angles to the plane of vibration. Out of this has developed the modern Wireless Telegraphy and Telephony (q.v.).

See DECLINATION NEEDLE, DIAMAGNETISM, DIPPING-NEEDLE, DYNAMO-ELECTRIC MACHINES. For literature, see ELECTRICITY; and refer to Sir J. J. Thomson, *Elements of Electricity and Magnetism*; A. G. Webster, *Theory of E. and M.* (with bibliography); Levins, *Theory of E. and M.*; Sir Oliver Lodge, *Modern Views of Electricity*.

Magnetism, ANIMAL. See ANIMAL MAGNETISM, HYPNOTISM.

Magnetism, TERRESTRIAL. Under the general article MAGNETISM the broad fact that the earth is a magnet has been incidentally touched upon. With the earth there is associated a magnetic field, with lines of magnetic force. These we can only study at the earth's surface, but everything goes to show that they are continuous and curved in space, passing from regions in the southern hemisphere (positive regions) to regions in the northern hemisphere (negative regions, like the space round the south end of an ordinary bar magnet). The direction of the line of force at any place is given by freely suspending a bar magnet on an axis passing through its centre of mass. If this axis be horizontal, we have the Dipping-needle (q.v.). The north-seeking end of the dipping-needle makes with the local horizontal plane an angle; as the dipping-needle is turned round a vertical axis, this angle passes through a maximum value; when the angle is a maximum, the needle lies along the local line of force, and the maximum angle is

the dip. Fig. 1 shows, for the year 1922, lines drawn through all places at which the dip has the value indicated by the number marked; in the northern hemisphere the dip is downward, in the southern hemisphere upward. The line

of zero dip is called the magnetic equator. The maximum downward dip, 90° , occurs at the north magnetic pole, 97° W. and $70\frac{1}{2}^\circ$ N.; the maximum upward dip, 90° , at the south magnetic pole, which, according to Shackleton, is at $155^\circ 16'$ E. and

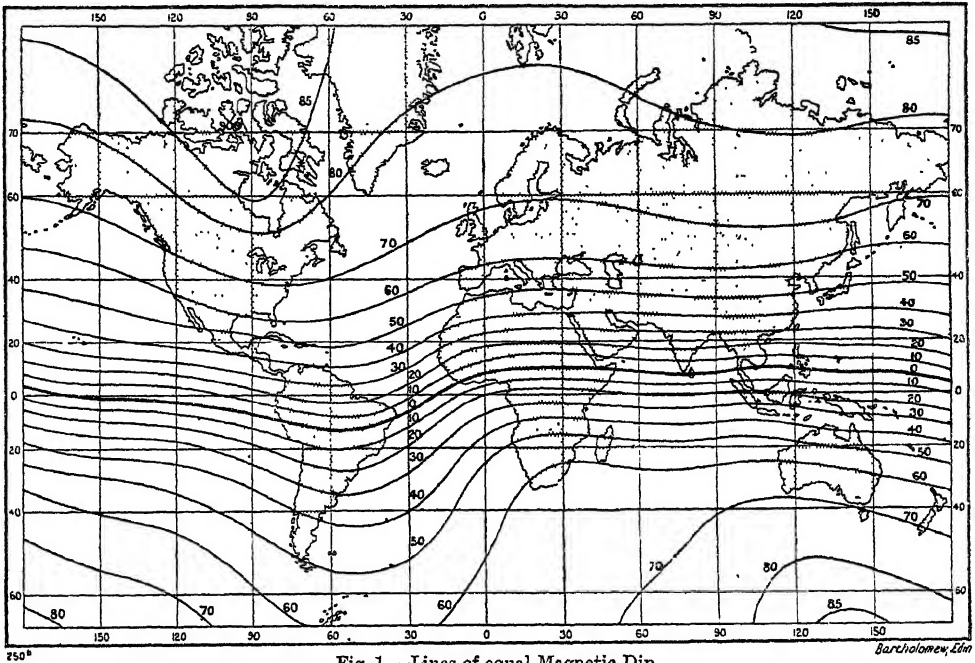

Fig. 1.—Lines of equal Magnetic Dip.

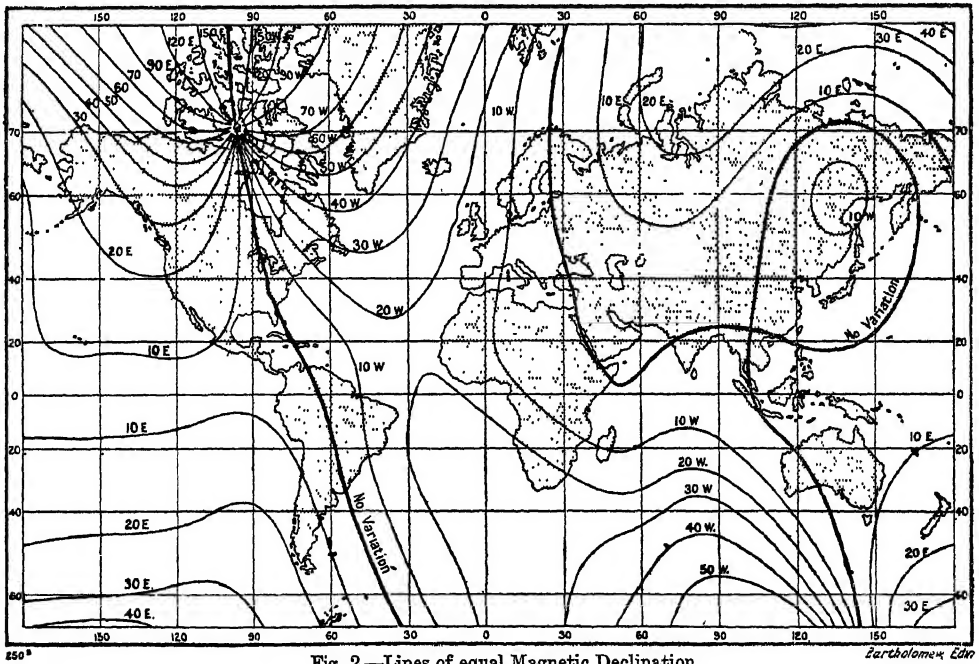

Fig. 2.—Lines of equal Magnetic Declination.

$72^\circ 25'$ S. These magnetic poles are, however, not points, but areas of considerable extent. We can readily recognise a marked departure of the earth's magnetic condition from the magnetic condition of a uniformly magnetised ellipsoid of revolution whose magnetic axis coincides with the polar axis; for this, fig. 1 would present parallel straight lines.

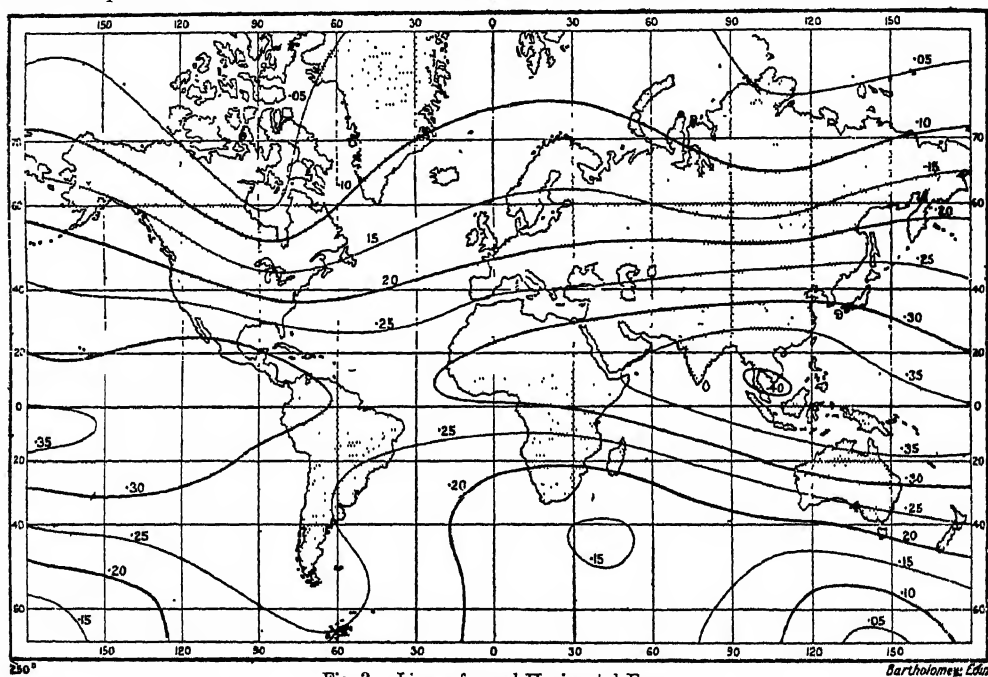

When the needle is suspended and rotated so as to show the maximum dip, it also makes a certain angle, the declination or the variation, with the geographical meridian. The mariner's compass, in which the needle is so poised as to lie horizontally in spite of the tendency to dip, does not (except at places where there is no variation)

point geographically north and south, but points to the west or to the east of the true geographical north, according to the locality. Fig. 2 shows, for the year 1922, the lines or 'isogones' drawn through all places where the declination has the value marked. One peculiarity to be noted is that from the north magnetic pole to the north geographical pole the line of no variation or 'agonic line' is continued as a line of declination 180° E. or W., for at places along that line the needle points south; thereafter it forms part of the agonic line of the eastern hemisphere; and similarly in the southern hemisphere. Another is the cross-loop of the agonic line in the east of Asia, which encloses a region of westerly declination. Declination charts for all seas and shores are invaluable to the practical navigator, by whom they are called variation charts. From them he learns at a glance in what direction the magnetic needle points at the place he happens to be in, and can steer his desired course accordingly.

The strength or intensity of the local magnetic force still requires to be ascertained. The simplest

and most accurate way of doing this is to measure its horizontal component, the 'earth's horizontal force,' and then to multiply this by the secant of the angle of dip. Fig. 3 shows, for the year 1922, the lines joining all places where the 'horizontal force' has the values marked. The horizontal force vanishes at the magnetic poles. In a general way the total force increases as we approach the magnetic poles. Its maximum values, however, are not exactly at these poles, nor do the positions of minimum values lie on the magnetic equator.

The declination, dip, and horizontal force are commonly called the magnetic elements of a place. They are all subject to variations in time, so that it is constantly necessary to keep magnetic charts up to date (see MAGNETOMETER). In 1884 the cross-loop of fig. 2 was a somewhat remote isolated closed oval, and the agonic line was more to the east in its northern part. During the forty-four years preceding, both agonic lines had been moving westward and the closed oval eastward. In 1600, according to Hansteen, the agonic formed a great loop from Trinidad to the north of Norway, then

at times of maximum sun-spots; and, according to Loomis, a great magnetic storm is always accompanied by an unusual disturbance on the sun's surface. Again, there is no doubt some connection between certain types of magnetic changes and earth-currents, the latter being particularly strong during magnetic storms; but it is now admitted by all authorities that earth-currents cannot be regarded as an efficient cause of the magnetic disturbances.

In addition to the well-marked solar-diurnal variation of the magnetic elements, there is also a lunar-diurnal variation, which has been specially studied by Broun and Chambers. These and other phenomena of terrestrial magnetism show that the earth is magnetically sensitive to cosmic influences. These influences may be directly magnetic; or, as is more probable in the case of the solar-diurnal variations, they may give rise to meteorological changes involving electric and magnetic actions. As to the ultimate origin of the earth's magnetism as a whole it is not possible, in the present state of the science, to formulate any satisfactory hypothesis. The rotation of the earth, which is so important a factor in the broad meteorological features that exist over the earth's surface, is the only dynamic polarity that can be compared to the magnetic polarity. According to the nebular hypothesis the earth's rotation is a part of a grand circulatory motion of the solar system. So may the earth's magnetism be a part of the general magnetic conditions of the same system. If such a view is too vague for acceptance, the only hypothesis which seems to meet the case is that suggested by Balfour Stewart, who traced the magnetic condition of the earth to the terrestrial meteorological system, as modified by the earth's rotation, acting cumulatively through the ages.

Magnetite. See LOADSTONE.

Magneto-electric Machine. See DYNAMO-ELECTRIC MACHINES.

Magnetometer is, in general, any instrument for measuring magnetic force, or for comparing one magnetic force with another. A freely-suspended magnet, whereby the strength and direction of the lines of force in a magnetic field may be ascertained by observing the position assumed by a freely-suspended magnet and also its rate of oscillation and the amount to which it is deflected when under the influence of a second magnet, is the essential feature of all magnetometric instruments. The peculiar importance to us of the earth's magnetic field has, however, led to the construction of instruments of precision, to which the name Magnetometer is specially applied.

In a magnetic observatory the self-registering magnetometers or magnetographs form an extremely important set of instruments. By these the quick changes in the intensity of the earth's magnetic field and in the declination are registered by photographic means. The essential feature of the method is the reflection of a beam of light from a mirror attached to a magnet, which is suspended or pivoted so as to be sensitive to changes in the particular element that is being measured.

Magneton. See MAGNETISM.

Magnificat, the 'song of the Virgin Mary,' which, in the Vulgate, begins with *Magnificat*. See BREVIARY.

Magnifying Glass. See LENSES, MICROSCOPE.

Magnolia, a genus of beautiful trees of the natural order Magnoliaceæ, having a calyx of three sepals, a corolla of six to twelve petals, and carpels in spikes arranged in cones, and opening at

the dorsal suture. They are natives chiefly of North America, the Himalaya Mountains, China, and Japan. The flowers are large and solitary; the leaves generally large, in some species evergreen, in others deciduous. The wood is in general

Magnolia grandiflora.

soft, spongy, and of little value. *M. grandiflora*, sometimes called the Laurel-leaved Magnolia, has white flowers of great size. It is an evergreen tree attaining 100 feet high, with magnificent laurel-like leaves, found in the lower districts from North Carolina to the Gulf of Mexico. It succeeds well as an ornamental tree in the south of England, but in Scotland requires a wall and some protection in winter. *M. Umbrella* is found on the Alleghany Mountains, and extends as far north as lat. 43°. From the radiated manner in which its leaves are disposed at the extremities of the branches it has received the name of Umbrella Tree. It has very large white flowers. It is one of the species most commonly cultivated in Britain, but in Scotland it requires a wall. *M. acuminata* inhabits the same districts, and is a lofty tree with greenish-yellow flowers. It endures the climate of Britain well, but its flowers are not so much admired as those of some of its congeners. *M. glauca*, a native of Pennsylvania, Virginia, and the Carolinas, is known by the names of *White Bay*, *Beaverwood*, and *Swamp Sassafras*. It is a tree or shrub, with very beautiful and fragrant white flowers, and blue-green leaves, silvery below. The Yulan, or Chinese Magnolia (*M. Yulan* or *conspicua*), has been much cultivated in China for more than twelve hundred years on account of its beautiful and fragrant white flowers, which it produces in great profusion. It is one of the finest ornamental trees, and succeeds well in the south of England. It is a deciduous tree, and the flowers expand before the development of the leaves. *M. Campbellii*, another native of the same region, produces great rose-coloured flowers, and is described by Hooker as the most superb of the genus. The bark and fruit of all magnolias possess tonic bitter properties, and the bark of some of the species, particularly that of *M. glauca*, is used in domestic medicine in the marshy districts of North America in cases of rheumatism and fever. *Michelia* (see CHAMPAC) is a closely allied genus. *Michelia excelsa* is a predominant tree in some parts of the Himalaya Mountains, at an elevation of 7000 to 8000 feet; the mountains, when it is in blossom, appearing as if sprinkled with snow. The natural order Magnoliaceæ is closely allied to Ranunculaceæ, differing chiefly in the arborescent habit, and in the large stipules which envelop the young leaves before they open, but soon fall off. The leaves are simple. Aromatic properties are prevalent. To this order belong the Tulip Tree, Star Anise, and Winter's Bark.

Magnus, St, a Scandinavian Earl of Orkney who in 1114 was assassinated in Egilshay Island by his cousin Haco.

Magnus or MAGNI, OLAUS, Swedish historian, was born at Linköping in 1490, and became secretary to his elder brother Johannes, Archbishop of Uppsala. At the Reformation both brothers went abroad, and ultimately settled in Rome. On the death of Johannes, Olaus became titular archbishop, and died in 1558. Both brothers wrote on Swedish history; the famous work of Olaus is his *Historia de Gentibus Septentrionalibus* (1555).

Magpie, or PIE (*Pica*), a genus of birds of the family Corvidæ (q.v.), distinguished from the true crows by their small size, long tail, short wings, and variegated plumage. The only British species is the Common Magpie (*P. rustica*), common in Britain, very abundant in Ireland, and found in almost all parts of Europe, in Asia as far as India, China, and Japan, and in the northern parts of North America from the Pacific to Michigan. It is from 16 to 18 inches long, the longest tail-feathers sometimes measuring 11 inches in length. It is of a glossy-black plumage, slightly greenish and violet on the crown and back, with a slightly coppery tinge on the head; rump gray; shoulder-feathers and under-surface of body white; wings and tail blue, green, and white; bill, legs, and feet black. The female is slightly smaller than the male and less brilliant in plumage. The magpie is a shy, mischievous bird, extremely vigilant and cunning, both in eluding enemies and in seeking its own food. It is generally seen in pairs, but

Both in its wild and tame state it has a propensity to seize and carry off bright and glittering articles and hide them. The genus *Pica* consists of nine species, very widely distributed in Europe, Northern Africa, Asia north of the Himalayas, in Arctic America, and California.

A great wealth of popular superstition has clustered round the magpie or *pyet*, and almost universally it is considered as in a special sense a bird of evil omen. In Germany Sweden, and Brittany it is closely connected with witches and with the devil, and it is unlucky to kill one, except during the twelve days between Christmas and Epiphany in Sweden and North Germany, and during the month of March in Thuringia. Popular reasons for the bird's persistent wickedness, in the north of England, are: because it was the only bird that would not go into the ark with Noah; because it is a hybrid between the raven and the dove; because after the crucifixion it alone of all the birds did not go into full mourning. Its appearance and the numbers seen at one time are always significant. There are many variants (some even contradictory), but the following is in good belief in the north of England:

One is sorrow, two is mirth,
Three a wedding, four a birth,
Five heaven, six hell,
Seven the devil's ain sel.

Wordsworth, in the *Excursion*, alluded to the auspicious omen of seeing two magpies cross one's path, and Sir Humphry Davy, in *Salmonia*, linked the fact with the goodness of the weather.—For Australian magpies, see BARITA.

Maguey. See AGAVE.

Magyars. See HUNGARY.

Mahābhārata (meaning probably 'the great history of the descendants of Bharata') is the name of one of the two great epic poems of ancient India; the other being the Rāmāyana (q.v.). In its present condition the epos consists of a hundred and ten thousand couplets, each containing thirty-two syllables; but there is ground for believing that it was formerly known in other recensions of a still greater extent. In its actual shape it is divided into eighteen parvas or books, the Harivansa being considered as a supplementary part of it. That this huge composition was not the work of one single individual, but a production of successive ages, is manifest from the multifariousness of its contents, from the differences in style, and even from the contradictions which disturb its harmony. Hindu tradition ascribes it to Vyāsa, but as Vyāsa means 'the distributor or arranger,' and as the same individual is also the reputed compiler of the Vedas, Purānas, and several other works, it is obvious that no historical value can be assigned to this generic name. The contents of the Mahābhārata may be distinguished into the leading story and the episodic matter connected with it. The former is probably founded on real events in the oldest history of India, though in the epic narrative it will be difficult to disentangle the reality from the fiction. The story comprises the contest of the celebrated families called the Kauravas and Pāndavas, ending in the victory of the latter, and in the establishment of their rule over the northern part of India. Kuru, a descendant of Bharata, had two sons, Dhritarāshtra and Pāndu. Dhritarāshtra's sons, the Kauravas, were a hundred in number; Pāndu's, the Pāndavas, only five. Pāndu having resigned his throne, Dhritarāshtra, though blind, assumed the government, and ultimately divided his kingdom between his sons and the sons of Pāndu. The former, however, coveting the territory allotted to the Pāndu princes, endeavoured to get possession of it. A game of dice was the

Common Magpie (*Pica rustica*).

occasionally in large flocks. Its note is a harsh chatter, kept up as long as any obnoxious person or animal is near its haunts. In diet it is almost omnivorous, living on snails, slugs, worms, frogs, rats, mice, and the eggs and young of poultry. It builds its nest usually in the fork of a tree at some distance from the ground, but sometimes on low hedges and thorn bushes, or even on the ground. In Norway and Sweden, where it is favoured, it may be found nesting near houses on low gooseberry bushes. Its nest is large and dome-shaped, made of sticks cemented with clay and lined with fine roots and dried grass. It is strongly fortified with rough thorns, so as to resist the attacks of other animals, and even the action of the small shot which gamekeepers fire into it when they suspect it to contain young birds. The eggs are from six to nine in number, of a pale bluish green or yellowish-white, spotted with olive-brown. The mother shows great attachment to her progeny. The magpie is easily tamed, becomes impudently familiar, and learns to articulate a few words.

means by which they bound over their cousins to relinquish their kingdom, promising, however, to restore it to them if they passed twelve years in the forests, and a thirteenth year in such disguises as to escape detection. This promise was faithfully kept by the Pándavas; but when the term of their banishment had expired the Kuru princes refused to redeem their word. A war ensued, ending in the complete destruction of the Kauravas. Duryodhana and his brothers are pictured as the type of all conceivable wickedness, and the Pándu princes as paragons of virtue and heroism, and the incarnations of sundry deities. Out of the hundred and ten thousand couplets which constitute the great epos barely a fourth part is taken up by this narrative; all the rest is episodical. The matter incidentally linked with the main story may be distributed under three principal heads: one comprising narratives relating to the ancient or mythical history of India, as, for instance, the episodes of Nala and Sakuntalá; a second is more strictly mythological, comprising cosmogony and theogony; a third is didactic or dogmatic—it refers to law, religion, morals, and philosophy, as in the *Bhagavad-Gítá*. In virtue of this episodical matter, superadded at various dates, the *Mahábhārata* gradually became the encyclopædia of India. The text was first printed in 1834-39 at Calcutta. There are complete English translations by Mohan Ganguli (1896) and M. N. Dutt (1895 *et seq.*), a condensed one by Romesh Dutt (1898), and of parts, as in Sir E. Arnold's *Indian Idylls* (1883). See Oman, *The Great Indian Epics* (1899), and Hopkins, *The Great Epic of India* (New York, 1901), besides the German works of Holtzmann, Bühler, and Dahlmann.

Mahádeva. See SIVA.

Mahan. ALFRED THAYER (1840-1914), born at West Point, the son of a professor there, studied at the United States Naval Academy, and from 1856 till 1896 served in the navy, as captain from 1885 on. His writings on naval science and history are luminous and authoritative, and are principally devoted to the influence of sea-power in history. In 1906 he was given the rank of rear-admiral retired. See Life by C. C. Taylor (1920).

Mahánadí, 'the great river,' rises in the Central Provinces, and after an eastward course of 520 miles, 300 miles of which are navigable, it divides into branches near Cuttack, flows east and south-east through the district of that name, and falls by several mouths into the Bay of Bengal. The catchment basin of the Mahánadí is less than 44,000 sq. m., yet its maximum discharge in time of flood equals that of the Ganges—1,800,000 cubic feet per second—and exceeds that of the Mississippi. An elaborate system of canals has been constructed to take advantage of this abundance.

Mahanoy' City, a mining town of Pennsylvania, 109 miles by rail NW. of Philadelphia, with a score of collieries and several manufactories. Pop. 16,000.

Maharaja. See RAJA.

Mahatma. See THEOSOPHY.

Mahávansa, two celebrated works written in Páli, and relating to the history of Lanká, or Ceylon, from its earliest period down to the reign of Mahásena, who died 302 A.D. The first thirty-eight chapters were published in 1837 by G. Turnour; and there is an edition of the whole in Páli and Singhalese (Colombo, 1877-83).

Mahávira (literally, 'the great hero') is the 24th or last Jina, or deified saint, of the Jains (q.v.). His legendary history is given in the *Kalpa-Sútra* and the *Mahávira-Charitra*, two works held in great authority by the Jains.

Maháyána (Sanskrit, 'Great Vehicle,' opposed to *Hinayána*, 'Little Vehicle'), that later development of Buddhism (q.v.) which prevails in northern regions. See LAMAISM.

Mahdi (pass. part. of Arab *hadd* = 'the guided'; 'the well-directed one'), the Mohammedan restorer of all things. Though not mentioned in the Koran, he is said to have been promised by Mohammed to complete his work in filling the world as full of righteousness as it is of iniquity. The idea is that of the Jewish and Christian Messiah and of the Zoroastrian Saoshyant. Some need for reform soon made the idea practical. The first three khalifs were by Ali's party regarded as usurpers; and after Ali's reign and murder that party grew in number and in determination to recognise as Imám or khalif none but Ali's heirs. Mohammed, a son of Ali though not of Fátima, but of 'the Hanafite,' bore unwillingly the name of Mahdi, and dying in peace he was expected to return. The Shia or party of Ali consisted mainly of Persians. This race opposed the Ommiades because these were unprincipled men and half heathen, because they were their foreign tyrants, and because as usurpers they had broken through the divine right of heredity. The Abbasides who, descended from the prophet's uncle, expelled and destroyed the Ommiades by aid of the Shia were as much the enemies of these as their predecessors had been. The seventh Shiite Imám was poisoned by Haroun Alraschid, the eighth by his temporarily Shiite successor Almamún; the ninth, tenth, eleventh followed the same path of martyrdom. The twelfth, Mohammed by name, disappeared after captivity at the age of twelve years in 879. The Shiite inference is that he, the 'hidden Imám,' will yet come as Mahdi to destroy the false prophet and, with the help of Jesus, to destroy or convert to Islám all mankind, and to put all wrongs right. Then will follow the resurrection and the final judgment. The native princes of Sofi's line who mastered the Persian throne in 1505 called themselves the lieutenants of the coming Mahdi. From the Ismailis (q.v.) in North Africa arose another Mahdi, from whom sprang the Fatimide khalifs. The seventh of these was Hakim, one of God's incarnations that had previously been Ali. He died, 'became hidden,' in 1020, and is expected by his sect the Druses. Among the Berbers of Mount Atlas in the 12th century arose another Mahdi, by name Mohammed ibn Tumert, whose disciple and successor Abdumúmin overran Morocco and supplanted the Almoravide dynasty there and afterwards in Spain. Hence the Almohade ('Unitarian') dynasty. The year 1666 produced in Turkey its Jewish Messiah, Sabbatai Zevi, and in consequence its Kurdish Mahdi for the suppression of this Dejjál, or false prophet. Both fell quietly into the sultan's hands. In 1799 another Mahdi arose in Egypt, against the French, and fell in battle. In Dongola, towards 1843, was born Mohammed Ahmed. He was for a time in the Egyptian civil service, but disagreeing with the governor, he became a trader and a leading slave-dealer. About the prophetic age of forty he claimed to be the Mahdi. Gradually at the Mahdi's call—the Muslim equivalent for a revolutionary spirit—the Eastern Sudan stirred itself against Egyptian misrule. In 1883 he seized El-Obeid, the chief city of Kordofan, and made it his capital; and on the 5th November of that year the Egyptian army commanded by Hicks Pasha was annihilated. In 1885 Khartum was taken, and General Gordon, whom Britain had sent to pacify the Sudan, was killed. The Mahdi died at Omdurman on 22d June 1885. The Khalifa Abdulla succeeded him, but never wielded his power, and his influence was destroyed by the British expedition to Dongola in 1896 and the

disastrous defeats inflicted on him by the Sirdar Kitchener (afterwards Lord Kitchener) at the Athara in April 1898, and especially at Omdurman on 2d September 1898. The Mahdi's tomb in Omdurman was destroyed, the Egyptian flag was hoisted at Khartum, and, after Fashoda, the whole Nile Valley came under British influence.

For the rebellion, the defeat of Hicks Pasha, and the fall of Khartoum, see EGYPT, GORDON, SUDAN. See also Darmesteter, *The Mahdi's Past and Present* (Eng. trans. 1885); Wingate, *Mahdism and the Egyptian Sudan* (1891); Ohrwalder, *Ten Years' Captivity in the Mahdi's Camp* (1892); Slatin Pasha, *Fire and Sword in the Sudan* (trans. by Wingate, 1896); Bennett Burleigh, *Sirdar and Khalifa* (1898); G. W. Stevens, *With Kitchener to Khartoum* (1898); Margoliouth, *Mahdis and Mahdism* (1916). See also SENUSSI.

Mahé, the only French settlement on the west coast of India, is in Malabar district, 35 miles NNW. of Calicut. Area, 3½ sq. m.; pop. 11,000. See also SEYCHELLES.

Mahi Kantha Agency, a group of fifty-two native states in Bombay. Of the total area of 3124 sq. m., 1668 belong to the state of Idar. Pop. (1921) 450,478, including 46,000 Bhils.

Mah-Jongg, a Chinese table-game, for which an antiquity of 1000 years—some say 2000—has been claimed, and which became fashionable in Europe and America in and after 1923. The game is for four players, each playing for himself. A Mah-Jongg set comprises 144 'tiles'—small oblongs, in surface about the size of a postage stamp. Good sets, which are costly, have tiles with bamboo backs and bone or ivory faces. Each tile bears a design painted in colours. There are 36 different designs, viz. East Wind, South, West, and North Winds; White, Red, and Green Dragons; Seasons and Flowers; 1, 2, 3, 4, 5, 6, 7, 8, and 9 of Circles, of Bamboos, and of Characters. Of every design there are 4 tiles alike. The four Flowers and four Seasons are generally dispensed with, as they but add to the gambling chances—already high. Each player builds a wall of tiles in front of him, 17 long and 2 high, and the four walls are adjusted to form a square. By quaint ceremonial the banker (East Wind) is chosen, the wall is broken, and the players take from it 13 tiles. East Wind takes 14, but discards one. Thereafter each player in turn (which goes counter-clock-wise) draws a tile from the wall and discards one from his hand, the discarded tiles being named and placed face upwards on the table. The object is, by drawing, discarding, and claiming (under fixed conditions) others' discards, to get a Mah-Jongg hand, i.e. one made up of one pair of like tiles and 4 sets of like tiles or sequences (e.g. 3, 4, 5 Circles). The game itself is not difficult to learn, but the system of counting is rather complicated. The banker, whose rôle passes round the table, pays or receives double, according as he loses or wins. Chips—strips of ivory—serve as counters. Large sums may exchange hands if the game is played for money, as some Mah-Jongg hands, owing to a system of doubling and redoubling, count so high (the maximum possible is 147,456) that a limit value, say 2000, is usually agreed upon beforehand. The curious ritual and nomenclature, and the artistic charm of the tiles, add to the fascination of a game which offers ample scope for judgment and an inexhaustible variety of luck.

Mahler, GUSTAV, composer, was born at Kalischt, in Bohemia, 7th July 1860, studied under Bruckner at Vienna, and conducted opera at Cassel, Leipzig, London, Budapest, Hamburg, Vienna, and New York. He returned to Europe in 1911, and died 18th May at Vienna. His nine symphonies are well known.

Mahmud. See TURKEY, GHAZNI.

Mahogany, the wood of *Swietenia Mahagoni*, a tree from 80 to 100 feet high, belonging to the natural order Meliaceæ, a native of the West Indies and of South America. The trees attain an immense size, and its timber is generally sound throughout in the largest trees. It is most abundant on the coast of Honduras and around Campeachy Bay. San Domingo and Cuba yield a finer quality than that got from the mainland, which is often called Bay Wood, to distinguish it from Cuba mahogany, usually called Spanish. The wood varies much in value, according to the colour and beauty of curl. It is very generally cut into veneers, its great weight and value unfitting it for being always employed solid. It is noticed in connection with the repairing of some of Sir Walter Raleigh's ships in Trinidad in 1597; but the wood does not appear to have been carried to Britain till it was brought from the West Indies as ballast by a Captain Gibbons. The captain's brother, Dr William Gibbons (1649-1728), wished to use the timber for his house then in course of erection, but the workmen declined to work it owing to its extreme hardness. A portion was, however, given to one Wollaston, a cabinet-maker, to make a candle-box for Dr Gibbons. The box, and a bureau made afterwards, exhibited such rare beauty as to create much interest in society; and bureaus made by Wollaston soon established the reputation of mahogany for cabinet-work. The bark has a faint aromatic smell and a very astringent bitter taste, and in the countries where the tree grows is used as a medicine. As *Mahogany Bark*, or *Amaranth Bark*, it has been employed as a substitute for Peruvian Bark.—There is much confusion in the use of the name, which is extended to other genera of Meliaceæ, as *Cedrela* and *Melia*. East India Mahogany is the timber of the *Rohinia Tree* (*Soyimida febrifuga*), and African Mahogany (sometimes) of *Khaya senegalensis*, both of the order Meliaceæ.

Mahomet. See MOHAMMED.

Mahón, or PORT MAHON (anc. *Portus Magonis*), the capital of Minorca (q.v.), is beautifully situated on a deep, narrow inlet in the south-east of the island. Its harbour is one of the finest in the Mediterranean, and is protected by powerful forts and fortifications. Building stone, shoes, cottons, cattle, and honey are exported. Pop. 18,000. The town was held by the English from 1708 to 1756, and again from 1762 to 1782. It was they who made it a first-class fortress. See STANHOPE.

Mahony, FRANCIS (1804-66), better known as 'Father Prout', was born at Cork, and educated for the priesthood at a Jesuit college in Paris, and subsequently in Rome, where he remained for two years and received ordination. He taught in a Jesuit college, was chaplain to a Cork hospital, but ceased to exercise the clerical calling about 1834, and joined the staff of *Fraser's Magazine*, his contributions to which were republished under the title of *Reliques of Father Prout* in 1836. He contributed also to *Bentley's Magazine* from 1837. For two years he acted as Roman correspondent to the *Daily News*, and his letters were collected and published in 1847 as *Facts and Figures from Italy by Don Jeremy Savonarola, Benedictine Monk*. During his last years he lived in Paris, and was correspondent to the *Globe*. Mahony possessed great scholarship and a rich fund of genial humour. In one of his own phrases, he is an Irish potato, seasoned with Attic salt.

Mahound, a corrupt early western form of MOHAMMED (q.v.).

Mahrattas (*Maráthas*, or *Marhatas*), a people of mixed origin, Hindus in religion and caste ordi-

nances, inhabiting western and central India, from the Satpura Mountains to Nagpur. The Mahratta Brahmans claim to be Rajputs; the bulk of the people are Sudras, and probably of aboriginal blood mainly. They are first mentioned in history about the middle of the 17th century, when they possessed a narrow strip of territory on the west side of the peninsula. The founder of the Mahratta power was Sivaji, a freebooter or adventurer, whose father, Shahji Bhonsla, was an officer in the service of the last king of Bijapur. By policy or by force, he eventually succeeded in compelling the several independent Hindu chiefs to acknowledge him as their leader, and with the large army then at his command overran and subdued a large portion of the emperor of Delhi's territory. His son and (1680) successor, Sambhaji, after vigorously following out his father's policy, was taken prisoner by Aurungzebe in 1689, and put to death. His son, a prisoner, resigned his rule to his minister, with the title of *Peshwá*; the descendants of Sivaji thenceforward reigned over but did not govern Sattara (see INDIA). Under the fourth hereditary *Peshwá* there were five Mahratta states, more or less powerful and independent: that of the *Peshwá* at Poona; that of the Bhonslas at Nagpur; Gwalior, ruled by Sindhia; Indore, by Holkar; and Baroda, by the Guicowar. The invasion of the Delhi empire by Nadir Shah afforded these wild and warlike mountaineers an opportunity, of which they eagerly availed themselves, to wrest additional territory from the feeble grasp of the Mogul emperor. From this time they discharged the office of arbiters in the quarrels between the emperor, his vizier, and his rebellious subjects; but the frightful defeat (January 1761) they sustained at the hands of Ahmed Shah Duráni, the ruler of Afghanistan, on the field of Panipat, where they lost 50,000 men, and all their chiefs except Holkar, weakened their power for a time. They still, however, continued to be the hired mercenaries of the Delhi emperor, till the growing influence of the British compelled them to look to their own safety. After many long and bloody contests with the British and their allies (1780, 1803, 1817-18), in which sometimes the whole, but more frequently a portion of the Mahrattas joined, they were one by one, with the exception of Sindhia, reduced to a state of dependence. This last-mentioned chief, having raised a powerful army, officered by Frenchmen, and disciplined after the European method, continued the contest for a number of years, till his power was finally broken in 1843. The dignity of *Peshwá* was abolished in 1818, and his territories were occupied by the British. The Mahrattas are almost all now in British or Mohammedan states; in the states called Mahratta states (Gwalior, Indore, Baroda; see INDIA) only the prince and his relatives are Mahrattas, the people being of other stocks. See histories by Grant Duff (1826, revised 1921), and Kincaid and others (1919 *et seq.*).

Mahwa-tree. See BUTTER-TREE.

Mai, ANGELO, CARDINAL, a distinguished Italian scholar, was born in the village of Schilpario, in Lombardy, 7th March 1782. He was educated and lived till 1808 in Jesuit establishments, next was a secular priest at Milan, and became custodian of the Ambrosian Library there. Here he devoted himself to palæography, and during the next six years discovered a series of long-lost works, many from palimpsests. Among these were fragments of some of Cicero's *Orations*; of Plautus, especially of the *Vidularia*, a lost play; of *Letters of Fronto*, the preceptor of Marcus Aurelius; of *Isæus*, *Themistius*, *Dionysius of Halicarnassus*, *Philo*, *Porphyrios*, and the *Chronicon* of Eusebius. All these, however, were eclipsed by his well-

known edition and restoration of the *De Republica* of Cicero (1822). Meanwhile Mai had been invited to Rome by Pius VII., and named to the charge of the Vatican Library. He at once turned his attention to the unedited MSS. of the Vatican, and although appointed in 1833 a secretary of the Propaganda, and in 1838 cardinal, he found time to superintend a series of publications almost unexampled in extent and importance in modern times. His *Scriptorum Veterum Nova Collectio, e Vaticanis Codicibus edita* (10 vols. 1825-38) was followed by *Classicorum Auctorum Collectio, e Vaticanis Codicibus edita* (10 vols. 1828-38), *Spicilegium Romanum* (10 vols. 1839-44), and *Patrum Nova Bibliotheca* (6 vols. 1845-53). He died 9th September 1854; and his long delayed edition of the *Codex Vaticanus* was published in 1858. This work, far from satisfactory, was superseded by the edition of Vercellone and Cozza (1868). His library was bequeathed, at half its estimated value, to the Vatican, for the good of the poor of his native village.

Maiden, an old Scottish instrument of execution, differing from the Guillotine (q.v.), in that it chopped instead of slicing.

Maiden Castle. See DORCHESTER.

Maidenhair (*Adiantum Capillus-Veneris*), a small, delicate, and graceful fern, with bipinnate fronds, alternate obovate and wedge-shaped membranaceous pinnules on capillary stalks, and marginal *sori* hidden beneath oblong *indusia*; growing

Maidenhair :

a, *Adiantum Capillus-Veneris*; b, *Adiantum cuneatum*.

on moist rocks and old walls, especially near the sea; rare in Britain, but very abundant in the south of Europe, where it covers the inside of wells and the basins of fountains (as at Vaucluse) with a tapestry of the most delicate green. Another species of the same genus, *A. pedatum*, a native of North America, with *pedate* leaves, has a sweet, fragrant root-stock, of which *Capillaire* (q.v.) is made. It is supposed that the name maidenhair originated in the use of a mucilage made from this fern by women for stiffening their hair. This name is sometimes applied also to some species of spleenwort (*Asplenium*), as *A. Adiantum-nigrum* and *A. Trichomanes*. It is also applied to the *Adiantum* family generally, of which there are many species and varieties. The most common of all and best known popularly is *A. cuneatum*, a Brazilian species, which is much cultivated by florists.—For the Maidenhair Tree, see GINKGO.

Maidenhead, a municipal borough of Berkshire (pop. 17,000), is situated amidst beautiful scenery 13 miles E. by N. of Reading, and 26 miles W. of London, on the right bank of the Thames, over which are two bridges, one of

stone, built 1772, and the other of brick, on the Great Western Railway. In 1399 the town was the scene of an engagement between the forces of Richard II. and Henry IV., and in 1647, at the Greyhound Inn, of the interview of Charles I. with his children. On the opposite, or Bucks, side of the river is Taplow (pop. 1000), whose wooded slopes are crowned by 'Cliveden's proud alcove.' The present house dates only from 1851; two previous mansions—in the earlier of which Thomson, whilst on a visit to the father of George III., probably composed 'Rule Britannia'—having been destroyed by fire in 1795 and 1849.

Maidment, JAMES, Scottish antiquary and literary collector, was born in London in 1794, being descended on his mother's side from Jan van Olden Barneveldt, the Dutch patriot. He was educated at the High School and university of Edinburgh, and was called to the Scottish bar in 1817. He became almost the greatest authority in Scotland on genealogical law cases, and took a prominent part in the Mar peerage case and others. He died in Edinburgh, 24th October 1879. The passion of his life was the collection of literary rarities, often not of a very choice character. His most ambitious publication was *The Dramatists of the Restoration* (14 vols. 1872-79), edited (not very well) with W. H. Logan; besides this he edited several collections of ballads and pasquils; wrote an account of the Bannatyne Club; and several historical, antiquarian, and genealogical works.

Maids of Honour. See HOUSEHOLD.

Maidstone, the county and assize town of Kent, is seated on the Medway, 25 miles W. of Canterbury. At its west entrance, overlooking the river, which is spanned by a three-arch stone bridge, stand the picturesque remains of All-Saints' College (of which William Grocyn was once master), established in 1260 as a hospital for pilgrims travelling to Canterbury, and suppressed in the reign of Edward VI. Close by is All-Saints' Church, a fine example of the Perpendicular style, built towards the end of the 14th century, and restored 1860; its interior is 227 feet long, and contains many interesting monuments and brasses, and a fine organ. From the tower, 78 feet high, rose a spire of 94 feet, destroyed by lightning in 1731. To the north of this, the principal church, is a former palace of the archbishops of Canterbury. There are many other ancient buildings—a tithe barn, a gateway, Corpus Christi College, &c.; and other features of interest comprise a grammar-school, founded 1549, rebuilt on a new site, 1871; museum and public library, established 1858 in Chillington House, where, too, are the headquarters of the Kent Archaeological Society; town-hall (1764); county gaol (1812-19), built of Kentish rag from adjacent quarries; hospital (1832-89); barracks; corn exchange (1835); ophthalmic hospital (1851-69); and a public recreation ground, known as Penenden Heath, to the N.E. of the town, where formerly were held the county elections and other great meetings. There are several other parks and gardens. Lining the river-banks are numerous paper-mills and a large oil-mill, whilst several breweries are in operation, and an important traffic is carried on in hops. Maidstone returned two members to parliament till 1885, and one till 1918, and was incorporated as a municipal borough in 1548. Pop. (1801) 8027; (1831) 15,387; (1881) 29,623; (1901) 33,516; (1921) 37,448. Its history is bound up with that of Kent (q.v.), the only special incidents identified with Maidstone being its storming in 1648 by Fairfax, when garrisoned by a royalist force, which only surrendered after a desperate resistance. Sir Thomas Wyatt the poet,

and his son the rebel, lived at Allington Castle, 2 miles distant.

Maigre (*Sciæna aquila*), a fish of the acanthopterous family Sciænidae, common in the Mediterranean but rare on British shores; like a large basse, it is good eating.

Maikop, a great petroleum field in Northern Caucasia, 85 miles S.E. of Ekaterinodar.

Maidun, the hero of an ancient Irish romance, first translated by Dr Joyce in his *Ancient Celtic Romances* (1879), and supposed by him to be the product of a rich and vivid imagination, working freely on a real voyage made in the beginning of the 8th century. The story forms one of the four extant *Imrama* or voluntary sea-expeditions, of which the most famous is the 6th-century voyage of St Brendan; and it has been made familiar to all readers in the splendid verse of Tennyson. Maidun was the son of Allil Ocar Aga, of the tribe of Owenaght of Ninus, in the north-west of County Clare, and before his birth his father was killed by a band of sea-robbers. He grew up handsome and accomplished, but had scarce reached manhood before he set sail in a triple-hide curragh with a crew of sixty men to find his father's murderer. For three years and seven months he voyaged on the western sea, seeing marvels such as no eyes had seen before. He visited islands of monstrous ants, of blood-thirsty quadrupeds, of red-hot animals, and of those which turn themselves round inside their skins, as well as the isles of the blest, of laughing, of weeping, of intoxicating wine-fruits, of the mystic lake, of the burning river, of the crystal bridge, and the four precious walls. Further wonders were the demon horse-race, the palace of solitude, the miller of hell, speaking birds, a water-arch in the air, and the silver pillar of the sea. At length Maidun found the murderer of his father, but forgave him his wrong because of the great mercy of God in having delivered himself from so many dangers.

Maimana, once an Uzbek state tributary to Afghanistan, now a province of that country, situated on the northern frontier next Western Turkestan; it has an area of about 4750 sq. m., and a pop. of 100,000, mostly warlike Uzbeks and Tajiks. The country is mountainous. The capital is Maimana, S.W. of Balkh, 25 miles from the frontier. Previous to the seizure of the place by the Afghans, in 1874, it was a considerable town, but is now a village trading in horses, carpets, and dried fruits.

Maimansingh (*Mymensingh*), a district (pop. 4,838,000) of the Bengal division of Dacca; capital, Maimansingh (25,000).

Maimatchin, a trading town on the northern boundary of Mongolia, opposite Kiachta (q.v.), from which it is separated by a narrow strip of neutral territory.

Maimbourg, LOUIS (1610-86), a French Jesuit church-historian, was expelled in 1685 from the order for his defence of Gallicanism, but became a pensioner of Louis XIV. He wrote histories of Wyclifism, Lutheranism, Calvinism, and of the prerogatives of the Church of Rome.

Maimon, SOLOMON, philosopher, born of Jewish parents about 1754 in a village on the Niemen, near Mir, qualified for a rabbi. Having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages, and some science. A child of nature, with the strong, subtle intellect of the born philosopher; shy, eccentric, dirty, and unmethodical; improvident, intemperate, and wholly irregular in his habits, Maimon led a vagabond life, battling against chronic poverty, and

always dependent upon his friends for the bare necessities of existence. Besides cultivating his own mind, and teaching a little, he never did any work, except write some philosophical treatises and literary hackwork, done anywhere and at any time, mostly in poor taverns. Yet this ragged philosopher had Mendelssohn, the philosopher, among his friends, was admired by Kant, and attracted the attention of Goethe. This good fortune he owed to his *Versuch einer Transcendental-philosophie* (1790), an eclectic system, in which he attempted to supplement Kant's by truths gleaned for the most part from Spinoza, Leibniz, Hume, Locke, and others. He died in the house of Count Kalkrenth, his last patron, at Siegersdorf, in Lower Silesia, on 22d November 1800.

See his very interesting *Autobiography* (1792; Eng. trans. by J. Clark Murray, 1888); S. J. Wolf's *Maimoniana* (1813); and the Life by Witte (Berlin, 1876).

Maimonides, the name by which Christians generally know the great Jewish teacher, Rabbi Moses ben Maimon, who from the initials of these words is called by the Jews RAMBAM. He was born at Cordova, March 30, 1135, and received his first instruction from his father. Under the most distinguished Arabic masters of the time he then devoted himself to the study of Greek (Aristotelian) philosophy, the science of medicine, and theology. Under the Almohades his family had to conform outwardly to Mohammedanism, and ultimately emigrated to Egypt, and Maimonides became physician to the reigning sultan, Saladin. At Cairo he died December 13, 1204. His importance for the religion and science of Judaism, and his influence upon their development, are so gigantic that he has not unjustly been placed second to Moses, the great lawgiver, himself. He first of all brought order into those almost boundless receptacles of tradition, and the discussions and decisions to which they had given rise, which, without the remotest attempt at system or method, lie scattered up and down the works of Haggada and Halacha—Midrash, Mishnah, Talmuds. Imbued with the spirit of lucid Greek speculation, and the logical thought of the Arabic Peripatetics, Maimonides, aided by an enormous knowledge, became the founder of rational Scripture exegesis. The Bible, and all its written as well as implied precepts, he endeavoured to explain by the light of reason, with which, as the highest divine gift in man, nothing really divine could stand in real contradiction. The miracles themselves, though not always traceable to their immediate cause, yet cannot be wrought in opposition to the physical and everlasting laws in nature. Where literal interpretation seems to jar upon the feelings of reverential awe towards the Highest Being, there an allegorical explanation is to be adopted unhesitatingly. As to the philosophical system of Maimonides, we can barely hint at its close similarity with that of Averroes. Maimonides fully allows the freedom of will, and holds that providence reigns in a broad manner over humanity; but he utterly denies the working of providence in the single event that befalls the individual, who, subject above all to the great physical laws, must learn to understand and obey them. The soul, and the soul only, is immortal, and the reward of virtue consists in its unbodily bliss in a world to come; while the punishment of vice is the 'loss of the soul.'

Maimonides' first work of paramount importance is his Arabic commentary of the Mishnah, which forms an extensive historical introduction to *Tradition*, or the Oral Law; and this introduction, translated into Hebrew, has now for more than five hundred years been deemed so essential a part of the Talmud itself that no edition of the latter is con-

sidered complete without it. This was followed by the *Sefer Hammizvoth*, or Book of the Precepts, in Arabic, which contains an enumeration of the 613 traditional laws of the Halacha; the text was first edited by M. Bloch (Paris, 1888). This book is to be considered chiefly as an introduction to the gigantic work which followed in 1180, under the title of *Mishne Torah* ('Second Law'), or *Yad Chasakah* ('Strong Hand'), a Hebrew compendium in 982 chapters, embracing the entire Halachâ. The summit of his renown, however, Maimonides reached in his grand Arabic work, *Delalath Al-Hairin* (translated into Hebrew by R. Tibbon as *Moreh Nebuchim*, 'Guide of the Erring'), a philosophical exegesis, which, while on the one hand it has contributed more than any other work to the progress of rational development in Judaism, has on the other hand also become the arena for a long and bitter fight between orthodoxy and science, between the spiritualistic Maimonidian and the 'literal Talmudistic' schools. Ultimately the antagonistic parties came to a reconciliation, and Maimonides' name became the pride and glory of the race; and as early as the 13th century, already portions of his works, chiefly the *Moreh* ('Doctor Perplexorum'), became, in Latin versions, the text-books of European universities.

See *The Guide of the Perplexed of Maimonides* (Eng. trans. Friedländer, 1910; Germ. trans. A. Weiss, 1923); and the Life by Yellin and Abrahams (1903).

Main, a river of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and the Red Main, 4 miles below Kulmbach, in north-east Bavaria. The White Main rises in the Fichtelgebirge, 2900 feet above sea-level; the Red Main, a few miles S. of Bayreuth. The river flows westwards by huge zigzags past Bamberg, Schweinfurt, Würzburg, Aschaffenburg, Hanau, Offenbach, and Frankfurt, and mingles its yellow waters with the green current of the Rhine opposite Mainz, after a total course of 307 miles. The chief affluents are, on the right, the Saale, and on the left, the Regnitz. The Main flows through a beautiful country, the hill-slopes generally covered with vineyards and surmounted by castles. It forms a link in the great Rhine-Main-Danube waterway (begun in 1921), which will carry ships of 1500 tons from the North Sea to the Black Sea. The Main divides politically North Germany from South Germany.

Maine, an old province of France, having Normandy on the north, Brittany on the west, and Anjou on the south, corresponded to the modern departments of Sarthe and Mayenne. Its chief town was Le Mans.

Maine, the north-easternmost state of the American Union, and one of the New England group of states, is bounded N. by the Canadian provinces of Quebec and New Brunswick, E. by New Brunswick, S. and S.E. by the Atlantic Ocean (Gulf of Maine), W. by New Hampshire, and N.W. by the province of Quebec. Area, 33,040 sq. m., of which one-tenth is water, there being many large and fine lakes (Moosehead, Chesuncook, Schoodic, Grand, Sebago, &c.) and important rivers (Penobscot, Kennebec, Androscoggin, Saco, St Croix, Arrostook, and Walloostook or St John). It is thus somewhat larger than Ireland. Measured in a direct line the coast extends some 270 English statute miles, but if its sinuosities and the outlying island-shores were measured it is estimated that the whole would be extended to about 2500 miles. When the poet Whittier speaks about 'hundred-harboured Maine,' he scarcely exaggerates, for the rocky coast-line, broken by the force of the waves and trenched in former geological times by glaciers, forms almost that number of

anchorage, some of them highly important for their commerce, and others serving as harbours of refuge. Towards the south-west the shore is sandy, and there are salt marshes, producing much coarse hay. The surface is uneven, and in the north-central regions and the west it is even mountainous. The scenery at some points (as on Mount Desert Island, on some of the lakes, and in the region near Camden) is very picturesque. The highest mountain is Katahdin (5385 feet). The soil is mostly stony and hard, as in New England generally, but some sections are very fertile—the Aroostook region in the north-east for the most part exceedingly so. The northern portion of the state is covered in great part with a dense forest, and its population is very sparse.

The geological features are complex, but a great proportion of the strata shows metamorphic traces. The surface is everywhere scored with prehistoric glacier and drift ice. Granite is very extensively quarried, and presents many handsome varieties. Excellent lime is largely produced. Traces of coal are found (as at Georgetown and Bucksport), and there are local beds of valuable graphite. The state is rich in rare minerals. Many silver-mines have been opened, and a few are still operated in a small way; but the ores (sulphide of silver accompanying galena, &c.) are often rebellious and expensive to work. Vast beds of copper (bornite, chalcocite, chalcopyrite) exist, some of them quite rich. Felspar, flagstone, limonite, mica, yellow-ochre, glass sand, slate (the latter in vast quantities and of high grade), lead ores, talc, tripoli, and manganese are all wrought to a greater or less extent. Tourmaline is obtained as a precious stone, for jewellers' use; and lepidolite, a mineral rich in the rare metal cesium, is locally found in considerable abundance. Mineral waters are shipped in large quantities.

The cool climate and the opportunities for fishing and shooting make this state a favourite region for summer resort. The winter climate is severe for the latitude; the winters are long and the snows deep. Ice, which is harvested especially on the Kennebec, is an important commodity for export. The leading crops are hay, potatoes, apples (of excellent quality), and the ordinary grains and small fruits. The sweet varieties of maize (sugar-corn) are extensively cultivated, and are sold largely in tins and glass for winter consumption; this is a prominent industry in some sections. The rainfall is copious. The rivers of Maine afford an enormous water-power, only a relatively small part of which is at present utilised. Forest products (timber, tan-bark, &c.) are extensively cut. Navigation is favoured by the numerous inlets and the large navigable streams, and railway communication is fairly developed. Timber, building-stone, ice, cattle, wool, and farm products are shipped. Maine has considerable shipbuilding (more than any other state), and the coasting trade is carried on largely. The fishing interests are extensive; mackerel, lobsters, herring, 'sardines' (mostly small herring), cod, fish-oil, and fish-guano are the staple products of the fisheries. The principal manufacturing industries of the state are the making of cotton and woollen goods, leather, boots and shoes, flour, paper, and foundry products, the sawing and planing of lumber, shipbuilding, the canning of fruit, vegetables, fish, and lobsters, &c.

Maine contains sixteen counties, and returns four members to congress. The chief towns are Portland, the largest city and principal seaport; Lewiston, the seat of extensive cotton manufactures; Bangor, on the navigable river Penobscot; Bath, noted for its shipbuilding; Augusta, the state capital; Biddeford, Auburn, Waterville, &c. Education is general and on the whole progres-

sive. There are colleges of repute at Brunswick (Bowdoin), Waterville (Colley), Lewiston (Bates), and Orono, the last a state institution. The Maine Liquor Law, one of the earliest of the stringent Liquor Laws (q.v.; and see TEMPERANCE), was enacted in 1851. The population is mainly of the English Puritan stock of New England. There is a large element of French-speaking Canadian immigrants, and in the extreme north there is a considerable body of Acadian French who have long occupied a fertile region on the river St John. Lately there has been an influx of Irish, Swedish, and German settlers. An old German colony near the coast has become completely Americanised. There are only about 800 Indians left in the state, and some 1300 negroes. Pop. (1820) 298,335; (1860) 628,279; (1880) 648,936; (1900) 694,466; (1920) 768,014.

History.—The early Dutch settlements did not prove permanent. The English established settlements here as early as 1607, but with no success. The French planted an unsuccessful colony on Neutral Island in 1604, but all their attempts at colonisation on the coast were speedily abandoned. Bristol or Pemaquid was settled in 1630, and had an interesting early history, becoming in 1648 a centre of a new but temporary 'Ducal State' subject to the Duke of York, afterwards James II. York, settled probably in 1624, was the capital of a colony under Sir Ferdinando Gorges (q.v.). In 1635 the western part of Maine received the title of the Province of Maine, and from 1651 to 1820 it formed a detached part of Massachusetts, called the district of Maine; Massachusetts in 1677 bought the title to the Gorges colony. Eastern Maine until 1691 formed a part of Acadia or Nova Scotia. Maine became a state in 1820. An angry dispute with Great Britain as to the northern and eastern boundary was settled in 1842 by a compromise. Latterly the depletion of the pine-forests and a large emigration to the West have checked the material progress of Maine, but its healthful climate and its natural resources ensure to the state a prosperous future.

MAINE, SIR HENRY JAMES SUMNER (1822–88), had his education at Christ's Hospital and Pembroke College, Cambridge, where his career was unusually brilliant. He graduated in 1844 as senior classic and Chancellor's classical medallist, as well as a senior optime in mathematics. Soon after he was elected to a tutorship at Trinity Hall, and in 1847 was appointed regius professor of Civil Law, which office he vacated in 1854 to become Reader on Jurisprudence at the Middle Temple. He was called to the bar in 1850, and went to India in 1862 as Law Member of the Council in India—an office held by Macaulay, in which he himself was succeeded by Sir James Fitzjames Stephen. In 1869 he was appointed to the new chair of Comparative Jurisprudence at Oxford, and in 1871 to a seat in the Council of the Secretary of State for India. At the close of 1877 he was elected Master of Trinity Hall at Cambridge, and in 1887 also Whewell professor of International Law. Maine gave some wise reforms to Indian law, but it is by his work on the origin and growth of legal and social institutions that his name will be best remembered. His books are *Ancient Law* (1861), one of the most influential works of its time; *Village Communities in East and West* (1871; new ed. by Pollock, 1906); *Early History of Institutions* (1875); *Early Law and Custom* (1883); and *Popular Government* (1885). One fundamental idea of Maine's was to make paternal or patriarchal power the germ from which society developed. This view was strongly controverted by M'Lennan, Morgan, and Spencer; but Maine's answer was marked by equal learning and far

greater lucidity and grace of exposition. See the Memoir by Sir M. E. Grant Duff (1892).

Maine-et-Loire, a département of France, formed out of the old province of Anjou, and watered by the rivers whose names it bears, is divided into the arrondissements of Angers, Beaugé, Cholet, Saumur, and Segré. Area, 2749 sq. m.; pop. (1872) 518,471; (1886) 527,680; (1921) 474,786. The soil is fertile, and produces excellent corn and wine, with hemp, linseed, fruit, and green crops. Slate-quarries and coal-mines are worked; and there are mills for cotton, woollen, and linen manufactures. Capital, Angers.

Mainotes, the inhabitants of the mountainous peninsula of Maina, that lies between the gulfs of Koron and Marathonisi in the extreme south of Greece. They claim to be the descendants of the ancient Spartans, number close upon 50,000, and are a well-built race, industrious and hospitable, but revengeful, great lovers of liberty, and formerly implacable foes of the Turks. They took a prominent part in the war for the liberation of Greece. In 1676 about 1000 Mainotes emigrated to Corsica; their descendants still survive at Cargèse in that island. Amongst the emigrants were some bearing the name of Kalomeros, which in Italian is translated Buonaparte. Hence the people of Maina believe that the great Napoleon was of Greek origin. The emigrants were settled at Ajaccio from 1729 down to 1769, in which year Napoleon was born there.

Mainpuri, capital of a district in the United Provinces of Agra and Oudh, 75 miles E. of Agra. Population, 16,000.

Maintenance is a law-term commonly used to denote an illegal succouring of a person, as by lending money to a stranger in carrying on law-suits. Contracts are sometimes held to be illegal on this ground. At Guildford, in July 1889, a man got six months' imprisonment with a fine of £200 for maintenance and Barratry (q.v.).

Maintenance, CAP OF, sometimes called *Cap of Dignity*, a cap of crimson velvet lined with ermine, with two points turned to the back, originally only worn by dukes, but afterwards assigned to various families of distinction. Those families who are entitled to a cap of maintenance place their crests on it instead of on a wreath. See the article HERALDRY.

Cap of Maintenance.

Maintenon, FRANÇOISE D'AUBIGNÉ, MARQUISE DE, famous for her connection with Louis XIV., was the daughter of Constant d'Aubigné, the worthless son of the famous Huguenot, Théodore Agrippa d'Aubigné, and was born in the prison at Niort, November 27, 1635. When four years old she was carried to Martinique in the West Indies, whence she returned after her father's death in 1645 to France. Her conversion to the Roman Catholic religion was effected not without difficulty, and on her mother's death she found herself at fifteen reduced to absolute penury. Soon after this she became acquainted with the kind-hearted poet Scarron, who offered either to marry her himself or to pay the money required for her entrance into a nunnery. Although Scarron was lame and deformed, she chose to marry him, and for nine years lived contentedly in the midst of the intellectual society which frequented the house of the poet. On his death (1660) she was again reduced to great poverty; but Anne of Austria continued and increased her husband's pension. On her death (1666) it was discontinued, and she

was about to go as a governess to Portugal, when Madame de Montespan obtained for her the continuance of her pension. In 1669 she was given the charge of the king's two sons by Madame de Montespan, and in this capacity displayed a patient tenderness and sleepless care that no mother could have surpassed. By 1674 she had made enough money to buy the estate of Maintenon, and four years later had it made a marquise by the king. She had now completely established her ascendancy over the heart of Louis, who made her in 1680 second lady-in-waiting to the dauphiness. The queen died in 1683, and Madame de Maintenon, who had become first lady-in-waiting to the dauphiness the year before, married the king privately in the winter of 1685. Her own morals were severe, but her moral influence over the court would have been greater had she filled a more recognised position. From the time of the marriage most historians—probably exaggerating her influence—have credited to her most of the disastrous blunders of French polity, including the support of James II. of England, the recognition of the Pretender, the war of the Spanish Succession, the disgrace of Fénelon for his sympathy with Quietism, the condemnation of Jansenism, the suppression of Port Royal, the revocation of the Edict of Nantes. She was not naturally a politician; but she laboured to make the king devout, and with him devotion meant bigotry. She was a liberal patroness of letters, and often turned for solace to the home for poor girls of good family she had established at St Cyr, for which she laboured with the most ceaseless care. Thither she retired when the king died in 1715, and there she died, 15th April 1719. Her pretended *Mémoires* (6 vols. 1755) are spurious, but her delightful *Lettres* (9 vols. 1756) are partly genuine.

See Lady Blennerhasset's *Louis XIV. and Madame de Maintenon* (1910); books by Madame Suard (1810), Lafont d'Aussonne (1814), the Duc de Noailles (1848-58), Dyson (1909), Madame Taillandier (1920; trans. 1922); also Lavallée's *Histoire de St Cyr*, and its review in vol. viii. of Sainte-Beuve's *Causeries du Lundi*; studies by Cotter Morison (1885) and Bowles (1888); *Souvenirs sur Madame de Maintenon* by D'Haussonville and Hanotaux (1902-4).

Mainz (Fr. *Mayence*), a town of Hesse, seat of a Roman Catholic bishop, and till the treaty of Versailles an imperial German fortress of the first rank, is on the left bank of the Rhine, opposite the junction of the Main, 22 miles WSW. of Frankfurt. The Rhine is here crossed by a stone bridge (superceding in 1885 the former pontoon bridge) to the village of Kastel, and by an iron railway bridge, 140 yards long, to the port of Gustavsberg, at the mouth of the Main. Pop. (1875) 56,421; (1919) 107,930, of whom two-thirds are Roman Catholics; in the 14th century it is said to have reached 90,000. Mainz is one of the most ancient cities in Germany; but its oldest part, known as *Küstrich*, has been rebuilt in a modern style since its destruction in 1857 by the explosion of a powder-magazine; while a handsome quarter has sprung up on the north, in the space afforded by the advancing of the fortifications in 1874. The cathedral, originally built in 978-1009, was thrice destroyed by fire, and dates in its present form from the 13-14th century. In 1870-78 it was thoroughly restored, and the central Romanesque tower, 270 feet high, built. It has five lesser towers, and is adorned in the interior with frescoes and numerous monuments. Besides various modern public buildings, the city contains the palace of the former grand-dukes, originally a lodge of the Teutonic Order, dating from the beginning of the 18th century, an arsenal of 1736, and the large red-sandstone electoral palace, in which are deposited various public collec-

tions, including a library and the valuable Romano-German Museum, an antiquarian and historical collection unequalled elsewhere in Europe. Mainz is an important centre of the Rhine trade with Holland and Belgium, and carries on an active manufacturing industry (metallurgy, chemicals, spinning, &c.). It has elaborate harbour-works, including docks and storehouses; while the Rhine is skirted by a broad quay. Grain, wine, timber, books, music, and the manufactures of the town are the chief articles of trade. Furniture, leather goods, machinery, musical instruments, chemicals, gold and silver ware, hats, soap, &c., are among the manufactures; and brewing, printing, and market-gardening in the environs are also important industries. The history of Mainz connects it with Rome from the year 13 B.C., when Drusus built on its site the important fort of *Moguntiacum* or *Maguntiacum*. Among the numerous Roman remains the most remarkable are the *Égelstein*, a column supposed to mark the tomb of Drusus, and the remains of an aqueduct $3\frac{1}{2}$ miles long. The real importance of the town dates, however, from the Frankish emperors. In the 13th century Mainz was the head of the confederacy of the Rhenish cities, but in 1462 it was added to the domains of the archbishops of Mainz, the premier spiritual electors of the empire. The city was several times in the possession of France, notably in 1801-14. After the Congress of Vienna it was assigned in 1816 to Hesse-Darmstadt, on condition that it was to constitute a federal stronghold, and it was garrisoned by Prussian and Austrian troops. After 1866 it was held by Prussian troops, until in 1870 it was declared an imperial fortress. The treaty of Versailles provided for the dismantling of the fortress and fifteen years' occupation of the *tête-de-pont*. Mainz was the birthplace of Gutenberg (q.v.), whose house is still pointed out, and the town became the centre of early book-printing. Bopp also was a native.

Maison Carrée. See NÎMES.

Maistre, JOSEPH MARIE, COMTE DE, was born 1st April 1753, at Chambéry, of a noble French family which had settled in Savoy. While Savoy was occupied in 1792 by the French, De Maistre, a member of the senate, withdrew, and from 1793 to 1797 he lived at Lausanne. In 1803 he was sent by the King of Sardinia as ambassador to St Petersburg, and there he remained until 1817, when he was recalled to occupy a place in the home government. Thereafter he lived in Turin till his death, 26th February 1821. De Maistre was an ardent ultramontane, and argued with an incisive force of logic and brilliancy of rhetoric more often associated with the opposite side. He maintained the pope as the source and centre of all earthly authority, and an ordered theocracy as the only protection from social and religious anarchy. He is an unusually strong and steady thinker, and has a remarkable faculty of forcing plain arguments forward to an irresistible conclusion. He is profoundly learned as well as logical, and, in short, is more easily denounced than answered. His first notable work was *Considérations sur la France* (1796), an able defence of Legitimist views, and onslaught on the *philosophes* of the 18th century. In St Petersburg he wrote his *Constitutions Politiques* (1810), *Du Pape* (1819), *De l'Église Gallicane* (1821-22), *Soirées de St Pétersbourg* (1821). The last is unfinished and desultory, but is pregnant with strong thought and suggestiveness. Here is to be found the panegyric on the hangman as the foundation of social order. Other works are his *Examen de la Philosophie de Bacon* (1836), *Lettres et Opuscules* (1851), and *Mémoires politiques et Correspondance Diplomatique* (1860). His *Œuvres Complètes* (1884-7) fill 14 vols. See Sainte-Beuve's

Portraits Cont. (vol. ii.), and *Lundis* (vol. iv.); Morley's *Critical Miscellanies*; and French books on him by Descostes (1893-96), Paulhan (1893), Cogordan (1894), Grasset (1901), Savaète (1808).

XAVIER DE MAISTRE, his younger brother, was born at Chambéry in October 1763, and from an early age served in the Sardinian army. He shared his brother's politics, and after the campaign of 1799 followed Suwaroff to Russia. Here he served with distinction, rising to the rank of general, married a Russian lady, and settled down, even after the fall of Napoleon had restored the dynasty of Piedmont. He paid visits to Naples and Paris, where Sainte-Beuve saw him, and died at St Petersburg, 12th June 1852. His name is remembered for a few delightfully fresh and unpretending books, written in perfect French, and showing that rare mastery of the narrative art in the simple fashion for which Sainte-Beuve sets him beside Prosper Mérimée. The best known is the *Voyage autour de ma Chambre* (1794), a quaint fantasy, giving an account of a temporary confinement to his quarters at Turin, that might have been written by a stainless Sterne. *Le Lépreux de la Cité d'Aoste*, a sweet and touching little story, shows the same inspiration and the same originality in the use made of it. Other stories are *Les Prisonniers du Caucase* and *La jeune Sibérienne*. The *Expédition Nocturne autour de ma Chambre* is a less successful continuation of his earliest book. His *Œuvres* appeared in 3 vols. in 1825. See Sainte-Beuve's *Portraits Contemporains* (vol. iii.), and W. Ungewitter's *Xavier de Maistre, sein Leben und seine Werke* (1892).

Maitland, EAST and WEST, neighbouring towns of New South Wales, situated on the Hunter River, about 40 miles from its mouth at Newcastle (the distance by road or railway, however, is only 20 miles). Both towns are on the right bank of the river, but East Maitland lies on a hillside above flood mark, while West Maitland covers the river bank and the lower land behind it. Large sums of public money have been expended in endeavours to mitigate the danger from floods, which are especially severe because the Hunter falls only 18 feet in its last 40 miles, and receives in their course two large tributaries which are often flooded at the same time. The Maitlands are the centre not only of a prosperous agricultural and dairying district, but also of the most important coalfield in Australia. West Maitland is the larger town and the seat of a Roman Catholic bishopric. Joint pop. 12,000.

Maitland, the name of a Scottish family, celebrated in both the literary and political history of their country. The first who acquired distinction was SIR RICHARD MAITLAND of Lethington, son of William Maitland of Lethington and Thirlstane, who fell at Flodden, and of Martha, daughter of George, Lord Seton. He was born in 1496, studied at St Andrews and in France, and on his return to Scotland was successively employed by James V., the Regent Arran, and Mary of Lorraine. About 1551-52 he received the honour of knighthood, became a lord of the Court of Session in 1551 (before which, however, he had the misfortune to lose his sight), and Lord Privy Seal in 1562. He died 20th March 1586, at the age of ninety. Maitland was one of the best men of his time. In an age of violence, fanaticism, and perfidy, he was honourably conspicuous by his moderation, integrity, and anxiety for the establishment of law and order. He merits consideration not only as an eminent and upright lawyer, but as a poet, a poetical antiquary, and a historian. All his own verses were written after his sixtieth year, and show what things he had most deeply at heart. For the most

part they consist of lamentations for the distracted state of his native country, the feuds of the nobles, the discontents of the common people, complaints 'aganis the lang proceis in the courts of justice,' and the depredations of the border robbers. Knox, in his *History of the Reformation*, says of him that he was 'ever civile, albeit not persuaded in religioun.' A complete edition of Maitland's original poems was first published in 1830 by the Maitland Club (see BOOK-CLUB). Sir Richard's collection of early Scottish poetry was a work undertaken, if not completed, before his blindness attacked him. It consists of two MS. vols., the first containing 176, and the second 96 pieces; they are now preserved in the Pepysian Library, Magdalene College, Cambridge (ed. Craigie, *Scot. Text Soc.*, 1919 *et seq.*). Maitland's principal historical performance is the *Historie and Cronicle of the Hous and Surname of Seytoun*, &c. See Brunton and Haig, *Senctours of the College of Justice* (1832).

WILLIAM MAITLAND, best known in Scottish history as Secretary Lethington or Ledington, was the eldest son of Sir Richard Maitland of Lethington. The exact date of his birth is unknown, but it must have been between 1525 and 1530. He probably studied at St Andrews, though his name does not occur in any list of the graduates of that university, and he seems also to have spent some time in study on the Continent. Knox, who was not friendly to him, describes him as 'a man of good learning, and of sharp wit and reasoning.' At the outset of his public career he took the side of the party of reform in religion; but all through life he was the politician first and the reformer afterwards. In 1558 he became secretary of state to Mary of Lorraine, the Queen-Regent, and in the following year joined the Lords of the Congregation, who were in arms against her. His ability soon gave him a prominent place amongst his new allies. In 1560 he acted as Speaker in the Convention of Estates, and was sent to the English court to represent the interests of the Protestants. On the arrival of Queen Mary in 1561, Maitland associated himself with Moray in opposing the extreme proposals of Knox. He represented Mary more than once at the court of Elizabeth; but made her his enemy by his connivance at Rizzio's murder (1566), again, however, to become her counsellor. At first he favoured Bothwell, and was privy to the murder of Darnley, yet on Bothwell's marriage with Mary he acted with the insurgents. Nevertheless, after the queen's flight to England, while seeming to side with the new government, he secretly favoured the exiled queen. One of the commissioners who accompanied Moray to present to Elizabeth their indictment against Mary (1568), he was plotting against his colleagues; and the subsequent formation of a party in favour of Mary was mainly the work of Maitland—a party which could not resist the government, supported as it was by English money and arms. Shut up in the castle of Edinburgh, Maitland and Kirkcaldy of Grange held out till 29th May 1573, when they surrendered. Maitland died in prison in Leith on 9th June, having, some said, poisoned himself. Spite of his accomplishments and political adroitness, while all parties admired his ability, he gained the skepticism of none. See Buchanan's *Chamæleon*, Skelton's *Maitland of Lethington* (1887-88); Mathieson's *Politics and Religion* (1902), and E. Russell's *Maitland of Lethington* (1912), defending the consistency of his aims as a statesman. See also LAUDERDALE.

Maitland, SAMUEL ROFFEY (1792-1866), son of a London merchant of Scottish stock, studied at Cambridge, was called to the bar, took orders in

1821, held a cure at Gloucester from 1823, and in 1838-48 was librarian in Lambeth. He wrote an admirable monograph on the Waldenses (1832) against Milner's view that they were evangelical protestants; and to the *British Magazine* (which for some years he edited) he contributed the famous papers on *The Dark Ages* which, published as a book in 1844-49, threw much dry historical light from the tractarian point of view on a subject hitherto obscured by Protestant prejudices. He wrote some 30 other works, mainly ecclesiastical and historical.—His grandson, **FREDERICK WILLIAM MAITLAND** (1850-1906), educated at Eton and Trinity, Cambridge, spent fifteen years at the bar, but, devoting himself to the history of law and of legal institutions, was in 1888 made professor of English law at Cambridge. His published work is remarkable for laborious research, profound learning, philosophic breadth, originality, and a brilliant literary and imaginative power of recreating the past. He edited numerous law books (*Select Pleas*, *Bracton's Notebook*, &c.): but his principal work was *The History of English Law*, in conjunction with Sir F. Pollock (1895; new ed. 1898). Others were *Domesday Book and Beyond*, *Canon Law in England*, and a *Life of Sir Leslie Stephen*. See his *Life* by H. A. L. Fisher (1910), who also edited his *Collected Papers* (1911).

Maiwand, 50 miles NW. of Kandahar, where an English army was defeated by Ayub Khan, 27th July 1880. See AFGHANISTAN.

Maize, or INDIAN CORN, is the produce of *Zea Mays*, a species of cereal having monoecious flowers, the features of which are well illustrated in the accompanying cut. The stem, which is filled with a pithy, fibrous structure, is divided at irregular intervals by nodes, and its strength and solidity increased by a siliceous outside covering. From the lowest, and sometimes also the second and third nodes, it sends out brace roots, and these help to support the plant, which sometimes grows to 18 feet in height, the minimum being generally 3 feet. The ears

—which are developed within the leaf-sheath at the nodes, and consist of a 'cob' with the grains disposed upon it in regular rows of from eight to twenty, and long 'silk' threads attached to each embryo, which usually extend beyond the closely-folded tip of the mass of imbricated leaves ('husk') that wraps the whole—are from half an inch to 3 inches in diameter, and from 2 to 17 inches in length. The stem

is topped by a 'tassel,' producing an abundance of light, dry, loosely-attached pollen. Maize is hardly less a staple article of food to the inhabitants of tropical and subtropical countries than rice, and is rapidly becoming popular in various forms in temperate and colder climates. It is held to be superior in nutriment to barley, buckwheat, and rye. By analysis it gives 77 per cent. of starch;

Maize (*Zea Mays*):
a, flower; b, ear.

3 of zein, a principle analogous to gluten; 2.5 of albumen; 1.45 of sugar; .8 of extractive; 1.75 of gum; 1.5 of sulphate and phosphate of lime; 3 of lignin; and 9 of water. It is more generally used in America (North and South) than in the other continents; but in the Mediterranean countries, Germany, &c., it is also highly valued. Maize oil, extracted from the kernel, is used for cooking, burning, lubricating, soapmaking, and as a rubber substitute. The green ears of the sweet varieties are boiled and eaten from the kernel or served in milk. When coarsely ground maize forms the *hominy* of the southern states of America, and finer ground it furnishes the *mush* or porridge of the northern states; while the whole grains with the cuticle removed after being loosened by boiling in a weak lye, are the *hulled corn* of the states generally. *Popcorn* is a variety whose grains can be roasted and turned and shaken smartly over a brisk fire till they swell and burst, turning inside out; in this state they are coated with syrup and pressed into a ball, or the separate grains are simply sprinkled with salt. The deficiency of gluten in the meal of maize renders it ill-adapted to bread-making; but *johnny-cakes* made from it are popular along with bacon, &c., and mixed with rye-meal it forms the common brown bread of New England. Large quantities of starch are manufactured from maize, both for laundry purposes and for making puddings, custards, and blanc-mange; and the starch, by treatment with acid, is converted into glucose or grape sugar (see SUGAR). The canning of green sweet corn is also an important industry in some states. By the Mexicans the small young shoots of thickly-sown crops are served at table like asparagus and as dessert. The stems of the sugar corn when full grown yield by pressure a thin sweet juice, which unfermented gives a pleasant syrup and from five to fifteen per cent. of sugar, fermented a beer called *chicha*, and distilled an excellent spirit resembling brandy. In countries where maize does not ripen well it is sometimes sown to afford food for poultry, or to be mown as green fodder for cattle. Where it is cultivated for its grain the dried leaves are used as winter fodder. The stalks are used for thatch and for fuel, and for making baskets. The fibres of the culm and leaves afford a durable kind of yarn; and the husks are elastic, and can be applied to the stuffing of chairs, saddles, &c., and to the manufacture of good durable mattresses. The husks are also much used for packing oranges and lemons, and in South America for making cigarettes; and good paper has been manufactured from them. Hollowed corn-cobs make homely but serviceable pipe-heads for smoking tobacco.—Another species of maize, called Chile Maize or Valparaiso Corn (*Z. Curagua*), is distinguished by its serrated leaves. It is a smaller plant, a native of Chile, and has won a superstitious regard because its grains when roasted split in the form of a cross. Formerly in England maize was known by the name *Turkey wheat*, being then solely an article of trade from the East. In America it is simply called corn. Its native country is uncertain; but it is probably Mexico. From Mexico maize-cultivation seems to have spread northwards. The mound-builders passed it on to their Indian successors, and they to the whites. In an ancient Chinese encyclopædia in the national library at Paris is an excellent representation of the plant; so that while it may have been first introduced to Europe about the year 1520 by Columbus from America, there are good grounds for the conclusion that it was known and cultivated in the ancient world long before that time.

Majesty, a title of honour now usually bestowed on sovereigns. Among the Romans *maiestas* was

used to signify the power and dignity of the people and after the overthrow of the republic became exclusively the attribute of the emperors. The *maiestas* of the emperors of Rome was supposed to descend to the German emperors as their successors; but the adoption of the attribute by other European sovereigns is of comparatively late date. Its use began in England in the latter part of the reign of Henry VIII., up to which time 'Your Grace' or 'Your Highness' had been the appropriate mode of addressing the sovereign. Henry II. was the first king of France who was styled 'Most Christian and Catholic Majesty,' the king of Spain came to be 'Catholic Majesty,' and of Hungary 'Apostolic Majesty.' All European kings and queens are now generally addressed as 'Your Majesty.'

Majolica (from the Italian name of the island of Majorca, where this ware seems to have been first made), a decorated kind of enamelled pottery made in Italy from the 15th to the 18th century. It attained its greatest development in the duchy of Urbino, which included the four great manufactories of Pesaro, Gubbio, Urbino, and Castel Durante. Majolica is an earthenware usually of a coarse paste, covered with a stanniferous glaze or enamel. It has sometimes been called 'Raffaelle ware' from the fact that a number of the paintings upon it were copied from the designs of that famous painter. Majolica is generally considered to be the most beautiful decorated pottery that was ever extensively made, at least during the Christian era. Some of the finer pieces when they come into the market bring large, almost fabulous, sums of money. See POTTERY.

Major, in the Army, is the lowest rank of field-officer. There are four in each infantry unit, one as second in command, and three who command companies in the battalion; one in the headquarters of every cavalry regiment, and three commanding the squadrons; one in command of each battery of artillery. All these officers are mounted. There are about 200 in the engineers, promoted from captain after about 20 years' service, when a vacancy occurs; 54 in the Royal Marines. The senior major is second-in-command of the unit, and in barracks is in charge of interior economy and finance. Previous to 1872 the majors of artillery and engineers were called first-captains. In garrisons all regimental majors of brevet rank or otherwise take their turn as president of district courts-martial and as field-officer of the day.

The word major is used also in conjunction with other military titles, thus: major-general is the lowest rank of General (q.v.); surgeon-major is the rank next above surgeon; drum-major, trumpet-major, farrier-major, &c. are the old titles of the sergeant-drummers, sergeant-trumpeters, sergeant-farriers, &c. A corporal-major in the household cavalry corresponds to the regimental sergeant-major or senior non-commissioned officer in other corps.

Major, or MAIR, JOHN, was born near North Berwick, Haddingtonshire, about 1470. After receiving the elements of his education in Scotland, he studied at Oxford, Cambridge, and Paris. At Paris he first entered the college of Sainte-Barbe, and took his degree of Master of Arts in 1494. He next entered the college of Montaigu, the great stronghold of scholastic studies in the university of Paris, and in 1505 became Doctor of Theology. While continuing to reside in Montaigu he gave lessons in the scholastic logic and philosophy in the college of Navarre, and in these studies gained a reputation second to that of no teacher in Paris, and therefore in Europe. Besides teaching, Major wrote voluminous commentaries on Peter Lombard, which, though among the famous books of their

time, were wholly out of touch with the true intellectual and religious movements of the 16th century. To this period of his life also belongs his combined history of England and Scotland, written in medieval Latin, but still of real value as a record of facts, and by reason of the independent judgment of its author.

In 1518 Major was teaching at Glasgow (where Knox, if born in 1514, could not have been his pupil). In 1523 he was called to St Andrews, where he acted as regent in Arts at the Pædagogium of that university till 1525. At St Andrews he had among his students Patrick Hamilton, and likewise George Buchanan, who spoke of him as 'teaching the art of sophistry rather than dialectics.' Leaving St Andrews in 1525 Major again returned to Paris, where he remained till about 1530, admired and honoured by all who still maintained the traditions of the university as opposed to those who were eager for the introduction of the new lights of the Renaissance. In 1533 he was appointed provost of St Salvator's College, St Andrews, an office which he held till his death in 1550. Of his last years nothing is known; though it is worthy of mention that in 1547 he was present in St Andrews parish church at the first public sermon preached by John Knox then completely identified with the cause of religious reform in Scotland.

Major was the most famous literary Scotsman of his generation, and as the acknowledged champion of medievalism was assailed by men of such diverse character and aims as Melancthon and Rabelais. It was his misfortune that his life was mainly given to the advocacy of ideas which were already doomed by the new teachings of the revival of learning. Though born after Erasmus, with whom he was a contemporary in Paris, he yet remained dead to those influences of the Renaissance which made Erasmus the life-long foe of Montaigu and the Sorbonne. Nevertheless, by his great reputation in his own day, and by the strong individuality stamped on those of his writings which still have a certain interest, Major claims a far higher place than has yet been accorded him in the literary history of his country. See Mr A. Constable's translation of his *History* issued by the Scottish History Society (1892), in which full information is given regarding Major and his works.

Majorca, or **MALLORCA**, the largest of the Balearic Isles (q.v.), lies about 100 miles from the Spanish coast, and 150 N. of Algiers. It is 60 miles long by 40 broad, and 1310 sq. m. in area. The climate is healthful, the sea-breeze preserving a nearly equable temperature over the whole island. In the north there are mountains reaching 3500 to 5000 feet in height. The hillsides are terraced; olive groves abound, and apricot, almond, orange, fig, and other fruit trees are common. Locust beans are grown and good wine is made. The soil is extraordinarily fertile, and is cultivated with marvellous patience and skill by the inhabitants, above 250,000 in number, who manufacture cloth, cotton goods, ropes, silk, soap, shoes, canvas, brandy, &c., and have a profitable trade with the mainland. There are some 75 miles of railways, the capital, Palma (q.v.), being connected with Manacor (13,000), the second town of the island (where as well as at Arta there are magnificent caves), and La Puebla (8000). Between this town and Alcudia, the port for Minorca and Barcelona, lie the marshes of Albufera (5000 acres), drained by a London company in 1865-71, and now of extraordinary fertility. Raymond Lully was born at Palma; at Valdemosa George Sand resided in 1838 and wrote her *Spiridion*; and the beautiful palace built by an Austrian archduke is at Miramar. Large quantities of lusted ware (see **MAJOLICA**) were exported to Italy and elsewhere in the 15th century;

this ware is still made to a small extent. Many of the nobles have handsome palaces in the island.

See Bidwell's, *Balearic Isles* (1876); the sumptuous *Balearen in Wort und Bild* (5 vols. 1869-84), by Archduke Ludwig Salvator; Sir Clements Markham's *Story of Majorca and Minorca* (1909).

Majority is the age at which a person acquires the status of a person *sui juris*—i.e. is able to manage his or her own affairs. This age in the United Kingdom is twenty-one. Under that age persons in England and Ireland are called infants, and are more or less subject to guardians, who manage for them their property. See **INFANT**.

Majuba Hill, situated in the extreme north of Natal, was the scene of the defeat of 648 British troops, with the loss of their leader, Sir George Colley, by a greatly superior force of Transvaal Boers on 27th February 1881. The night before, after an eight hours' climb, they had occupied the hill, which overlooked the enemy's position at Laing's Nek, and which towards noon was unexpectedly carried by a rush of the Boers. Their loss was 1 killed and 5 wounded; of the British, 85 killed and 122 prisoners (many wounded), besides some missing. See Sir W. Butler's *Life of Colley* (1899).

Makart, HANS, Austrian painter, was born at Salzburg on 28th May 1840, studied under Piloty at Munich (1861-65), and after visiting Italy settled in Vienna in 1869. Ten years later he was appointed professor at the academy in the Austrian capital, and there he died on 3d October 1884. He painted grandiose spectacular and historical genre pictures, gorgeous with colour and of gigantic size; but the drawing and modelling were frequently faulty, and the treatment nearly always sensuous and voluptuous to a degree. His brilliant colouring and generally theatrical style of art made him notable in the art of his age, but his pigments were so faulty that almost all his pictures have faded beyond repair. Amongst the most notable specimens of his brush are 'Amorettes', 'Entrance of Charles V. into Antwerp', 'Cleopatra on the Nile', 'The Five Senses', 'The Seven Deadly Sins', 'Diana hunting', 'Summer', and 'Spring.'

Makkari, AHMED EL-, Moorish historian, was born at Makkara near Tlemcen, in Algeria, about 1585, travelled in Morocco, and in 1618 made the pilgrimage to Mecca. This he subsequently repeated five times, besides making seven pilgrimages to Medina, and two to Jerusalem. At Damascus he created an enthusiastic impression by his preaching in 1627. His chief residence, however, was at Cairo, where he died in 1631.

His principal work was his *History of the Mohammedan Dynasties of Spain* (1855-61 and 1862; Eng. trans., in part, 1840-3).

Mako, a market-town of Hungary, on the Maros, 19 miles ESE. of Szegedin, is the centre of a rich farming district; pop. 35,000.

Makololo, a tribe of Basutos (q.v.) who, under their chief Sebituane and his son Sekeletu, founded an extensive kingdom in the basin of the Upper Zambesi; but a rebellion by the conquered Barotse tribes broke up the kingdom in 1864.

Makrizi, TAKI-ED-DIN AHMED EL- (1364-1442), the most eminent of the Arabic historians of Egypt, born at Cairo, derives his surname from his family's residence at Makriz, a suburb of Baalbek. He held various official posts, as secretary of state, inspector of markets, preacher, reader, and lecturer in Cairo, and curator of the Kalânsiya and the Nuriya hospital at Damascus. Returning to Cairo, he devoted himself to historical studies.

His sixteen major works include the *Khitat*, or *History and Topography of Egypt and (especially) Cairo* (1853); other historical works; biographies; and treatises on Mohammedan coins and weights and measures.

Makwar. See GEZIRA (EL).

Malabar, a district (5794 sq. m.) on the south-west coast of India, in the Presidency of Madras (q.v.). Pop. 3,000,000, two-thirds Hindus, and one-third Mohammedans. In 1921 a conflict broke out between the Moplahs, who are ardent Moslems, and the Hindus and Europeans, in which many lives were lost and much property destroyed. Malabar is one of the most fertile and salubrious districts in Southern India. The name is applied to the whole south-western coast of Southern India.

Malacca, or MALAY PENINSULA, the southernmost peninsula of the SE. of Asia, anciently known as the GOLDEN CHERONESE, begins geographically at the head of the Gulf of Siam, and thus includes part of Siam proper and part of Burma; but it is usual to limit the name to the portion south of the river Pakshan, the frontier of Tenasserim. The width varies from 44 miles at the isthmus of Kra (q.v.) to 210 at Perak. The interior consists mainly of magnificently-wooded mountain-ranges, disposed parallel to the long axis of the peninsula, some of whose peaks attain a height of 6000 to 8000 feet, while along the coast there are mangrove swamps, half-a-dozen miles deep, backed by low fertile plains reaching to the mountains. Amongst the more valuable of the trees are rubber, gutta-percha, ebony, camphor, teak, sandalwood, cinnamon, rattan, cocoa, areca and other palms, nutmeg, &c. The rivers are of little use for navigation. A double belt of islands runs along parts of both coasts. The peninsula is the richest tin-yielding region in the world (see TIN). The tin ore occurs in conjunction with gold and silver, both extracted; iron and coal exist, the former in great quantity, but neither mineral is worked. The forests and mountains shelter numerous varieties of wild animals, as the tiger, rhinoceros, tapir, elephant, hog, buffalo, monkeys, &c., and many beautiful birds. The climate is pretty uniform all the year round. The low districts are hot and moist, and neither they nor the highlands are healthy for Europeans. Rain falls on 190 days in the year. The thermometer ranges from 70° to 90° F. A railway connects Singapore with Bangkok. See SIAM, MALAY STATES, JOHORE, STRAITS SETTLEMENTS, MALACCA, PENANG, &c. The inhabitants of the peninsula are also dealt with under MALAYS, NEGRITOS.

See Keane's *Malay Peninsula* (1887); Guillemard's *Malaysia* (1908); Rathborne's *Camping in Malaya* (1898); Wright and Reid's *Malay Peninsula* (1912); Ridley's *Flora of the Malay Peninsula* (1922 et seq.); R. O. Winstedt's *Malaya* (1923); Tomlinson's *Tidemarks* (1924); and books cited at MALAYS.

Malacca, part of the Straits Settlements, is situated on the south-west coast of the Malay Peninsula, 100 miles from Singapore, and is 42 miles in length, and from 8 to 25 broad. Area, 700 sq. m.; pop. (1921) 153,522. The coast-lands are flat and swampy, and produce rice; inland there are low hills. Besides rice, the chief products are tapioca, pepper, fruits, &c. Tin is mined and exported. Tapioca is the only other export of value. The mean annual rainfall varies from 68 to 91 inches. The town of Malacca, capital of the settlement, is situated in 2° 1' N. lat., 102° 14' E. long., at the mouth of a small river, and consists of the old Dutch or European town and the Chinese and Malay town on the other (left) bank of the river. The church of Our Lady del Monte was the scene of the labours of St Francis Xavier. Pop. about 20,000.

Malacca was taken by the Portuguese under Albuquerque in 1511, and flourished as one of the great emporiums of Indo-China; but it was subse-

quently supplanted by Penang, and Penang by Singapore. Malacca became a Dutch possession in 1641, and fell in 1795 into the hands of the British, who restored it to the Dutch in 1818; but they returned it to Britain in 1824.

Malacca, STRAIT OF, separates the Malay Peninsula on the north-east from the island of Sumatra on the south-west, and connects the Indian Ocean with the Chinese Sea. Length, 480 miles; breadth, varying from 30 miles at the south-east to 115 miles at the north-west extremity. On this strait are the British settlements of Malacca, Penang, &c.

Malachi (probably an abbreviated form of *Malachiyyah*, meaning 'messenger of Jehovah'; the LXX. and Vulgate have *Malachias*), the name given to the last book in the prophetic section of the Old Testament canon. Regarding its author nothing is known. It has even been doubted whether Malachi is a proper name or only an appellative ('my messenger' or 'Angelical'), many authorities both in ancient and in modern times favouring the latter view, and thinking that some such writer as Ezra, or even some supernatural person is meant. But although *Malachiyyah* does not actually occur anywhere in the Old Testament, there is nothing to make it impossible as a proper Hebrew name. The book consists of a series of reasoned remonstrances against prevailing laxity in religious and social conduct, the points brought chiefly into prominence being the bringing of defective offerings to the altar, irregularity and evasion in payment of tithes, mixed marriages and unjustifiable divorces, a spirit of scepticism as to the divine cognisance of human actions and as to the reality of moral distinctions, the practice of witchcraft, sorcery, perjury, oppression. Warning is given of the approaching judgment, when Jehovah himself, preceded by the angel of the covenant, shall come to cleanse the sinful community by the removal of those who have been found unfaithful. It is the priests who are primarily addressed, and the community which they lead is that of 'Judah and Jerusalem'; both circumstances, combined with the reference to the pasha or governor, show that the prophecy belongs to the Persian period. Some have assigned it to the governorship of Nehemiah, but in view of Neh. v. 15, 18 this is improbable; its date is to be sought rather in the interval between his two terms of office, or after the close of the second—possibly many years after. It is usual to speak of the style of Malachi as marking the transition from the age of the prophets to that of the scribes, as having little of the freedom and fire of the older period, and as tending to the artificiality of formal scholastic disputation. Yet its dialogue is not without dramatic force; and relatively to its size the little book has contributed an unusually large number of memorable phrases and bold and striking figures to the language and thought of Christendom. For commentaries on Malachi, see the works on the minor prophets mentioned under HOSEA; also J. M. P. Smith, in *The Intern. Crit. Comm.* (with full bibliography).

Malachite, a mineral, essentially a carbonate of copper, of a green colour, occurs generally massive, with a globular reniform, botryoidal or stalactitic surface; frequently fibrous and showing irregular bands of colour; sometimes earthy in texture. Very rarely it is met with crystallised in rather oblique monoclinic prisms, bevelled on the extremities. These are acicular, and, as in the crystal illustrated, are often twinned. It is valuable as an ore of copper, although seldom smelted alone, not only because it

Crystal of Malachite.

is found along with other ores, but because the metal is apt to be carried off with the carbonic acid. It is sometimes passed off in jewellery as turquoise, although easily distinguished by its colour and much inferior hardness. It is used for many ornamental purposes; slabs of it—chiefly from the mines of Siberia—are made into tables, mantel-pieces, &c. of exquisite beauty. In 1835 a mass of solid malachite was found in the Ural Mountains of more than 17 feet in length, and weighing about 25 tons. By the ancients it was used as a charm to protect infants from witchcraft and sorceries. It has been suggested that a knowledge of copper was derived accidentally from the use of malachite as a colouring material.

Malachy, St, Archbishop of Armagh, was born about 1095 at Armagh, early inclined to the Roman system, became abbot of Bangor. Elected to the see of Connor (1125), he failed till 1134 to establish himself therein, and, that done, he withdrew three years later to the see of Down. Appointed papal legate for Ireland, he twice went to Rome seeking the pallium, visiting St Bernard at Clairvaux going and returning, and at Clairvaux, on All Saints' Day 1148, Malachy died of a fever in St Bernard's arms. He was canonised by Clement IV.

The curious 'Prophecies of St Malachy' were first published in his *Lignum Vitæ* (Venice, 1595) by the Flemish Benedictine, Arnold Wion, who deemed them a recent forgery. They consist of Latin mottoes for the popes from 1143 onwards. Down to 1590 they are (says Lord Bute) 'almost without exception transparent indications of the individuals to whom they apply. In the case of Urban VI. the very family name, Pregnani, is given (*De inferno Pregnani*); and the overwhelming majority of the others are simple puns or plays upon the Christian name, the origin or native place, the previous employment, or the coat-of-arms.' The forecasts after 1590 are usually vague in contrast to their predecessors; still, there are some good shots—none better than *Rastrum in portâ* ('the rake at the gate') for Innocent XII. (1691), who was one of the Pignatelli of Rastello at the gates of Naples. Then *Peregrinus Apostolicus* fits nicely for Pius VII., and *Aquila rapax* for Pius VIII., carried off to France by Napoleon, whose emblem was an eagle. For Pius IX. the motto was *Cruis de cruce*; for Leo XIII., *Lumen in Cælo*, his arms bearing a fiery star; for Pius X. *Ignis ardens*; for Benedict XV. *Religio depopulata*; for Pius XI. *Fides intrepida*. The prophecies still unfulfilled are *Pastor angelicus*, *Pastor et navita*, *Flos florum*, *De medietate lunæ*, *De labore solis*, and *Gloria olivæ*; after which 'the City of the Seven Hills shall be destroyed.'

See St Bernard's *Vita Malachie* (in Migne's *Patrologia*); Stoke's *Ireland and the Celtic Church*, and, for the Prophecies, the *Catholic Encyclopedia*, &c.

Malacology. See MOLLUSCA.

Malacopterygii ('soft-finned'), a term applied by Cuvier to those Bony Fishes (q.v.) in which the dorsal fins are supported by soft, jointed rays.

Malacostraca. See CRUSTACEA.

Málaga, a seaport in the south of Spain, is situated on the Mediterranean, 65 miles NE. of Gibraltar. Sheltered on the north and east by mountains, and with a wonderful equable, dry, and sunny climate, it is a great resort for invalids. Its only noteworthy buildings are the cathedral (1528-1765) and the Moorish castle. Málaga is a great seaport. It exports olive-oil, wine, raisins, lead, almonds, lemons, grapes, chick peas, and esparto grass. The manufactures include cotton and linen goods, machinery, fine art pottery, flour, and soap. Pop. (1920) 150,584. The *Malaca* of

the Romans, the town was founded by the Phœnicians, and was an important city under the Moors, but it was captured for Ferdinand and Isabella in 1487.—The modern *province* of Málaga has an area of 2836 sq. m., and a pop. (1920) of 554,301.

Malagasy. See MADAGASCAR.

Malagrida, GABRIEL (1689-1761), born in the Milanese, served in a Jesuit mission at Maranhao in Brazil, but had settled in Portugal when Pombal's crusade against the Jesuits began. When the Jesuits were expelled some were executed for complicity in a plot to assassinate the king. Malagrida was tried and acquitted, but burnt for heresy.

Malakoff. See SEBASTOPOL.

Malapterurus. See ELECTRIC FISHES.

Mälär, LAKE, one of the largest lakes, and the most beautiful, in Sweden, measures 80 miles in length from east to west, and has numerous long narrow arms and offsets; area, 650 sq. m. It is studded with upwards of 1200 islands, mostly well wooded. Its east end is close by Stockholm, where its waters are poured into the Baltic Sea. It is connected with the sea by canals also.

Malaria (Ital., 'bad air') and **Miasma** (Gr., 'deilement'), names formerly given to a supposed earth-born poison, erroneously credited with the causation of malarial fever.

MALARIAL FEVER, known also as Marsh Fever, Jungle Fever, Paludism, Ague, and Intermittent or Remittent Fever, is a disease which is very prevalent in tropical and warm climates, and which formerly occurred during the summer as far north as Sweden, Holland, and England. In the tropics it often affects a quarter or more of the total population every year, and causes a quarter or more of the total attendances at the hospitals and dispensaries. Fortunately the direct mortality due to it amounts only to about 0.5 per cent. of the cases; but it attacks so many people, and has such a debilitating effect on its victims, that the indirect mortality has been estimated as amounting to as many as 4 or 5 per 1000 persons every year. In India the malaria mortality has been officially estimated to exceed a million deaths *per annum*. Owing to its predilection for the most fertile areas, and to its persistent endemic nature, it has always been the inveterate enemy of explorers, planters, engineers, merchants, soldiers, and administrators in the tropics, and has exerted a marked influence on the history of many parts of the world.

It was well known, after about 500 B.C., to the ancients. They recognised most of its symptoms and varieties, knew that it is specially connected with the presence of marshes, learnt that it may be reduced by drainage of the soil, and even conjectured that it is caused by insects which breed in water. These observations were confirmed after the 16th century by many writers, who (not quite correctly) attempted to explain the relation between marshes and the disease by supposing that the former exhale a poisonous *miasma* called *malaria*. In the 17th century cinchona bark was brought to Europe from Peru, and this drug and its extractive, quinine, have now been proved by centuries of medical practice to be a specific for the disease when properly given. In 1880 A. Laveran, a French army surgeon, discovered that malarial fever is caused by numbers of minute animal parasites which live in the red corpuscles of the blood; and subsequently B. Danilewsky and others have found similar parasites in monkeys, bats, squirrels, and birds. In 1885 C. Golgi proved that in man the parasites reproduce themselves by simultaneous sporulation, occurring every two days or every three days; that the patient's fever commences when this act of sporulation takes place; and that there are three varieties of parasites

causing the three principal varieties of malarial fever. Since 1882 C. Gerhardt and many others have caused the symptoms of malarial fever and have reproduced the parasites in no less than fifty-one healthy persons by inoculating small quantities of the blood of patients. In 1897-99 Sir Ronald Ross showed that the parasites undergo further development in certain kinds of mosquitoes fed on infected men or birds, and then pass again from such mosquitoes to healthy persons or birds respectively. Since then Bignami and others have infected no less than thirty-eight healthy persons by the bites of infected mosquitoes, the most remarkable cases being those of two persons infected in London by means of mosquitoes brought alive from Italy under the direction of Sir P. Manson.

Malarial fever in man is at least of three kinds, which are respectively caused by three species of parasites. Quartan fever is due to *Hæmaphysa malarie*, which sporulates every three days; tertian fever to *H. vivax*, which sporulates every other day; and 'malignant' malaria to *H. falciparum*, which also sporulates every two days. Two more varieties are admitted by some authorities. The various kinds of parasites can be easily distinguished under the microscope. They all begin life in the blood as a minute spore, about one-thousandth of a millimetre in diameter. This enters a red corpuscle; lives and grows in it for two or three days, as the case may be; then produces from about eight to thirty spores (according to the species); and, when ripe, bursts the containing shell of the corpuscle and scatters the new spores in the blood-serum. These now repeat the story, and so on indefinitely. When each sporocyst bursts it probably liberates a little poison or toxin, and the simultaneous discharge of the toxin of millions of the parasites causes the sudden onset of the patient's fever. About 150 million parasites are required to produce this effect, but nearly a billion may be present in severe cases. The paroxysm often commences with a severe shivering fit, followed by high fever and profuse sweating, the whole attack lasting from one or two to forty hours or more. The successive generations of parasites are associated with successive attacks of fever. A patient may contain different species or different sets of parasites at the same time, and the attacks may overlap each other, producing a continuous fever called malarial remittent. After some weeks, patients often become partially habituated to the poison; the attacks become milder, and the number of parasites falls below the fever-producing limit. Unfortunately many relapses are apt to occur in badly treated cases, and patients have remained infected for years. In such chronic cases great enlargement of the spleen frequently develops, and the sufferer becomes anæmic, thin, and yellow. Occasionally single attacks become 'pernicious,' and have a high fatality. The dangerous illness called black-water fever belongs to this class. Thirty grains of quinine a day nearly always reduce the fever in three days, but the drug must be continued for at least four months in five to ten grain doses if the parasites are to be entirely extirpated from the body. Rest in bed is always beneficial.

Besides the parasites which form spores in the blood, other (sexual) forms exist which, when sucked up by certain species of anopheline mosquitoes (see GNAT), develop in them. After about ten days in warm weather these produce another kind of spores, which enter the insects' salivary glands and pass thence into the wound made by these mosquitoes in the skin of fresh victims, whom they may now infect. Thus the insects carry the disease from man to man—as occurs in many other maladies; and it is very unlikely that the malarial infection can be caused in any other way. The

anophelines breed principally in marshes—thus explaining the observation of the ancients; but the malaria or miasma given off by the marsh consists not of gas, but of living insects.

Indigenous malarial fever cannot exist unless the carrying anophelines are not only present, but sufficiently numerous; unless they have access to human beings; unless they live long enough to mature the parasites; unless the weather is warm enough for them to bite; and unless enough persons have the parasites in their blood. If the anophelines are only just numerous enough to keep the infection alive in a locality, the disease merely smoulders; but a very small increase above this number may cause a wide-spread epidemic. These facts explain why malarial fever is absent in some places, slight in others, and very prevalent in suitable places, especially during the warm rainy season. In hundreds of thousands of villages in warm countries (e.g. Southern Italy, Greece, India, tropical Africa and America) a large proportion of the native children are infected, though the survivors tend to become partially immune at puberty.

The same facts indicate the various methods of prevention. Private persons should, if possible, avoid living near dangerous spots or native localities; should always use mosquito-nets or wire-gauze to the windows; and should take at least five grains of quinine daily before breakfast, and continue it for two months after leaving the malarious area. For public prevention (a) all cases should be carefully sought out and thoroughly treated in order to destroy their parasites; (b) the people should be constantly urged to take quinine, and use nets or screens; and (c) the insects should be reduced as much as possible by draining or filling their breeding-places. All these measures have been tried in a number of places since 1900 and the results have been specially striking in Italy, Ismailia, the Panamá Canal Zone, in one of the Federated Malay States, and in the United States and some Dutch possessions. As a rule mosquito-reduction is most appropriate for towns, especially because it tends to reduce other diseases besides malaria; but in rural areas the expense of drainage often compels us to fall back on less fundamental measures, particularly quinine.

The literature of the subject is enormous. Dr Laveran's *Traité du Paludisme* (Paris) and Sir Ronald Ross's *Prevention of Malaria* (London) may be consulted.

Malatia (anc. *Melitene*), a town in the province of Diarbekir in Asia Minor, 8 miles from the Euphrates, once the capital of a Hittite kingdom (see HITTITES); pop. 20,000.

Malay Peninsula. See MALACCA.

Malays, the dominant native race in the Eastern Archipelago and neighbouring Asiatic peninsula, which from them are commonly named respectively the Malay Archipelago and Malay Peninsula, and collectively Malaysia. Physically the Malays have been regarded as an oceanic branch of the Mongolic division of mankind, diversely modified by interminglings, especially with dark (Papuan) elements in the eastern, and light elements in the western and central parts of the archipelago. The former (*Malayo-Papuan*), often designated by the somewhat vague term 'Alfuro,' merge gradually eastward through Timor, Ceram, and South Jilolo in the true Papuans of Aru and New Guinea. The latter form two distinct groups, the *Indonesians* and the *Malays proper*. According to some, the Indonesians are a mixture of a Mongolic race with a 'Caucasic' element derived from India, the Malays proper being more nearly pure Mongolic.

Others see in the Indonesians merely a primitive Malay, or 'proto-Malay' race. The Indonesians, represented by the Battaks of Sumatra, and some of the inhabitants of the Philippines, are of medium and even tall stature, well proportioned, with light brown complexion, long (dolichocephalic) head, straight eyes, large nose, and regular features. The Malay race proper comprises all the rest of the inhabitants of Malaysia, except the Negritos of the Malay Peninsula (Semang) and of the Philippine and the Sakai of the Peninsula (Mon-Khmer in language); it comprises also the Chams of the south-eastern Cochin-China, many of the Formosan tribes, the Hovas of Madagascar, and some of the Micronesian islanders. They are of low size, averaging little over five feet, with yellowish complexion, straight black hair, round (brachycephalic) head, somewhat almond-shaped eyes, small nose, high cheek-bones, flat features, small hands and feet, in general so like the east Asiatic Mongols that Chinese dressed as Balinese could scarcely be distinguished from Malays, while many natives of Java might pass very well for Chinese (Wallace).

But linguistically the Malays are entirely severed from the Asiatic Mongols, all the Malay languages without exception belonging to the widely-diffused Malayo-Polynesian family, which extends across the Indian and Pacific Oceans from Madagascar to Easter Island, and from New Zealand northwards to Hawaii. This area includes many dark populations, such as the natives of the New Hebrides and Solomon Islands, who speak primitive or archaic forms of the organic Malayo-Polynesian tongue, of which the standard Malay, Kavi, Javanese, and other idioms of the more cultured Malay peoples appear to be later developments (Codrington).

The peoples of standard Malay speech—i.e. the Malays in the narrower and popular acceptance of the term—occupy a comparatively limited portion of Malaysia, being mainly confined to the Malay Peninsula to about 9° N. lat., the southern provinces of Sumatra (Menangkabo, Palembang, &c.), Lingen, Banka, and the other islands between Sumatra and Borneo; Banjermassin, Pontianak, Brunei, and some other maritime districts in Borneo; Tidor, Ternate, and the Banda group in the Moluccas, and the Sulu Islands. But at all events since the 13th century these Malays have been the chief trading people of the archipelago, where their language was already the general medium of intercourse throughout Malaysia at the arrival of the Portuguese towards the close of the 15th century. The question of their origin has been much discussed, some fixing the cradle of the race on the Asiatic mainland, others in Sumatra. This island, and especially Menangkabo, was undoubtedly the point of dispersion of the later historic migrations both to the mainland and to the eastern parts of the archipelago, which migrations can be traced back to the 12th century. But the race itself, if a branch of the Mongolic stock, must have originally reached the islands from the mainland. The so-called *Orang-Laut* ('men of the sea'), have from times long anterior to the Sumatran migrations been scattered over all the inland waters of the archipelago, 'a vile people, living by fishing and piracy' (De Barros). The *Orang-Melayu* themselves—i.e. the civilised Malays, formerly Brahmanists and Buddhists, now mostly Mohammedans—had already overrun the southern parts of Annam in the 8th century, and the Hovas had reached Madagascar at a still earlier epoch—i.e. before the spread of Hindu influences in the archipelago, for there are no Sanskrit words in the Malagasy language. Hence the Menangkabo dispersion can only be regarded as an episode in the history of the Malay race, whose origin

has been sought in the Indo-Chinese peninsula. On the other hand, other anthropologists, looking to differences in physical characters and to the facts of geographical distribution, deny that the Malays are Mongolic, and hold that the evidence points to a migration not from the north but from the south. Some are of opinion that they are descended from the same remote ancestors as the Polynesians.

The Malays have mostly abandoned their lawless roving habits, and are now spoken of as a somewhat mild, patient, and taciturn people, occupied chiefly with fishing, trade, and agriculture, and distinguished for their extreme courtesy towards each other and strangers. But the old fiery spirit still smoulders beneath an apparently passive exterior, and too frequently reveals itself in those sudden outbursts of murderous frenzies known as 'running amok.' The Malays have never developed a native culture, their civilisation being entirely due to foreign influences, chiefly Hindu and Arab. They excel in artistic work in silver. The Malay language, which is soft and harmonious and of simple structure, is written in the Arabic character, which is ill suited for the purpose. The Roman system has been largely adopted, especially in the Dutch and English dependencies. The literature, which is copious, comprises poetical compositions, such as rhyming-proverbs, love-songs, and dramas displaying some originality, but little imagination. The prose-writings (histories and chronicles in which truth and fiction are inextricably interwoven; treatises on law, theology, and ethics) are mostly based on Arab or Persian models.

Skeat, *Malay Magic* (1902), and other works; A. C. Haddon, *Head-hunters* (1902); *Play and Politics*, by an Old Resident (1901); Sir Hugh Clifford's works, including his Malay dictionary (with Frank Swettenham); W. G. White, *The Sea Gypsies of Malaya* (1922); Wilkinson, *History of Peninsular Malays* (3d ed. 1924).

Malay States. FEDERATED and UNFEDERATED. The portion of the Malay Peninsula (see MALACCA) south of Siam is under British protection, and may conveniently be divided into (1) the Straits Settlements (q.v.); (2) the Federated Malay States (i.e. states administered by British residents); and (3) the Unfederated or Native Malay States. Both the Federated and Unfederated States are covered in large part with thick forests, and have many rivers, few of which, however, are of use commercially.

The Federated Malay States.—Pérak, Selangor, Negri Sembilan, and Pahang have a joint area of 27,506 sq. m., and a population of 1,324,890 (1921), comprising 510,821 Malays, 494,548 Chinese, and 305,219 natives of India:

	Area.	Population, 1921.		
	Sq. Miles.	Males.	Females.	Total.
Pérak.....	7,800	373,902	220,153	599,055
Selangor.....	3,156	267,165	133,844	401,009
Negri Sembilan.....	2,550	119,569	59,193	178,762
Pahang.....	14,000	87,892	58,172	146,064
Federated Malay States	27,506	853,528	471,362	1,324,890

The preponderance of males over females is due to the number of Chinese and Indian immigrants. Kuala Lumpur (q.v.), pop. about 80,000, is the capital of the Federated States; and Kuala Kangsar, Ipoh, Taiping, Seremban, and Port Swettenham are other towns of importance.

The climate of the Federated Malay States is

tropical, with a moist heat, which has a very slight variation in the mean temperature throughout the year.

The state of Pérak came under British protection in 1874, Selangor in 1874, Negri Sembilan (itself a federation) in the same year, and Pahang in 1888. At first they were each administered by a resident, and were only subject to the governor of the Straits Settlements, being politically and financially separate units. Pérak and Selangor, however, greatly outstripped the other states, and in 1896 the four were federated under the governor of the Straits Settlements, who became commissioner for the Federated States. The sultans of the states, along with the chief secretary, the British residents, native nobles, and nominated Chinese members, form the federal council. The development of the Federated States in peace, commerce, hygiene, prosperity, and the outward indications of civilisation, including roads, railways, hospitals, and schools, is one of the most remarkable triumphs of British supervision and management. The products are coconuts (copra), rice, rubber, sugar, tapioca, and pepper; the largest acreage being allotted to rubber. The Krian irrigation works provide irrigation for a large area under rice. There are many minerals, including gold, lead, copper, and manganese; but tin is the most important. The Malay States, indeed, form the chief tin-producing area in the world.

The Unfederated Malay States.—Johore, Kedah, Kelantan, Trengganu, and Perlis remain outside the Federation; but in 1909 Siam handed over her suzerainty of the four last named to Great Britain. They have, although governed by their own native sultans or chiefs, British agents who are stationed in each state, and who act in an advisory capacity. The relations of Johore with Great Britain were defined by a treaty in 1885; and in 1914 the sultan agreed to act upon the advice of a British officer, called the general adviser. The Native States are far behind the Federated States in their degree of civilisation, exploitation, and commerce. They have a combined area of about 23,500 sq. m., and an estimated population of 1,125,000. See separate articles.

Malcolm, SIR JOHN, G.C.B., a British soldier, statesman, and historian, was born at Burnfoot, near Langholm, Dumfriesshire, May 2, 1769, and at fourteen went to India as a cadet in the Madras army. In 1798 he was appointed assistant to the resident at Hyderabad by Lord Wellesley. He distinguished himself at the siege of Seringapatam in 1799, and in 1800 he was sent as ambassador to Persia, to form an alliance with that country against Bonaparte, in which he succeeded. In 1801 he acted as private secretary to Wellesley; in 1803 was appointed governor of the Mysore Residency; and during the next two years did much to reduce to order and tranquillity the newly-conquered Mahratta states. In 1807 and 1810 he was again sent as minister-plenipotentiary to the Persian court. In 1817 he became the governor-general's political agent in the Deccan, with the rank of brigadier-general in the Indian army; in the latter capacity he greatly distinguished himself in the wars against the Pindaris and Holkar. To this period belong his anonymous *Sketches in Persia* (1827). Governor of Bombay (1827-30), he entered parliament in 1831 as member of Launceston, and opposed the Reform Bill. He died of paralysis in London, 30th May 1833. The Duke of Wellington in 1824 wrote to Malcolm that from the year 1796 'no great transaction has taken place in the East in which you have not played a principal, most useful, conspicuous, and honourable part.' Malcolm's writings are *A History of Persia* (1815), *Memoir of Central India* (1823), *Political History of India from 1784 to 1823* (1826), *Persia*

(1829), and *Life of Lord Clive* (1836). See his *Life and Correspondence*, by Kaye (1856).

Malcolm Canmore (Gael. *Ceann-mor*, 'great head'), king of Scotland, was a child when in 1040 his father, King Duncan, was slain by Macbeth (q.v.). He seems to have spent his youth in Northumbria with his uncle, Earl Siward, who in 1054 established him in firm possession of Cumbria and Lothian. In 1057, on the death of Macbeth and (seven months later) of Lulach, as well as that probably of Earl Thorfinn of Orkney, he ascended the throne of all Scotland. For the first eight years he was free to devote his energies to the consolidation of his kingdom, England then being ruled by the peaceful Edward the Confessor; but even during this period he made one raid into Northumbria (1061). And after 1066 the history of his long reign is one of ceaseless warfare with the Norman. His first wife, Ingibjorg, Thorfinn's widow, had died; and in 1069 Malcolm wedded Margaret, sister of Edgar the Atheling (q.v.), whose cause thenceforth he warmly made his own. Five separate times did he harry Northumbria, as far sometimes as York (1069, 1070, 1079, 1091, and 1093); and there were counter invasions by William the Conqueror and Prince Robert, in 1072 and 1080, on the former of which occasions at Abernethy 'King Malcolm came and made peace with King William, and gave hostages and became his man.' This homage he renewed to William Rufus in 1091; but, according to Scottish historians, it was only for Lothian and Cumbria, which once had belonged to England. In 1092 Rufus wrested from Scotland all Cumbria south of the Solway; and next year Malcolm gathered his army and marched into England, 'harrying with more animosity than ever behoved him. And then, on 13th November 1093, Robert de Moubray, Earl of Northumberland, ensnared him at Alnwick with his men unawares and slew him. Morel of Bamborough, who slew him, was Earl Robert's steward and King Malcolm's gossip. With Malcolm, also, was slain his son Edward, who should, if he had lived, have been king after him.' Malcolm left, however, five sons, of whom four succeeded him on the throne—Duncan (by Ingibjorg), Edgar, Alexander, and David. His reign is an important one, as the commencement of the transition of Scotland, Celtic and Culdee, to Scotland, feudal and Roman Catholic; but the change was not due to him so much as to his saintly queen.

See the article MARGARET, and Skene's *Celtic Scotland* (1876); and see the article SCOTLAND for the other three kings of that name—Malcolm, son of Donald, king of Alban from 942 to 954; Malcolm, son of Kenneth, king of Scotia from 1005 to 1034; and Malcolm the Maiden, king of Scotland from 1153 to 1165.

Maldegem, a town of East Flanders, 12 miles by rail E. of Bruges, with distilleries. Pop. 10,000.

Malden, a village of Surrey, 3 miles S.E. of Kingston-upon-Thames. From 1264 to 1274 it was the seat of Merton College, so may claim to be the metropolis of Oxford. With New Malden, 2 miles E. of Kingston, it forms part of the urban district of The Maldens and Coombe (pop. 14,500).

Malden, a town of Massachusetts, 5 miles by rail N. of Boston. There are manufactures of rubber boots and shoes, cords and tassels, and sand-paper. Pop. (1890) 23,031; (1921) 49,103.

Malden Island, a British possession in the Central Pacific, lies N.W. of the Marquesas in 4° 3' S. lat. and 155° W. long. It is a coral island 5 miles long by 4 broad, and has valuable deposits of guano. Pop. about 200.

Maldivé Islands, a chain of characteristic Coral (q.v.) atolls in the Indian Ocean, lying S.W.

of Ceylon. They extend 550 miles in length by 45 in average breadth, and consist of seventeen groups, distributed politically into thirteen, and embracing a total of several hundred islands. All of these are very small in area, and less than 200 are inhabited. Malé, the residence of the native 'Sultan of the Twelve Thousand Isles,' is 1 mile long by $\frac{3}{4}$ mile wide. The population of the whole chain is estimated at about 70,000. The people resemble the Singhalese in their personal appearance, and speak a language closely akin to Singhalese. They are Mohammedans by religion, and boast of an ancient civilisation. They are peaceful, affectionate, well behaved, and of cleanly habits. Dried bonito fish and fish-products are exported. The Arab geographer Ibn Batuta lived more than a year on the islands (1343-44). The Portuguese maintained factories there at various times after 1518; but in 1645 the sultan put himself under the protection of the Dutch governor of Ceylon, and along with that island they exchanged Dutch for English supremacy.

Maldon, a municipal borough of Essex, 9 miles E. of Chelmsford and 38 NE. of London, stands on a hill near the confluence of the Chelmer and the Blackwater, in the vicinity of which traces are still extant of a Roman encampment. It has two fine churches, partly Decorated and partly Perpendicular, and a quaint town or moot hall dating from the reign of Henry VI. The manufacture of crystallised salt is a speciality, and in the Blackwater—a noted resort of wild-fowl—are extensive oyster-fisheries. From 1328 to 1867 Maldon returned two members to parliament, and thence to 1885 one. In the battle of Maldon (991), the subject of a famous Old English poem (*The Battle of Maldon*, ed. by W. J. Sedgfield (1904)), the English under Brihtnoth were defeated by Norwegian Vikings under Guthmund and Olaf Trygvason. Pop. (1801) 2358; (1921) 6589.

Malebranche, NICOLAS, French philosopher, precursor of modern scientific psychology, was born, 6th August 1638, at Paris. He entered into the congregation of the Oratory, and devoted himself to the study of Patristics and church history, till Descartes's treatise, *De Homine*, falling into his hands, attracted him to philosophy. His famous work, *De la Recherche de la Vérité* (3 vols. 1674; 6th ed. 1712), revealed great depth and originality of thought combined with perspicuity and elegance, its object being the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God—his famous *Vision en Dieu*; that all beings and thoughts exist in God—*Dieu est le lieu des esprits, comme l'espace est le lieu des corps*; and that God is the first cause of all changes which take place in bodies and souls, which are therefore merely passive therein. His system is a kind of mystic idealism. It was immediately opposed by Ant. Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Leibniz. Other works of Malebranche's are *Traité de Morale* (1684) and *Méditations Chrétiennes et Métaphysiques* (1683), in the latter of which he endeavoured to exhibit the harmony of his philosophic views with Christianity. He died at Paris, 13th October 1715. The story of Stock, Berkeley's biographer, that Malebranche died of the excitement induced by a metaphysical discussion with the subtle Berkeley, is disproved by the dates; Berkeley having been in England from August 1714 till 1716.

An edition of his works, published in 1712, filled 11 volumes. Later editions are by Genoude and Lourdoueix

(1837) and Jules Simon (1859-71). See the Life by André (Tours, 1886), the Studies by Blampignon (1861), Ollé-Laprune (1870), Pilon (1895), and Joly (1901); and Ginsberg's translation of *Dialogues on Metaphysics and on Religion* (1923).

Male Fern. See FERN (MALE).

Maleguetta Pepper. See GRAINS OF PARADISE.

Malesherbes, CHRÉTIEN GUILLAUME DE LAMOIGNON DE, born at Paris, 6th December 1721, became in 1750 president of the Cour des Aides. He was a determined opponent of government rapacity and tyranny; as censor of the press he showed himself tolerant, and to him we may ascribe the publication of the *Encyclopédie*. In 1771 his remonstrances against royal abuses of law led to his banishment to his country-seat of Ste Lucie; at Louis XVI.'s accession (1774) he was recalled, and took office; but retired on the dismissal of Turgot, and, save a short spell in office in 1787, spent his time in travel or in the improvement of his estates. Under the Convention he came to Paris to defend the king, and from that day himself was doomed. He was arrested in December 1793, and guillotined, 22d April 1794, along with his daughter and her husband. Malesherbes was a member of the Academy, and brought an able pen to the discussion of agriculture and botany as well as political and financial questions.

His *Œuvres Choies* (1809) contains his most interesting writings. See Lives by Dubois (3d. ed. 1806), Gaillard (1805), Boissy d'Anglas (1818), Rozet (1831), Dupin (1841), and Vignaux (1874).

Malet. See MALLET.

Malherbe, FRANÇOIS DE (1555-1628), born at Caen, ingratiated himself with Henry IV., and received a pension. He was an industrious writer, producing odes, songs, epigrams, epistles, translations, criticisms, &c. His own poetry is colourless and insipid, but he founded a literary tradition—'Enfin Malherbe vint'; he led his countrymen to disdain the richly-coloured and full-sounding verses of Ronsard, and to adopt a style clear, correct, and refined, but cold and prosaic.

See his *Œuvres* in 5 vols. (Lalanne ed. 1862); Tilley's *From Montaigne to Molière* (1908); and works by De Gournay (1852), Basset (3d ed. 1890), Gasté (1890), Brunot (1891), Arnould (1892), Allais (1892), Duc de Broglie (1896); and Counson (1904).

Malibran, MARIA FELICITA, mezzo-soprano singer, born at Paris, 24th March 1808, was the daughter of Manuel Garcia (q.v.). She made her début in London in 1825, and soon her reputation extended over Europe. Her father attempted to establish the Italian opera in New York, but without success; and she married M. Malibran, a French merchant there, who soon became bankrupt. Thereupon she returned to the stage, and was received with great enthusiasm in France, England, Germany, and Italy. Her first marriage having been dissolved, she married M. Bériot, a famous violinist, in 1836; but on 23d September of that year she died at Manchester. She was one of the greatest of operatic singers. See Life by Pougin (trans. 1911).

Malic Acid, $H_3C_4H_3O_5$ (from Lat. *malum*, 'an apple'), occurs abundantly in most acidulous fruits, particularly in unripe apples, gooseberries, and currants, in which it is found as an acid or acid salt of potash or lime, which gradually changes into a neutral salt as the fruit ripens. It crystallises in groups of radiating acicular prisms, but, as the crystals are very deliquescent, it is usually obtained as a syrupy, semi-transparent mass, with a very sour smell, and readily soluble in water and alcohol. The chemical changes which this acid

undergoes under the influence of various reagents are very singular, and serve to illustrate many points in vegetable physiology in reference to the maturation of fruits. Thus, nitric acid converts it into oxalic acid; hydrated potash, into oxalic and acetic acids; ferments, into succinic, butyric, acetic, and carbonic acids and water.

Malignant Pustule. See ANTHRAX.

Malignants, a term used by the parliament men to designate those whom they considered to be the evil advisers of Charles I. They are so called in the Grand Remonstrance, Laud and Strafford being singled out as the most prominent, and to their door are laid all the evils which afflicted the kingdom. Afterwards the name was extended to all who sided with the king against the parliament.

Malines, or MECHLIN (Flem. *Mechelen*), a city of Belgium, on the navigable Dyle, 14 miles SSE. of Antwerp. It has fine squares, noble buildings, and wide regular streets. Notwithstanding its great railway works, it has lost its former greatness, and fallen far behind other Belgian cities in commercial enterprise and industrial activity. As the see of the primate of Belgium it still retains a certain degree of ecclesiastical importance, and possesses numerous churches, the most noteworthy of which is St Rombold's cathedral (wrecked by German bombardment in 1914), a vast building, covering nearly two acres, its interior adorned with Van Dyck's 'Crucifixion' and many other fine pictures and carvings, its unfinished clock-tower 324 feet high. It was mostly built in 1437-52. The churches of St John and of Our Lady contain works by Rubens; the old town-hall, now the post-office, dates from the 15th century; the Cloth Hall (1340) has been converted into a town-hall; noteworthy also are the splendid modern archiepiscopal palace, the Béguinage, the Salm inn (1534), and the monument to Margaret of Austria (1849). The manufacture of pillow-lace, famous in the 17th century (see LACE), has been transferred elsewhere; but chairs, linen and woollen fabrics, beer, needles, &c., are made here. Pop. 60,000.

Malipiero, FRANCESCO, Italian composer, born 1882, who, after studying under Borsi, went to Paris, where, falling under the influence of advanced exponents, he developed his own highly individualistic art. The symphonic pieces, *San Francisco d'Assisi* and *La Mascarade des Princesses Captives*, are examples of his style, while he also excels in chamber-music.

Mallard. See DUCK.

Mallarmé, STÉPHANE (1842-98), was, like Verlaine (q.v.), a leader of the 'symbolistic' school of French poetry. A born Parisian, he became professor of English in the Lycée Fontanes, and translated Poe's poems. But it was his *L'Après-midi d'un Faune*, illustrated by Manet (1876), that made the wilful obscurity of his style famous; *Les Dieux Antiques* (1880), *Poésies* (1899), *Vers et Prose* (1893) were other works, warmly admired by the 'decadents.' See a study by Thibaudet (1913).

Malleability, a property in some metals of being reducible to thin leaves, by hammering or by lamination between rollers—in this order, Gold, Silver, Copper, Platinum, Palladium, Iron, Aluminium, Tin, Zinc, Lead, Cadmium, Nickel, Cobalt. Gold far surpasses all the other metals in malleability, being capable of reduction into films not exceeding the 200,000th of an inch in thickness; and silver and copper may be reduced to leaves of great tenuity. Although gold and silver also present the property of Ductility (q.v.) in the highest degree, there is no constant relation between the two properties; for example, iron,

although it may be reduced to extremely thin wire, is not nearly so malleable as gold, silver, or copper.

Mallee Hen. See MOUND-BIRDS.

Mallee Scrub, impenetrable thickets in Australia, 8 or 10 feet high, chiefly composed of *Eucalyptus dumosa* and *E. oleosa*, to which the so-called cypress-pine (*Callitris verrucosa*) is often added.

Mallet, or MALET, CLAUDE FRANÇOIS DE, a conspirator against Napoleon I., was born 28th June 1754 at Dôle in Franche-Comté, and became an eager supporter of the Revolution. Entering the army, he had risen to the rank of a brigadier-general by 1799. But in 1801 he was detected in a conspiracy against Napoleon, and again in 1808; he was arrested and kept in confinement until 1812. During Napoleon's campaign in Russia Mallet made his escape from prison on the night of October 22-23, and by circulating the false news of Napoleon's death and by dexterous use of a forged decree of the senate won over some of the national guards. Whilst the latter occupied the principal public offices in his name, Mallet himself proceeded to liberate his fellow-conspirators, Generals Guidal and Lahorie, from prison. But at the house of Hullin, commandant of the troops in Paris, Mallet was himself taken prisoner by Hullin's adjutant, Laborde. He was shot, along with his fellow-conspirators, 29th October 1812. See histories of the conspiracy by Lafon (1814), Saulnier (1834), and Donrille (1840).

Mallet, or MALLOCH, DAVID (c. 1705-65), wielder of a venal pen, was born, about 1705, at Crieff, was janitor at Edinburgh High School, and toured Europe as a tutor. In 1723 the adaptation of two old ballads into a new one, 'William and Margaret,' gained him a reputation as a poet, which he enhanced by a poem, *The Excursion* (1728). After this, having 'by degrees cleared his tongue from his native pronunciation, so as to be no longer distinguished as a Scot, . . . he took upon him to change his name from Scotch Malloch to English Mallet'—an instance of his insufferable vanity. Strange to say, Pope, the poet, was his friend, and to please him Mallet reviled his critics in a work in verse, *Verbal Criticism* (1733). About this time he was appointed under-secretary to Frederick, Prince of Wales, then holding a separate court from his father's. In 1740 Mallet published a mediocre life of Bacon, and in 1742 another fairly creditable poem, *The Hermit, or Amyntor and Theodora*. After this he appears in the most despicable character: to gratify Bolingbroke he heaped abuse upon his dead friend Pope in a preface to Bolingbroke's *Patriot King*; at the bidding of the ministry he directed the popular rage for the loss of Minorca upon Admiral Byng, and his reward for this 'price of blood was,' says Dr Johnson, 'a pension which Mallet retained till his death;' and he received a legacy of £1000, besides other sums, to write a life of the great Duke of Marlborough, but never penned a single line—he groped for materials and thought of it till he had exhausted his mind.' He also tried his hand at play-writing, but with no very great success: *Mustapha* pleased for a while in 1739, because it was thought to contain some political allusions; *Eurydice* (1731) and *Elvira* (1763), tragedies, were failures. *Alfred, a Masque* (1740) was written in conjunction with Thomson, and one of its songs, 'Rule Britannia,' has been claimed for both of them. Besides, Mallet published two volumes of miscellaneous verse.

Mallorca. See MAJORCA.

Mallow, a market-town and watering-place of Ireland, is beautifully situated on the left bank of the Blackwater, 20 miles by rail N. by W. of Cork. Close by are the ivy-covered ruin of the castle of the Desmonds, destroyed in 1641, and the later Mallow Castle, built by Sir Denham Norreys towards the end of the 18th century. Pop. 4500. Till 1885 Mallow returned one member to the House of Commons. It suffered from military 'reprisals' in 1920.

Mallow (*Malva*), a genus of plants of the natural order Malvaceæ, whose species are herbaceous plants, or more rarely shrubs. The Common Mallow (*M. sylvestris*) is plentiful over most of Europe, and in Britain on waysides and heaps of rubbish. It is a perennial, with rather large

Common Mallow (*Malva sylvestris*).

bluish-red flowers on erect stalks. The Dwarf Mallow (*M. rotundifolia*), also a common native of Britain, has smaller whitish or reddish-white flowers. These two plants have a mucilaginous and somewhat bitter taste, and the leaves are used as an emollient and demulcent medicine, a decoction of them being employed in cases of irritation of the pulmonary and of the urinary organs; and poultices made of them are very frequently employed to allay external inflammation. Other species have similar properties. The Musk Mallow (*M. moschata*), not unfrequent in England, but rare in Scotland, has a faint musk-like smell. The fibre of *M. crispa* is used in Syria for textile purposes, and the fibres of many species are probably fit for similar use, and for the manufacture of paper. The young leaves of some are boiled as vegetables. A Mallow (*Lavatera arborea*) grows on the Bass Rock and in Haddingtonshire. The Marsh-mallow (q.v.) is of another genus.

Malmaison, a château on the left bank of the Seine, 10 miles W. of Paris, the favourite residence and the death-place of the Empress Josephine, belonged to Richelieu, and was restored by Napoleon III. in 1861.

Malmedy, a Belgian (till 1919 a Prussian) town in a mountain-valley, close to the frontier and 51 miles S. of Aachen, with mineral springs; pop. about 5000.

Malmesbury, an old-world borough of Wiltshire, on a bold eminence between two head-streams of the Avon, 26 miles by rail NNE. of Bath and 17 WNW. of Swindon. It owes its name to Maildulf, an Irish missionary. Aldhelm (q.v.), his scholar, became about 673 first abbot of the famous abbey here, in which Athelstan was buried, and of which William of Malmesbury was librarian and precentor in the first half of the 12th century.

To his time belong the building of a short-lived castle, and the rebuilding (also by Bishop Roger of Salisbury) of the abbey church, which, Transition Norman in style, and cruciform in plan, with a central spire, was 350 feet long. Little more than the nave—now the parish church—remains; but this is a most interesting fragment, its finest feature the south porch. At the Dissolution (1539) the mitred Benedictine abbey became a cloth-factory. A beautiful market-cross (temp. Henry VII.) is noteworthy. Hobbes was a native. Pop. 2400.

Malmesbury, JAMES HARRIS, EARL OF (1746–1820), son of 'Hermes' Harris (q.v.), held posts at Madrid (1768), Berlin, St Petersburg, The Hague (1784), and was made K.C.B. (1778), Baron (1788), and Earl of Malmesbury (1800). In 1793 he had seceded from Fox to Pitt, and in 1795 had married by proxy and conducted to England the Princess Caroline. See *Diaries and Correspondence* (1844) and *Lord Malmesbury and his Friends* (1870), both edited by his grandson, JAMES HOWARD HARRIS, third EARL (1807–89), who had just been returned to the House of Commons (1841) when his father's death called him to the Upper House. In 1852 and 1858–59 he was Foreign Secretary; in 1866–68 and 1874–76, Privy Seal. See his *Memoirs of an Ex-Minister* (1884).

Malmesbury, WILLIAM OF, historian, was born near the close of the 11th century, and was educated in the monastery at Malmesbury, where he became a monk, and in due time librarian, and afterwards precentor. In 1140 he declined the office of abbot, took part in the council at Winchester against Stephen in 1141, and died most probably soon after 1142, when his latest work, the *Historia Novella*, comes abruptly to an end. His *Gesta Regum Anglorum* gives the history of the kings of England from the Saxon invasion to the twenty-eighth year of Henry I., or the year 1128. The *Historia Novella* brings down the narrative to the year 1142, but is really a separate work. Sir T. D. Hardy edited both together for the English Historical Society in 1840, and Stubbs in the Rolls Series in 1887–89. Sharpe's translation (1815) has been often reprinted. The two form admittedly one of the most valuable authorities for the Anglo-Norman period of our history, the work of a man of great learning, industry, intelligence, and impartiality—no mere compilation, and written moreover with unusual clearness and force. The *Gesta Pontificum* gives an account of the bishops and principal monasteries of England from the conversion of Ethelbert of Kent by St Augustine to 1123. It was edited in the Rolls Series in 1870 by Mr N. E. S. A. Hamilton. Other works of William's are an account of the church at Glastonbury, printed in Gale's *Scriptores XV.*, and translated by F. Loman (1907), and a life of St Dunstan, printed in the Rolls Series (ed. Stubbs, 1874).

Malmö, the third largest town of Sweden, on the Sound, nearly opposite Copenhagen, 17 miles distant. Besides being a busy seaport, it has manufactures of cigars, sugar, beer, and woollens, and some shipbuilding. The exports are chiefly grain, flour, butter, eggs, cement, chalk, matches, live-stock, and timber, and the imports coal, machinery, cotton, grain, textiles, coffee, &c. A free harbour is being constructed. The only remaining part of the old fortifications is the castle in which the Earl of Bothwell (q.v.) was confined. The town-house is a fine Renaissance building of 1546. Pop. 110,000. Down to the 16th century Malmö was one of the busiest commercial towns in that part of the Baltic. In 1523 a treaty of peace between the Danes and Gustavus Vasa was signed there.

Malmsey (Fr. *vin de Malvoisie*), a name bestowed originally on the red and white wines of Napoli di Malvasia or Monemvasia, in the Morea, not because it produced them, but because it exported them; they were grown in the islands of the Aegean and the Levant. The Malmsey wines of modern commerce are mostly the produce of Teneriffe, Madeira, the Azores, Sardinia, Sicily, and one or two other places.

Malone, EDMUND, editor of Shakespeare, was born in Dublin, 4th October 1741, graduated with credit at Trinity College, and was called to the Irish bar in 1767. He soon devoted himself to literary pursuits, his first work being a 'supplement' to Steevens's edition of Shakespeare (1778). He contributed to Steevens's third edition of Shakespeare (1785). Malone's own edition (1790) was warmly received, especially the essays on the 'History of the Stage' and the 'Genuineness of the Three Plays of Henry VI.' As an editor Malone displays great good sense, conscientiousness, much acuteness, extensive research, and a becoming respect for the text of the earlier editions. He had been one of the first to express his unbelief in the antiquity of Chatterton's Rowley poems, and in 1796 he denounced the impudent forgeries of the wretched Ireland. In 1797 he published the works of his friend Sir Joshua Reynolds, and in 1800 those of Dryden. He died 25th May 1812. He left behind a large mass of materials for another edition of Shakespeare, which at length appeared in 1821, in 21 vols., under the editorship of James Boswell the younger, and as the 'Variorum Shakespeare' is known and valued by all scholars. See Life by Sir James Prior (1860).

Malory, SIR THOMAS, is immortal in his work, the *Morte d'Arthur*, while of himself but little is known. We learn from Caxton's preface that Malory was a knight, that he finished his work in the ninth year of the reign of Edward IV. (1470), that he 'reduced' it from the French, and that he was a servant of Jesus both day and night—a statement which has needlessly led to the inference that he was a priest. Professor Kittredge discovered some particulars. Probably he was the Sir Thomas Malory of Newbold Revel in Warwickshire whose arrest was twice ordered (1451, 1452) in connection with some dispute with the prior and monks of the neighbouring house of Monks Kirby. Later he sat in parliament for Warwickshire. A Sir Thomas Malory was twice excluded from pardons by Edward IV. in 1463, perhaps as a follower of the king-maker. If this was the author of the *Morte d'Arthur* it would explain his concluding prayer for 'deliverance.' Probably liberated in 1469 or 1470, he died 14th March 1470-71.

Sir Thomas Malory's work 'is indisputably,' says Scott, 'the best prose romance the English language can boast of.' Miss Scudder declares it 'the most important single book produced in England during the Middle Ages.' It was due to an attempt to work up and weld the whole mass of French Arthurian romance, and the result shows that its author was no slavish copyist or compiler merely, but that he turned much that was dross into pure gold, and stamped upon the whole the impress of his own individuality as Shakespeare did with his Holinshed and Plutarch. Caxton's impression was finished in 1485, and is a black-letter folio, of which but two copies now exist. There have been many editions since that of Wynkyn de Worde. The best is that of Oskar Sommer, 1889-91, with Introduction, a treatise on the Sources, and Andrew Lang's essay on Malory's prose style. See the critical study by Professor Vida D. Scudder (1921), and Mr E. K. Chambers's essay (1922).

Malpighi, MARCELLO, an Italian anatomist, was born at Crevalore, near Bologna, on 10th March 1628, and died at Rome on 29th November 1694. He held, at different periods of his life, the professorship of Medicine in Pisa (1656-60), Messina (1662-66), and Bologna (1666-91). In 1691 he was appointed chief physician to Pope Innocent XII. Like his contemporary Leeuwenhoek, he was a pioneer in the study of minute anatomy with the microscope, and is chiefly known for his discoveries in connection with capillary circulation (1660) and in the anatomy of the skin, the kidney, and the spleen (see KIDNEYS). Amongst his works may be mentioned *Epistolae Anatomicae* (1662), *De Structura Viscerum* (1669), *De Pulmonibus* (1661), *De Structura Glandularum Conglobatarum* (1689), and *Anatomia Plantarum* (1675-79). See the bicentenary monograph by Atti, Virchow, Haeckel, Todaro, Michelis, and others (Milan, 1898).

Malpighiaceae, a natural order of dicotyledons, trees or shrubs, many of them, climbing shrubs or lianas. See BARBADOS CHERRY.

Malplaquet, a village in the French department of Nord, 10 miles S. of Mons in Belgium. Here, on 11th September 1709, over 90,000 British and Dutch, under Marlborough and Prince Eugene, defeated about the same number of French under Marshal Villars. In this 'very murderous battle,' as Marlborough called it, the loss of the allies was from twenty to thirty thousand, of the French from six to sixteen thousand. Its result was the capture of Mons.

Malström. See MAELSTRÖM.

Malt and Malting. See BEER.

Malta, an island and British possession in the Mediterranean, 17½ miles long by 8½ broad, with an area of 91 sq. m. It has been proclaimed European territory. It stands on the submarine plateau which, stretching across from Sicily to Africa, divides the Mediterranean into two basins, and is of late Eocene or perhaps Miocene formation, the prevailing rocks being limestones. From its central position in the Mediterranean Sea, 58

miles S. of the Sicilian coast and about 180 SE. by E. of Cape Bon in Algeria, and from the enormous strength of its fortifications, Malta is one of the most important of the British dependencies. It is the headquarters of the British Mediterranean fleet, the principal coaling station for merchant-vessels as well as the navy in the Mediterranean, a powerful stronghold (Valletta), a valuable sana-

torium for troops employed in the Orient, and an interesting island historically, architecturally, and archaeologically. The dependencies include the island of Gozo (26 sq. m.), lying NW. of Malta, and separated from it by a channel 3 miles wide, in which are the little islands of Comino and Cominotto, and several islets round the coasts of the larger islands. The area of the entire governorship of Malta extends to 118 sq. m. Malta is oval in shape, the north-eastern and eastern shores being broken into several good harbours (Valetta, Marsa Scirocco, St Paul's Bay, Melliha Bay, &c.); the southern coast rises in picturesque cliffs 400 feet high. The culminating point of the island is 758 feet. The sea has hollowed out among its cliffs grottoes and caverns in almost every direction, some of considerable extent, especially one in Comino. Malta has a bare, stony appearance, owing to the absence of trees and the fact that the fields and gardens are enclosed in high walls to shelter the crops against the violent winds. There are no rivers or lakes; but water is easily obtained from springs. The soil is thin, but remarkably fertile; and its fertility is increased by the skilful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, clover, oranges, figs, grapes, carob beans, and peaches and other fruits are also grown. Fine honey is produced; in spring the island is gay with flowers. The manufactures include lace and cigarette-making and filigree work. The *Scirocco* raises the temperature to 80° to 100° F., and the climate becomes very enervating. In the cold season it ranges from 50° to 70° F. The severe Malta, Mediterranean, or Neapolitan fever has long been endemic, but is not serious.

In 1881 Malta and Gozo contained 149,782 inhabitants; in 1921 the civil population numbered 213,024, and the total 224,680. The language of the people is a corrupt dialect of Arabic, with a strong admixture of Italian and other words; some connect it with the ancient Phœnician, and the native population believe themselves to be of Phœnician descent. The language question has caused much discontent and friction, but apart from the peasantry, who only speak Maltese, English is the chief official language of administration and Italian that of the law courts. Debates in the legislature may be in English, Italian, or Maltese. Other causes of discontent have been the ecclesiastical jealousy of the predominant church, and social jealousy between the impoverished native nobility (for the most part counts and marquises created by the Knights of St John, who take rank and precedence immediately after members of the Irish Peerage) and the upper classes of the British. The Maltese are a sober, industrious race of people, though often quick-tempered and ignorant. Canon law is recognised as the civil law of Malta. Owing to the rapid growth of the population and its density, large numbers are compelled to emigrate; they are found in all parts of North Africa and the Levant. Education is provided for in a university, a lyceum, two secondary schools (one for boys and one for girls), a technical manual school, and 100 government schools, attended on an average by about 20,000 pupils. The university, founded in 1769, has six faculties. The coinage of the knights was superseded in 1887 by the British currency. Under the Malta Constitution Letters Patent, 1921, there is an elected legislature to control local affairs, consisting of a senate (partly nominated) of 17 members and a legislative assembly of 32. Matters connected with the control of the forces, relations with foreign states, and

imperial interests are dealt with by the governor, assisted by an executive council consisting of such ministers as he may select, and a nominated council. There is a railway, 8½ miles long, connecting Valetta (q.v.), the present capital, with the old capital Citta Vecchia, known to Cicero as Melita, to the Saracens as Medina, and to the modern Maltese as Notabile, a place founded so long ago as 700 B.C. Here is the cathedral of St Paul (1697), traditionally occupying the site of a palace of Publius, who erected there a church, and of a cathedral built by the Normans in the 12th century and destroyed by earthquake in 1693. The cathedral is adorned with mosaics, pictures, statues, and other works of art. Near by are the extensive catacombs and the Grotto of St Paul, where he is popularly believed to have lived during his three months' stay on the island. Two miles distant is the Verdala Palace, built by the grand-master Verdala in 1586, now a summer residence of the governor of the island. At Mnajdra and Hagiar Kim, in the south of the island, there are megalithic temples, the ground-plans, not only of the general structures, but also of the detailed compartments, being all elliptical in shape. In 1902 the huge hypogeum at Hal-Saffieni was discovered. It consists of a series of irregular monolithic rooms, subterranean and inter-communicating, which cover an approximate area of 600 sq. yd. It belongs to the Neolithic period, and bones in large numbers were discovered in the rooms. In 1922 buildings were uncovered at Krenda (Malta) and at Gigantia (Gozo) which are without question structures of the Stone Age, and so of great importance in the study of the Mediterranean culture of early times. The traditional scene of St Paul's shipwreck is on the north side of the Bay of St Paul. The church of Musta (1833-64) is designed on the model of the Pantheon at Rome. The church of the great International Order of St John of Jerusalem is a magnificent building.

In 1917 teeth of Neanderthal man were found in the cave of Dar Ghalam, at the head of the Marsa Scirocco. Neolithic remains are abundant. From the time of the megalith-builders the people have been Mediterranean long-heads, slightly modified by newcomers, partly Armenoid in character, apparently late in the Bronze or early in the Iron Age. At all events the Phœnicians colonised the island at a very early date, more than 1000 years before the birth of Christ. Before they were disturbed in their possession by the Greeks, about 700 B.C., they had developed considerable commerce. The Greeks, who called the island *Melita*, were driven out by the Carthaginians about 480 B.C. As early as the first Punic war Malta was plundered by the Romans, but did not come definitely into their hands until 216 B.C. In those early times Malta was renowned for its manufactured cotton, its roses, and its honey; and its Roman temples and villas boasted excellent works of art and other indications of great luxury. On the division of the Roman world (395 A.D.) Malta followed the fortunes of the Eastern empire. During the 5th century it fell successively under the Vandals and the Goths; and though in 533 Belisarius recovered it for the Byzantine empire, its prosperity departed, and its civilisation almost vanished amid constant local feuds. In 870 the Arabs destroyed the Greek power in Malta, and fortified the harbour. Count Roger of Sicily drove out the Arabs in 1090. As a fief of Sicily, Malta passed, under a marriage-contract, to the Emperor Henry VI. (1194). In 1282 the island was conquered by Pedro of Aragon, and, so coming eventually into the hands of Charles V., was given by him, along with Gozo and Tripoli, in perpetual sovereignty to

the Knights of the Order of St John of Jerusalem (1530). The Knights raised the stupendous fortifications which rendered Malta so powerful, and spent much wealth in beautifying the island. To revenge their attacks on the Barbary pirates, Sultan Solymán sent in 1565 a very powerful fleet, strengthened by the galleys of Dragut of Tripoli, against the forts. Valetta was founded in the following year, after the Turkish attack, which lasted three months, had been beaten off (see VALETTA). In 1571 the Maltese followers of the Knights of St John behaved courageously at the battle of Lepanto. The Hospitallers continued in possession of Malta until 1798, when they surrendered their fortresses to the French. The Maltese, however, rose in a few months against their new masters, who treated them ill, and after a siege of two years, during which they were assisted by Neapolitan and British forces, they forced the French to capitulate to the English general Pigot. The treaty of Amiens stipulated that Malta should be restored to the Knights of St John; but the Maltese protested against such an arrangement, and preferred the government of Great Britain. The British government consequently refused to give up the island, and Napoleon made the refusal one of his grounds for the resumption of hostilities. The Congress of Vienna (1814) finally recognised Malta as a British dependency.

Malta, KNIGHTS OF. See HOSPITALLERS.

Maltebrun, KONRAD (properly MALTHE KONRAD BRUNN), geographer, born 12th August 1775, at Thisted, in Jutland, studied in Copenhagen, but was banished in 1800 because of his having openly shown his sympathy with the French Revolution. He sought refuge in Paris, where he supported himself by teaching and literary labours. With Mentelle and Herbin he compiled a *Géographie Mathématique du Monde* (16 vols. 1803-7); and in 1808 he began *Annales des Voyages de la Géographie, et de l'Histoire* (24 vols.), in 1818 *Nouvelles Annales*. His principal work is a *Précis de la Géographie Universelle* (8 vols. 1810-29; new ed. 6 vols. 1879). He also contributed to the *Dictionnaire de la Géographie Universelle* (8 vols. 1821), and took an active part in founding the Geographical Society of Paris. He died 14th December 1826.—His son, VICTOR ADOLPHE MALTEBRUN (1816-89), was professor of History and Geography at the college of Pamiers and subsequently at Paris (1848-60); and from 1860 onwards he was secretary of the Geographical Society of Paris. He was the author of numerous geographical works, as *La France Illustrée* (new ed. 1879-84), *L'Allemagne Illustrée* (1884-86), *Histoire Géographique de l'Allemagne* (1866-68), and books on the United States and on polar exploration.

Maltese Cross. See CROSS.

Maltese Dog, a small kind of spaniel, with roundish muzzle, and long, silky, generally white hair. It is fit only for a lapdog.

Malthus, THOMAS ROBERT, the expounder of the theory of population, was born 17th February 1766, at the Rookery, near Dorking, in Surrey, where his father owned a small estate. He was ninth wrangler at Cambridge in 1788, was elected Fellow of his college (Jesus), took orders, and was appointed to a parish in his native county. In 1798 he brought out his *Essay on the Principle*

of Population, which attracted great attention and met with no little criticism. During the following years Malthus extended his knowledge of the subject both by travel and by reading, and in 1803 published a greatly enlarged edition of his essay. In 1804 he married happily, and next year was appointed professor of Political Economy and Modern History in the East India Company's college at Haileybury, a post which he occupied till his death at Bath on 23d December 1834.

Personally Malthus was a kindly and accomplished man, who followed what he believed to be the truth, and who endured without a complaint the abuse and misunderstanding to which his writings exposed him. The aim of the *Essay* was to supply a reasoned corrective to the theories regarding the perfectibility of society, which had been diffused by Rousseau and his school, and which had been advocated in England by Godwin. Malthus maintained that such optimistic hopes are rendered baseless by the natural tendency of population to increase faster than the means of subsistence. He pointed out that both in the animal and vegetable kingdoms life was so prolific that if allowed free room to multiply it would fill millions of worlds in the course of a few thousand years. The only limit to its increase is the want of room and food. With regard to man, the question is complicated by the fact that the instinct of propagation is controlled by reason; but even in his case the ultimate check to population is the want of food, only it seldom operates directly, but takes a variety of forms in accordance with the complexity of human society. The more immediate checks are either preventive or positive. The former appear as moral restraint or vice. The positive checks are exceedingly various, including 'all unwholesome occupations, severe labour and exposure to the seasons, extreme poverty, bad nursing of children, large towns, excesses of all kinds, the whole train of common diseases and epidemics, wars, plague, and famine.' Malthus goes on to illustrate the action of his principle by a review of the history of the different nations and races, showing what are the actual checks that have limited population—celibacy, wars, infanticide, plagues, vicious practices—and proving that the population difficulty has affected the development of society from the beginning.

It cannot be said that Malthus was original in his exposition of the theory of population. It is a theme of both Plato and Aristotle. Shortly before the time of Malthus the problem had been handled by Benjamin Franklin, Hume, and many other writers. Malthus crystallised the views of those writers, and presented them in systematic form with elaborate proofs derived from history. In certain details and in the form of exposition the *Essay* may be criticised; but the broad principles of it can be doubted only by those who do not understand the question. The enormous increase of the means of subsistence attained by colonisation and modern industrial development has only for a time postponed the population difficulty for the world at large, while its pressure is still felt in the more thickly peopled centres both of Europe and of the East. At the present time the most interesting feature of Malthus is his relation to Darwin. Darwin saw 'on reading Malthus *On Population* that natural selection was the inevitable result of the rapid increase of all organic beings,' for such rapid increase necessarily leads to the struggle for existence. To prevent misunderstanding it should be added that Malthus gives no sanction to the theories and practices currently known as Malthusianism. In this reference Malthus approved only of the principle of moral self-restraint; 'do not marry till you have a fair prospect of supporting a

family.' Besides his *Essay on the Principle of Population* Malthus wrote two important works, *An Inquiry into the Nature and Progress of Rent* and *Principles of Political Economy*. See Memoir by Dr Otter, Bishop of Chichester (prefixed to 2d ed., 1836, of the *Principles of Political Economy*); also Bonar's *Malthus and his Work* (new ed. 1925).

Malton, a town in the North Riding of Yorkshire, on the Derwent, 22 miles N.E. of York. It consists of New Malton and Old Malton, with Norton adjoining in the East Riding. The *Derwent* probably of the Romans, it has the Norman church of a Gilbertine priory (1150), and a free grammar-school, founded in 1545 by Archbishop Holgate; but no trace remains of a Norman castle. Iron and brass founding, tanning, brewing, &c., are carried on; and Norton is famous for its training stables. Till 1868 Malton returned two members, and then till 1885 one. Pop. (Malton) 4400; (Norton) 4000.

Malvaceæ, a natural order of dicolytedons, of which about 1000 species are known, chiefly tropical and most abundant in America, although the most important species belong to the Old World. They are herbaceous plants, shrubs, and occasionally in tropical countries trees; with alternate entire or lobed leaves; the flowers showy, generally on axillary stalks. The plants of this order have a great general similarity both in appearance and in properties and products. All contain a mucilaginous substance in great quantity, and some are very useful as an emollient and demulcent in medicine. The seeds contain a considerable quantity of bland fixed oil. The inner bark of the stem often yields a useful fibre, for which species of *Hibiscus* and *Sida* are particularly valued; and to this order belong the cotton plants.—See COTTON, HIBISCUS, HOLLYHOCK, MALLOW, MARSH-MALLOW, &c.

Malvern, GREAT, one of the most fashionable watering-places in England, is situated 9 miles SW. of Worcester, and 129 WNW. of London, on the east side of the Malvern Hills, at the foot of the Worcestershire Beacon (1395 feet above sea-level). It is irregularly laid out, and has a fine cruciform church, with a square embattled tower 124 feet high rising from the centre, rebuilt in the reign of Henry VII., and restored in 1860-61. In the centre of the town are large Assembly Rooms, and on the outskirts is Malvern College, a handsome building in the Gothic style of the early Decorated period, erected in 1863-65. There are several entrance scholarships, and leaving scholarships tenable at Oxford or Cambridge. Jenny Lind resided near Malvern for many years. Sir E. Elgar also lived there. Malvern urban district includes Great Malvern, Malvern Wells, West Malvern, and Malvern Link. Pop. 18,000. The Malvern Hills, where Long Will dreamed of the 'fair field full of folk,' rise above Malvern and extend for nine miles, commanding views which claim to be beyond compare in the British Islands.

Malwa, a former kingdom of India. See CENTRAL INDIA.

Mälzel, JOHANN NEPOMUK (1772-1838), born at Ratibon, became in 1808 court mechanician at Vienna. Among his inventions were a sort of orchestron and an automatic trumpeter, but not the Metronome (q. v.).

Mamelukes, properly MAMLÛKS, an Arabic word signifying white slaves captured in war or purchased in the market, and especially applied to the slave-kings in Egypt. These had their origin in the importation of a large number of Turkish slaves, from the regions of the Caucasus and Asia Minor. Originally it was the Khalifs of Bagdad who initiated the practice of purchasing Turkoman

or Mongol slaves, of educating them and then attaching them to their persons. This dangerous habit was prompted by a desire to counterbalance the Arab influence, which, indeed, it ultimately superseded. That the Mamelukes soon made themselves supreme in the state was inevitable. Yet in spite of this warning example, the Fatimid Khalifs of Egypt and their successors, the Ayyûbids, followed the same course. The competition among sultans and emirs in Cairo to acquire talented Asiatic slaves both enhanced the price and stimulated the supply; it reached its height under Es-Sâlih Ayyûb, grand-nephew of Saladin, and sultan of Egypt, in the middle of the 13th century. The slaves were intended to act as a bodyguard and to defend their master against his numerous rivals as well as against the Crusaders, and they fulfilled their duty well, as is shown by the success of their repulse of the French invasion and the capture of St Louis in 1249. The Sultan Turan, son of Es-Sâlih, allowed St Louis to go free and attempted to curb the tyranny of the Mamelukes, who slew him and seized the government. Turan was the last Ayyûbid sultan. The Mamelukes set up one of their own number, the Emir Aibek, as sultan of Egypt, in 1250, and from that year to the Ottoman conquest in 1517 that country and Syria were ruled exclusively by Mameluke sultans. They were forty-eight in number, often retaining the throne but a few years, or even months, in consequence of the intrigues of rival emirs; and they fell into two dynasties, the Bahri or Turkish Mamelukes (1250-1382), so called because they were settled on an island on the Nile, *Bahr*; and the Burji or Circassian (1382-1517), so called because their quarters were in the citadel, *Burj*, Gk. *πύργος*. The sultan was chosen out of the military oligarchy, and owed his throne to personal prowess and the support of the biggest battalions, rarely to hereditary title. The Mamelukes did not readily propagate their race in a foreign country, and fresh importations were necessary to keep up the stock. This difficult question is discussed by H.E. Yacoub Artin Pasha in the appendix to Muir, *cit. infra*. As a rule the most powerful lord of the day became king, and kept his place just so long as he retained his following. Violent deaths were common; the sultan's bodyguard was the most essential part of the constitution, and held a large portion of the land of Egypt on a species of feudal tenure. Each of the great lords was a Mameluke sultan in miniature, kept a bodyguard, lived in much state, and was generally prepared to fight his way to the throne should occasion favour the attempt. The streets of Cairo were frequently the scenes of sanguinary conflicts, and its citadel is full of the memories of treacherous assassinations. With all their excesses, however, it may be doubted whether Egypt ever since the days of the Pharaohs possessed a more enlightened series of rulers than the Mamelukes. Their system of law and police, their military organisation and naval enterprise, their postal service, their irrigation-works and engineering operations were far in advance of their time; and, rough soldiers as they appear, they were munificent patrons of art and literature. Nearly all the exquisite mosques that still adorn Cairo, essentially the Mameluke city, are of their building, educational institutions met with their unfailing support, and they carried their taste for refinement into the smallest details of house furniture and decoration. The museums of Europe and Cairo are full of their delicate inlaid and engraved brass-work, wood-carvings, ivory reliefs, enamelled glass, tiles and stone and plaster work, mosaic pavements, and silk embroideries. Their court ceremonies were gorgeous with the pomp of heraldry and armour and dazzling

robes; their luxury at home was stupendous. Turks as a rule, they had tastes beyond the ken of the Ottoman Turks who dispossessed them in 1517, and Egypt has not yet recovered from their loss. After the Turkish conquest the government was placed in the hands of an Ottoman pasha assisted by a council; whilst twenty-four Mameluke beys were allowed to administer the provinces. The beys retained most of the power, however, and the pasha became a cipher. Their last brilliant achievements were on the occasion of Napoleon's invasion of Egypt in 1798, when they fought the disastrous battle of the Pyramids near Cairo; but after the retirement of the French and British armies Egypt became a prey to disorder, rival Mamelukes fought and intrigued, and order was not restored until Mohammed Ali established his authority as pasha under the Porte, and by two treacherous massacres, in 1805 and 1811, exterminated the Mameluke princes, save a small remnant who took refuge in the Sūdān, where their mediæval armour was seen by the British forces employed against the Mahdi.

See Weil, *Geschichte der Khalifen*; Quatrenère, Makrizi's *Histoire des Sultans Mamlouks*; S. Lane-Poole, *Cairo, History of Egypt*; Art of the *Sarracens in Egypt*; Sir W. Muir, *The Mameluke or Slave Dynasty* (1896).

Mamers, a town in the French dep. of Sarthe, on the Dive, 43 miles NNE. of Le Mans; pop. 6000.

Mamertine Prison, of ancient Rome, consists of the Carcer, where prisoners were detained pending trial, and, beneath it, of the Tullianum, a dungeon where executions took place. The name is of mediæval origin. The Tullianum is the oldest existing building of Rome.

Mamiani della Rovere, COUNT TERENCE, born in 1800 at Pesaro, took a prominent part in the futile outbreak at the accession of Gregory XVI., and was compelled to flee to Paris, whence he returned to Rome in 1848 after the unconditional amnesty of Pius IX., and actually held office for three months in the papal ministry. He next withdrew to Turin, where he founded, with Gioberti, his famous society for promoting Italian unity. On the flight of Pius IX. from Rome to Gaeta he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Galetti. On the fall of Rome he retired to Genoa; in 1856 he was returned member of the Sardinian parliament, and in 1860 entered Cavour's ministry as minister of Instruction. He was appointed ambassador to Greece in 1861, to Switzerland in 1865, and died at Rome, 21st May 1885.

Among his writings are *Del Rinnovamento della filosofia antica Italiana* (1836), *Poeti dell' Età media* (1842), *Del Papato* (1851), *Confessioni d'un Metafisico* (1865), *Teoria della Religione e dello Stato* (1868), *La Religione dell' Avenir* (1879), besides books on special social and philosophical problems, and treatises on various subjects. See his *Life* by Gaspari (1887).

Mammals (*Mammalia*, Lat. *mamma*, 'a teat') form what is usually considered the highest class of backboneed animals, including numerous orders, of which horse, elephant, and whale, dog, beaver, and bat, anthropoid ape, and man himself are in different ways prominent illustrative types. Compared with birds, mammals are most notably characterised by the greater development of their brains, and by the close connection between mother and offspring; but in both these respects there are grades of excellence. Thus, the Monotremata (q.v.; and see ORNITHORHYNCHUS, ECHIDNA) have simple brains and lay eggs; the Marsupials (q.v.) have also lagged behind in cerebral development and bring forth their young precociously after a short gestation; while in the higher orders there are many steps in the perfecting of brains and wits,

and in the evolution of the organic connection between the unborn young and the mother. The habitats are also very varied, for though the great majority are *terrestrial*—burrowers, runners, leapers, and climbers, a thoroughly *aquatic* habit is exhibited by the cetaceans, the sea-cows, the seals and walruses, and many genera here and there, while the bats have the power of true flight, and many swooping forms, such as the flying opossums, squirrels, and lemurs are more or less *aerial* (see FLYING ANIMALS). Similarly as regards food there is great variety, for fruit and insects, fish and herbs, roots and flesh, are all utilised, and the diversity of diet is associated with marked differences in dentition. About 2700 living species have been recorded, varying in size from the smallest harvest-mouse, which is scarcely the weight of a halfpenny, to the giant whales, which approach 70 feet in length.

General Characters.—It will be useful to refer to the article BIRDS, where the three highest classes of vertebrates are contrasted; but a more detailed summary is now necessary. Female mammals always nourish their young for some time after birth with the milk produced by the mammary glands. Except in the oviparous Monotremes, the young are born viviparously; and in all mammals above Marsupials the embryo in the womb is organically connected with the mother by means of a Placenta (q.v.). The skin always bears at least some hairs, and these usually cover the whole body, so that most mammals may be justly called furred quadrupeds. The high body-temperature is some index to the pitch of the life, and mammals are also like birds in having this temperature almost invariably constant (warm-blooded). A complete muscular partition (midriff or diaphragm) separates the breast from the abdominal cavity. The lungs lie freely and are invested by (pleural) sacs; the heart is four-chambered and gives off a single aortic arch to the *left* side (to the *right* in birds); the red blood-corpuscles are non-nucleated when fully formed. The parts of the adult brain show a greater curvature than in lower forms, while the cerebral hemispheres predominate, become more and more convoluted, and are united by an important bridge called the corpus callosum. Except in Monotremes, the rectal and the urogenital apertures are separate; and, with the same exception, the ova are small and poor in yolk, and undergo total segmentation. The skeletal characteristics are necessarily more technical, but it is important to notice that the skull moves not on one condyle as in birds and reptiles, but on two as in amphibians; the lower jaw is a single bone on each side, and articulates not with the quadrate as in Sauropsida but with the squamosal; a chain of three ear-ossicles (malleus, incus, and stapes, probably equivalent to the articular, quadrate, and columella or hyo-mandibular of lower forms) connects the drum with the internal ear; the teeth, rarely quite absent, are set in distinct sockets; the vertebrae of the neck are (with four exceptions) seven in number; the coracoid bone (except in Monotremes) is a mere process of the scapula; and so on. As the various systems are dealt with in special articles (see BRAIN, CIRCULATION, HAIR, SKULL, &c.), it seems unnecessary to expand the above summary.

The Sub-classes of Mammals.—In 1816 De Blainville divided mammals into three sub-classes, which subsequent investigation has firmly established. The two orders of Monotremes (duckmole and Echidna) and of Marsupials (kangaroo, opossum, &c.) he raised to the rank of sub-classes under the titles Ornithodelphia (lit. 'bird-wombed') and Didelphia (lit. 'double-wombed'), in contrast to all the other mammals, which he termed Monodelphia.

For these three sub-classes, which are distinct enough to be regarded as separate branches of the primitive mammalian stock, Huxley proposed the less objectionable titles Prototheria, Metatheria, and Eutheria, which are now generally adopted.

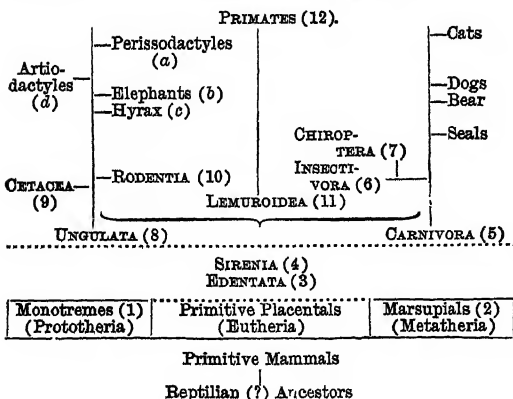

The most important contrasts between them may be summarised in the following tabular scheme, which ought to be expanded and vivified by reference to the articles ORNITHORHYNCHUS, ECHIDNA, KANGAROO, MARSUPIAL, &c.

	Prototheria. Ornithodelphia. Monotremes.	Metatheria. Didelphia. Marsupials.	Eutheria. Monodelphia. Placentals.
PARTURITION.....	Oviparous; obviously no placenta; (a temporary pouch in Echidna).	Precociously viviparous; placenta incipient; (a pouch for the young except in some opossums).	Viviparous; placenta established; no pouch.
OVA.....	Large, rich in yolk, with a slight shell, with partial segmentation.	Small, with total segmentation and relatively large yolk-sac.	Small, with total segmentation. The yolk-sac is small and quite without yolk.
MAMMÆ.....	None; the glands open on a bare patch of the skin, whence the secretion is licked off by the young.	Teats lie within the pouch, if that be present, and the milk is forced into the mouth of the young.	The well-developed teats are sucked by the young.
BRAIN.....	Small corpus callosum. Large anterior commissure Cerebellum uncovered.	Small. Large. Uncovered.	Large. Small. Increasingly covered.
TEMPERATURE.....	25°-28° C.	32°-36° C.	35°-40° C.
SKELETON.....	The sutures of the skull-bones close, and the surface is polished. The ram of the lower jaw are free and without an ascending process. The three ear-ossicles have primitive characters—e.g. large malleus, small incus, rod-like stapes. The vertebrae have no terminal caps or epiphyses (as also in Sirenia). The pectoral girdle is reptilian-like, with coracoids reaching sternum, with 'interclavicle,' &c. There are marsupial or epipubic bones. No teeth in adults.	The angle of the lower jaw is inflected sharply inwards. There are the usual epiphyses, much reduced coracoids (mere processes of the scapula), and almost always epipubic bones. The dentition is in most cases peculiar.	The typical characters of mammalia already noted. No epipubic bones, or at most slight rudiments of them; no marked inflection of the angle of the lower jaw.
OTHER PECULIARITIES...	Heart somewhat bird-like. Cloaca persists. Oviducts very simple and quite separate. The testes abdominal, and the ureters open into cloaca. Vasa deferentia are not continuous with the penis.	The urinogenital aperture is separate from the rectal, but there is a slight cloaca. Ureters open into bladder. There are two uteri and two vaginae. The scrotum lies in front of the penis.	Ureters open into bladder; one vagina, and usually one uterus. Scrotum, if present, lies behind the penis.

Orders of Mammals.—Leaving the MONOTREMATA (1)—duckmole and Echidna—and MARSUPIALIA (2)—kangaroo, opossum, &c.—by themselves in marked contrast to one another and to the placental series, we begin the latter with two orders in many ways more primitive than the rest—viz. the EDENTATA (3)—sloths, ant-eaters, armadillos, &c.—and the SIRENIA (4)—dugong and manatee. It seems possible to group the other

which some would erect a special order. Another line is especially characterised by the great order UNGULATA (8), including (a) Odd-toed or Perissodactyle forms—horse, rhinoceros, tapir, &c.—(b) Proboscideans or elephants, (c) the unique genus Hyrax, and (d) the Even-toed or Artiodactyle forms—sheep and cattle, chevrotains, camels, hippopotamus, and pigs. But with the Ungulates there are many reasons for connecting two other orders, the CETACEA (9)—whales and dolphins—and the RODENTIA (10)—rats, hares, squirrels, &c. Finally, along a third branch, which probably had its origin in a stock common to the Ungulates on the one hand, to the Carnivores and Insectivores on the other, we have to place the LEMUROIDEA (11)—lemurs—and the PRIMATES (12), the latter including the marmosets, the New-World monkeys, the Old-World monkeys, and man himself.

Extinct Mammals.—(a) The oldest mammalian remains date from the Upper Trias—i.e. from near the beginning of the Mesozoic or Secondary system. Some of these, mostly mere fragments, are grouped as Allotheria or Multituberculata and assigned to a position near Monotremes. (b) In the Jurassic strata there are more of these Allotheria, some Marsupials, and some forms with trituberculate teeth which look like primitive Insectivores. (c) There are few Cretaceous remains of mammals, but some of these suggest that the orders of placentals were beginning to be differentiated. (d) In the beginning of the Tertiary period, however, most of the modern orders of mammals have put in an appearance, and, as one would expect, there are remains of many types which form the common base of branches now widely divergent. Thus, the Creodonta (e.g. Hyænodon

orders along three definite lines. One of these is especially marked by the CARNIVORA (5)—cats, dogs, bears, and seals—to which the INSECTIVORA (6)—hedgehogs, moles, shrews—are apparently allied, while these in turn lead to the divergent CHIROP-TERA (7) or bats, and to an aberrant genus—the flying lemur or Galeopithecus, for

and Provivera) are primitive Carnivora, which show skeletal affinities with Marsupials and Insectivores. Not less remarkably generalised are the *Condylarthra* (e.g. *Phenacodus* and *Periptychus*), primitive Ungulates showing affinities with Artiodactyles and Perissodactyles, with Hyracoidea and (through the Creodonts) with Carnivores, and (according to Cope) even with the Lemurs. In the same way the palaeontologists find transitions

Fig. 1.—Slab of Rock showing the left lateral aspect of the skeleton of *Phenacodus primævus*; from the Lower Eocene of North America: actual size of slab, 49 inches in length. (After Cope.)

between Insectivorous, Lemuroid, and Creodont types, between Perissodactyles and Proboscidea (Dinocerata and Coryphodonts), between Rodents and Ungulates (Mesotherium and Toxodon). So, too, a common base has been found for dogs and bears, for pigs and sheep, for deer and chevrotains; but it is enough for our purpose to emphasise the fact, which rapidly progressive research continually corroborates, that in early Tertiary times there persisted numerous generalised mammals which united many of the characteristics of our extant orders.

Distribution in Space.—Referring to the article on GEOGRAPHICAL DISTRIBUTION for the general results reached by the labours of Murray, Wallace, Sclater, and others, we shall content ourselves with a few illustrations showing the importance of the inquiry in regard to mammals. Perhaps the most striking of these concerns the great insular region of Australasia, where, with the exception of some bats and marine mammals which transcend the usual limits, of some rats and mice, and of forms introduced by man, the whole mammalian fauna consists of Marsupials and Monotremes. As all extant Marsupials, except the American opossums and selvas, are now Australasian, and as fossil remains of the sub-class are found as far away as Europe, we have here one of the most remarkable cases of gradual restriction and of the saving results of geological changes. For, whatever the precise details may be, there seems no doubt that geological insulation saved the Marsupial immigrants to Australia from the jaws of their pursuers.

In the Lemuroid group, again, we find 'one of the most singular phenomena in geographical distribution.' For out of a total of fifty species thirty are confined to the one island of Madagascar, the remainder occurring through tropical Africa and in restricted portions of India and the Malay Islands—facts from which it is fairly concluded that in the insulated Madagascar 'the lowly organised Lemuroids diverged into specialised forms of their own peculiar type, while on the continents they have to a great extent become exterminated, or have maintained their existence in a few cases in islands or in mountain-ranges.'

The Edentata (sloths and ant-eaters) have also a very restricted distribution in modern times, for, with the exception of the scaly ant-eaters or Manidæ

(Ethiopian and oriental in range) and the African aardvark, the home of the order is in South America, where, moreover, in Pliocene times there flourished a giant race 'rivaling in bulk the rhinoceros and hippopotamus.'

Just as naturally as terrestrial mammals are absent from Oceanic islands, so the aquatic Cetaceans have a world-wide distribution, and the Sirenians almost as wide as required conditions of temperature will admit. But it must be clearly noted that when we follow in detail the distribution even of bats, whose great powers of flight free them from the limitations imposed on terrestrial mammals, we find that the inhabitants of special regions are usually marked off with perfect definiteness. The same local definiteness holds true of the world-wide (Australia always excepted) distribution of Ungulates, Rodents, and Carnivores, and is signally illustrated, for instance, in the complete absence of Insectivora from South America alone, or in the striking differences between Old and New World monkeys.

Development.—The ova, which are small and poor in yolk except in Monotremes, burst from the ovaries into the upper ends of the oviducts, may be fertilised by ascending spermatozoa, and with the above exception develop in the lower portion of the female duct known as the uterus. In the oviparous Monotremes the segmentation is partial, like that of birds and reptiles; in all the others the egg segments completely. The development proceeds in a fashion somewhat different in detail from that of the other vertebrates, but it is more important to notice that in the Placentals a close vascular connection is speedily established between the embryo and the wall of the uterus. In the hedgehog, which is a remarkably central type, this connection is first of all maintained simply by the outermost layer of the developing egg; but this is soon abetted by a union between the yolk-sac and the maternal wall, which in turn gives place to the true placenta, mainly due to the Allantois (q.v.). The final result is an interlocking of the maternal tissue with that of the foetal membranes, and the whole life of the embryo depends on the intimacy of this interlocking, by which the blood of the mother is vitally though not directly united with that of the offspring. At birth the union is severed, and the embryonic part of the placenta, with more or less of the associated lining of the uterus, is discharged. The form and structure of the placenta vary considerably in different orders, and have furnished important aid in determining relationship. Of mammals as of other animals it is true that the individual development recapitulates, in general outline, the history of the race, for the life begins at the beginning again in a single cell, divides into a ball of cells, acquires a layered body, and passes from stage to stage presenting successively the general features of a vertebrate, of a reptilian (?), of a simple mammal, of an insectivore, and finally of a young hedgehog. Nursing remains somewhat crude in the oviparous Monotremes, which are destitute of teats, but the embryos have a considerable store of yolk which serves as preliminary capital. The eggs of the duckmole are laid in a nest, those of the Echidna seem to be borne in a temporary pouch suggesting that of Marsupials. In both cases the young lick the bare patch of skin on which the mammary glands open. The non-placental Marsupials are, in a sense, as Professor Flower says, 'the most mammalian of mammals,' since most of them carry their prematurely-born young in an external pouch surrounding the teats, whence the milk is forced into their passive mouths. In the placental mammals the young are born in a more advanced state, though still requiring much care. They are able

to suck the mammæ actively, and their hitherto unused food-canals, gently tutored by the readily-digested milk, more or less rapidly acquire what Sollas has happily termed a 'gastric education,' which makes more substantial diet possible.

Origin of Mammals.—Though the duckmole and the Echidna lay eggs, and from the nature of their genital ducts have been termed Ornithodelphia, their affinities are rather with reptiles than with birds. For mammals and birds represent divergent branches, the common stem of which is exceedingly remote. Recognising this, the theories as to the origin of mammals are mainly concerned with the probabilities in favour of a reptilian or of an amphibian ancestry. In support of the latter it has been urged that mammals and amphibia have two skull condyles, while birds and reptiles have one; that the quadrate is small in the amphibians and mammals, large in Saurapsida; that some other parts of the mammalian skeleton (such as the pelvis) suggest affinities with amphibians rather than Saurapsida; and even that the amphibians in their varied reproductive experiments are as likely as reptiles to have originated the characteristic mammalian parturition. On the other hand, the *a priori* probabilities are in favour of the reptilian origin of mammals, for the reptiles are in general differentiation more evolved. Among the numerous extinct Saurians the Theriomorpha distinctly approach mammalia in some of their skeletal characters, the large partially-segmenting ovum of the Monotremes seems much liker that of reptiles than that of amphibians (which exhibits total segmentation), while it is not without interest that two lizards show an incipient form of yolk-sac placenta. A compromise between the rival theories has been proposed by St George Mivart, who suggests a dual origin of mammals, deriving the Monotremes from Anomodont or allied reptilian types, the Marsupials from a distinct and earlier source, perhaps amphibian. Another compromise, equally problematical, would derive mammals from a primitive stock of fingered quadrupeds, the common ancestors of amphibians and reptiles. On the whole, however, the balance of probabilities seems in favour of the origin of mammals from extinct Saurians, such as those which Cope has grouped as Theriomorpha. A few zoologists, who maintain the reptilian ancestry of mammals, and regard Cetaceans as a very primitive order, would derive these from the Ichthyopterygian reptiles; but this view has been received with virtually fatal criticism.

Evolution of Mammals.—Deeper than the problem of determining whether mammals had their origin from amphibians or reptiles is that which inquires into the factors which actually contributed to their rise. That this must have been very gradual both the fossil forms and the grades which still persist plainly show, and it is important to realise what is indeed a general truth in regard to evolution, that many of the characteristic features of mammals are not so much new acquisitions as reconstructions and elaborations of what is old. The all-important mammary glands seem to be but modifications of the sebaceous glands diffused over the skin; the placenta is chiefly composed of the allantois, which all young reptiles and birds possess; the corpus callosum, which forms a bridge between the cerebral hemispheres, is already hinted at in reptiles and amphibians. So, too, there is ample evidence of the very gradual evolution of special types and structures—witness the long series which connects the Eocene Eohippus, a five-fingered, three-toed ungulate, about the size of a fox, with the modern Horse (q.v.; see also FOOT); or the evolution of brains from the small casts found inside the skulls of some of the early giants

to such types as are exhibited by Monotreme and Marsupial, and from these upwards to the climax in man; or the gradual growth of Antlers (q.v.) from Miocene times onwards, a history rapidly recapitulated in the life of modern stags. But after realising the gradual development of types and structures, and appreciating the influence of natural selection in determining distribution, in eliminating giants, in fostering swiftness and strength, and in justifying big brains, many naturalists still find the problem of the evolution of mammals incompletely solved. Some follow Lamarck in postulating the transmission of the effects of use and effort. Others lay stress on the influence of a changeful environment, which may serve as a stimulus evoking variations or mutations. Furthermore, an account of the evolution of mammals has to take account of one of the most prominent characteristics, the maternal sacrifice expressed in the placental union, in the prolonged gestation (em-

phasised many years ago by Robert Chambers), and in the lacteal nutrition after birth, a sacrifice which must have been one of the most important factors in the progress of mammals. After a while the mammalian maternity (perhaps pathological at first and always expensive) must have paid or justified itself; but its recognition as 'a subordination of self-preserving to species-maintaining, of nutritive struggle to reproductive sacrifice,' is a necessary corrective to the prevalent theory which tends to emphasise too exclusively the competitive struggle for individual existence.

Intelligence and General Life.—Through the mammalian series, from the 'frog-witted' duckmole to the highest of the Primates, there is a gradual increase in complexity of brains and quickness of wits. The remarkably docile intelligence of the dog, the cleverness of the highly-evolved elephant, the ingenuity of the social beavers, and the 'humanness' of the higher apes are crowning illustrations which become all the more remarkable when we recall the minute brains of early mammals. A contrast between those types which excel and those which lag behind will also illustrate Spencer's

Fig. 2.—Fore and Hind Feet of the Horse and its extinct Ancestors.

Fig. 3.—Skulls and Casts of Brains of Eocene Mammals:

(After Marsh.)

conclusion that the rate of reproduction varies inversely with the degree of individuation, for in the more highly-developed forms the number of offspring tends to diminish, while the parental care and love proportionally increase. The adaptations to diverse habits and diets, the varying length of life and the means of avoiding death, the migrations of some and the hibernations of others, the struggle for mates as well as for food, the evolution of family-life and even of social sympathies are subjects of inquiry which will well repay observation and further study of mammals.

For general works, see Flower and Lydekker, *Study of Mammals* (1891); Weber, *Säugetiere* (1904); Lydekker's, Millais's, H. H. Johnston's, Barrett-Hamilton's *British Mammals*; Bell's *British Quadrupeds* (2d ed. Lond. 1874); Vogt and Specht, *Mammals* (trans. Edinburgh, 1887); Cassell's *Nat. Hist.*, vols. i.-iii., ed. by P. Martin Duncan; *The Riverside or Standard Natural History*, vol. v., ed. by J. S. Kingsley (Lond. and New York, 1888). The last mentioned has a general bibliography. A treasury both of information and illustration is to be found in Brehm's *Thierleben* (new ed. 1912 et seq.). For general structure, see the text-books of Owen, Huxley, Gegenbaur, Wiedersheim, Rolleston and Hatcher Jackson, and Flower's *Osteology of the Mammalia* (3d ed., along with Gadow, Lond. 1885). For history and evolution of mammals, see W. K. Parker, *Mammalian Descent* (Lond. 1884); O. Schmidt, *Mammalia in relation to Primeval Times* (Inter. Sc. Series, Lond. 1885); the papers of Cope and Marsh in the Reports of the U.S. Geol. Survey; Nicholson and Lydekker, *Manual of Palaeontology* (Edin. 1889); the relevant works of Darwin, Wallace, Haeckel, &c.; Huxley, *Proc. Zool. Soc.* (Lond. 1880); Cope's *Origin of the Fittest* (New York, 1887). For distribution, see A. Murray, *Geogr. Dist. of Mammals* (1866); A. R. Wallace, *Geogr. Dist. of Animals* (1876); Heilprin (1888); Sclater, *The Geography of Mammals* (1899). Also Beddard's *Mammalia* (1902).

Mammary Gland. See BREASTS.

Mamsee Apple (*Mammea americana*), a highly-esteemed fruit of the West Indies (where it is sometimes called the *Wild Apricot*) and tropical America. It is produced by a beautiful tree of the natural order Guttiferae, 60 to 70 feet high. The fruit is roundish, from the size of a hen's egg to that of a small melon, with a thick, leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its bitter taste. The pulp is firm and bright yellow, with a peculiar sweet and very agreeable taste, and a pleasant aromatic odour.—The Mamsee-sapota, red mamsee, or marmalade tree of the West Indies, is *Lucuma mammosa* (Sapotaceae).

Mammoth, the name (originally Tatar, through the Russian) for an extinct elephant (*Elephas primigenius*), whose remains are sufficiently common in the recent deposits of northern Europe and Asia to afford a valuable supply of fossil ivory. In geological time, it is only as it were yesterday that the mammoth ceased to live, for its remains are often found along with those of man, and it seems to have persisted in Britain until after the Glacial Period. The cave-dwellers made use of its tusks, and on these too the prehistoric artists—the literal old masters—cut with no tyro hand the outlines of reindeer and various animals, including the mammoth itself. But the comparatively recent decease of this monster elephant has been repeatedly evidenced in a startling way by the discovery in Siberia of almost intact specimens, standing upright in the ice and frozen soil, with hair and skin, muscles and viscera, as well as bones, all well preserved. The first fairly complete mammoth recorded was disinterred from the ice near the mouth of the Lena in 1806; the fisherman who discovered it had overcome his awe to the extent of cutting off the tusks, wild animals had gnawed the muscles, but the hair was still on the uninjured

parts of the skin, the brain in the skull, and the eyes still stared from their sockets. Others have since been disinterred, or washed out in great thaws, notably specimens in 1846 and 1901, so marvelously preserved that the stomach still showed young shoots of fir and pine, and a quantity of chewed cones. Great numbers that we know

Mammoth.

nothing of must have been similarly thawed out, and their frozen corpses swept seaward to swell the accumulations of their remains found in the Arctic seas. Their disinterment after thaws explains the old Siberian opinion that the mammoths were monster burrowers, which died when they came to the surface, while the upright position in which the intact forms have been found suggests that they had been smothered where they were buried by sinking heavily into the tundra marsh. Though mammoths in complete preservation are rare, their tusks, teeth, and other bones have been found in great abundance from almost every county in England to Behring Strait, and thence into North America.

'The whole appearance of the animal,' one of the discoverers writes, 'was fearfully wild and strange. Our elephant is an awkward animal, but compared with this mammoth it is as an Arabian steed to a coarse ugly dray-horse.' It stood 13 feet high, 15 feet in length, with tusks 8 feet long; but some other specimens seem to have been larger. The dark skin was covered with yellowish to reddish soft wool about an inch long, with interspersed brownish hairs of 4 inches, and much sparser and longer black bristles. 'The giant was thus well protected against the cold.' The mammoth was liker the Indian than the African survivor, but it is only one of a crowd of fossil Proboscidea distributed in Tertiary deposits over all the great continents. Mammoth, Mastodon, and Dinotherium are the three most prominent types. Most of them were giant animals, but there seem also to have been pigmies no larger than sheep. Once numerous and widespread, the elephants are now represented only by the two modern species of restricted distribution. To this result many factors, such as the voracity of Carnivores, the deforesting of countries, the changes of climate, and the expensiveness of great bulk, have contributed. The ivory exported in large quantities from Siberia is in great part collected from the islands, some of which are almost literally heaps of mammoth bones.

See ELEPHANT; also, for facts, not inferences, H. H. Howorth's *Mammoth and the Flood* (1887); Norden-skiöld's *Voyage of the Vega*; Boyd Dawkins, in *Quart. Journ. Geol. Soc.* XXXV. (1879).

Mammoth Cave, in Kentucky, is 85 miles by rail SSW. of Louisville. The cave is about 10 miles long; but it is said to require upwards of 150 miles of travelling to explore its multitudinous

avenues, chambers, grottoes, rivers, and cataracts. The main cave is only 4 miles long, but it is from 40 to 300 feet wide, and rises in height to 125 feet. Lucy's Dome is 300 feet high, the loftiest of the many vertical shafts that pierce through all the levels. Some avenues are covered with a continuous incrustation of the most beautiful crystals; stalactites and stalagmites abound. There are several lakes or rivers connected with Green River outside the cave, rising with the river, but subsiding more slowly, so that they are generally impassable for more than six months in the year. The largest is Echo River, three-fourths of a mile long, and in some places 200 feet wide. The air of the cave is pure; the temperature keeps at about 54°.

There is an elaborate work on *The Mammoth Cave of Kentucky* by H. C. Hovey and R. E. Call (1912); for the fauna, see works cited at CAVE; A. S. Packard, *The Inhabitants of the Mammoth Cave* (1872); and a memoir on 'The Cave Fauna of North America' (1888).

Man. As the races of mankind, the structure and functions of the human body, and the higher activities most distinctive of man are discussed in special articles, it is enough here to restrict attention to three problems: (1) the human characteristics, (2) the origin or descent of man, and (3) the antiquity of the race.

(1) *Characteristics.*—Considered like any other organism, man is strictly the highest of the Primates, differing from the anthropoid apes only in degree. In adult life he is unique in his erect posture, and in the freedom of his hands from any direct share in locomotion. His body is unusually naked, his canine teeth are not longer than their neighbours, his thumbs are larger and more opposable than those of monkeys, and his feet are distinguished by the horizontal sole which rests flatly on the ground, by the projecting heel, and by the non-opposable great toe which normally lies quite parallel to the others. His face is notably more vertical than that of apes, lying below rather than in front of the forepart of the brain-case; the jaws, the orbits, and the ridges above them are relatively smaller; the nose-bones project more beyond the upper jaw; and the chin is more prominent than in other Primates. A much more momentous characteristic, however, is involved in the fact that the normal brain of an adult man is more than twice as heavy as that of any anthropoid ape, for this structural advance is an index to that intellectual and emotional development which raises even the savage many degrees above the brute, and which in its highest realisation is still full of promise. Therefore, while all naturalists allow, with Professor Owen, that there is 'an all-pervading similitude of structure' between the human body and that of the anthropoid apes, there is equal agreement that in intelligence, emotions, and controlled conduct man is pre-eminent.

But, apart from these zoological considerations, it is interesting to notice some statistical results in regard to human (and especially British) characteristics derived from the Report (1890) of the Anthropometric Committee of the British Association. Thus, the average height of man is 5 ft. 5½ in., the Polynesians leading the way with an average of 5 ft. 9.33 in., the English professional class following with 5 ft. 9.14 in., and so on, down to the Bushmen, who average 4 ft. 4.78 in. As to the adult population of Britain, in height the Scots stand first (68.61 in.), the Irish second (67.90 in.), the English third (67.36 in.), and the Welsh last (66.66 in.), the average being 67.66 in. The Scots are also first in weight (165.3 lb.), the Welsh second (158.3 lb.), the English third (155 lb.), and Irish fourth (154.1 lb.), the average being 158.2 lb. Again, a typical adult Englishman has a stature of 5 ft. 7½ in., a chest girth of 36½ in., a

weight of 10 stone 10 lb., and is able to draw, as in drawing a bow, a weight of 77½ lb. As to the sexes (in England), the average male stature and weight is 67.36 in. and 155 lb., as against 62.65 in. and 122.8 lb. for the women. Moreover, the men are about twice as strong. For further results, many of which are of profound practical suggestiveness, the Report should be consulted.

(2) *Origin or Descent of Man.*—Even when we confine our attention to the opinions of those who accept the theory of evolution as a modal explanation of nature, we are in fairness bound to recognise some diversity of opinion in regard to the origin of man. (a) So unique does he appear to some that his descent from a humbler organism seems incredible—a position in favour of which some arguments will be found in the cited works of A. de Quatrefages. (b) Alfred Russel Wallace and others 'reject the idea of "special creation" for man, as being entirely unsupported by facts, as well as in the highest degree improbable,' yet believe that his progress from the brute was due to introduction of new causes, or 'spiritual influxes,' to which the higher human characteristics owe their origin. (c) The majority of naturalists deem this hypothesis of special spiritual influx inconsistent with the continuity of evolution, which they regard as a 'natural' process, self-sufficient throughout, for the origin of man as for other grand results.

The arguments which go to show that man is descended from a simpler animal are, of course, the same as those which substantiate the general theory. Thus, his structure and functions are not demonstrably different in kind from those of the nearest Primates; he develops from a fertilised egg-cell, and passes through successively higher grades of organisation in a manner which seems only interpretable as the recapitulation of ancestral history; he varies as other animals do, is subject to similar diseases, and exhibits numerous reversions and rudimentary structures which are enigmas, except on the theory that he had his origin from an ape-like stock. How his evolution was brought about is a problem requiring much elucidation, but among the special factors which conduced to evolve his higher characteristics of wisdom and gentleness it seems reasonable to attach much importance to the necessity for cunning in the struggle with stronger mammals, to the consequences of the prolonged weakness of infancy, to the influences of family life and of the indispensable combination into larger aggregates. As to the future, if we disregard minor changes—e.g. in hair and teeth, for which fashion and 'civilisation' are responsible—it seems almost certain, as Herbert Spencer has emphasised, that the progressive evolution of man must be restricted to intellectual and emotional qualities.

(3) *Antiquity of the Race.*—From the human remains, and far more frequently from the weapons, tools, and other vestiges of human activity, found in the more recent deposits on the earth's surface, it is obviously legitimate, after due caution, to infer the presence of man at the time—certainly not estimable in the years of any chronological system—when these beds were formed. Cuvier and others tried, indeed, to avoid this conclusion—for instance, by exaggerating the power of floods in mixing up recent deposits; while Boucher de Perthes, who in 1836 discovered flint axes along with mammoth bones in undisturbed strata 20–30 feet below the surface, had to wait almost twenty years for a fair hearing, and yet longer for decisive corroboration. Both were gained, however, and the conversion of naturalists may be dated from 1863, when Lyell summarised the existing evidence in his *Antiquity of Man*. Since then the problem has been worked at with ever-increasing energy

and success, and there is now general agreement that man was alive during the later stages of the glacial epoch, while there are indications of his presence in Pliocene ages (see GEOLOGY).

Older, however, than any indications of his Pliocene presence man must surely be, for zoologists refer his origin not to any of the existing anthropoid apes, as is sometimes popularly supposed, but to the common stock which included their ancestors and his, and which had apparently begun to diverge in Upper Miocene times. And the most ancient human remains are not those of a low or primitive type. The descent of man, and the succession of the various types of stone-age men (Chellean, Mousterian, Solutrean, Magdalenian; the Neanderthal, Spy, Cro-Magnon men, &c.), are more fully dealt with in the article ANTHROPOLOGY.

Man. ISLE OF, is situated in the Irish Sea, 16 miles S. of Burrow Head in Wigtownshire, 27 miles SW. of St Bees Head, and 27 E. of Strangford Lough. The length of the island is $33\frac{1}{2}$ miles, breadth $12\frac{1}{2}$ miles, and area 145,325 acres (227 sq. m.), of which nearly 100,000 are cultivated. At the south-western extremity is an islet called the Calf of Man, containing 800 acres, a large portion of which is under cultivation. A chain of mountains extends from north-east to south-west, the highest of which is Snaefell (2024 feet). In some of the streams trout abound, though in many the fish have been destroyed by the washings from the lead-mines. The coast-scenery from Maughold Head on the east, passing south to Peel on the west, is bold and picturesque, especially in the neighbourhood of the Calf, where Spanish Head, the southern extremity of the island, presents a sea-front of extreme grandeur.

The greater part of the island consists of clay-slate under various modifications. Through the clay-schist granite has burst in two localities, in the vicinity of which mineral veins have been discovered, and are extensively worked. About 2000 tons of lead are extracted annually, considerable quantities of zinc, and smaller quantities of copper and iron; the lead ore is very rich in quality. The principal mines are at Laxey on the east coast, and Foxdale near the west. The Great Laxey Mine is one of the most important in the United Kingdom.

The climate is remarkable for the limited range of temperature, both annual and diurnal; westerly and south-westerly winds greatly predominate, easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles and other tender exotics flourish throughout the year. The flora of the island is almost identical with that of Cumberland. The Manx cat is tailless, or nearly (see CAT).

The fisheries afford employment to nearly 1000 men and boys. More than 200 boats are employed in the herring and cod fisheries; the industry was formerly much greater. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are inconsiderable. The revenue derived from the island amounts to about £180,000 per annum; of this the greater part is received from customs duties, and the whole, except £10,000 a year payable to the imperial treasury, is used for insular purposes.

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLETOWN), probably the most perfect building of its date extant, was founded by Guthred, son of King Orry, in 947. The ruins of Rushen Abbey (1154) are picturesquely situated at Ballasalla. Peel Castle, with the cathedral of St German, is a very beautiful ruin, dating from the 12th century (see PEEL). There are numerous so-called Druidical remains and Runic monuments throughout the island; the Runic crosses, of which there are some forty in all, are especially numerous at Kirk Michael. The Tynwald Hill at St John's, near the centre of the island, is a perfect relic of Scandinavian antiquity. Once a year new Acts of Tynwald are here proclaimed. The hill is artificial, circular, and arranged in four platforms. Both institution and use should be compared with the Icelandic Tingvall. The island is divided into six *sheadings*, these into seventeen parishes; these, again, were divided into *treens* (now obsolete), and, lastly, into *quarter-lands*. The towns, noticed separately, are Castletown, Douglas, the modern capital, Peel, and Ramsey.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fine fleet of swift steamers. There is a submarine telegraphic cable between Maughold Head and St Bees Head. In 1873 a line of railway was opened between Douglas and Peel; in 1874 to Castletown and the south; and in 1879 to Ramsey—all on the single narrow-gauge system. Extensive improvements in harbour-works, piers, and promenades have been carried out at Douglas, Ramsey, and Peel. Pop. (1821) 40,081; (1841) 47,986; (1871) 54,042; (1881) 54,089; (1901) 54,758; (1911) 52,034, the decrease being attributable to emigration; (1921) 60,238. It is the most popular holiday resort for the north of England.

The Roman *Mona* was not Man, but Anglesey. Previous to the 6th century the history of the Isle of Man is involved in obscurity; from that period it was ruled by a line of Welsh kings, until near the end of the 9th century, when the Norwegian, Harald Haarfager, invaded and took possession of the island. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III. of Scotland (1266); this transference of claim being the direct result of the disastrous failure of the expedition of Haco of Norway against the Scots in 1263. On Alexander's death the Manx placed themselves under the protection of Edward I. of England by a formal instrument dated 1290; on the strength of this document the kings of England granted the island to various royal favourites from time

to time until 1406, when it was granted to Sir John Stanley in perpetuity, to be held of the crown of England, by rendering to the king, his heirs, and successors, a cast of falcons at their coronation. The Stanley family continued to rule the island under the title of Kings of Man, until 1651, when the style of Lord was adopted. In the same year the island was surrendered to a parliamentary force by Receiver-general Christian, who had raised an armed body against the government, then in the hands of the Countess of Derby. Parliament granted the island to Lord Fairfax; but on the Restoration the Derby family were again put in possession. On the death of James, tenth Earl of Derby, without issue in 1735, James, second Duke of Athol, descended from the youngest daughter of James, seventh Earl of Derby, became Lord of Man. The Isle of Man having been for a long period the seat of an extensive smuggling trade, to the detriment of the imperial revenue, the sovereignty of it was purchased by the British government, in 1765, for £70,000 and an annuity of £2000 a year, the duke still retaining certain manorial rights, church patronage, &c. The last remaining interest of the Athol family in the island was transferred to the British crown in 1829; the sum paid for the island having amounted in the aggregate to £493,000.

The Isle of Man forms a separate bishopric under the title of Sodor and Man. The bishopric of the Sudoreys—Scandinavian for 'Southern Isles'—was for a time annexed to Man; hence the title of Sodor, which is still retained, the name having been transferred to the islet of Holm Peel, on which the cathedral church of the diocese stands. This bishopric is said to have been founded by St Patrick in 447. Among the bishops the most famous was Thomas Wilson (q.v.), the author of *Sacra Privata*.

The Isle of Man has a constitution and government of its own, to a certain extent independent of the imperial parliament. It has its own laws, law-officers, and courts of law. The legislative body is styled the Court of Tynwald, consisting of the Lieutenant-governor and Council—the latter being composed of the bishop, attorney-general, two deemsters (or judges), and six others, and the House of twenty-four Keys, or representatives. A bill is separately considered by both branches, and on being passed by them is transmitted for the royal assent; it does not, however, become law until it is promulgated in the English and Manx languages on the Tynwald Hill. The House of Keys was formerly self-elective; but in 1866 an act was passed establishing an election by the people every seven years; and a bill passed in 1880 to amend this act abolished the property qualification for members, granted household suffrage in towns, £4 owner and £6 tenant franchise in the country, and conferred the suffrage on women. The armorial bearings of Man are three legs in armour conjoined at the thighs. The Manx people are of Celtic origin, with a strong dash of the Scandinavian. The language belongs to the Goidelic group of the Celtic languages (see CELTS). It is now but little spoken. Church service in the Manx language has been discontinued since the middle of the 19th century. There is no literature beyond a few songs and carols. The Prayer-book was translated into Manx in 1765, the Bible in 1772. A dictionary was compiled in 1835. Some account of the native superstitions will be found in the notes to *Peeveril of the Peak*.

Down to the middle of the 19th century the island was almost exempt from taxation, and consequently looked upon as a cheap place of residence, while its laws were available for the protection of English debtors. All this has long ceased. Taxation, locally imposed, has been introduced for

various purposes; though there is no poor-law, rates in aid are not unknown; and the influx of visitors and facilities for exporting native produce have equalised prices with those in England.

See Cumming's *Isle of Man* (1848); Train's history of the island (1845); Brown's *Popular Guide*; Halliwell's *Roundabout Notes* (1857); the *Chronica Regum Mannie*, edited by Munch (Christiania, 1860); the publications of the Manx Society (19 vols. 1858-68); Spencer Walpole's *Land of Home Rule* (1893); A. W. Moore's history of the island (1900), and of the diocese of Sodor and Man (1893), and his book on Manx surnames and place-names (1890); Kermodé and Herdman, *Monks Antiquities* (1914).

Mana, a native term of the Pacific region, now used as a general name for the power attributed to sacred persons and things. Locally it signifies a force altogether distinct from physical power, which acts in all kinds of ways for good and evil, and which it is of the greatest advantage to possess or control.

Manaar', GULF OF, lies between Ceylon and the Madras coast, and is closed on the north by a low reef of rocks and islands called Adam's Bridge (q.v.). Its extreme width is nearly 200 miles. The gulf is famous for its pearl-fisheries.

Manacor', a town of Majorca, in a fertile plain, 30 miles E. of Palma by rail; pop. 13,000.

Managua, the capital of Nicaragua, in a fertile district, on the south shore of Lake Managua, 53 miles by rail S.E. of León, has a modern archiepiscopal cathedral, government buildings, university, and about 60,000 inhabitants. See also LEÓN.

Manakin, a name applied to various birds of the South American group of chatterers, including the Cock of the Rock (q.v.). See also COTINGA.

Manaos, capital of the Brazilian state of Amazonas, is a busy port on the Rio Negro, 12 miles above its confluence with the Amazon, and 1000 miles from the sea, reached by ocean-going steamers. An ugly, whitewashed cathedral rises in the centre of the town, which trades in various forest-products, but principally in india-rubber. Pop. 80,000.

Manasarowar, a great lake in Tibet. See MANASAROWAR.

Manassas, formerly MANASSAS JUNCTION, a village close to Bull Run (q.v.). The Confederates called their two victories here the first and second battles of Manassas.

Manasseh, the name of the eldest son of Joseph. The tribe of Manasseh received land on both sides of the Jordan (see PALESTINE).—MANASSEH was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 697 or 699 B.C., at the age of twelve, and reigned, according to the narrative, for fifty-five years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. Carried prisoner to Babylon, he repented, and his prayer was heard (2 Chron. xxxiii.).—The apocryphal composition called the *Prayer of Manasses*, found in some MSS. of the Septuagint, was never positively received as canonical.

Manasseh ben Israel, Jewish scholar, was born at Lisbon in 1604, fled with his father from the Inquisition, and settling at Amsterdam became chief rabbi of the synagogue there. In 1655-57 he was in England, seeking to secure from Cromwell the readmission of the Jews. He died at Middelburg in 1657. He published texts of various parts of the Old Testament, with notes; *De Creatione Problemata XXX.* (1635); *De la Resurreccion de los Muertos* (1636); *De Terminis Vitæ* (1639); *Espança de Israel* (1650); *Humble Address to the Lord Protector on behalf of the Jewish Nation* (1656); and *Vindiciae Judæorum, or a Letter in Answer to Questions propounded* (Lond. 1656). See JEWS.

Manatee (*Manatus*), a genus of Sirenia, along with the Dugong (q.v.) and the exterminated Rhytina. They are plump, almost cylindrical, rather sluggish, exclusively aquatic, nearly hairless, herbivorous mammals. The fore-limbs are flippers, the hind-limbs are absent, there is a vestige of a hip-girdle, the tail is flattened horizontally and shovel-shaped, but there is no near affinity with Cetaceans. The length is 10 to 12 feet. Very remarkable is the presence of only six cervical vertebrae, instead of the usual seven, and the reduction of the teeth to molars, which seem to increase in number posteriorly as they are worn down and lost anteriorly. The skin is dark and wrinkled; the upper lip is cleft, and used in gripping seaweeds and the like. There is but one offspring at a time, and there are two mammae

Manatee.

on the pectoral region. The unborn young has a coating of rudimentary hairs. Manatees are relatively smooth-brained, gentle, and affectionate creatures, for the most part littoral and fluviatile. From the dugongs they differ in having a thicker body and a straighter head, with the jaws but slightly curved, in the rounded or shovel-like shape of the tail, and in the presence of rudimentary nails on the fore-limbs, to the hand-like form of which the word *manatus* was long supposed to refer (as if it were 'having a hand' from Lat. *manus*; really through the Spanish from the Carib name *manattoui*). They differ also in more technical characters. The Old World *M. senegalensis* occurs on the west coast of Africa from 16° N. to 10° S.; *M. latirostris* on American coasts from Florida to Brazil and the Antilles; *M. inunguis* in Brazilian rivers has no traces of the nails which are represented by rudiments on some of the fingers in the other species. Manatees are caught

for their flesh, blubber, and strong skin. See Memoirs by Murie and Garrod in *Trans. Zool. Soc.*, vols. viii., x., xi.; by Beddard in *Proc. Zool. Soc.* 1897.

Manbhum, a district forming the eastern part of Chota Nagpore (q.v.).

Manby, GEORGE WILLIAM, inventor of life-saving apparatus for shipwrecked persons, was born in 1765, at Hilgay, near Downham Market in Norfolk, served in the militia, and became barrack-master at Yarmouth in 1803. In 1808 he succeeded, with apparatus designed by him, in saving the lives of the crew of the brig *Elizabeth*. A career of usefulness was thus commenced, which he followed for the remaining forty-six years of his life. He repeatedly received grants of money from parliament. He died November 18, 1854. It was estimated that, by the time of his death, nearly 1000 persons had been rescued from stranded ships by means of his apparatus. See LIFE-SAVING APPARATUS.

Mancha, LA, a district of Spain, the southernmost part of the old kingdom of New Castile, comprising most of the present province of Ciudad Real, with parts of Albacete, Toledo, and Cuenca (see CASTILE). It is the country of the ever-memorable Don Quixote, his squire Sancho Panza, and of the peerless Dulcinea del Toboso.

Manche ('sleeve'), a maritime department in the north-west of France, formed from the old province of Normandy, is named from La Manche (the English Channel), which washes its rocky coasts. Greatest length, 81 miles; average breadth, 28 miles; area, 2289 sq. m. Pop. (1872) 544,776; (1911) 467,119; (1921) 425,512. The climate is mild but humid. Cereals, flax, hemp, beetroot, and fruits are extensively cultivated. Immense quantities of apples are grown, from which cider is made. Horses of the true Norman breed are reared, and excellent cattle and sheep are fed on the extensive pastures. There are valuable quarries, iron-foundries, zinc and copper works, and other industries. The department is divided into the six arrondissements of St Lô, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St Lô. The port of Cherbourg and the rock of St Michel (with its celebrated abbey) belong to this department.
